Slight Increase in Pig Iron Sales—Scrap Market Weaker

CINCINNATI, Jan. 24.—The pig iron market has a better tone. This is evidenced by a slight increase in sales during the past week. While the foundry melt in this district is still at a low point, indications are that operations will expand by the end of the month. Open inquiries are meager, but small-lot buying is being done by many consumers to tide them over the first quarter. At Ironton, Ohio, the one active furnace is reported to be piling considerable iron, and another producer has reduced its stock pile a fair amount in the past few months. The price there remains firm at $19, base furnace. Northern Ohio makers are understood to be selling some iron in southern Ohio at $16.50, base furnace, although there is a more noticeable tendency to quote higher figures. Tennessee and Alabama iron are unchanged at $16, base Birmingham, but sales north of the Ohio River have been unimportant. The movement of silvery iron from Jackson County furnaces is only fair. Prices are steady at $25, base furnace, for 8 per cent.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$20.89
So. Ohio malleable	$20.14 to 20.89
Alabama fdy., sil. 1.75 to 2.25	19.69
Alabama fdy., sil. 2.25 to 2.75	20.19
Tennessee fdy., sil. 1.75 to 2.25	19.69
Southern Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—The announcement of an increase of $1 a ton in the prices of bars, structural shapes and plates and the expansion of the demand for sheets have been factors in giving added strength to the finished steel market. There has been an improvement in the position of many small fabricators in the past week, an influx of jobs ranging from 100 tons downward having been responsible for the betterment. However, there has been a noticeable absence of sizable projects, although indications are that several good inquiries will come out within the next few weeks. Sheet consumers are specifying more heavily against first quarter contracts, and the outlook is favorable for continued operations of mills in this territory at a high rate of production. While some of the bookings have been from automobile manufacturers, buying has been well distributed among all consuming industries and jobbers. Prices are holding well in all varieties of sheets except galvanized stock for roofing purposes, in which a deviation from the established quotations have been noted in the South. Local wire jobbers are continuing to receive common wire nails by barge from Ironton, Ohio. Mills are asking $2.55 per keg, base Pittsburgh or Ironton. Sales of cold-rolled bars have increased somewhat, and orders for spikes have been liberal.

Warehouse Business.—There has been an improvement in sales in the past week, and jobbers now are of the opinion that the volume of business in January will exceed that of December. Prices are unchanged.

Coke.—While by-product foundry coke specifications from the automobile industry have been fairly good, the improvement in that direction has been offset by the curtailment of production in jobbing foundries. The result is that shipments in January will be little more than in December. Sales of by-product domestic grades have been about 50 per cent above those of December. The present scale of prices probably will remain undisturbed during February, although no formal announcement has been made.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
Reinforcing bars	3.30c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Open-hearth spring steel	4.75c. to 5.00c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in	19.00
4-in.	39.00

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates: $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—Signs of weakness have cropped out. Steel mill operations are trending upward slowly, but plants are willing to buy scrap only on an exceptionally desirable basis. A Portsmouth, Ohio, company last week purchased heavy melting steel and cast iron borings at delivered prices of $14.25 and $11.50, respectively. Foundries nearby are taking scattered lots of material, but in the aggregate their consumption has been small.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.75 to $12.25
Scrap rails for melting	12.50 to 13.00
Loose sheet clippings	9.00 to 9.50
Bundled sheets	9.50 to 10.00
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.50 to 9.00
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.50 to 8.00
Rails for rolling	13.00 to 13.50
No. 1 locomotive tires	13.50 to 14.00
No. 1 railroad wrought	11.50 to 12.00
Short rails	17.00 to 17.50
Cast iron carwheels	13.00 to 13.50
No. 1 machinery cast	16.00 to 17.00
No. 1 railroad cast	13.50 to 14.00
Burnt cast	8.00 to 8.50
Stove plate	9.25 to 9.75
Brake shoes	10.00 to 10.75
Railroad malleable	12.75 to 13.25
Agricultural malleable	12.25 to 12.75

Canada

Forward Buying of Pig Iron Declines—Scrap Prices Are Weak

TORONTO, ONT., Jan. 24.—Fully 75 per cent of the melters of pig iron are estimated to have covered their requirements for the near future, and the volume of forward buying has declined. Sales during the past week were mostly small lots for prompt shipment. Production of pig iron in Canada has received a setback due to an explosion in No. 3 furnace at the plant of the Algoma Steel Corporation, Sault Ste. Marie, Ont., and until repairs are made the company will have only one furnace in blast. Price shading on pig iron is believed to be less prevalent than last month.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	25.00
No. 2 foundry, sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—Toronto and Montreal scrap markets show very little change. Hamilton, Ont., consumers are taking more interest. Prices are weak, but have not been revised.

Dealers' buying prices:

Per Gross Ton	Toronto	Montreal
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	6.00
Boiler plate	7.00	7.00
Heavy axle turnings	7.50	7.50
Cast borings	7.50	6.00
Steel turnings	7.00	6.50
Wrought pipe	5.00	6.00
Steel axles	14.00	19.00
Axles, wrought iron	16.00	21.00

Stove plate	9.00	....
Standard carwheels	13.00	....
Malleable scrap	13.00	....

Boston

Eastern Pig Iron Selling at Low Prices in New England

BOSTON, Jan. 24.—Pig iron sales in New England the past week were not much more than 3000 tons, 90 per cent being by furnaces east of Buffalo. While a firmer tendency is noted in other sections of the country, prices on iron from furnaces east of Buffalo are weaker in New England because of keen competition and varying freight rates. At certain New England points No. 2X has been sold on a delivered basis equivalent to $16.50 a ton furnace, Buffalo, or less. No. 2 plain was offered last week at $21.02 a ton delivered, as against $21.41 for Buffalo iron, while No. 1X is available at $21.40 delivered, contrasted with $21.91 to $22.41 for Buffalo iron and $24.15 for eastern Pennsylvania iron. There is no established basis, for while these low prices prevail, others equivalent or almost equivalent to the full Buffalo furnace quotations have been obtained. A New York furnace took 300 tons, silicon 2 to 2.50, from a New Hampshire machinery manufacturer, against a lower bid from the Mystic stack, which helps to illustrate the mixed condition of the market. Iron sold the past week calls for deliveries running into the second quarter. A Worcester, Mass., plant is expected to close on 1000 tons this week, part No. 2 plain and part No. 2X.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$21.41 to $21.91
Buffalo, sil. 2.25 to 2.75	21.91 to 22.41
East. Penn., sil. 1.75 to 2.25	23.15
East. Penn., sil. 2.25 to 2.75	23.65
Virginia, sil. 1.75 to 2.25	25.71
Virginia, sil. 2.25 to 2.75	26.21
Alabama, sil. 1.75 to 2.25	22.91 to 24.77
Alabama, sil. 2.25 to 2.75	23.41 to 25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Shapes and Plates.—McClintic-Marshall Co. and the New England Structural Co. jointly have been awarded the fabrication of 15,000 tons of steel for the New England Building to be erected in the Park Square district, Boston. This tonnage is the largest ever awarded in New England for a building. The Bethlehem Steel Co. will furnish the plain material. The market for plates and standard shapes is 1.80c. to 1.85c. per lb., base Pittsburgh.

Coke.—Contrary to intimations made last week by by-product foundry coke interests that a change in price was expected before Feb. 1, it is definitely established the price will remain at $11.50 a ton delivered within a $3.10 freight rate zone until March 1. No improvement in the movement of foundry coke is reported. The price for domestic coke remains at $8.50 a ton ovens, Everett, Mass., or the equivalent.

Cast Iron Pipe.—Watertown, Mass., has placed 1000 tons of 6 to 16-in. pipe with the Warren Foundry & Pipe Co. Massachusetts has purchased 400 tons of 6 to 12-in. pipe from the United States Cast Iron Pipe & Foundry Co. for a hospital. Medford, Mass., has placed 250 tons of 6 to 12-in. pipe with R. D. Wood & Co. Malden, Mass., closes bids today on 300 tons of pipe, various sizes. Stone & Webster, Inc., has yet to close on 2000 tons of gas pipe for its 1928 requirements. Private water pipe business continues quite brisk. For large pipe the market remains unsettled. On private business 4-in. pipe is selling at $45.10 to $46.10 a ton, delivered common Boston freight rate points, and 6 to 12-in. at $41.10 to $42.10. The usual $5 differential is asked on class A and gas pipe.

Cold-Rolled Strip Steel.—Sales have quickened somewhat for deliveries extending late into the first quarter. The undertone of the market is firmer.

Imports.—Receipts of pig iron at Boston for the first half of January were 1282 tons, made up of 750 tons of English, 237 tons of Dutch and 295 tons of Indian. Imports in the first half of December were 594 tons.

Mill Prices on Cold-Rolled Strip in North Atlantic States: In 1 to 3-ton lots, 3.25c. per lb., base Pittsburgh, and also, 3.25c. to 3.40c. per lb., base Worcester, Mass.

Old Material.—Old material is slightly more active. With the exception of scrap rails, which are about 25c. a ton cheaper, scrap prices are holding and in some instances are firmer. Skeleton the past week moved more freely, generally at $6 to $6.50 on cars shipping point, and in at least one instance at $7, and this statement applies also to forge flashings. Pipe is more active and 50c. a ton higher. Steel turnings generally are selling at $6 to $6.50 a ton on cars, but one broker is paying $6.10. The shafting market, dull a week ago at $13 to $13.50 a ton because of the withdrawal of a Maine mill from the market, today is $13.25 to $14 for Pennsylvania delivery. For New England delivery, there is an abundance of textile machinery cast at $14 to $15 a ton delivered, with $14 to $14.50 having been paid. No. 1 machinery cast was sold the past week at $16 a ton, delivered on a high freight rate, whereas the average transaction is at $14.50 or $15. A Massachusetts brake shoe maker is paying $11 a ton for stove plate. The Boston & Maine Railroad closed bids today on 80 cars of miscellaneous material.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to $9.25
Scrap rails	8.50 to 8.75
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	8.50 to 9.00
Machine shop turnings	6.00 to 6.50
Cast iron borings (steel works and rolling mill)	6.00 to 6.25
Bundled skeleton, long	6.00 to 6.50
Forge flashings	6.00 to 6.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	6.00 to 6.50
Shafting	13.00 to 13.50
Steel car axles	15.50 to 16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	8.00 to 8.50
Rails for rerolling	10.00 to 10.50
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton delivered consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	14.50 to 15.00
No. 2 machinery cast	12.50 to 13.00
Stove plate	11.00
Railroad malleable	13.00 to 13.50

The American Demag Corporation, 310 South Michigan Avenue, Chicago, was recently incorporated to sell in the United States the products of the Demag Co., Duisburg, Germany. The German company is a leading builder of steel plants, rolling mills, seamless tube mills, cold drawing machinery and harbor dock equipment in Europe. It recently acquired the Thyssen Machine Co., builder of heavy mill machinery and gas engines. H. A. Brassert & Co., Chicago, are affiliated with the American corporation and K. W. Atwater, who has been one of the American representatives of the German company, is vice-president.

Pacific Northwest

Expected Improvement in Steel Business Slow to Develop

SEATTLE, Jan. 20 (*By Air Mail*).—The increase in steel orders expected this month has failed to materialize, and conditions in the local steel trade are quiet. While the outlook is hopeful there is nothing in sight to indicate when conditions will improve.

Pig Iron.—Sales are few and involve small lots only. Prices remain unchanged. Utah No. 2 foundry and basic are quoted at $24 to $25 per gross ton, Seattle delivery.

Plates and Shapes.—The local market is very quiet. The only worthwhile jobs placed in the past week were 1000 tons of shapes for the new plant of the Union Bag & Paper Co. at Tacoma, taken by the United States Steel Products Co. and 672 tons for the Argo crossing in Seattle. Much new work is in sight, but it is very slow in coming out. Shapes are quoted at 2.30c. and plates at 2.25c., Seattle delivery.

Sheets.—Demand is very quiet for black and blue annealed, but for galvanized is fairly active. Prices are unchanged: No. 24 galvanized at 4.35c.; No. 24 black, 3.50c., and Nos. 9 and 10 blue annealed, 2.75c., Seattle.

Bars.—New work is entirely in small lots, but a good deal is in sight which may not be placed for some time. The new Bon Marche store, the Beacon Hill tunnel, two large apartments and additions to the Elks' Temple and the Olympic Hotel will take 5000 tons or more. Prices range from 1.85c. to 2.25c., depending on the size and desirability of the order.

Hoops and Bands.—Foreign hoops have been sold for delivery at nearby consuming points at $3 per ton or more below domestic prices. Domestic hoops and bands are quoted at 2.73c., Seattle.

Detroit Scrap Market Weak; Pig Iron Shipments Large

DETROIT, Jan. 24.—Prices on old material in this district have not changed during the past week, but the tone of the market is slightly weaker. This has no doubt been brought about by high operations at producing plants and also because mills and furnaces have not bought as heavily or as far in the future as was expected.

Pig iron shipments are on a high basis with indications that the February melt will be above that of January.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling Steel	$12.00 to $12.50
Boring and short turnings	9.00 to 9.50
Long turnings	7.75 to 8.25
No. 1 machinery cast	16.00 to 17.00
Automobile cast	18.00 to 19.00
Hydraulic compressed sheets	10.75 to 11.25
Stove plate	11.50 to 12.50
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	10.00 to 10.50

Navy Department Awards Steel

WASHINGTON, Jan. 24.—The Carnegie Steel Co. has been awarded the contracts to furnish 2317 tons of special treatment plates and 110 tons of shapes for modernization of the battleships Oklahoma and Nevada. The Pacific Coast Steel Co. has been awarded a contract to supply 137 tons of shapes and the Bethlehem Steel Co. 102 tons of shapes for light cruisers Nos. 28 and 29. There are additional small tonnages still to be awarded for the latter two ships.

Carnegie Steel Co. Making Floor Plate

The Carnegie Steel Co. has engaged in the manufacture of floor plate of the raised pattern type which is furnished in thicknesses ranging from 3/16 to 3/4 in. and in widths to 66 in.

FEWER CASTINGS IN 1927

Bookings 12 Per Cent Below 1926 for Commercial Steel Castings—Output Down 16 Per Cent

WASHINGTON, Jan. 24.—Showing an increase of 14,025 tons, orders for commercial steel castings totaled 74,939 tons in December, against 60,914 tons in November. For the 12 months they aggregated 875,146 tons, compared with 996,266 tons in 1926, according to reports received by the Department of Commerce from 123 manufacturers. Production in December amounted to 56,414 tons, against 56,935 tons in November. For the year the total was 920,657 tons, compared with 1,095,166 tons in 1926.

Bookings in December represented 56 per cent of capacity, against 46 per cent in November. Of the December bookings, 38,266 tons was for railroad specialties, representing 64 per cent of this class of capacity, against 26,752 tons, or 45 per cent, in November. Bookings of railroad castings for the year amounted to 358,422 tons, or 50 per cent of capacity, against 382,478 tons, or 53 per cent, in 1926. Bookings of miscellaneous castings in December totaled 36,673 tons, or 50 per cent of capacity, against 34,162 tons, or 47 per cent, in November. For the year, bookings of miscellaneous castings totaled 516,724 tons, or 43 per cent of capacity, compared with 613,788 tons, or 70 per cent, in 1926.

Of the December output 18,671 tons was in railroad specialties, representing 31 per cent of capacity, against 18,046 tons, or 30 per cent of capacity, in November. Production of railroad specialties last year aggregated 343,716 tons, or 48 per cent of capacity, against 403,416 tons, or 56 per cent, the year previous. Production of miscellaneous castings in December amounted to 37,743 tons, or 52 per cent of capacity, against 38,889 tons, or 53 per cent, in November. Nineteen hundred and twenty-seven production of this kind of castings totaled 576,941 tons, or 66 per cent of capacity, against 691,750 tons, or 79 per cent, in 1926.

Obermayer Contest for Foundry Devices Announced for 1928

The 1928 Obermayer prize of the American Foundrymen's Association will be given to the person submitting a device, drawing or model of some jig or method, which, in the opinion of the judges, embodies the best ideas for economical production of castings. The entries in this prize contest will be on display at the Philadelphia meeting the week of May 14. Devices which have been prize winners in the past were:

Rochester meeting, 1922: A fixture for making green sand cores of two fittings in a single box.

Cleveland meeting, 1923: A device used in making 12-in. chilled mine car wheels.

Milwaukee meeting, 1924: A roller gagger and core rod mold former.

Syracuse meeting, 1924: A continuous device for recording temperatures of iron at the cupola spout.

Detroit meeting, 1926: A safety device for raising cupola drop bottom doors.

Those who contemplate entering this contest should notify the secretary of the American Foundrymen's Association, 140 South Dearborn Street, Chicago.

Record Production of Portland Cement

Production of Portland cement in the United States in 1927 is reported by the Bureau of Mines at 171,908,000 bbl. This is an increase of about 4½ per cent over the 1926 production of 164,530,000 bbl. Each in turn was a new high record. Nearly one-quarter of the entire amount came from eastern Pennsylvania, New Jersey and Maryland, which produced slightly less than in 1926, when the contribution of this area was a little more than one-quarter of the total.

Production reached a peak in August, 1927, at 18,315,000 bbl. This was about 7 per cent ahead of the highest month of 1926, which was July, with 17,134,000 bbl. Five months of 1927 exceeded the largest month of any previous year.

NON-FERROUS METAL MARKETS

The Week's Prices

Cents per Pound for Early Delivery

	Jan. 24	Jan. 23	Jan. 21	Jan. 20	Jan. 19	Jan. 18
Lake copper, New York	14.25	14.25	14.25	14.25	14.25	14.25
Electrolytic copper, N. Y.*	13.87½	13.75	13.75	13.75	13.75	13.80
Straits tin, spot, N. Y.	55.37½	55.62½	....	55.00	54.50	54.37½
Lead, New York	6.50	6.50	6.50	6.50	6.50	6.50
Lead, St. Louis	6.30	6.30	6.30	6.30	6.30	6.30
Zinc, New York	6.00	6.00	5.95	5.95	5.97½	5.97½
Zinc, St. Louis	5.65	5.65	5.60	5.60	5.62½	5.62½

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, Jan. 24.—Practically all of the markets are quiet but firm. Concessions in copper have practically disappeared and export sales have increased. Some activity in tin has developed, with prices a little higher. The lead market is unchanged. Some strength has appeared in zinc after a week of lower prices.

Copper.—Sales yesterday and today of considerable electrolytic copper for export have somewhat changed the complexion of the market. A few custom smelters, who were shading the price of leading producers, have practically ceased such tactics and the market is virtually on a basis of 14.12½c., delivered in the Connecticut Valley. Sales during the week, as low as 14c., delivered, are noted, but the volume was not large. There were also some sales at the price of leading producers. Export demand amounted to about 2500 tons Monday, and today it was expected that this total would be equalled, Germany being the principal buyer. As a result of the export demand, inquiry from domestic consumers has become somewhat more lively. The official quotation of Copper Exporters, Inc., is unchanged at 14.50c. c.i.f. usual European ports. A fair business has been done in Lake copper recently and the quotation is unchanged at 14.25c., delivered, with some sales at 14.30c.

Tin.—Sales for the week ended Saturday, Jan. 21, were about 1200 tons. The business consisted mostly of trading between dealers, consumers being quite inactive. Some London houses were anxious for orders and pressed hard to obtain business. Most of the week the market was sluggish and heavy despite the fair amount of business done. Prices in the week have advanced, although transactions yesterday and today have been in very moderate volume. Spot Straits tin was quoted today 55.37½c., New York. Arrivals thus far this month have been 4015 tons, with 5675 tons reported afloat.

Lead.—The market has been moderately active and a fair business has been done for January and early February delivery. The quotation of the leading interest is unchanged at 6.50c., New York. Prices in the outside market are 6.30c., St. Louis, although during the last week some resale metal changed hands as low as 6.25c.

Zinc.—Yesterday and today the market for prime Western zinc is a little stronger, following quotations last week which, at 5.60c., St. Louis, were equal to the low level of 1927. Partly because of better conditions in the ore district, quotations yesterday and today were on a basis of 5.65c., St. Louis. Although the price of ore is still $36, Joplin, production and sales were each about 12,000 tons last week. Producers of zinc report a fair amount of inquiry and business.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. with shot nickel at 36c., and electrolytic nickel at 37c. per lb.

Antimony.—A fairly large consuming demand recently is reported, but market quotations are practically unchanged for Chinese metal at 11c. for spot and 11.25c. for futures, New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in ingots is quoted 23.90c., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Jan. 24.—A fair volume of business is being transacted in all commodities except lead. Inquiry

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	57.50c. to 58.50c.
Tin, bar	59.50c. to 60.50c.
Copper, Lake	15.25c.
Copper, electrolytic	15.00c.
Copper, casting	14.25c.
Zinc, slab	7.25c. to 7.75c.
Lead, American pig	7.65c. to 8.65c.
Lead, bar	9.90c. to 10.90c.
Antimony, Asiatic	13.00c. to 13.50c.
Aluminum No. 1 ingot for remelting (guaranteed over 99 per cent pure)	27.00c. to 28.00c.
Aluminum ingots, No. 12 alloy	26.00c. to 27.00c.
Babbitt metal, commercial grade	30.00c. to 40.00c.
Solder, ½ and ½	39.25c. to 40.25c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	60.50c.
Tin, bar	62.50c.
Copper, Lake	15.25c.
Copper, electrolytic	15.25c.
Copper, casting	14.50c.
Zinc, slab	7.75c.
Lead, American pig	7.25c.
Antimony, Asiatic	16.00c.
Lead, bar	9.50c.
Babbitt metal, medium grade	19.75c.
Babbitt metal, high grade	65.25c.
Solder, ½ and ½	36.25c.

Rolled Metals from New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—	
High brass	18.50c. to 19.25c.
Copper, hot rolled	22.75c. to 23.75c.
Copper, cold rolled, 14 oz. and heavier,	25.25c. to 26.25c.
Seamless Tubes—	
Brass	23.37½c. to 24.37½c.
Copper	24.50c. to 25.50c.
Brazed Brass Tubes	26.50c. to 27.50c.
Brass Rods	16.25c. to 17.25c.

From New York Warehouse

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9), casks	10.50c. to 11.00c.
Zinc sheets, open	11.00c. to 11.25c.

Non-Ferrous Rolled Products

No changes in mill prices of bronze, brass and copper products have occurred since the advances of Dec. 5. Zinc sheets and lead full sheets have not changed since Aug. 5 and Dec. 1, respectively.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Zinc	10.00c.
Lead (full sheets)	10.00c. to 10.25c.
Seamless Tubes—	
High brass	23.62½c.
Copper	24.50c.
Rods—	
High brass	16.50c.
Naval brass	19.25c.
Wire—	
Copper	15.75c.
High brass	19.25c.
Copper in Rolls	21.75c.
Brazed Brass Tubing	26.75c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also allowed to St. Louis on shipments to destinations west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machne rods	34.00c.

Rolled Metals, f.o.b. Chicago Warehouse

(Prices Cover Trucking to Consumers' Doors in City Limits)

	Base per Lb.
Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Copper, cold rolled, 14 oz and heavier	25.00c.
Zinc	11.00c.
Lead, wide	9.75c.
Seamless Tubes—	
Brass	25.12½c.
Copper	26.00c.
Brazed Brass Tubes	26.75c.
Brass Rods	16.50c.

for zinc for delivery in March and April is brisk. The old metal market is dull and prices are weak.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 56.75c.; lead, 6.35c.; zinc, 5.70c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.25c.; pewter, No. 1, 34c.; tin foil, 40c.; block tin, 50c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

REINFORCING STEEL

Awards of 9500 Tons Include 8000 Tons For Plants in Chicago and Boston

Awards of more than 9500 tons included 5000 tons for the Boston-Cambridge, Mass., plants of Sears, Roebuck & Co. and 3000 tons for the Campbell Soup Co. plant in Chicago. New projects reported totaled only about 900 tons, less than any week since the first of the year. Included in new business was 400 tons for an apartment building in Chicago. Awards follow:

BOSTON-CAMBRIDGE, 5000 tons, Sears, Roebuck & Co. plants, to Concrete Steel Co.

PROVIDENCE, R. I., 125 tons, Court House, to Truscon Steel Co.

ROCHESTER, N. Y., 180 tons, State hospital, to unnamed local contractor.

PITTSBURGH, 360 tons, Grant Building; 160 tons to Truscon Steel Co., and 200 tons to Carlem Engineering Co.

CHICAGO, 3000 tons of rail steel bars, plant for Campbell Soup Co., to Calumet Steel Co.

MARSHALLTOWN, IOWA, 200 tons, hotel, to Concrete Engineering Co.

ST. LOUIS, 220 tons, apartment buildings, to Laclede Steel Co.

ORLAND, CAL., 326 tons, Stony Gorge dam; 281 tons to Pacific Coast Steel Co., and 45 tons to Laclede Steel Co.

SEATTLE, 100 tons, Bartell Drug Co., to Pacific Coast Steel Co.

SEATTLE, 110 tons, Queen Anne High School addition, to Pacific Northwest Steel Rolling Mills.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BUFFALO, 100 tons, seven County bridges; bids opened Feb. 7.

CHICAGO, 400 tons, apartment building at 222 Chestnut Avenue.

RIVERSIDE, CAL., 120 tons, Victoria Avenue bridge; bids opened.

SEATTLE, WASH., 2500 tons, Bon Marche department store; bids soon.

SEATTLE, 1000 tons, Weaver Street bridge; bids being taken.

SEATTLE, 1000 tons, Beacon Hill tunnel; bids being taken.

ELYRIA, OHIO, 300 tons, sewage disposal plant.

Total apparent consumption of babbitt metal in 1927 was 60,111,843 lb., as against 65,934,782 lb. in 1926, according to reports received by the Department of Commerce from 31 firms. Sales by manufacturers in 1927 amounted to 47,003,959 lb., and consumption by producers to 13,107,884 lb., comparing with 50,555,110 lb. and 15,379,672 lb. respectively in 1926. Total apparent consumption in December was 4,465,787 lb., compared with 4,505,954 lb. in November.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	9.75c.	11.00c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.75c.
No. 1 yellow brass turnings	7.75c.	8.75c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	4.25c.	4.75c.
Zinc	3.75c.	4.25c.
Sheet aluminum	12.75c.	14.50c.
Cast aluminum	12.75c.	14.50c.

RAILROAD EQUIPMENT

Inquiries for About 500 Cars But Orders Are For Minor Lots

Although expectations are that railroad equipment buying will show a new spurt soon, the week's business amounted only to a few small purchases and inquiries for about 500 cars. Details follow:

Government of Siam has ordered eight locomotives from Baldwin Locomotive Works.

Wilson & Co., Chicago, have made inquiry for 300 40-ton refrigerator cars.

Northern Pacific has ordered 50 caboose car underframes from Siems-Stembel Co.

Western Lumber Co. has ordered one Prairie-type locomotive from Baldwin Locomotive Works.

Great Northern has placed an order for eight 30-cu. yd. air-dump cars with Koppel Industrial Car & Equipment Co.

Sloss-Sheffield Steel & Iron Co. has ordered one consolidation type locomotive from Baldwin Locomotive works.

Toronto, Hamilton & Buffalo has placed an order for two 2-8-4-type locomotives with Montreal works of American Locomotive Co.

Texas & Pacific has ordered two business cars from American Car & Foundry Co.

Southern Railway has ordered one baggage and mail car from Bethlehem Steel Co., in addition to 25 cars reported some time ago.

Standard Oil Co. of New Jersey is inquiring for 12 all-steel 50-ton box cars.

Republic Iron & Steel Co. is inquiring for 50 70-ton gondola car bodies.

Manila Railroad has ordered 50 flat cars from Gregg Co. and has made inquiry for 50 box cars.

Lake Superior & Ishpeming will buy 250 ore cars.

New York, Westchester & Boston Railway has ordered 10 additional electric passenger cars from Westinghouse Electric & Mfg. Co.

Universal Pipe & Radiator Co. Plans Expansion

The Universal Pipe & Radiator Co., 420 Lexington Avenue, New York, has proposed to its stockholders an increase in the authorized common stock of the company from 400,000 to 3,000,000 shares, for the reported purpose of acquiring additional properties. In a letter to the stockholders of the company calling a special meeting for Feb. 15, President Louis B. Ladoux said in part:

> In connection with the rapid growth of the business of your company, the management has for the past few years pursued a policy of diversification with the idea of offsetting the seasonal fluctuations in the building and allied trades. In line with this policy, the business of the company has recently been extended to include through its subsidiaries, the manufacture of railroad brake shoes, the operation of by-product ovens and the manufacture of artificial stone for ornamental purposes. Plans for further expansion are being considered which, if consummated, would greatly strengthen your company.

The Universal Pipe & Radiator Co. was incorporated in 1923 to take over the properties of the Iron Products Corporation, the Central Foundry Co. and the Central Radiator Co. It is also the holding company of the Essex Foundry Co., Newark, N. J., the Molby Boiler Co., Lansdale, Pa., and the Chattanooga Iron & Coal Corporation, Chattanooga, Tenn.

FABRICATED STRUCTURAL STEEL

Cleveland Award of 57,800 Tons Brings Week's Total to 103,000 Tons

Marked by two structural steel awards of unusual size, 57,800 tons for the Cleveland Union Terminals, Cleveland, and 15,000 tons for a building in Boston, the week's total of fabricated steel contracts exceeded 103,000 tons. Other outstanding awards were 8000 tons for a bank building in Chicago and 7000 tons for subway work in New York. Awards follow:

ALLERTON, N. J., 350 tons, Packers' Island bridge for New Jersey State Highway Commission, to Phoenix Bridge Co.

PHILADELPHIA, 115 tons, Fern Rock Terminal for Department of City Transit, to Montgomery Iron & Steel Co.

CLEVELAND, 57,800 tons, railroad station, department store building, garage and Huron Road viaduct, as part of Cleveland Union Terminals project, to American Bridge Co.

BOSTON, 15,000 tons, New England Building, to McClintic-Marshall Co. and New England Structural Co.

NEW YORK, 900 tons, tunnel shields for Fulton Street tunnel, to Biggs Boiler Works Co., Akron, Ohio.

NEW YORK, 7000 tons, section 13, route 107 of subway, to McClintic-Marshall Co.

NEW YORK, 700 tons, apartment building on East Twenty-second Street, to Easton Structural Steel Co.

NEW YORK, 700 tons, apartment building on Forty-third Street, to Harris Structural Steel Co.

NEW YORK, 550 tons in the following awards as reported to the Structural Steel Board of Trade, Inc.: Office building at Franklin Avenue and Fifteenth Street, Flushing; apartment building on Scotland Road, East Orange, State Bank at Eighth Avenue and Forty-third Street and inclosures for sledge beds for Barnes Engineering Co. at Lodi, N. J., to Lehigh Structural Steel Co

FLUSHING, N. Y., 200 tons, apartment building, to an unnamed fabricator.

STATE OF NEW JERSEY, 150 tons, highway bridge, to Bethlehem Steel Co.

BALTIMORE & OHIO RAILROAD, 1500 tons, bridges at Philadelphia, to Shoemaker Bridge Co.

NEW YORK CENTRAL RAILROAD, 750 tons, bridges in Indiana; 250 tons to Fort Pitt Bridge Works, and 500 tons to Bethlehem Steel Co.

BUFFALO, 500 tons, marine towers for Hecker-Jones-Jewell flour mill, to Kellogg Structural Steel Co.

CHICAGO, 8000 tons, Forman National Bank building, to Hansell-Elcock Co., local.

CHICAGO, MILWAUKEE & ST. PAUL RAILROAD, 250 tons, girder spans, to American Bridge Co.

LA CROSSE, WIS., 400 tons, highway bridge, to McClintic-Marshall Co.

CHIPPEWA FALLS, WIS., 400 tons, power house gates for Northern States Power Co., to Minneapolis Steel & Machinery Co.

COLUMBIA, MO., 100 tons, Columbia Theater, to St. Louis Structural Steel Co.

NILES FERRY, TENN., 300 tons, bridge for Tennessee Highway Commission, to St. Louis Structural Steel Co.

STATE OF TEXAS, 500 tons, highway bridge across Brazos River, to Missouri Valley Bridge & Iron Co., Leavenworth, Kan.

BILLINGS, MONT., 300 tons, bridge over Snake River at Swan Valley, to unnamed fabricator.

LOS ANGELES, 1250 tons, Medical Building, to Union Iron Works.

OAKLAND, CAL., 350 tons, Women's Athletic Club, to Herrick Iron Works.

RICHMOND, CAL., 1000 tons, plates and shapes for two 80,000 and five 21,000-bbl. tanks for Petroleum Securities Co., to Western Pipe & Steel Co.

FRESNO, CAL., 2500 tons, building for Western Fruit Exchange Co., to Minneapolis Steel & Machinery Co.

STEGE, CAL., 110 tons, plant for Western Industries, Inc., to Jansen Iron Works.

OLYMPIA, WASH., 100 tons, bridge over Nooksack River, Whatcom County, to Wallace Bridge & Structural Steel Co.

PORT TOWNSEND, WASH., 250 tons of additional plates for pipe line, to Steel Tank & Pipe Co.

TACOMA, WASH., 1200 tons, for Pacific Bag & Paper Co., to United States Steel Products Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PHILADELPHIA, 150 tons, bank and office building, Sixteenth and Locust Streets.

PHILADELPHIA, 250 tons, telephone building, Seventeenth and Tioga Streets.

PHILADELPHIA, 250 tons, Ninth Bank and Trust Co. building.

PHILADELPHIA, 150 tons, addition for West Philadelphia Title & Trust Co.

PHILADELPHIA, 500 tons, Northeastern Title & Trust Co. building; general contract to Frank G. Stewart, local.

BUFFALO, 200 tons, three Erie County bridges.

ERIE, PA., 600 tons, factory extension for J. A. Zurn Co.

CLEVELAND, 200 tons, laboratory for American Gas Association.

CLEVELAND, 100 tons, Kresge store building.

CLEVELAND, 200 tons, Steel Improvement & Forge Co., factory building.

LEXINGTON, KY., tonnage unstated, memorial building for University of Kentucky.

STATE OF NEW HAMPSHIRE, 1000 tons, highway bridges.

BOSTON, 150 tons, highway bridge for city.

NEW YORK, 700 tons, chapel for Fordham University.

EAST ORANGE, N. J., 200 tons, municipal building.

ALBANY, N. Y., 500 tons, garage.

ROCHESTER, N. Y., 175 tons, State Hospital.

GARY, IND., 700 tons, Lake County Court House.

CHICAGO, 4500 tons, Steuben Club.

CHICAGO, 2400 tons, office building at Jackson Boulevard and Franklin Street.

CHICAGO, 700 tons, Home Syndicate Garage.

PEKIN, ILL., 1700 tons, bridge across Illinois River.

BLOOMINGTON, IND., 700 tons, building for University of Indiana.

MILWAUKEE, 7000 tons, Sixteenth Street viaduct, with bascule span; bids close Feb. 10 on fabrication and delivery only; bids on erection later.

BOISE, IDAHO, 233 tons, bridge over Clark Fork River, Sanders County; bids in.

SAN FRANCISCO, 270 tons, apartment building, Pacific and Laguna Streets; bids being taken.

FABRICATED STEEL PLATES

Bookings 3 Per Cent Lower in 1927—Gains in Oil Storage Tanks Offset Elsewhere

WASHINGTON, Jan. 24.—Bookings of fabricated steel plates totaled 497,697 tons in 1927, representing 51.5 per cent of capacity, against 513,913 tons or 51.9 per cent in 1926, according to reports made to the Department of Commerce by 51 firms. Of the 1927 orders, 210,974 tons were for oil storage tanks, comparing with 175,367 tons in the preceding year; 26,364 tons for refinery materials and equipment, as against 36,829 tons; 42,905 tons for tank cars, as against 42,938 tons; 39,212 tons for gas holders, as compared with 47,524 tons; 6924 tons for blast furnaces, as against 14,406 tons; and 171,318 tons for stacks and miscellaneous purposes, as against 196,849 tons.

Bookings in December totaled 35,648 tons, or 44.1 per cent of capacity, comparing with 27,341 tons, or 33.8 per cent of capacity in November.

Shipments in December were 42,694 tons, as compared with 37,986 in November. Production in December amounted to 47,876 tons, against 40,845 tons in November. The December monthly capacity was 100,685 tons, with 47.6 per cent operated, as against 100,778 tons, or 40.5 per cent, operated in November.

December bookings were distributed as follows: Oil storage tanks, 13,367 tons; refinery materials and equipment, 1554 tons; tank cars, 3764 tons; gas holders, 3490 tons; blast furnaces, 385 tons; stacks and miscellaneous, 13,085 tons.

Plan World Congress of Engineers

More than 75 prominent engineers have accepted membership on the American committee of the World Congress of Engineers, to be held in Tokio, Japan, in November, 1929. Dr. Elmer A. Sperry, chairman of the division of engineering of the National Research Council, is chairman of the permanent committee and Secretary of Commerce Hoover is honorary chairman. Maurice Holland, secretary of the research council's division of engineering, is secretary of the American committee.

Advancement of international cooperation in the study of engineering science and problems, and stimulation of a sense of brotherhood among the engineers of the world are the announced purposes of the congress.

PERSONAL

Charles E. Stuart has resigned as president, treasurer and a director of the Central Alloy Steel Corporation, Massillon, Ohio, and has been succeeded by B. F. Fairless, formerly vice-president and general manager. S. S. French has been elected a director to succeed Mr. Stuart on the board and will become vice-president and treasurer. Mr. French will continue as president of the Berger Mfg. Co. division of the corporation. Mr. Stuart was one of the two organizers of the Central Steel Co., Massillon, Ohio, in 1914, and became its secretary and treasurer. Later he was made vice-president and in 1926 succeeded F. J. Griffith as president, the latter becoming chairman of the board. When the Central Steel Co. and the United Alloy Steel Corporation were merged later in the same year as the Central Alloy Steel Corporation, Messrs. Stuart and Griffith retained the same official positions with the new organization that they had held with the Central Steel Co. Mr. Fairless, after his graduation at Ohio State University, taught school for a time and went with the Central Steel Co. at the time of its organization, as a civil engineer. He worked his way up to the position of vice-president and general manager. After the merger he became vice-president and general manager of the new corporation and in the latter capacity had charge of operations of both the Massillon and Canton plants. He will continue as general manager of the company.

B. F. FAIRLESS

Laurence Thompson has resigned as Cleveland district manager of the United States Electrical Tool Co., Cincinnati, to become Cleveland district engineer for the New Haven Sand Blast Co., New Haven, Conn. After Feb. 1 he will be located at 355 Erie Building.

C. E. Stuart, who resigned recently as president of the Central Alloy Steel Corporation, Massillon, Ohio, and W. H. Crawford, secretary of the Reliance Mfg. Co., Massillon, sailed from New York Jan. 25 for an extended Mediterranean cruise.

Milton H. Pettit, vice-president Nash Motors Co., Kenosha, Wis., has been appointed general manager of the company. He joined the Nash organization as a vice-president in charge of plants and production, July 1, 1926, having previously served in the same capacity with the Simmons Co., Kenosha.

John A. Coe, president of the American Brass Co., Waterbury, Conn., has been made president of the Waterbury Savings Bank to succeed the late Robert F. Griggs.

Robert W. Adams, manager of the Providence, R. I., office of the General Electric Co., was the speaker last week before the Worcester, Mass., section of the American Institute of Electrical Engineers.

Thornton E. Stokes, for the past two years Southern sales manager of the Lawrenceburg Roller Mills Co., Lawrenceburg, Ind., has been made sales promotion manager for the Continental Steel Corporation, Kokomo, Ind.

Earl A. Emerson, vice-president of the Armco International Corporation, Middletown, Ohio, has been elected president of the Foreign Trade Association of the Cincinnati Chamber of Commerce. He succeeds Charles D. Oesterlein, vice-president and general manager of the Oesterlein Machine Co., who becomes a member of the board of directors. The association also elected H. G. Moebus, export manager of the Andrews Steel Co., as vice-president, and Robert S. Alter, vice-president of the American Tool Works Co., as a member of the board of directors.

R. C. Storch, traffic manager of the R. K. LeBlond Machine Tool Co., Cincinnati, has been elected secretary and treasurer of the newly organized Greater Cincinnati Freight Association.

Howard W. Edwards, treasurer of the Edwards Mfg. Co., Cincinnati, maker of sheet metal products, has been named second vice-president of the Cincinnati Chamber of Commerce.

William Reis has been appointed purchasing agent of the R. K. LeBlond Machine Tool Co., Cincinnati, succeeding the late F. W. Weimann. Mr. Reis has been associated with the purchasing department of the company for a number of years.

William C. Oberg, for the past nine years superintendent of the roll department, Homestead works, Carnegie Steel Co., has been appointed to a newly created position of superintendent of roll departments, with jurisdiction over the roll shops in the several plants of the company. Mr. Oberg will make his headquarters at the company's general offices in Pittsburgh. He was a roll designer at the Homestead works before his promotion to the superintendency of the shop, and joined the Carnegie company after having been with the Pittsburgh Rolls Corporation for several years.

Philip E. Bliss, since 1923 vice-president of the Warner & Swasey Co., manufacturer of turret lathes and screw machines, Cleveland, has been elected president, succeeding Col. Frank A. Scott, who has been made chairman of the board. Ambrose Swasey and Worcester R. Warner have alternated as chairman for a number of years and will continue to participate actively in the company's management as directors. They recently passed their eighty-first birthdays. Mr. Bliss has been associated with the company for 18 years and has served in practically all of its departments. He was cashier and later auditor, and in 1917 was made treasurer, holding that position until he became executive vice-president in 1923. He was born in Cleveland in 1885 and attended Ohio Wesleyan University, Delaware, Ohio. He has taken an active interest in the National Machine Tool Builders' Association, and last September was elected its president. He is a member of the Society of Automotive Engineers and of the Cleveland Engineering Society.

PHILIP E. BLISS

C. E. Luttrell, for five years manager of the Knight-Luttrell Iron Co., Atlanta, Ga., has been placed in charge of the iron and steel department of Thomas F. Seitzinger's Sons, Atlanta, dealers in iron, steel and metals.

H. C. Atkins, president E. C. Atkins & Co., saw manufacturers, Indianapolis, and other officials of the company entertained the Atkins Pioneers, an organization of old-time employees of the company, at dinner at the Hotel Severin, Indianapolis, Saturday night, Jan. 14. The Atkins Pioneers was organized in 1906, with 62 charter members who had served the company 20 years or more, and it now has 228 male members and a women's auxiliary consisting of 18 members who have served 10 years or more. At the dinner there were talks by H. C. Atkins, who is honorary president of the Atkins Pioneers, and by William J. Strack and C. A. Newport, president and secretary respectively of the Pioneers, and also by W. A. Atkins, general factory director of E. C. Atkins & Co.

Harold E. Boyd has resigned as employment manager of the Republic Metalware Co., Buffalo, and as lecturer in industrial management in the evening session of the University of Buffalo, to become industrial engineer with the Nashua Gummed & Coated Paper Co., Nashua, N. H. During his 11 years with the Republic company, Mr. Boyd held the positions of time study man, head time study man, educational supervisor, efficiency engineer, assistant to general manager and office manager.

VICTOR WINDETT

Victor Windett, newly appointed manager of the gas producer division of the Wellman-Seaver-Morgan Co., Cleveland, as announced in THE IRON AGE last week, has been engineer of that division since 1917. He is a graduate in mechanical engineering of the Massachusetts Institute of Technology. Following his college course, he was connected with the Illinois Steel Co., Chicago, in operating and engineering work and designed and supervised the construction of that company's ore docks. As Chicago representative of Julian Kennedy, blast furnace engineer, he superintended the building of the Lake Shore plant of the Iroquois Iron Co. Later he was resident engineer of the American Coke & Gas Construction Co. in the building of the Otto Hoffman coke oven plant at Mayville, Wis., for the Northwestern Iron Co. He spent some time as engineer and contractor at New Orleans and in other points in Louisiana on drainage, water, sewerage and levee construction work, in the Chicago district on various public work, including harbor and bridge work, and on the United States locks at Sault Ste. Marie, Mich. During the World War he supervised the building of open-hearth furnaces at the Watertown, Mass., arsenal for the Wellman-Seaver-Morgan Co. and of sulphuric acid plants at Cuba City and at New Diggings, Wis., for the Leonard Construction Co., Chicago.

W. B. Speirs, formerly associated with the Delaware, Lackawanna & Western Railroad in various capacities, has been appointed district manager of the Newark, N. J., office of the Elwell-Parker Electric Co., Cleveland. He succeeds D. D. Ritson. The company's Newark office is in the Military Park Building.

Ires Prosser has been appointed Southeastern representative of the Botfield Refractories Co., Philadelphia. His territory will extend from North Carolina to San Antonio, Tex., and his headquarters will be at Atlanta, Ga.

E. R. Goldapp, associated for 12 years with the Portland Wire & Iron Works, Portland, Ore., has been made manager of the company. He takes over the duties of T. Harry Banfield, who has succeeded the late C. J. Parker in the management of the Parker-Banfield Co., owner of the Portland Wire & Iron Works. Before becoming associated with the latter company, Mr. Goldapp was identified with the Portland Sheet Metal Works, Portland.

J. B. Cooper, formerly in the Los Angeles office of the Allis-Chalmers Mfg. Co., Milwaukee, has been placed in charge of a new district sales office opened by the company at 308 Heard Building, Phoenix, Ariz. His territory will include Arizona, New Mexico and northern Mexico. The company also has opened a branch office at 619 Frost National Bank Building, San Antonio, Tex., in charge of Earle R. Hury. G. C. Culver is manager of another new office at Grand Rapids, Mich.

Daniel W. Northup, president Henry G. Thompson & Son Co., New Haven, Conn., has been elected president of the recently organized Hack Saw Manufacturers' Association of America. The association is now working, under the auspices of the Department of Commerce, for the improvement of conditions in the industry.

Dr. Thomas Stockham Baker, president Carnegie Institute of Technology, Pittsburgh, will spend six weeks in Europe during February and March in the interests of the organization of the second International Conference on Bituminous Coal, to be held at Pittsburgh the week of Nov. 29.

Charles Pasche, secretary and treasurer Davenport Locomotive & Mfg. Corporation, Davenport, Iowa, has been elected president of the company, succeeding E. Parmly, Jr., and will also continue as its treasurer. Mr. Pasche has been associated with the company since 1901.

Frank W. Gorman, formerly with the Mine & Smelter Supply Co., El Paso, Tex., has been appointed district sales representative at El Paso for the Ohio Brass Co., Mansfield, Ohio. He succeeds L. M. Keating, who has been transferred to the general sales department at Mansfield.

Joseph H. Donberg, recently with Louis E. Emerson & Co., Chicago, machinery dealers, has organized his own company under the name of Joseph H. Donberg & Co., with temporary quarters at 1426 South Harding Avenue, Chicago. The company will deal in new and used machine tools and equipment.

C. M. MacChesney has been elected secretary of the Acme Steel Co., Chicago, succeeding Donald MacMurray, who was vice-president and secretary. Mr. MacMurray remains vice-president. L. H, Whiting has been elected a director of the company, succeeding H. G. Merrill, resigned.

Myron C. Taylor, chairman of the finance committee of the United States Steel Corporation, has been elected vice-president of the New York Genealogical and Biographical Society to take the place of the late Elbert H. Gary, who held the position for many years.

Dr. W. R. Ingalls, director of the American Bureau of Metal Statistics, 115 Broadway, New York, sailed recently for Europe on a professional trip. He will return about April 1.

E. H. Wachs, since 1911 secretary of the Stocker-Rumely-Wachs Co., 117 North Jefferson Street, Chicago, dealer in machine tools, and C. R. Gregg, until recently in charge of machinery sales in the Chicago district for Joseph T. Ryerson & Son, Inc., are now managing the Stocker-Rumely-Wachs Co.

William Butterworth, president Deere & Co., Moline, Ill., who left this week for a trip to the Hawaiian Islands, will be speaker at a meeting of the Western division of the Chamber of Commerce of the United States in Honolulu. Mr. Butterworth is vice-president of the United States Chamber.

Total exports from the United States in 1927 were valued at $4,866,160,000 and imports at $4,184,453,000, according to the Department of Commerce. Exports were higher and imports lower than in 1926.

OBITUARY

Edward Larned Ryerson, chairman of the board of Joseph T. Ryerson & Son, Inc., Chicago, died on Jan. 19 at his home in that city. Death followed a stroke of apoplexy which he suffered on Jan. 14. He was the youngest son of Joseph Turner Ryerson, founder of the firm which bears that name, and was born in Chicago Nov. 24, 1854. After graduation in 1876 from the Sheffield Scientific School of Yale University, he entered his father's business and two years later was made a partner in the firm. At that time the company name was changed to Joseph T. Ryerson & Son. The younger Mr. Ryerson succeeded his father in the management of the business upon the death of the latter in 1883, and when the company was incorporated in 1888 he became president. In 1911 he retired from the presidency to become chairman of the board. Throughout an active life in the business world Mr. Ryerson maintained contacts with the civic and cultural life of his city and was a member of many associations and clubs. He was a director and member of the executive committee of the Illinois Merchants' Trust Co., Chicago, and was at one time a trustee of the Chicago Commons Association. He was a trustee and for a number of years vice-president of St. Luke's Hospital, and was one of the founders and honorary president of the Foundation for Architecture and Landscape Architecture of Lake Forest, Ill., which provides professional education to promising youths. He was a member of the Chicago Art Institute and a vice-president of the American Institute of Graphic Arts. He was a governing member of the Chicago Symphony Orchestra, a trustee of the Chicago Historical Society and since 1914 had been president of the Newberry Library, Chicago. Mr. Ryerson is survived by his widow, three sons and one daughter. The sons, Joseph T., Donald M. and Edward L., Jr., are president, vice-president and general manager and vice-president respectively of the Ryerson company.

EDWARD L. RYERSON

—

Thomas Arthur Jones, president and general manager of the Sackett Screen & Chute Co., Chicago, and vice-president of the W. A. Jones Foundry & Machine Co., Chicago, died on Jan. 19 at his home in River Forest, Ill. He was born Dec. 12, 1864, in Susquehanna County, Pennsylvania, and there attended the public schools and Wyoming Seminary. He went to Chicago in 1892 and became associated with the W. A. Jones company. He served as secretary for many years and later was president. In 1918 he took over the active management of the Sackett Screen & Chute Co., conducting this business until his death.

—

Frank Billings, for 30 years prominently identified with the iron ore industry in Cleveland as president of the Tod-Stambaugh Co., died suddenly at his home in that city Jan. 19, aged 74 years. He attended the public schools of Chicago and the University of Chicago, having moved to that city from Hastings-on-the-Hudson, N. Y., where he was born. Later he went to Cleveland, and in 1894 he became president of the Tod-Stambaugh Co., remaining at the head of that company until Jan. 1, 1925, when its ownership passed to the M. A. Hanna Co. His associate in the Tod-Stambaugh Co. was Col. Carmi A. Thompson, who was vice-president and general manager. Mr. Billings was a director of the Union Trust Co. and the Guardian Trust Co., Cleveland, and was connected with various industrial corporations.

—

Harvey Mundie, secretary-treasurer of the Mundie Foundry & Machinery Co., Peru, Ill., died Jan. 6 as a result of an automobile accident.

—

Frederick W. Sumner, president of the Sumner Iron Works, Everett, Wash., died recently at his home in that city, aged 77 years. He was a native of Wisconsin and went to Everett in 1893, where he established the Sumner Iron Works.

—

Charles C. Roundy, president of the Sargent, Osgood & Roundy Co., Randolph, Vt., and well known in the agricultural implement industry of New England, died Jan. 19 at his home in Worcester, Mass. He was born at Springfield, Vt., 65 years ago.

—

James W. Corrigan, president Corrigan, McKinney Steel Co., Cleveland, died suddenly Jan. 24 of heart failure at the age of 47. He had been head of the company since early in 1925, when he acquired a minority interest which, added to his large stock holdings, enabled him to wrest control of the company from the late Price McKinney. Shortly afterward the name was changed from the McKinney Steel Co. to the present name. Mr. Corrigan had been vice-president of the McKinney Steel Co., which was the successor of Corrigan, McKinney & Co., of which his father, the late James C. Corrigan, was one of the founders, but he did not take an active part in the business until he acquired control. Since he became president he had given close attention to the company's affairs.

—

Charles Leon Snow, who was treasurer of the Air Reduction Co., Inc., 342 Madison Avenue, New York, until his retirement last year, died at his home in New York on Jan. 6. He was born at Portland, Me., in 1875, and attended the Portland high school and Dartmouth College, having been graduated from the latter institution in 1898. He became associated with the New York office of the Western Electric Co., remaining with that company until 1913, when he became general auditor in charge of the Minneapolis division of the Interstate Co. His connection with the Air Reduction company dated from 1916 and in 1920 he was made treasurer, holding the latter position until his retirement on account of failing health.

—

William Parker Ward, mining engineer and a pioneer in the production of ferromanganese in the United States, died on Jan. 17 at his home in Savannah, Ga., aged 83 years.

—

William J. Henry, president Oswego Tool Works, Oswego, N. Y., and of the Henry Forge & Tool Co., and the Crouse-Pope Foundry Co., both of Auburn, N. Y., died in the Auburn City Hospital on Jan. 18, following an operation. For a number of years he was president of the Henry & Allen Mfg. Co., but sold his interests in that concern some 10 years ago and organized the two Auburn companies in which he was active until his death. In 1927 he secured a controlling interest in the Oswego Tool Works, a concern for which his Auburn plants had made forgings for many years.

—

Robert Bentley, president Ohio Iron & Steel Co., Lowellville, Ohio, and a director of the Youngstown Sheet & Tube Co., Youngstown, died at his home in the latter city on Jan. 21. He was born at Youngstown on Aug. 30, 1854, and after attending the public schools in that city he entered the employ of the First National Bank. He organized the Ohio Iron & Steel Co. in 1879 and was actively associated with it until his death. He was also prominently identified with many other financial and industrial organizations in the Mahoning Valley.

STEEL TREATERS' PROGRAM

Technical Papers Scheduled for First Semi-Annual Meeting to Be Held at Montreal Feb. 16-17

FIFTEEN technical papers have been obtained for the first semi-annual meeting of the American Society for Steel Treating to be held at the Mount Royal Hotel, Montreal, Canada, Feb. 16 and 17. The program is as follows:

Thursday, Feb. 16.

Morning Session: Alfred Stansfield, chairman.

"A Development of the Structure of the Micro Constitutents of Metals," by R. G. Guthrie, Peoples Gas Light & Coke Co., Chicago.

"Medium Carbon Pearlitic Manganese Steel," by Jerome Strauss, United States Navy Yard, Washington.

"Steels for Case Nitrification," by A. B. Kinzel, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y.

Afternoon Session: R. M. Bird, chairman.

"The Manufacture of Stainless Steel Castings in the Various Industries," by V. T. Malcolm, Chapman Valve Mfg. Co., Indian Orchard, Mass., and V. O. Homerberg, Massachusetts Institute of Technology, Cambridge.

"X-Rays and the Constituents of Stainless Steel," by E. C. Bain, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y.

"Hardness Testing," by H. M. German, Universal Steel Co., Bridgeville, Pa.

Evening Session.

"Heat Treatment of Forgings and Castings for Selective Directional Adjustment of Residual Stresses," by W. J. Merten, Westinghouse Electric & Mfg. Co., East Pittsburgh.

"The Modern Trend in Metallurgy," by Dr. F. C. Langenberg, Climax Molybdenum Co., New York.

Friday, Feb. 17.

Morning Session: Dr. J. A. Mathews, chairman.

"Effects of Antimony, Arsenic, Copper and Tin in High-Speed Tool Steel," by H. J. French and T. G. Digges, Bureau of Standards, Washington.

"Some General Thoughts on Fusion Welding," by S. W. Miller, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y.

"Types of Failure of Steel," by Robert Job, Milton Hersey Co., Ltd., Montreal.

"Some Failures of Locomotive Parts and Study of Same under the Microscope," by F. H. Williams, Canadian National Railways, Montreal.

Evening Session: E. F. Cone, chairman.

"Alloy Steel for Boilers," by Charles McKnight, International Nickel Co., New York.

"The Effect of Heat Treatment on the Properties of Chromium-Molybdenum Sheet Steel," by F. T. Sisco and D. M. Warner, Wright Field, Dayton, Ohio.

"A Note on the Hardness and Impact Resistance of Chromium-Nickel Steel," by B. F. Shepherd, Ingersoll-Rand Co., Phillipsburg, N. J.

Previous to the technical sessions, there will be the usual meeting of the board of directors on Wednesday, Feb. 15, as well as sessions of the recommended practice committee and the publication committee. The early bird's dinner is, as usual, scheduled for Wednesday evening followed by the choice of a theater or a tobogganing party. Several plants are to open their doors for visitations on Friday afternoon, Feb. 17.

Foundry Conference To Be Held by University of Wisconsin

A second annual foundry conference has been arranged by the department of mining and metallurgy of the college of engineering and the university extension division of the University of Wisconsin, Madison, Wis., for Jan. 31, Feb. 1, 2 and 3. It is to be held in the laboratories of the department of mining and metallurgy. Organized especially for foundry superintendents, managers, foremen, chemists, metallurgists and others interested in foundry problems, it will follow the plan of the first conference held last February. The round table method of presenting the subject matter will be used, and a group leader will lead the discussion. Some of the topics to be taken up are cupola practice, sand conditioning, malleable and steel castings, ferrous and non-ferrous metallography with laboratory work, the heat treatment of steel, cost accounting, routing and planning, brass and bronze castings, and aluminum and light metal castings.

Testing Society's Group Meetings at Washington March 20-23

Plans are being made by the American Society for Testing Materials to hold the usual spring group meeting of committees at Washington, from Tuesday, March 20, to Friday, March 23. With the meetings starting on Tuesday it will be possible to schedule the sessions of the metals and non-metals committees during the same week, a plan that has worked out successfully in recent years at similar meetings at Cleveland, Providence and Philadelphia.

Coming Meetings of Institute of Metals

The annual general meeting of the Institute of Metals (British) will be held in London on March 7 and 8, and the autumn meeting in Liverpool, Sept. 4 to 7.

During the past year the membership of the institute increased from 1801 to 1903. It is anticipated by the council that the present year, the twentieth of the institute's existence, will witness the enrollment of the two thousandth member.

The Quad-City Foundrymen's Association met Jan. 23 at the Davenport Chamber of Commerce, Davenport, Iowa, to discuss apprenticeship.

Foundrymen to Organize Research for Gray Iron Industry

In consideration of a proposed organization devoted to cast iron research for the betterment of the product of gray iron foundries, the board of directors of the Philadelphia Foundrymen's Association at its last meeting named a cast iron research committee and instructed this committee to take the necessary steps to assure the holding of a meeting for the discussion of this subject. B. H. Johnson, Cresson-Morris Co., Philadelphia, chairman of committee, has sent a notice to all the foundry associations of the country asking them to send a delegate to attend a meeting in Philadelphia on Tuesday, March 13, as the guest of the Philadelphia Foundrymen's Association, to discuss any research activity that may benefit the gray iron industry and to determine a method of procedure.

COMING MEETINGS

February

American Ceramic Society. Feb. 5 to 11. Thirtieth annual meeting held concurrently with meeting of National Brick Manufacturers Association, Hotel Ambassador, Atlantic City, N. J. Ross C. Purdy, 2525 North High Street, Columbus, Ohio, secretary.

Foundry Equipment Manufacturers' Association. Feb. 7. Annual meeting, Hotel Cleveland, Cleveland. H. Cole Estep, Penton Publishing Co., Cleveland, secretary.

Midwest Power Conference and Chicago Power Show. Feb. 14 to 17. Hotel Stevens, and exhibition at Coliseum, Chicago. George F. Pfisterer, secretary.

American Society for Steel Treating. Feb. 16 and 17. Semi-annual meeting, Mount Royal Hotel, Montreal, Canada. W. H. Eisenman, 7016 Euclid Avenue, Cleveland, secretary.

American Institute of Mining and Metallurgical Engineers. Feb. 20 to 23. Institute of Metals Division, Engineering Societies Building, New York. H. Foster Bain, 29 West Thirty-ninth Street, New York, secretary.

European Markets Continue Quiet

Inquiry Active in Many Lines, but Orders Slow—Poland Has All Its Blast Furnaces Operating

(*By Cable*)

LONDON, ENGLAND, Jan. 23.

PIG iron is quiet, but inquiry is improving and Cleveland foundry and forge producers are anticipating improved business soon. Hematite stocks are heavy and prices have weakened. Foreign ore is dull.

Finished iron and steel are quiet generally, especially the plate market, but there is a fair demand for light material and structural and engineering steel for domestic use. Mills rolling plates and shapes are seeking to meet competition in export markets and are reported to be devising a plan of selling below cost, receiving compensation from a fund to be levied on domestic production. Confirmation, however, is lacking and full details are not yet available.

Tin plate business is quiet, but inquiries are fair. Most sellers are asking up to 18s. 3d. ($4.45) per base box, f.o.b. works port, for forward shipment. Buyers, however, expect to purchase at about the official minimum of 17s. 9d. ($4.33) per base box, f.o.b. works port.

Galvanized sheets are quiet, but inquiry is improving and most makers have agreed on a minimum price of £13 per ton (2.82c. per lb.) for No. 24 gage corrugated sheets in bundles. Black sheets are dull and unchanged.

Overseas demand for Continental iron and steel has increased, particularly for bars, which are firmer in tone, but British exporters are quiet and have but little moving. In semi-finished material, Continental mills are reported to be well sold.

In Poland all 18 blast furnaces in the country were operating at the end of the year. The Polish Government is considering erection of a large shipyard near Danzig. Belgian mills have been awarded 2000 tons of rails for Sweden by the European Rail Makers' Association.

The German steel ingot output in December was 1,368,000 tons, bringing the year's production to 16,305,000 tons. Friedrich Krupp A. G. and Otto Wolff & Co. combined are negotiating with Rumania for deliveries of railroad material totaling £2,000,000.

British Market Inactive—Pig Iron Depressed

LONDON, ENGLAND, Jan. 6.—Recovery from the holiday period is still awaited by iron and steel producers. Sentiment in all markets is much improved, although the problem of meeting the competition of Continental producers is still unsolved. As an example of the seriousness of foreign competition in the British domestic market, total exports of Cleveland iron in 1927 were 250,000 tons, although prices declined a total of £1 ($4.87) per ton during the year, while imports of pig iron for the 12 months totaled 570,000 tons. At present there are only 40 furnaces in blast on the Northeast coast, and of the 31 furnaces in blast at the year's end in Scotland 9 have been blown out. In a normal pre-war year the average operation in Scotland was about 85 furnaces.

There has been a slight improvement in the volume of inquiry for finished products in the past few days, but export business is slack, particularly in heavy material. The capacity of plate mills is still greatly in excess of normal demand, and a considerable tonnage of foreign plates continues to be received by consumers. Mills producing lighter materials are fairly well engaged, and structural steel fabricators are active.

British shipbuilding in 1927 is estimated at 1,300,000 tons, about double the tonnage of the previous year, when the coal strike was in progress. In 1925 the total was 1,084,000 tons, and in 1924, 1,439,885 tons. Included in the production of last year was a large floating dock for the Singapore naval base.

Luxemburg Prices Firm with Market Quiet

LUXEMBURG, Jan. 4.—The improvement in business which began in October of last year reached a climax in the rather heavy purchasing in December occasioned by the threat of a suspension of German steel production because of the proposed enforcement of the

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0	17½s.			$4.27		
Bilbao Rubio ore*..	1	0½	to £1	1s.	4.99	to	$5.11
Cleveland No. 1 fdy.	3	7½			16.44		
Cleveland No. 3 fdy.	3	5			15.83		
Cleveland No. 4 fdy.	3	4			15.59		
Cleveland No. 4 forge	3	3½			15.46		
Cleveland basic (nom.)	3	15	to 3	15½	18.27	to	18.39
East Coast mixed...	3	8	to 3	10	16.56	to	17.05
East Coast hematite	3	8½	to 3	10½	16.68	to	17.17
Rails, 60 lb. and up.	7	15	to 8	0	37.75	to	38.96
Billets	6	0	to 6	10	29.22	to	31.66
Ferromanganese ...	13	10			65.75		
Ferromanganese (export)	13	0	to 13	5	63.31	to	64.53
Sheet and tin plate bars, Welsh	5	7½	to 5	15	26.18	to	28.01
Tin plate, base box.	0	18	to 0	18¼	4.39	to	4.45
Black sheets, Japanese specifications.	13	5	to 13	10	64.53	to	65.75
					C. per Lb.		
Ship plates	7	12½	to 8	2½	1.66	to	1.77
Boiler plates	10	10	to 11	0	2.28	to	2.39
Tees	8	2½	to 8	12½	1.77	to	1.99
Channels	7	7½	to 7	17½	1.60	to	1.71
Beams	7	2½	to 7	12½	1.55	to	1.66
Round bars, ¾ to 3 in.	7	5	to 7	15	1.58	to	1.69

Germany	6	1			1.34		

(a) Nominal.

8-hr. day in rolling mills. With this threat removed, the steel market gradually became quiet. Mills have a good tonnage of business on their books and consequently are maintaining prices.

Semi-finished material continues quiet, with the market at £4 7s. to £4 9s. 6d. ($21.19 to $21.80) per ton, f.o.b. Antwerp. Beams are at the same level, and bars range from £4 17s. to £4 18s. per ton (1.08c. to 1.09c. per lb.), f.o.b. Antwerp. Severe competition from German and Dutch sellers of sheets has caused a slight decline in prices, particularly on the heavy gages.

Production of pig iron in November, 1927, was 221,217 metric tons, with 39 out of 47 furnaces in blast. Steel ingot output was 207,402 tons.

BELGIAN PRICES WEAKER

Mills Offer Concessions and Better Deliveries—German Competition Increases

ANTWERP, BELGIUM, Jan. 7.—The market is quiet and prices are unchanged, although slightly weaker. Export business is rather inactive, and mills are beginning to show more interest in securing additional tonnage, offering earlier deliveries and occasionally shading prices. In general, however, producers are fairly well booked as a result of the heavy purchasing at the end of the year.

A feature of the present market is the reappearance of German mills as serious competitors for a share of export trade. The prospect of intensified competition for foreign business has apparently caused some consumers to refrain from buying in expectation of still lower prices.

Pig Iron.—Domestic buying has been light, but prices are well maintained as a result of the limited tonnage available from the furnace syndicate. Export business continues quiet, with quotations on foundry iron ranging from £3 to £3 2s. ($14.61 to $15.10) per metric ton, f.o.b. Antwerp. This price is apparently too high to interest foreign users, so that sales are restricted. Bessemer iron, with sulphur at 0.08 per cent is quoted at £2 17s. to £2 19s. ($13.89 to $14.38) per metric ton, f.o.b. Antwerp.

Semi-Finished Material.—The lack of any sizable purchasing of billets or blooms renders determination of prices difficult. With practically no activity in billets, prices are nominally £4 6s. 6d. to £4 7s. 6d. ($21.07 to $21.31) per metric ton, f.o.b. Antwerp. Blooms are also quiet, with the market about £3 18s. ($19) per ton for 6-in. and larger to £4 2s. ($19.97) per ton for 4-in. blooms. Sheet bars are quite active, and, with mills well booked, the market ranges from £4 8s. to £4 9s. ($21.43 to $21.68) per ton, Antwerp.

Finished Material.—Small purchases of steel bars are bringing £4 17s. 6d. to £4 18s. 6d. per ton (1.08c. to 1.09c. per lb.), f.o.b. Antwerp. Desirable business, however, could probably be closed at 1s. (24c.) per ton less. Beam prices are maintained at £4 7s. to £4 9s. per ton (0.96c. to 0.98c. per lb.), f.o.b. Antwerp. The hoop market is fairly active, with hot-rolled material quoted at £5 17s. 6d. per ton (1.29c. per lb.), f.o.b. Antwerp. Wire rods are quoted at £5 10s. per metric ton (1.21c. per lb.), f.o.b. Antwerp. Sheet prices show less strength, particularly on the heavy gages, large tonnages of which have been offered by German mills.

Stainless Steel Containers Adopted in Germany

HAMBURG, GERMANY, Jan. 7.—Recent tests by breweries are said to show that containers made of Krupp stainless steel "V2A" do not affect the quality of beer. Several large breweries are preparing to use large stainless steel containers in making export shipments. The containers are being designed so that they may be folded when emptied and returned flat. They are expected to reduce costs of shipping beer, as they will occupy less room and be subject to less damage than bottles.

BRITISH TRADE AT PEAK

Production, Exports and Imports of Steel Reach Post-War Maximums in 1927

WASHINGTON, Jan. 24.—Nineteen twenty-seven marked the peak of the post-war activity of the British iron and steel industry, says a statement prepared by J. Joseph W. Palmer of the Iron and Steel Division, Department of Commerce. Production of both iron and steel reached levels not attained since the easing off from the intensive activity of the war years. Exports and imports likewise reached post-war heights.

The year was marked also by the first concerted effort on the part of the British industry to reduce the tonnages of foreign iron and steel imported for fabrication. It was proposed, Mr. Palmer points out, and put into effect as of Sept. 1, that the British steel makers should pay a rebate to fabricators who purchased all of their steel from British mills up to Jan. 1. On the latter date it was proposed to have a casting up of accounts. No announcement has been made as to the result of the plan.

Imports had been mounting steadily and in 1927 reached a total of 4,406,125 tons, an increase of 17.8 per cent over imports in 1926. The December, 1927, import trade, in reaching the lowest figure for any month of the year, 280,520 tons, registered a loss of 4244 tons as compared with November. The 1927 increase in import trade was participated in by all but two of the 19 classifications into which the trade is divided, rails and wire. The largest increase was in raw and semi-finished steel.

Exports in 1927 were 4,199,665 tons, the highest since the war and 40.2 per cent greater than in 1926. During December, however, British exports fell off sharply to 351,795 tons, a decrease of 47,259 from November.

The largest gain in exports in 1927 was in steel rails, 277,870 tons, which is considered to be particularly significant as rails was one of the few items in the import trade to show reduced tonnage and during the year Continental rail manufacturers were making special efforts to develop their export markets. The second largest increase was shown in plates and sheets, 195,748 tons.

Production of pig iron and steel ingots and castings was well maintained over the whole of 1927. The totals registered for both pig iron and steel for the year, 7,289,600 tons and 9,086,300 tons respectively, represent the largest tonnages recorded in the post-war period.

Two-Thirds of Swedish Ore Exports Go to Germany

HAMBURG, GERMANY, Jan. 7.—Of the total exports of Swedish iron ore last year, 9,690,000 tons, Germany received 68 per cent. The remaining 32 per cent went to Czechoslovakia, Poland, Great Britain, France and other smaller consumers of Swedish iron ore.

French Ferrosilicon Exports Increase Despite Syndicate

HAMBURG, GERMANY, Jan. 7.—Although the European Ferrosilicon Syndicate recently published a report that the competition of French producers, who are not members, had been of less consequence since formation of the syndicate, export statistics indicate the contrary. During the first 10 months of 1925 French ferrosilicon exports were 1480 metric tons, in 10 months of 1926, 2013 tons, and in 10 months of 1927, 3607 tons.

Revenue freight loaded in the first week of January is reported by the American Railway Association at 754,062 carloads. Because this period this year included a holiday, it shows a sharp falling off from the corresponding figures of the two preceding years. Comparing it with the weeks which had the similar holiday, however, the total this year is above either of the two preceding years.

FAR EAST BUYS TIN PLATE

Both Chinese and Japanese Merchants Active—Oil Well Supply Order Placed Here

New York, Jan. 24.—There is still a fair volume of tin plate business from the Far East. Chinese merchants have been in the market for tin plate waste waste, and one exporter in New York has received an order for about 5000 boxes of waste waste from a purchaser in Shanghai. Current tin plate purchases in Japan are confined to small lots, but the Nippon Oil Co., according to recent cabled reports from Japan, will be in the market for its quarterly requirements about the end of this month. Export quotations on tin plate range from $5.20 to $5.30 per base box, c.i.f. Japanese or Chinese port. There is a moderate volume of inquiry from Japan for light-gage black sheets, but no purchases of consequence are reported at the present level of American mill quotations. While $77 per ton, c.i.f. Japan, might be shaded on a desirable tonnage in bundles of 13 sheets each, the British market is still lower.

The Northern Karafuto Oil Co., Japan, has placed 470 tons of oil well casing and about 48,000 ft. of gas pipe with an exporter in New York for delivery from American makers.

New York importers of European steel report sales of only a small tonnage of bars and shapes. The greater part of this business is in small lots sold from the dock or delivered from stocks maintained here by the importers. Prices of Continental steel range from 1.65c. to 1.75c. per lb., base, for Thomas steel bars and 1.55c. to 1.65c. per lb., base, for structural material, duty paid, New York. Sales from the dock or from stock bring up to 2c., or more, delivered. A fair business is being done by importers in hoops and bands, wire rods and strip steel. The only outstanding construction inquiry is about 4000 tons of reinforcing bars for a bridge near Boston. Although foreign bids for the bars have been accepted, it is believed that domestic material will be purchased. Importers of European sheet steel piling are submitting bids on several hundred tons for the Tacony-Palmyra bridge near Philadelphia. The reinforcing bars for this bridge are expected to go to domestic mills.

A list of inquiries for equipment required in railroad, highway and waterway construction in Colombia has been issued by the Colombian Government Bureau of Information, 1440 Broadway, New York. Included in the list are locomotives, railroad cars, steel bridges, barges, concrete mixers, rails and pipe. Translations of the inquiries, which are in Spanish, are being made and will be available in a few days. Bids on the equipment specified must be in the hands of the Minister of Public Works, Bogota, Colombia, before certain dates in March, April and May.

Newton Bill May Pass; Would Permit Collective Purchases Abroad

Washington, Jan. 24.—Proponents of the Newton bill to permit collective purchases by domestic consumers of commodities under foreign control are predicting that the measure will pass at this session of Congress. It is supported by Secretary of Commerce Hoover and Secretary of Agriculture Jardine, as well as by a number of important business organizations. The legislation is proposed as an amendment to the Webb-Pomerene export act, which permits American exporters to consolidate for the marketing of their products in foreign markets. At a hearing last week Secretary of Commerce Hoover said the bill would promote trade and not restrain it. No iron and steel or related interests were represented at the hearing.

German Steel Prices to Be Advanced

Washington, Jan. 23.—German iron and steel interests are reported to have decided upon an increase of 3m. (71c.) per ton in base prices on rods and structural shapes at a recent meeting, according to a radiogram received by the iron and steel division, Department of Commerce, from Fayette W. Allport, Berlin, commercial attaché. This action is a direct result of the pending readjustment of working hours and wage scales to conform to the 8-hr. day decree.

Steel Workers and Machinists Included in Immigrants

Of 27,758 aliens admitted to the United States in November, 1927, 203 were iron and steel workers and 214 were machinists. In the five-month period from July to November, 828 iron and steel workers and 983 machinists were admitted. But in November 33 iron and steel workers and 41 machinists went out of the country and in the five-month period 150 steel workers and 295 machinists departed.

British machine tool production and exports remained practically the same during 1927 as during the two previous years, according to a cablegram received by the Industrial Machinery Division, Department of Commerce, from Commercial Attache William L. Cooper, London. Imports to Sept. 30 increased 16 per cent, the American share of the total imports being 64 per cent or the same as last year. American sales were largely in the way of special purpose tools such as millers, grinders, gear cutters, honers and crankshaft balancing machines.

British Developing New Uses for Stainless Products

New uses for stainless and corrosion-resisting steels are continually being discovered in Great Britain. Rustless iron studs for traffic direction purposes on the roads are now established in popularity, and they are always bright, no matter how wet or damp the weather. Stainless steel is now used in pen manufacture, and there has recently been put on the market a fountain pen with a stainless steel point, which brings the selling price very low in comparison with the cost of a gold point. There is a steady demand for pen steel in thin sheets.

Smallest Year in Automobile Production Since 1922

Washington, Jan. 23.—Motor vehicles to the number of 3,393,887 were produced in the United States in 1927, comparing with 4,298,799 in 1926, according to the Department of Commerce. Of the 1927 production, 2,938,868 were passenger cars and 455,019 were trucks, comparing with 3,808,753 and 490,046 respectively in 1926.

Production in the United States in December totaled 133,178 motor vehicles, of which 105,784 were passenger cars and 27,394 were trucks. This compares with a total of 134,381 in November, of which 109,742 were passenger cars and 24,639 were trucks. The December total was the lowest for any month since February, 1922.

December production of automobiles in Canada, as reported by the Dominion Bureau of Statistics, was 2277 passenger cars and 1158 trucks, compared with production in November of 5173 passenger cars and 1444 trucks. Production in December, 1926, was 6052 passenger cars and 1700 trucks.

PRODUCTION OF AUTOMOBILES IN UNITED STATES AND CANADA

	1927	1926	1925	1924	1923
Passenger cars:					
U. S.	2,938,868	3,808,753	3,760,459	3,203,049	3,631,728

The National Metal Trades Association will hold its annual convention at the Hotel Astor, New York, April 25-26. J. E. Nyhan, Peoples Gas Building, Chicago, is secretary.

Machinery Markets and News of the Works

AUTOMOTIVE PURCHASES

Motor Car Companies Come Into Market for Machine Tools

Railroads Are Buying Very Little but Two Western Roads Will Soon Issue Large Lists

WITH renewed buying interest among automobile manufacturers and prospects that railroad purchasing will soon be in larger volume, the machine tool industry expects that February will bring further business improvement.

Automobile companies placed a number of orders during the week. The Ford Motor Co. bought special machinery for making rear axles; Dodge Brothers, Inc., added tools to increase manufacturing capacity for one of its models, and purchases also were made by the Packard Motor Car Co. Cincinnati machine tool builders received orders from the automobile industry for 13 17-in. lathes and 12 special lathes.

Railroad purchases consisted chiefly of single tools bought by the Missouri Pacific, Texas & Pacific and Central Railroad of New Jersey. At Chicago two lists are expected soon from Western roads covering a total of about $750,000 worth of shop equipment.

The Mergenthaler Linotype Co., Brooklyn, was the largest purchaser in the East, closing for about $100,000 worth of lathes, grinders, radial drills and milling machines.

The Firestone Tire & Rubber Co., Akron, Ohio, which will equip a new plant at Los Angeles, Cal., announces that purchases will be made on the Pacific Coast.

New York

NEW YORK, Jan. 24.

SELLERS of machine tools report a satisfactory number of inquiries for single tools and a moderate volume of purchasing. The outstanding buyer in this district is the Mergenthaler Linotype Co., Brooklyn, which is reported to have closed in the past week on tools valued in excess of $100,000. Included in this total, which represents part of the company's requirements, were 17 lathes reported purchased from the Monarch Machine Tool Co., three lathes from the Hendey Machine Co., a number of LeBlond grinders, also several radial drills and milling machines.

Purchasing by railroads is still inactive. The New York Central is still out of the market and no action as yet reported on the list of about 30 tools and other equipment for Delaware, Lackawanna & Western. Central Railroad of New Jersey has closed on a 30-in. x 16-ft. lathe and 2-in. Acme double bolt cutting machine with the Niles-Bement-Pond Co., and Pullman Car & Mfg. Corporation has bought a 32-in. Acme shaper from the same company.

Other purchases of tools have included a No. 2 axle lathe by Lehigh Coal & Navigation Co. and a No. 3 axle lathe by a company in New Jersey, two Cincinnati high-speed tapping machines by an Indiana company, a 6-in. vertical shaper by a Chicago manufacturer, a 12-in. vertical shaper by a Detroit motor car company and a No. 2 jig boring machine by a Cleveland manufacturer.

Contract has been let by Union Railway Co., 2396 Third Avenue, New York, to Andrew J. Robinson Co., 15 West Thirty-eighth Street, for a one-story shop and extensions and improvements in power house at its repair works, West Farms Road and 172nd Street, to cost $30,000.

O'Brien Electric Co., Inc., 505 West 125th Street, New York, manufacturer of electric equipment, has acquired four-story building at 327 West 126th Street, and will remodel for a new plant.

Tolhurst Machine Works, Inc., has been organized with capital of 100 shares of stock, no par value, to take over and expand company of same name with New York headquarters at 30 Church Street, and main plant at Troy, N. Y., manufacturer of centrifugal machinery, etc., to which will be added boilers, engines, and affiliated equipment. Incorporators include George S. Montgomery, Jr., Roy C. Wilson and I. F. Willey, Fifty-third Street and Lansdowne Avenue, Philadelphia, Pa.

Bacu Ice Co., Elm Place and High Street, Poughkeepsie, N. Y., has plans for three-story ice-manufacturing and cold storage plant, to cost more than $75,000; C. J. Cooke, 25 Cannon Street, architect.

Franklin, Gates & Heindsmann, 2526 Webster Avenue, New York, architects, have plans for two one-story automobile service, repair and garage buildings, 100 x 200 ft., to cost about $185,000 with equipment.

American Zinc, Lead & Smelting Co., 331 Madison Avenue, New York, has authorized plans for extensions and improvements in plant at East St. Louis, Ill., including installation of additional machinery, with storage equipment for sulphuric acid, etc., to cost approximately $725,000. It is purposed to remove portion of plant at Hillsboro, Mo., to East St. Louis and concentrate production there.

Hopwood Retinning Co., 56 Commerce Street, Brooklyn, has awarded general contract to Julius Auserhl, 13911 Queens Boulevard, Jamaica, L. I., for a one-story addition, 55 x 100 ft., including improvements in present works. John E. Cahill, Butler Building, Jamaica, is architect.

Officials of Standard Oil Co., of New Jersey, 26 Broadway, New York, have formed Stanco Products Co., with capital of $10,000,000, to manufacture and develop certain oil specialties heretofore produced by parent organization. An expansion program will be carried out. F. H. Bedford will be president of new company, and C. L. Bowman and A. J. Van Wynan, vice-presidents.

Dry Ice Corporation of America, Inc., 50 East Forty-second Street, New York, has awarded general contract to H. K. Ferguson Co., for a new one and two-story plant, 85 x 150 ft., at Elizabeth, N. J., to cost close to $50,000 with equipment. Manufacture will be carried out under special chemical process.

Lancia Motors of America, Inc., New York, lately formed under State laws with capital of $3,000,000 by interests connected with Lancia Motors Corporation, 140 West Fifty-seventh Street, has acquired a plant at Poughkeepsie, N. Y., with floor space of 129,000 sq. ft. on 14-acre tract, and will use for a new assembling plant for Lancia automobiles of Italy. It is purposed to have works ready for service by July, with facilities for an output of 250 cars per month.

American Telephone & Telegraph Co., 195 Broadway, New York, is arranging a construction and expansion program to cost $38,000,000, including aerial wire and pole lines, $4,341,000; long-distance cable lines, conduits, buildings and equipment, $19,791,000; switchboards, telephone and telegraph instruments, $9,519,000; line work, wire and pole replacements, etc., $4,345,000.

Harry Albanese, Inc., 63 Whipple Street, Brooklyn, plumbing equipment and supplies, has plans for a two-story factory, 25 x 100 ft., to cost about $23,000 with equipment. Laspia & Samenfeld, 269 Broadway, are architects.

Barozzi Drying Machine Co., 940 Van Wagenen Avenue, North Bergen, N. J., has plans for a two-story addition, 50 x 100 ft., to cost close to $50,000 with equipment. P. O. Simone & Co., 100 Sip Avenue, Jersey City, N. J., are architects.

The Crane Market

THERE are several inquiries for large capacity overhead cranes such as the two 120-ton and one 65-ton cranes for the Public Service Production Co., Newark, N. J., and a 150-ton crane for the Phoenix Utility Co., New York, but the greater number of current inquiries are for cranes ranging in capacity from 5 tons to 15 tons. The New York Edison Co., New York, has been asking for prices on a small capacity monorail hoist with bucket. The New England Public Service Co., Augusta, Me., is in the market for a 10-ton, 28-ft. span hand power crane with two 20-ton trolleys.

The Central Board of Purchases, Milwaukee, has rejected all bids on two electric traveling cranes for a new incinerating plant and is advertising for new quotations.

Among recent purchases are:

Blue Ridge Coal & Coke Co., Bluefield, W. Va., 30-ton, wide gage locomotive crane from Ohio Locomotive Crane Co.

E. H. Clement Co., Charlotte, N. C., 5-ton crawl-tread locomotive crane from Browning Crane Co.

Consolidated Gas Co., New York, 10-ton crawl-tread locomotive crane, from an unnamed builder.

Atlantic Aircraft Corporation, Hasbrouck Heights, Teterboro, N. J., has leased portion of former textile mills at Passaic, N. J., totaling 30,000 sq. ft., for expansion. New factory will be used primarily for production of wings, frames, etc., for airplanes of Fokker type, as manufactured by company. Major Lorillard Spencer is president.

Consolidated Safety Pin Co., 46 Farrand Place, Bloomfield, N. J., has plans for three-story addition, 35 x 74 ft., to cost about $45,000. Floyd Y. Parsons, 1123 Broadway, New York, is architect.

Public Service Electric & Gas Co., Public Service Terminal, Newark, is arranging an expansion and improvement program to cost $22,000,000, including extensions in power plants, substations and transmission lines, etc. Gas division of company will expend close to $4,500,000 for expansion and betterments in artificial gas plants and system. Plans are under way for two-story equipment storage and distributing plant, with repair department, for electrical division at Jersey City, two-stories, 125 x 192 ft., to cost $150,000.

V. and R. Tedeschi, 25 Mercer Street, Newark, have plans for two-story machine shop, 68 x 100 ft., to cost $45,000 with equipment. J. B. Acocella, 9 Clinton Street, is architect.

Wesley & Winter, 90 Mechanic Street, Newark, manufacturers of paper goods, have leased an adjoining three-story factory for expansion.

Philadelphia

PHILADELPHIA, Jan. 23.

PLANS are maturing for a four-story mechanical engineering building at Drexel Institute, Philadelphia, to cost $350,000 with equipment, and Board of Trustees, Dr. K. G. Matheson, president, will ask bids soon on general contract. Simon & Simon, 249 South Juniper Street, are architects.

Pennsylvania Railroad Co., Philadelphia, C. E. Walsh, room 415, 15 North Thirty-second Street, purchasing agent, is asking bids until Feb. 2 for steel transmission towers, contract 7-1928.

Silverman & Levy, 313 South Smedley Street, Philadelphia, architects, will soon take bids for four-story automobile service, repair and garage building, to cost in excess of $125,000 with equipment.

Philadelphia Stock Yards Co., Thirtieth Street, Philadelphia, is considering construction of an abattoir with cold storage and refrigerating division; elevating, conveying and other mechanical equipment, to cost $1,000,000.

Campbell Soup Co., Camden, N. J., has authorized plans for a new group of multi-story factory units, with power house on Delaware River waterfront, vicinity of its present plant, to cost more than $2,500,000 with machinery, including conveying, elevating, and other mechanical equipment, can machinery, etc. Plans for first unit, totaling 20 acres of floor space, have been filed. Company has also awarded contract to Henry Ericsson Co., 228 North La Salle Street, Chicago, for six-story factory, 245 x 340 ft., on West Thirty-fifth Street, Chicago, to cost approximately $1,000,000 with equipment. Other units will be built later at last-noted location.

Board of Education, Princeton, N. J., is considering installation of manual training equipment in new two-story high school to cost $750,000, for which superstructure will soon begin; Ernest Sibley, Bluff Road, Palisade, N. J., architect.

Lycoming Mfg. Co., Williamsport, Pa., manufacturer of automobile engines, is completing plans for establishment of new works division for production of airplane motors of company design.

Shenango Motor Co., West Washington Street, New Castle, Pa., will soon take bids on general contract for five-story service, repair and garage building, 85 x 170 ft., to cost about $200,000 with equipment.

Glen-Gary Shale Brick Co., Reading, Pa., has arranged for bond issue of $600,000, portion of proceeds to be used for expansion and improvements. Two plants are operated at Reading; one at Shoemakersville; and one at Harrisburg, Pa., with total output of 300,000 brick per day; expansion program calls for machinery and facilities to increase gross capacity to 430,000 brick daily.

Bridgeport Iron Works, Inc., Bridgeport, Pa., recently formed by A. I. Pollock, South and Eden Streets, Pottstown, Pa., and associates, will operate a local steel fabricating plant and general iron works. G. Plantau Middleton, 637 West Philadelphia-Ellena Street, Germantown, Philadelphia, is also interested in company.

Sun Oil Co., Finance Building, Philadelphia, has acquired 65 acres of sulphur bearing land at Boling Dome, Tex., and proposes installation of equipment for development and plant for sulphur recovery.

McClintic-Marshall Co., Pottstown, Pa., has work under way on one-story addition for assembling service, 125 x 600 ft., at its local steel fabricating works, to cost more than $150,000.

Owens Aircraft Corporation, Glenside, Pa., has been formed to manufacture airplanes. Company plans to lease plant in Philadelphia and will be in market for usual materials and standard parts used in aircraft construction. Factory equipment will also be purchased.

South Atlantic States

BALTIMORE, Jan. 23.

ARRANGEMENTS have been made by Arlington Ice & Fuel Co., Baltimore, recently organized, for purchase of plant of Zimmerman Ice Co., local. New owner will remodel and install additional equipment for capacity of 100 tons per day.

Consolidated Gas, Electric Light & Power Co., Lexington Building, Baltimore, has arranged for a preferred stock issue of $10,000,000, portion of fund to be used for expansion and betterments, including completion of new unit at power plant on Gould Street. Company is negotiating for purchase of Northern Maryland Power Co., operating at Havre de Grace and vicinity and plans extensions in that territory.

A. S. Lee Co., Norfolk, Va., plans rebuilding portion of its lime and fertilizer plant destroyed by fire Jan. 15, with loss of $50,000 including machinery.

U-Drive-It Co., 310 Monticello Avenue, Norfolk, Va., has awarded general contract to Claiborne & Taylor, Atlantic Life Building, Richmond, Va., for a two-story automobile service, repair and garage building, to cost close to $100,000 with equipment.

Ahoskie Supply Co., Ahoskie, N. C., has inquiries out for a squaring shear for installation at its plant.

Bureau of Supplies and Accounts, Navy Department, Washington, will receive bids until Feb. 7 for reduction gear units and spares for Mare Island, Puget Sound and Brooklyn Navy Yards, schedule 8343; until Jan. 31 for wire rope for Eastern and Western yards, schedule 8332; until Jan. 31 for gasoline engines and spares for submarine base, schedule 8357, and until Feb. 7 for bolts and nuts for Eastern and Western yards, schedule 8333.

Champion Fibre Co., Canton, N. C., is said to be arranging expansion and improvement program at local mill to cost about $200,000, including new steam-operated electric power plant, for which foundations will soon be laid. Headquarters at Hamilton, Ohio.

Board of Trustees, Loyola College, Evergreen and Charles Streets, Baltimore, has plans for a three-story and basement mechanical engineering building, to cost approximately $150,000 with equipment. Lucius R. White, Hearst Tower Building, is architect.

Morganton Furniture Co., Morganton, N. C., has plans for one-story addition, 80 x 260 ft., to cost about $45,000 with equipment.

Board of Education, Atlanta, Ga., is considering installation of manual training equipment in two-story William A.

Bass junior high school to cost $160,000, for which superstructure will soon begin. G. Lloyd Preacher & Co., Wynne-Claughton Building, are architects.

International Harvester Co., 6065 Michigan Avenue, Chicago, is said to be planning establishment of a factory branch and distributing plant at Raleigh, N. C., with service and repair department. It is proposed to establish a local assembling works later.

General Equipment Machinery Co., Inc., 116 Northeast Sixth Street, Miami, Fla., has taken over machinery department of I. E. Schilling Co., and will act as distributer of machinery and equipment. Plans are under way for establishment of a branch office at Jacksonville, Fla.

Bids are being asked by Bureau of Yards and Docks, Navy Department, Washington, until Feb. 8 for a one-story motor-testing building, 25 x 161 ft., at naval air station, Pensacola, Fla., specification 5524.

Board of Awards, City Hall, Baltimore, is disposing of a bond issue of $1,500,000, proceeds to be used for a municipal airport, including hangars, mechanical and repair shops, pumping station and other structures, with equipment.

West Knitting Corporation, Syracuse, N. Y., plans construction of a one-story steam-operated electric power plant at its proposed mill at Wadesboro, N. C., entire project to cost in excess of $100,000. R. C. Biberstein, 1614 Elizabeth Avenue, Charlotte, N. C., is architect.

Edisto Public Service Co., Denmark, S. C., has acquired electric light and power plant at Allendale, S. C., and plans expansion and improvements in that section, including transmission line construction.

Wood Mfg. Co., Norfolk, Va., has acquired property at Planters Avenue and Cromwell Road, and plans erection of one-story furniture manufacturing plant, to cost $80,000 with equipment.

Piedmont Print Works, Inc., Taylors, S. C., is asking bids until Jan. 30, for a new local textile print mill, including one and two-story machine shop, 100 x 150 ft., and boiler plant. J. E. Sirrine & Co., Greenville, S. C., are architects and engineers.

D. Q. S. Brick Co., Berlin, Md., is planning purchase of additional equipment, including motor-driven, 24-in. gage locomotive, about 2-tons capacity; crawler type digger, about ½-yd. capacity; side-dump clay cars, etc.

Harbison-Walker Refractories Co., Farmers' Bank Building, Pittsburgh, has plans for new works in Curtis Bay district, Baltimore, where 30 acres was purchased several months ago. It will be devoted to production of chrome and magnesite brick and will cost close to $1,000,000 with machinery. Contract for two tunnel kilns has been let to American Dressler Tunnel Kilns, Inc., Cleveland, and awards for machinery and operating equipment will be made soon.

Buffalo

BUFFALO, Jan. 23.

BIDS will soon be asked on general contract by Houde Engineering Corporation, 237 Winchester Avenue, Buffalo, manufacturer of automobile shock absorbers, for a two-story addition, 210 x 225 ft., to cost upward of $200,000 with equipment. G. Morton Wolfe, 1377 Main Street, is architect.

Hecker-Jones-Jewell Milling Co., St. Clair Avenue, Buffalo, has taken out permit for a new grain elevator to cost $950,000, including elevating, conveying and other machinery.

United States Radiator Corporation, Dunkirk, N. Y., has arranged for increase in capital from 200,000 to 400,000 shares of stock, no par value, portion of proceeds to be used for expansion and improvements.

Roessler & Hasslacher Chemical Co., Buffalo Avenue and Twenty-sixth Street, Niagara Falls, N. Y., manufacturer of industrial chemicals, has awarded general contract without competition to Wright & Kremers, Inc., Pine Avenue and Main Street, for a one-story addition, 110 x 350 ft., to cost more than $65,000 with equipment.

Willett W. Wetmore, 364 Voorhees Avenue, and S. M. Quackenbush, 1580 Amherst Street, Buffalo, have formed W. W. Wetmore Corporation, with capital of $25,000 and 500 shares of stock, no par value, and plans early establishment of plant for manufacture of heating equipment.

Erie County Board of Supervisors, Buffalo, has made available appropriation of $30,000 for equipping shops for additional industries at County penitentiary at Mill Grove. Walter W. Nicholson is commissioner of corrections.

Fire, Jan. 21, caused loss of $40,000 to boiler plant of Otis-Sawyer Co., Oswego, N. Y., manufacturer of small heating boilers.

New England

BOSTON, Jan. 23.

ALTHOUGH trade is far from active, more machine tools were sold in this district the past week than in the previous month and a half. Inquiries are more numerous than at any time since last October and include two 18-in. and several larger lathes, radial drills, boring mills and a large planer from New England railroads, and quite a list of smaller machines from numerous manufacturers. Some companies inquiring for equipment last October have renewed negotiations, and in many instances old quotations will not hold. There is a small inquiry out from the city of Boston for school equipment and it is intimated a large list will shortly be forthcoming.

Recent sales include a new jig borer to a Vermont shop, squaring shear, 28-in. Prentice drill, 14-in. x 6-ft. lathe, saw table to greater Boston users, all used tools; a used two-spindle drill to a Maine shop, two small used presses and several new and used bench lathes to Rhode Island and southern Massachusetts plants. The Pneumatic Drop Hammer Co. has sold two 200-lb., one 300-lb. and one 100-lb. hammers to a Providence manufacturer, one 500-lb. and one 350-lb. hammer to an Indiana plant, and one 500-lb. hammer to a Cincinnati manufacturer and expects to close on several other machines before Jan. 31. Demand for forges is more active than in many weeks. Small tools, gages, etc., are selling better than in two months.

Plans have been completed for one-story, 93 x 95 ft., automobile body and paint shop, at Somerville, Mass., for P. J. Kiley, 101 Washington Street. Plans are private.

Work has started on a one-story, 60 x 90 ft., light manufacturing plant, Dorchester district, Boston, for John F. Duby, 15 Hancock Street, Dorchester, metal and other specialties. Miller & Levi, 46 Cornhill, Boston, are architects.

Plans are nearing completion for a jewelery manufacturing plant at Providence, R. I., for the Jewelers Supply Co., 37 Garnet Street. C. R. Makepeace, 907 Grosvenor Building, Providence, is engineer.

Plans are in progress for an artificial ice making plant at Lynn, Mass., for North Shore Ice Co., 46 Lake Avenue. Plans are private.

Work has started on a four-story, 30 x 101 ft., addition for Edison Electric Illuminating Co., 39 Boylston Street, Boston. Bigelow, Wadsworth, Hubbard & Smith, 11 Beacon Street, Boston, are architects.

Sessmee Lock Co., Hartford, Conn., will increase its capitalization from $500,000 to $750,000 to provide additional working capital. Hartford Machine Co. is at present manufacturing company's product.

Contract has been let by George Muench, 575 Pacific Street, Stamford, Conn., manufacturer of special machinery and parts, to Genovese & Rich, 1 Bank Street, for one-story addition, 50 x 100 ft. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., is architect and engineer.

Department of Public Buildings, City Hall, Boston, plans construction of an equipment storage and distributing works, with automobile service and repair departments, to cost in excess of $200,000 with equipment.

Central Maine Power Co., Augusta, Me., is reported planning a hydroelectric power development at Bingham, Me., for ultimate capacity of 100,000 hp., to cost more than $8,000,000 with power dam and transmission lines.

Cambridge Sheet Metal Co., 295 Franklin Street, Cambridge, Mass., manufacturer of automobile bodies, etc., has awarded general contract to M. J. Ryan, 763 Massachusetts Avenue, Boston, for one-story addition, 60 x 85 ft., to cost about $25,000 with equipment.

Central Falls Mfg. Co., 121 Lincoln Avenue, Central Falls, R. I., contemplates early rebuilding of portion of woodworking plant and power station recently destroyed by fire, with loss of about $100,000 including machinery.

Herbert C. Hearne, 1389 Main Street, Springfield, Mass., architect, has plans for a three-story automobile service, repair and garage building, 110 x 140 ft., to cost in excess of $125,000 with equipment.

Hartford Gas Co., Hartford, Conn., is planning increase in capital from $500,000 to $3,750,000, a considerable part of proceeds to be used for extensions in artificial gas plants, storage facilities and lines.

Hamden Tool & Metal Works, Hamden, Conn., recently formed by Carl R. Olson, 960 Dixwell Avenue, New Haven, Conn., will soon complete a one-story plant to specialize in manufacture of steel and brass shells.

Connecticut River Power Co., Waterbury, Conn., comprising recent merger of Connecticut Light & Power Co., Connecticut Power Co., Somers Electric Co., and other utilities, has secured permission for a hydroelectric power plant at Windsor Locks, Conn., to develop an initial capacity of 50,000 hp., to cost about $5,000,000 with transmission lines.

W. H. Hunt & Son, 197 Washington Street, Salem, Mass., architects, are completing plans for a one-story automobile service, repair and garage building, 120 x 150 ft., to cost about $100,000 with equipment.

Bassick Mfg. Co., 2638 North Crawford Avenue, Chicago, manufacturer of lubricating equipment, grease cups, etc., subsidiary of Stewart-Warner Speedometer Corporation, 1826 Diversey Boulevard, has purchased plant of Columbia Phonograph Co., Bridgeport, Conn., for about $350,000, and will remodel for main plant. It is understood that plants of parent company at Meriden, Conn., and Newark, N. J., will be removed to Bridgeport, where operations will be concentrated.

Chicago

CHICAGO, Jan. 23.

ADDITIONAL signs of activity in the machinery market are noted as the third week in January closes. From a rather small beginning the early part of the month sales have steadily mounted and inquiry is now of such proportions that dealers are looking forward to February with optimism. Orders for the most part are widely scattered and of small size. Absence of railroad buying in this district has been marked, but it is understood that two Western railroads are preparing to issue lists that will represent expenditures aggregating $750,000. The St. Paul Railroad is asking for prices on a Williams, White & Co. No. 11 punching machine and a 24-in. x 4-in. double-wheel grinder. At least three manufacturers are in the market for tool room equipment. A hardware specialty manufacturer has purchased a 14-in. x 8-ft. lathe.

Beckwith Iron Works, 544 West Seventy-Ninth Street, Chicago, will build an addition, 40 x 180 ft., to cost $5,000.

Plans are said to be under way for rebuilding portion of plant of Belleville Enameling & Stamping Co., Belleville, Ill., recently destroyed by fire, with loss close to $200,000 with equipment.

Reliance Die & Stamping Co., 501 North La Salle Street, Chicago, has asked bids for a three-story plant, 90 x 255 ft., to cost upward of $125,000 with machinery. A. A. Wickland, 5 South Wabash Avenue, is engineer.

Samuel Olson & Co., 2418 Bloomingdale Avenue, Chicago, manufacturers of conveying and elevating machinery, pneumatic tube systems, etc., have plans for a one and two-story addition, to cost approximately $150,000 with equipment. Waller Co., 510 North Dearborn Street, is architect and engineer.

City Council, Willmar, Minn., is selecting an engineer to prepare plans for extensions and improvements in municipal electric light and power plant, and waterworks, including installation of additional machinery. Hans Gunderson is city clerk.

Atomized Fuel Corporation, 20 North Twelfth Street, Fort Dodge, Iowa, will soon begin superstructure for a new one-story plant, 35 x 126 ft., to cost about $85,000 with equipment.

Manning Light Co., Manning, Iowa, has acquired local property as site for electric light and power plant to cost $200,000, on which work will soon begin.

Viking Pump Co., Cedar Falls, Iowa, is completing plans for a one-story addition, to cost about $21,000 with equipment.

Simplex Mfg. Co., 213 West Austin Avenue, Chicago, manufacturer of roofing specialties, metal flashings, cornices, etc., has asked bids on general contract for a new one-story plant, 50 x 110 ft., to cost $35,000 with equipment. A. E. Strobel, 53 West Jackson Boulevard, is architect.

Board of Education, Rochester, Minn., is considering plans for central power and heating plant for schools to cost $130,000. Bond issue is being arranged.

Chicago, Rock Island & Pacific Railroad Co., 179 West Jackson Boulevard, Chicago, is arranging fund of $775,000 for new locomotive and car repair shops and engine houses at different points during the year. Another fund of $700,000 is being appropriated for new yards, including mechanical facilities; $6,500,000 for new equipment, and $1,650,000 for repairs and reconditioning of present equipment.

Biflex Products Co., North Chicago, Ill., manufacturer of automobile bumpers and other automotive accessories, has disposed of a note issue of $700,000, a portion of proceeds to be used for expansion. Company is acquiring all assets of L. P. Halladay Co., Decatur, Ill., manufacturer of kindred equipment, and will continue operation as a division.

Central Illinois Public Service Co., Springfield, Ill., has arranged for a bond issue of $29,000,000, portion of fund to be used for expansion and improvements, including transmission line construction.

Page Sales Service, Chicago, dealer in overhead electric travelling cranes, hand power cranes, magnetic pulleys, foundry machinery and flexible couplings, has moved its office from 14 East Jackson Boulevard to 608 South Dearborn Street.

Cincinnati

CINCINNATI, Jan. 23.

MACHINE tool builders report that business is quiet, and from present indications bookings this month will fall below those in December. However, many companies which recently raised prices anticipated a lull in buying this month, because consumers closed for equipment before the new schedule became effective. Furthermore, many industrial buyers are slow in making purchases, even though inquiries were issued some time ago. Definite signs of renewed interest on the part of automobile makers are appearing. Two companies in the Detroit district have brought a total of 13 17-in. lathes, while another manufacturer has placed an order for 12 special lathes. As soon as factories get into production on new models and ascertain the amount of business they can depend on in the early part of the year, further buying of machine tools is expected.

Aside from a sale of three engine lathes to the Missouri Pacific and another transaction involving a 5-ft. right line radial drill and a 2500-lb. single frame steam hammer for the Texas & Pacific, orders from carriers have been negligible. The Macor Car Co., Passaic, N. J., has contracted for a No. 3 axle lathe and the Lehigh Coal & Navigation Co., Philadelphia, for a No. 2 axle lathe. Many machine tool executives are of the opinion that an upward turn in business will not come before Feb. 1.

Bids have been asked by Cincinnati Street Railway Co., Dixie Terminal Building, Cincinnati, for a one-story equipment storage and distributing plant with repair facilities and automobile service and garage department, to cost $50,000 with equipment. Garber & Woodward, Leverone Building, are architects.

Department of Water, Cincinnati, is asking bids until Feb. 2 for two pumping units, capacity 30,000,000 gal. per day. Plans are under way for pumping machinery for sewage disposal plant to cost $70,000.

Volunteer State Oil Co., Atlantic and Erie Streets, Knoxville, Tenn., contemplates construction of new storage and distributing plant, with pumping station and other mechanical equipment.

Crane Enamelware Co., Chattanooga, Tenn., subsidiary of Crane Co., Chicago, is reported planning an addition in Alton Park district, to cost upward of $300,000 with machinery.

Battelle Memorial Institute, care of Otto C. Darst, 186 East Broad Street, Columbus, Ohio, architect, has plans for two research buildings including machine shop, engineering shop with electric crane, laboratories, etc. Entire project will cost close to $500,000; work to begin in spring.

Fire, Jan. 9, destroyed portion of building at 907-11 Main Street, Cincinnati, occupied jointly by C. & D. Auto Supply Co., and Pick Pen Co., with combined loss reported more than $125,000.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until Feb. 6 for two electric furnaces for heat-treatment of aluminum alloys, with alternate bids for three and four such units, circular 202; until Jan. 31 for miscellaneous engine parts, circular 197; until Feb. 1 for inverted Liberty engine spare parts, circular 199 and until Feb. 3 for three dynamometer scales, 3000-lb. capacity, circular 201.

Neuhoff Packing Co., 1308 Adams Street, Nashville, Tenn., will soon begin erection of addition to cold storage and refrigerating plant to cost about $45,000.

Stowers Lumber & Mfg. Co., Harriman, Tenn., is said to have authorized plans for rebuilding portion of hardwood flooring mill and millwork plant, recently destroyed by fire with loss of $70,000. It is proposed to purchase a standard metal building; also, electric generator, motors, wood-working machinery, etc.

Wombell Automotive Parts Co., Lexington, Ky., contemplates erection of one-story addition and improvements in present plant, with installation of additional equipment.

Knoxville, Tenn., Wiley W. Thomas, purchasing agent, will receive sealed bids up to March 1 on a considerable quantity of used equipment, including pumping machinery, boilers, filters, motors, cranes, etc.

Gulf States

BIRMINGHAM, Jan. 23.

WORK will begin on a one-story addition to the plant of Mason Foundry Co., Laurel, Miss., to cost close to $30,000 with equipment.

Pasotex Petroleum Co., recently formed by Standard Oil Co. of California, 225 Bush Street, San Francisco, is reported planning construction of a new refinery near El Paso, Tex., to cost close to $750,000 with equipment.

Standard Ice Co., Houston, Tex., will build one-story ice-manufacturing plant, to cost approximately $100,000 with machinery. E. Q. Staph is consulting engineer.

Colbert County Board of Education, Tuscumbia, Ala., Robert Hudson, superintendent, has plans for a vocational school for negroes at Leighton, to cost more than $75,000 with equipment.

River Falls Power Co., River Falls, Ala., has applied for permission to proceed with construction of auxiliary steam-operated electric power plant, to cost $150,000 with machinery.

Cities Service Gas Pipeline Co., operated by Cities Service Co., 60 Wall Street, New York, has arranged for bond issue of $12,000,000, portion of fund to be used for expansion in pipe lines and properties in Texas Panhandle district, including compressor stations. Company has recently completed building a line from section noted to Wichita, Kan.

City Council, Vernon, Tex., will receive bids until Feb. 6 for one 360-hp. Diesel engine, direct-connected to electric alternator, with belt-driven exciter, switchboard and auxiliary equipment, for service at municipal light and water plant.

Houston Gas Securities Co., Houston, Tex., operating Houston Gulf Gas Co., and Houston Gas & Fuel Co., has purchased plants and properties of Southern Gas Co., San Antonio, Tex., for $3,500,000. Acquired company has begun new pipe line to Austin, Tex., and vicinity, which will be completed by purchasing organization. Latter company will also make other extensions and betterments in natural gas properties and distribution, including pipe line construction.

Florida Cold Storage Co., Orlando, Fla., is said to have plans for a new cold storage and refrigerating plant, to cost in excess of $300,000 with machinery. Lockwood, Greene & Co., Johnston Building, Charlotte, N. C., are architects and engineers. W. O. Overstreet is president.

Northern Texas Traction Co., Third and Main Streets. Fort Worth, Tex., is said to be planning a new bus terminal, with service, repair and garage divisions for motor bus service, to cost in excess of $200,000 with equipment.

Central Power & Light Co., First National Bank Building, Victoria, Tex., has plans for extensions and improvements in ice-manufacturing plant. Ice conveyor will be installed in connection with other equipment.

Central States Power & Light Co., Kahl Building, Davenport, Iowa, has purchased four ice-manufacturing plants of Laurel Ice & Packing Co., Laurel, Miss., two being located at Laurel; one at Ellisville, Miss., and another at Heidelberg, Miss. New owner is reported planning expansion and improvements, including installation of new equipment.

Phillips Petroleum Co., Bartlesville, Okla., will construct and operate three new plants for production of carbon black, in Carson, Hutchinson and Gray Counties, respectively, each to include machine and mechanical shops, tool houses, equipment storage and distributing plants, pipe lines and compressor stations. It is proposed to have units completed within six months, with cost placed in excess of $250,000 with equipment.

City Council, Orlando, Fla., is said to have plans under way for municipal airport on 50-acre tract at Lake Underhill, recently acquired, with hangars, machine repair and mechanical shops, pumping station and other buildings, to cost in excess of $100,000 with equipment.

East Plains Gas Co., Amarillo, Tex., is planning construction of a pipe line about 60 miles long, for natural gas service at Wewaka, Farnsworth, Spearman and vicinity, to cost $350,000 with equipment.

Seaboard Coal Co., 25 Broad Street, New York, is reported planning construction of coal terminal on former site of plant of Alabama Drydock & Shipbuilding Co., Mobile, Ala., with elevator type of loading equipment, conveying machinery and other mechanical equipment, to cost about $150,000.

Canadian Ice Co., New Orleans, is completing plans for one-story ice-manufacturing plant, 60 x 120 ft., to cost close to $100,000 with machinery.

Contractors' Rock Asphalt Co., John Wills, 913 South Fortieth Street, Birmingham, recently organized with capital of $275,000, is planning development and operation of asphalt mines in vicinity of Florence, Ala., to cost in excess of $75,000.

Pittsburgh

PITTSBURGH, Jan. 23.

ORDERS have been coming in fairly well for machine tools on which original inquiries were made the latter part of last year. Some dealers already have put the month down as a good one and there are few who do not report improvement in sales compared with December. An exceptionally lively inquiry is noted for heavy rolling mill equipment, although for the most part prices asked at this time are chiefly for estimating purposes.

Carnegie Steel Co. has revived the project of an open-hearth furnace plant for its Mingo, Ohio, works, which it is believed will mean installation of a new blooming mill, besides cranes and other auxiliary equipment. Jones & Laughlin Steel Corporation is said to have elaborate plans on paper for betterments and extensions at its Aliquippa works. Mention is made also of another seamless pipe unit at Gary works of the National Tube Co.

American Rolling Mill Co., Middletown, Ohio, has bought 50 type CL carbon circuit breakers, capacities ranging from 1200 to 10,000 amperes, from Westinghouse Electric & Mfg. Co.

Contract has been let by Automatic Gas-Steam Radiator Co., Fulton Building, Pittsburgh, to Rust Engineering Co., 311 Ross Street, for a one-story plant, 100 x 200 ft., to cost $55,000 with equipment.

Board of Education, Farrell, Pa., contemplates installation of manual training equipment in new high school to cost $500,000, for which plans will soon be prepared. H. W. Bovard, president.

Chicago Pneumatic Tool Co., Franklin, Pa., is continuing expansion program at its local plant and has let contract to Hughes-Foulkrod Co., 421 Seventh Avenue, Pittsburgh, for two one-story additions, 40 x 53 ft., and 35 x 70 ft., to be equipped as a foundry and power house, respectively, to cost in excess of $75,000. Headquarters are at 6 East Forty-fourth Street, New York.

Dravo Contracting Co., Neville Island, Pittsburgh, plans immediate expansion in its steel barge plant at Wilmington, Del., including construction of four additional shipways, wth shops and operating facilities.

Milwaukee

MILWAUKEE, Jan. 23.

EVIDENCES of an improving demand for machine tools are appearing, and the volume of sales is growing more satisfactory as the season advances. Interest among automobile manufacturers is showing a healthy increase following the national and local shows. There is no disposition to buy heavily, but the fact that some shops are now going beyond urgent replacement needs is regarded as encouraging. Inquiry generally is improved and the trade considers February prospects relatively good.

Metro-Nite Co., Hammond and Hopkins Avenues, North Milwaukee, Wis., manufacturer of paint ingredients from stone, is letting contracts for equipment of a $50,000 addition. Requirements include one bucket elevator, screw conveyor, pan conveyor, belt return conveyor and several 65-ton steel bins. Contract for set of screens has been placed with Sturtevant Mill Co., Boston, Mass.

Allover Mfg. Co., 1200 Irving Place, Racine, Wis., manufacturer of hair clippers, expects to make immediate repairs and replacements to offset damage of $10,000 or more to plant and equipment on Jan. 16.

Northwestern Motor Co., Eau Claire, Wis., builder of heavy-duty gas engines, is erecting a one-story addition, 50 x 66 ft. General contractors are Walker & Olson, 716 Churchill Street, local.

J. A. Barnes Machine Co., 123 Marion Street, Oshkosh, Wis., has sold its machine shop and real estate to Oshkosh Auto Parts Co., and is preparing to build a new shop early in spring.

Manitowoc Board of Industrial Education, Manitowoc, Wis., is about to select an architect to make plans and estimates for new unit of vocational training school, to cost $250,000 with equipment. A. L. Nimtz is vocational director.

Common Council, Stoughton, Wis., has engaged Power Engineering Co., Minneapolis, Minn., to take charge of modernizing municipal electric light and power plant and recommend replacement equipment. Work is estimated to cost upward of $30,000.

Wisconsin Power & Light Co., Madison, Wis., has been granted permission to construct and operate a 20,000-hp. hydroelectric generating plant on Wolf River, in Menominee Indian Reservation, near Shawano, Wis. Mead & Seastone, Madison, Wis., are consulting engineers.

Terminal Warehouse Co., 274 South Water Street, Milwaukee, is preparing to call for bids about Feb. 15 for construction of a new storage building, 147 x 323 ft., five stories and basement, accommodating railroad tracks, and 420 ft. of docks at West Water and Buffalo Streets. Investment will exceed $1,000,000. E. D. Fryer is president and general manager.

Adjutant General's Department, State of Wisconsin, Madison, will be ready for bids Feb. 18 for construction and equipment of a waterworks system in State military reservation at Camp Douglas, Wis., to cost $70,000. Specifications include two 200-gal. electric motor-driven pumping units, 50,000-gal. steel storage tank, 8000 lin. ft. of 6-in. cast iron mains. Work is in charge of Maj. Henry C. Hengels, State military architect, 445 Milwaukee Street, Milwaukee.

Board of Industrial Education, Neenah, Wis., has directed John D. Chubb, architect, Chicago, to revise plans for new senior high and vocational training school to cost $250,000. Original bids were rejected and new bids will be taken about Feb. 15. Mrs. J. F. Dillingham is secretary of board.

Cleveland

CLEVELAND, Jan. 23.

A FAIR amount of activity in machine tools has developed in the automotive industry in Detroit the past week. Stimulation of the market in that city appears to be due to increase in motor car production. Automobile companies which placed fair sized orders include the Ford Motor Co., which bought special machinery for making rear axles; Dodge Brothers, Inc., equipment for increasing manufacturing capacity for one of its models; and Packard Motor Car Co.

In this territory there is a moderate demand for single tools. Some business in vertical milling machines and shapers is coming from rubber mold manufacturers in Akron. The Firestone Tire & Rubber Co. has announced that equipment for its new Los Angeles plant will be purchased on the Pacific Coast. Turret lathes continue to move in fair volume, a local manufacturer having taken quite a few single machine orders since the recent price advance.

Contract has been let by Forest City-Walworth Foundries Co., 4500 Euclid Avenue, Cleveland, to Super-Built Construction Co., 1836 Euclid Avenue, for a two-story addition, 85 x 100 ft., to cost about $50,000 with equipment. Paul Schmidt, address noted, is engineer.

Sanymetal Products Co., Urbana Road, Cleveland, has awarded general contract to Austin Co., for a one-story addition, 75 x 220 ft., to cost about $70,000 with equipment.

Baltimore & Ohio Railroad Co., Baltimore, is planning construction of a locomotive house with repair facilities, power plant, steel water tank and tower, and other mechanical facilities at Youngstown, Ohio, to cost upward of $250,000. Work will be carried out in connection with expansion program in this district to cost approximately $1,000,000.

Mills, Rhines, Bellman & Nordhoff, Ohio Building, Toledo, architects, have plans for a two-story automobile service, repair and garage building to cost close to $100,000 with equipment.

Officials of Fairfield Engineering Co., Marion, Ohio, manufacturer of mechanical equipment, have formed Grain Mfg. Co., to manufacture special farm equipment for production of grain products. A portion of Fairfield works will be given over to production. H. B. Walker is president and treasurer.

Cleveland Railway Co., Hanna Building, Cleveland, has awarded general contract to Austin Co., for three-story automobile service, repair and garage building, 100 x 125 ft., to cost about $200,000 with equipment. Wilbur Watson & Associates, 4614 Prospect Street, are architects and engineers.

Artcraft Sign Co., East Kibby Street, Lima, Ohio, is considering construction of a one and two-story addition, 60 x 180 ft., to cost more than $40,000. A two-story office building, 60 x 70 ft., is also planned.

Cleveland Electric Illuminating Co., Illuminating Building, Cleveland, will soon begin erection of four-story power substation, 56 x 130 ft., to cost $100,000 with equipment.

General Instrument Co., Akron, Ohio, has been organized to manufacture oil, gasoline and other liquid gages for industrial purposes. It will also make indicating gages for domestic oil burners and dash gages for automobiles. No plant will be built at present, but company will assemble parts purchased elsewhere, particularly die castings and stampings.

Indiana

INDIANAPOLIS, Jan. 23.

PLANS are being considered by Ames Shovel & Tool Co., Anderson, Ind., for three one-story additions, to cost close to $100,000 with equipment. Work is expected to begin early in summer. E. F. Miller, Farmers' Trust Building, is architect. Headquarters are at 1 Court Street, Boston.

V. M. Nussbaum & Co., 220 Montgomery Street, Fort Wayne, Ind., have inquiries out for a 200-kva. steam engine-generator set, non-condensing engine unit, generator to be 220-volt, 3-phase, 60-cycle.

Fire, Jan. 20, destroyed portion of plant of Case Radio Co., Marion, Ind., operated by Indiana Mfg. & Electric Co., with loss reported at $250,000 including equipment; boiler plant also destroyed.

Bishop, Knowlton & Carson, 312 North Meridian Street, Indianapolis, architects, have completed plans for three-story and basement automobile service, repair and garage building, to cost about $100,000 with equipment.

Parts Corporation, 733 Virginia Avenue, Indianapolis, manufacturer of automobile parts, has plans for two-story addition, 35 x 225 ft., to cost approximately $60,000 with equipment. Foltz, Osler & Thompson, J. F. Wild Building, are architects.

Following recent organization of Servel, Inc., Evansville, Ind., to take over and operate Servel Corporation, manufacturer of electric refrigerating equipment, plans are being arranged for concentration of all production at local plant, including motor-driven compressor type and electrolux absorption type refrigerating units and parts. Other works will be discontinued. Col. Frank E. Smith is president of new company, and W. F. Thatcher, vice-president.

J. W. Lanahan and G. R. Dumphy, Vincennes, Ind., automobile dealers, have purchased a half block of property in business district and plan erection of multi-story service, repair and garage building, to cost close to $100,000 with equipment.

City Council, Muncie, Ind., plans installation of pumping machinery, power and other equipment in connection with proposed sewage disposal works, to cost more than $2,000,000. Pearce, Greeley & Hanson, 6 North Michigan Avenue, Chicago, are engineers.

St. Louis

ST. LOUIS, Jan. 23.

PLANS are being considered by Gould Castings Corporation, Gould Road and Quincaro Boulevard, Kansas City, Kan., for one-story foundry addition, to cost about $25,000 with equipment.

Southwestern Sales Corporation, Atlas Life Building, Tulsa, Okla., has approved plans for a one-story generating plant, to cost more than $40,000 with equipment. Charles S. Dilbeck, Tulsa Building & Loan Association Building, is architect.

Galion Iron Works & Mfg. Co., 1321 West Ninth Street, Kansas City, Mo., has arranged for increase in capital from $1,500,000 to $3,000,000, portion of fund to be used for expansion.

Central States Utilities Corporation, operating Central States Pipe Line Corporation, Wetumka, Okla., and other electric light and power utilities in Oklahoma, Missouri, Arkansas, Iowa, and other States, is arranging for bond issue of $3,000,000, portion of fund to be used for expansion and improvements, including transmission line construction.

Neligh Electric Light Co., Neligh, Neb., has approved plans for a steam-operated electric power plant, 40 x 110 ft., to cost approximately $100,000 with equipment.

J. A. Semmelmeyer Belting Co., 6630 Waterman Avenue, St. Louis, manufacturer of mechanical belting, is considering erection of one-story addition, 100 x 120 ft., to cost close to $40,000 with equipment.

National Milling Co., 2221 Front Street, Toledo, Ohio, is reported planning a new flour mill at Kansas City, Mo., to cost more than $600,000 with machinery. Company is affiliated with National Biscuit Co., New York.

Camden Ice & Coal Co., Camden, Ark., has engaged George E. Wells, Security Building, St. Louis, consulting engineer, to prepare plans for rebuilding portion of ice-manufacturing and cold storage plant recently destroyed by fire.

Board of Education, Wellington, Kan., plans installation of manual training equipment in new high school to cost $275,000, for which plans are being completed by Schmidt, Boucher & Overend, Fourth National Bank Building, architects.

Continental Gas & Electric Corporation, Kansas City, Mo., operating Kansas City Power & Light Co., Iowa-Nebraska Light & Power Co., Panhandle Power & Light Co., and other utilities, is disposing of bond issue of $36,000,000, portion of fund to be used for expansion in power plants and system.

Ovens, power equipment, conveying and other machinery will be installed in new plant, 140 x 150 ft., to be erected at Tulsa, Okla., by C. J. Patterson Corporation, 4050 Penn Street, Kansas City, Mo., baker, to cost close to $100,000; and in similar plant of like size at Oklahoma City, Okla., to cost same amount.

Atchison, Topeka & Santa Fe Railway Co., Topeka, Kan., is said to be arranging an appropriation of $250,000 for extensions in engine house and shops, freight houses and yards at San Angelo, Tex., with installation of additional equipment. H. W. Wagner is chief engineer.

Detroit

DETROIT, Jan. 23.

OFFICIALS of Hess Aircraft Co., Wyandotte, Mich., have formed Alliance Aircraft Co., to acquire property at Alliance, Ohio, for new plant for assembling, for which site will soon be secured. It is reported to cost in excess of $40,000.

Pere Marquette Railroad Co., Detroit, has awarded general contract to Owen-Ames-Kimball Co., Grand Rapids, Mich., for extensions and improvements in engine house and shops at Grand Rapids, to cost about $75,000 with equipment.

Monroe Paper Products Co., West Street and Elm Avenue, Monroe, Mich., is considering a one-story addition to cost more than $50,000 with equipment.

Grand Trunk Railway Co., 400 East Jefferson Street, Detroit, is arranging an expansion and improvement program to cost in excess of $10,000,000. Portion of work will comprise extensions at its Pontiac shops and yards, including new engine terminal, machine shops, turntable, power house building and equipment, coaling facilities, standpipes, to cost more than $750,000 with equipment. Company will also install an electric block signal system on line between Battle Creek, Mich., and Granger, Ind., to cost close to $245,000 with equipment.

Detroit Stoker Co., General Motors Building, Detroit, has plans for a two-story addition at Monroe, Mich., to cost about $25,000. Reed M. Dunbar, Kiburtz Building, Monroe, is architect.

John R. Kerby, village clerk, Grosse Pointe Farms, Mich., is asking bids until Feb. 20 for pumping machinery with capacity of 31,650 gal. per min., with accessory equipment, for sewage system. Hubbell, Hartgering & Roth, Buhl Building, Detroit, are consulting engineers.

Michigan Electric Power Co., Bad Axe, Mich., is arranging an expansion and improvement program in Thumb district to cost about $500,000, including extensions in power plants and transmission lines. E. L. Edwards is general manager.

Bowen Products Corporation, 2760 West Warren Avenue, Detroit, manufacturer of lubricating devices, grease cups, etc., will soon begin work on a one-story and basement addition to cost $30,000, for which general contract has recently been let to M. J. Hoffman Construction Co., 7147 West Warren Avenue.

Edward Goff, Pontiac, Mich., local representative for Cadillac automobile, including Royal Oak and Birmingham districts, has secured property on West Huron Street for a service, repair and sales building, to cost $200,000 with equipment. Work will begin early in spring.

Kurth & Knapp Mfg. Co., Inc., Detroit, fabricator of steel and sheet metal, has moved into its new plant and office at Canfield Avenue and Moran Street.

Canada

TORONTO, Jan. 23.

MACHINE tool business is more active, with sales running mostly to single items which total a good volume. Inquiries are of a diversified nature and come from many sections of the Dominion. Demand from the mining fields of northern Ontario has improved considerably since the first of the year, and there is a steady inquiry for equipment for milling plants, etc. The automotive industry is the chief buyer at present with railroads running a close second, purchasing more extensively for replacement needs and for shops under construction. Improvement among manufacturing interests has been reflected in a stronger demand for small tools.

H. A. Brown, vice-president General Motors of Canada, Ltd., Oshawa, Ont., states that Walkerville plant of corporation, which has been idle four years, will be reopened early in February. Slightly more than one-half capacity will be put into operation as soon as machinery can be installed, major portion to be used for coach and truck division. A complete line of trucks, bus bodies and cabs will be made. Other space will be devoted to manufacture of front axles for Chevrolet and Pontiac cars. It is intended to remove entire manufacturing of General Motors trucks from Oshawa, Ont., to Walkerville, which will provide more room for expansion of other lines at Oshawa works.

Fraser Companies, Ltd., will start work immediately on erection of a $2,000,000 mechanical pulp mill at Edmunston, N. B., which is expected to be in operation by end of year. Enlargement of sulphite mill is already under way. Further official announcements are expected soon respecting establishment of other pulp and paper mills on Restigouche or Miramichi River in New Brunswick.

Corrugated Cattle Cake & Cotton Seed Oil Co., 66 Temperance Street, Toronto, will start work in spring on erection of a factory and mill at Huntsville, Ont., to cost $100,000. It will be two stories, 100 x 310 ft., steel and brick construction. T. Walsh, manager, is receiving bids until Feb. 10 on erection of like plant at Weston, Ont.

Western Canada

Quaker Oats Co. is planning erection of large mill at Saskatoon, Sask., on which work will start in spring.

Construction will start at once on erection of a plant at St. Boniface, Man., for Great West Paper Mills Co., to cost $300,000. Box board and building paper will be produced.

Pacific Coast

SAN FRANCISCO, Jan. 18.

CONTRACT has been let by Austin-Western Road Machinery Co., Los Angeles, to William P. Neill Co., Inc., 4814 Loma Vista Street, for one-story plant in central manufacturing district, 100 x 150 ft., to cost about $40,000 with equipment.

Municipal Power & Light Bureau, South Broadway, Los Angeles, has plans for a new power substation and distributing plant at Venice, Cal., to cost about $220,000, of which approximately $150,000 will be used for equipment. E. F. Scattergood is chief engineer.

Goodrum & Vincent, Santa Monica, Cal., local representatives for Buick automobile, have awarded general contract to H. M. Roth Construction Co., National Building, for a two-story service, repair and sales building, 150 x 150 ft., to cost $160,000 with equipment.

Utah Asphalt Corporation, Price, Utah, care of John F. Cregon, Third Street and North Grand Avenue, Pueblo, Colo., engineer, has plans for a rock asphalt mining plant, including power house, machine shop and other units, to cost $750,000 with machinery.

Washington Gas & Electric Co., Longview, Wash., has arranged for bond issue of $1,250,000, portion of proceeds to be used for extensions in power plant and transmission system.

Pacific Asbestos & Supply Co., 315 Front Street, Portland, has authorized plans for rebuilding portion of plant recently destroyed by fire, with loss reported at $50,000 including equipment.

Valley Motor Co., Salem, Ore., has work under way on a one-story service, repair and garage building, 157 x 220 ft., to cost close to $100,000 with equipment.

Smokeless Fuel Co., Salt Lake City, Utah, is completing plans for construction of first unit of new plant, to cost in excess of $200,000 with equipment. Other units will be built later, with entire cost placed at $1,000,000.

Board of Education, Glendale, Cal., will build vocational shop and power house in connection with new group of eight high school buildings to cost $1,200,000. Alfred F. Priest, Fay Building, Los Angeles, is architect.

Pacific Gas & Electric Co., 445 Sutter Street, San Francisco, has applied for permission to construct and operate a hydroelectric power plant on Feather River, Butte, Plumas and Sierra Counties, comprising group of eight generating stations, with gross capacity of 360,000 hp. Entire project with transmission lines will cost in excess of $15,000,000. Company has secured permission to dispose of stock issue of $6,460,000, portion of fund to be used for extensions and improvements.

Sperry Flour Co., 141 California Street, San Francisco, has awarded general contract to C. F. Dinsmore & Son, Ogden, Utah, for new factory branch at Ogden, with storage warehouse, grain tanks, etc., to cost about $250,000, including mechanical handling equipment.

Continental Can Co., with branch works in Seattle, has purchased plant of Seattle-Astoria Iron Works, Seattle. Latter company specialized in manufacture of automatic can-making and canning machinery for food and other dry products. Capital stock of Seattle-Astoria Iron Works was $500,000, and its transfer to Continental Can Co., will be made by an exchange of stock in each company. Continental Can Co. recently purchased Los Angeles Can Co., Los Angeles, G. N. Easton Can Co., San Jose, Cal., and Seattle Can Co., Seattle.

Washington Iron Works, Seattle, founder, machinist and boiler maker, is adding a forge shop to its new plant at Sixth Avenue South and Atlantic Street. It will be 48 x 150 ft. and will cost about $50,000. When completed, equipment will be removed from former forge shop and a new Mahr forging billet heating furnace installed.

Bids are being taken on a $750,000 plant at Cajon Pass for American Portland Cement Co., Story Building, Los Angeles.

Offices of Pacific Coast Steel Co., San Francisco, have been moved from Rialto Building to Hunter-Dulin Building.

United States Steel Products Co. has moved its Portland, Ore., offices to new headquarters at Thirty-third and Nicolai Streets. E. R. Eldridge is manager in this district.

Seattle branch of Allis-Chalmers Mfg. Co., Milwaukee, Rex T. Stafford, manager, has plans for new steel and concrete building, 60 x 150 ft., in which company will manufacture Texrope drive, which it is making in its present shop on leased ground. New plant is to be built on property owned by company. Equipment will include 15-ton electric crane.

Foreign

ARRANGEMENTS are being made by Westphalia United Electric Co., Berlin, Germany, for sale of bond issue of $20,000,000 in United States, under direction of Harris, Forbes & Co., 56 William Street, New York, bankers, proceeds to be used for expansion and improvements in power plants and system.

Company recently formed at Muzquiz, Coahuila, Mexico, has plans for a hydroelectric power project on San Juan River where site has been secured, and it is purposed to award contracts for construction and equipment at an early date. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Mexico No. 26500; also at American Consulate, Piedras Negras, Mexico, Oscar C. Harper, vice-consul.

Municipal Council at Prague, Czechoslovakia, has plans for construction of a brick-manufacturing plant at Jinonice where property with raw material deposits has been secured. Initial works will have annual output of 30,000,000 brick. Information at office of American Consulate, Prague; K. L. Rankin, assistant trade commissioner.

Government of Colombia, South America, is planning purchase of locomotives, rails, railroad cars, steel barges, concrete mixers, trucks, pipe and other construction equipment for building of railroads, waterways, highways, etc., with such machinery estimated to cost more than $2,500,000. Details at Colombian Government Bureau of Information, 1440 Broadway, New York.

Officials of General Electric Co., Schenectady, N. Y., and Electric Bond & Share Co., 2 Rector Street, New York, have formed Italian Superpower Corporation, an affiliated interest, to take over and develop light and power properties in Italy, including acquisition and expansion of existing hydroelectric properties and other power utilities. Plans are said to be under way for sale of bond issue approximating $30,000,000, considerable portion of proceeds to be used for power expansion and development. L. K. Thorne, president, Bonbright & Co., Inc., 25 Nassau Street, investment securities, will be chairman of board and president of new company.

NEW TRADE PUBLICATIONS

Railroad Equipment.—Worthington Pump & Machinery Corporation, 115 Broadway, New York. Bulletin No. W P-1000, dealing with railroad products. Included are pumps, air compressors, steam condensers, oil engines, water and oil meters, locomotive feed water heaters and pumps and open stationary feed water heaters.

Alloy Iron and Steel.—International Nickel Co., New York. Three pamphlets, Nos. 11, 203 and 204, have recently been issued, dealing respectively with "Notes on Machining Alloy Steel," "Effect of Nickel on Machinability of Cast Iron" and "Economic Value of Nickel in Cast Iron." The first is by Thomas H. Wickenden, the second by D. M. Houston, and the third is written by another member of the staff of the development and research department of the company. They are all well illustrated.

Pyrometers.—Pyrometer Instrument Co., 74 Reade Street, New York. An eight-page pamphlet describes the simplified pyro optical pyrometer which the company has recently developed.

Facts About Refractory Mortar.—Denver Fire Clay Co., Denver, Colo. Pamphlet discussing the essential properties of mortars for bonding fire brick in furnace and boiler settings. Describes the company's preparations which have high melting point, low changes in volume and strength at heat and good resistance to corrosive agencies.

Steel Castings.—Commercial Steel Casting Co., Marion, Ohio. Illustrated 16-page pamphlet showing various types of open-hearth castings produced and some of the equipment.

Welding and Cutting Equipment.—Torchweld Equipment Co., 224 North Carpenter Street, Chicago. Catalog, 32 pages, 4 x 9 in., illustrating interior construction of oxy-acetylene blowpipes and regulators. Full line of auxiliary equipment is listed and priced.

Design of Furnaces for Pulverized Coal.—Combustion Engineering Corporation, 200 Madison Avenue, New York. 8-page pamphlet emphasizing the necessity of turbulent mixing of fuel with preheated air in order to burn pulverized coal efficiently. Data on wall temperatures and notes on maintenance of boiler settings are also included.

Spectrographic Analysis.—Adam Hilger, Ltd., 24 Rochester Place, Camden Road, London, N. W. 1, England, 10-page pamphlet containing reports from eight different laboratories, citing their ability to detect impurities in metals of the magnitude of 0.001 per cent. Also a list of applications to commercial metallurgical analysis, and a brief description of the necessary equipment.

Worm-Gear Speed Reducers.—W. A. Jones Foundry & Machine Co., 4401 West Roosevelt Road, Chicago. Catalog 35 of 56 pages is devoted to speed-reducing units involving worm gears. Many of the illustrations are from installations used in plants of wide variety. Details of the equipment are shown, together with price lists, clearance diagrams and a large amount of tabular matter indicating sizes to be used for varying conditions.

Stampings Welded Into Complex Units

Moderate Investment in Machines and Equipment Produces Compact, Efficient and Reliable Parts for Iceless Refrigeration Units

BY ALAN G. WIKOFF*

SOME notable achievements have been accomplished in recent years by firms making various kinds of domestic refrigeration units, not the least being the ability to compress in very small compass the necessary mechanical and chemical units, so built and assembled as to be entirely automatic in operation. Numerous makes are now marketed, the results of marked ingenuity by designer and constructor.

One interesting variety operates on the so-called gas-fired absorption system. The entire device is made of thin-walled tubing and sheet metal stampings, with all joints welded. In the diagram the various parts are sketched in the location and shape they assume in the completed unit, except that the condenser and the liquid heat exchanger are rectangular coils respectively at top and bottom of the boiler.

The whole system operates at about 15 atmospheres pressure, high enough so ammonia gas will liquefy at the temperature of the cooling water, which may be tepid. Therefore it is essential that the complex system of pipes and chambers be absolutely tight—a pin hole leak at any joint would speedily render the outfit inoperative. As observed at the plant of Servel, Inc., oxy-acetylene welding is used almost exclusively in the construction, because of its ability to make sound joints and to assemble complex devices from simple units.

Construction of Parts

A Servel unit consists of seven principal parts: Boiler *B*; absorber *A* and evaporator *E* (which are similar); condenser *C* and liquid heat exchanger *L* (which are pipe coils); rectifier *R*; and gas heat exchanger G.

Absorber *A* and evaporator *E* are made of sheet

STOCK of Gas Heat Exchangers, with Pipes for Delivering Liquid Ammonia from Rectifier to Evaporator Protruding from Either End

metal stampings. A wrapper sheet, properly punched for side openings, is closed into a cylinder and a longitudinal seam made. A series of self-spacing stampings, the trays, is then slipped inside and fixed in place by spot welding. Sheet metal cups welded on top and bottom form the domed ends.

Gas heat exchanger *G* is built as follows: Several pieces of thin-walled steel tubing, about ¼ in. in diameter, cut to length, are slipped into corresponding holes in end diaphragms, and expanded enough for a tight fit. A longer tube for liquid ammonia is threaded through the last open hole, the entire nest is pushed into a longer tube about 2½ in. in diameter, where it fits snugly, and the protruding ends of the ammonia tube are bent upward. Over these ends cup-shaped stampings are slipped and welded to the outer casing forming the ends of the exchanger. A flange is also welded to the casing for attaching the refrigerator partition. Openings for the various connections are, of course, punched before the individual parts are assembled.

The rectifier *R* is made of two pieces of tubing, one short and straight, the other smaller in diameter and bent into a U after three holes for connections have been punched in the sides. Round disks are welded over one end of each of these tubes. A series of perforated stampings is then slipped over one arm of the bent tube, spot-welded top and bottom, and the outer tube is put in place. A ring welded to both tubes closes the annular space at the bottom.

First Assembly

Assembly starts with the parts that have just been described. A coil of copper pipe for cooling water is

CONCENTRATED ammonia solution (NH_3 *in water) in the bottom part of the boiler B on being heated drives ammonia gas* (NH_3) *and steam up through vent pipe at side of boiler across to rectifier R, where the steam condenses on the little shelves and trickles back into the top portion of boiler. Ammonia gas passing into the condenser C is cooled and liquefied, the liquid ammonia returning to the other leg of the rectifier R. From here it is piped to evaporator E, and, dripping from tray to tray, changes from liquid to gas, absorbing heat and thus cooling the refrigerator. The mixture of ammonia and hydrogen gas* (NH_3 *and* H_2) *in the evaporator E is heavy and settles into the absorber A by way of the gas heat exchanger G. In the absorber A, ammonia gas is washed out of the gas mixture by the water condensate overflowing from the boiler and trickling from tray to tray. Hydrogen gas* (H_2) *returns to the evaporator E.*

slipped over absorber *A* and held in place by clips welded to the wall. Two curved tubes connecting absorber *A* and gas heat exchanger *G* are then welded and to this is added the evaporator *E*. An interesting work-holding fixture used for many of the assembly operations is a swivel vise mounted on a substantial pipe standard so it can be turned in any direction. With this arrangement the position of the work can be quickly changed by the operator with hardly any interruption to the welding.

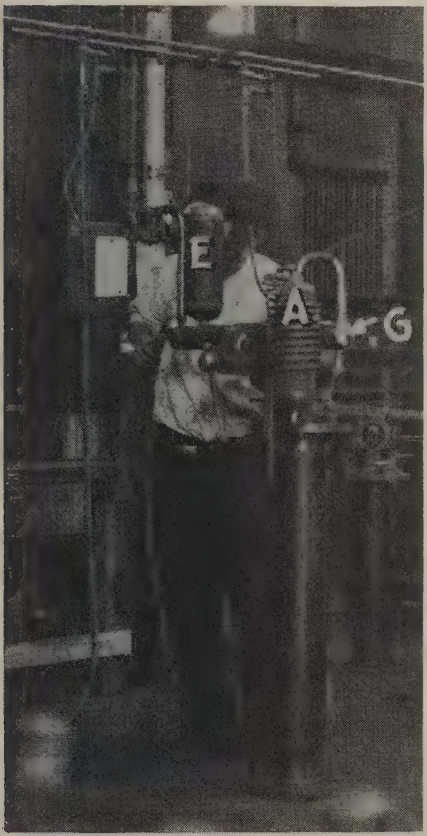
Attaching the rectifier, using a jig, completes the first assembly.

What might be called the hydrogen circuit is now completely assembled. It is tested for tightness by closing with clamps and gaskets any openings to which connections will be made later, and subjecting it to 800 lb. per sq. in. air pressure. Every joint is painted with soap solution; absence of bubbles indicates tight joints. After receiving its O. K. the unit goes to the galvanizing and tinning department, where the refrigerator side up to the partition is galvanized. A heavy coating of tin is applied to the absorber condenser coil by dipping, for the purpose of increasing the metallic contact between copper water coil and the absorber. This insures more efficient heat exchange between the cold water and the gases inside the absorber.

Coils

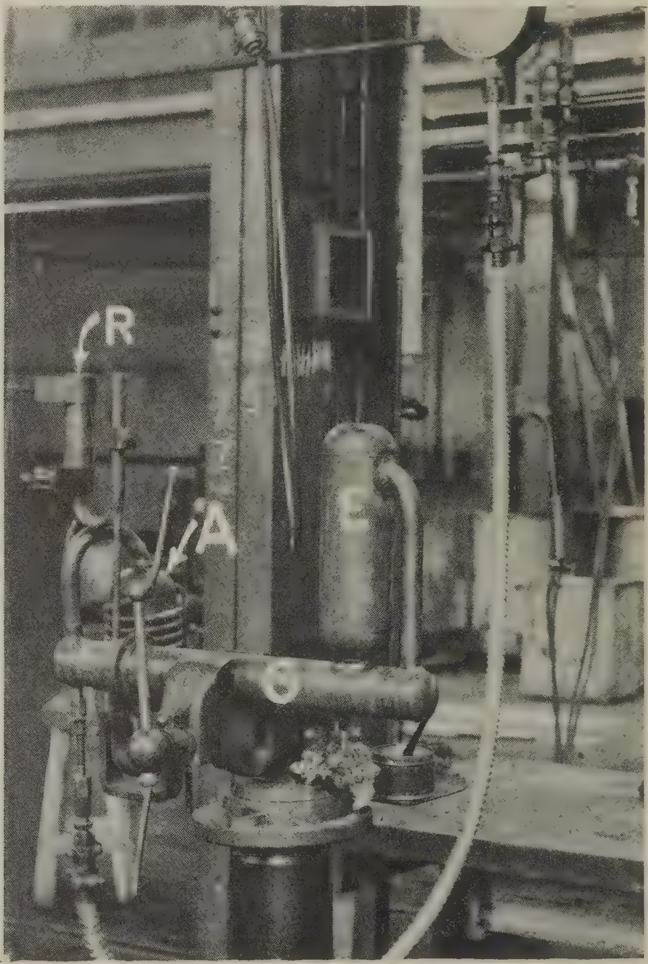
Liquid heat exchangers *L* are made simply by thrusting a small steel pipe through a larger one, welding the ends of the outer pipe to the inner, and bending them into a rectangular coil of about five turns. The condenser *C* is made as follows: A length of steel tubing to carry the ammonia and another of copper to carry cooling water are placed side by side and made into a rectangular coil of about three turns. It thus consists of alternate turns of steel and copper tubing, held together by steel clips tack-welded to the steel tubing. To increase metallic contact and thus give better heat transfer, the coil is dipped into molten tin which solders the pipes together. A strand of twisted copper wire is then placed in the space between adjacent coils and covered with soft solder applied with a welding blow-pipe.

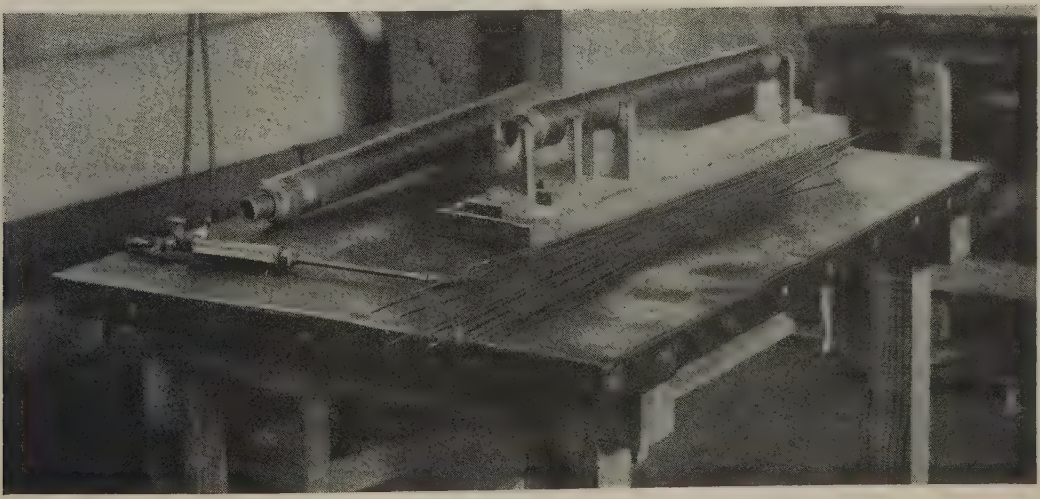
Boiler *B* is a jacketed tube. Over the inner chimney is slipped a sheet metal washer or annular diaphragm, and welded on. A small diameter tube for carrying ammonia and steam from the lower compartment is



(Above) Operator Welding Connections Between Evaporator E and Gas Heat Exchanger G

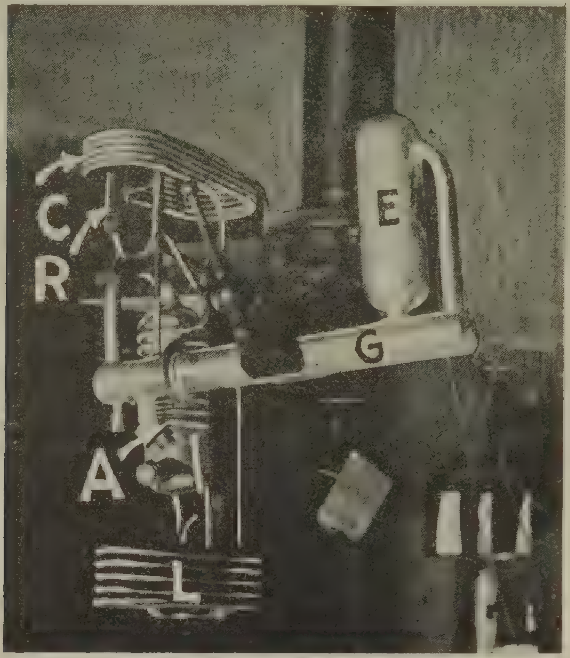
(At Right) First Assembly Under Pressure Test. Openings in rectifier R closed by clamps and gasket



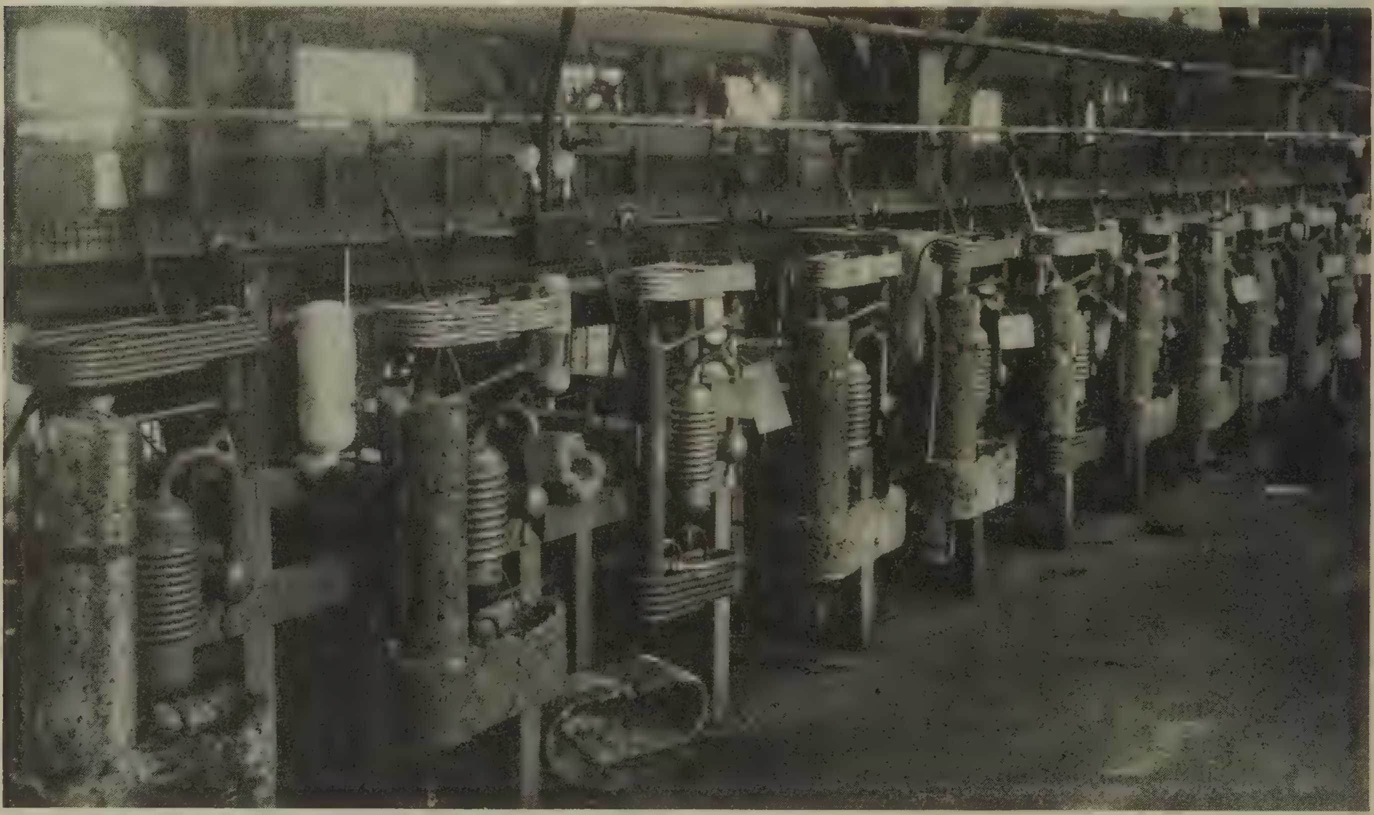


(At Left) Simple Work-Holder for Making Boiler

then thrust through a hole in the diaphragm and welded in place. Then one short and one long tube, each with one end swaged down, are slipped over the chimney until they butt against the diaphragm. One weld then makes a solid joint between diaphragm and jacket, and two others close the ends of the jacket.



Completed Unit. (This picture is printed upside down to place the various parts in working position)



Servel Units Under Operating Test Before Installation in Cabinets

Final Assembly and Test

Boiler and coils are then welded to each other and to the first assembly by short pieces of connecting tubing, when the complete unit is ready for proof test at 800 lb. air pressure. While this allows a liberal factor of safety over the normal working pressure, it does not even approach the ultimate strength of the unit, which can withstand over 3000 lb. per sq. in. hydrostatic pressure before failure. This is an indication of the uniformly high quality of material and workmanship maintained throughout this plant.

The unit is now ready to receive its charge of refrigerating agent. The air is first removed by a vacuum pump. The required volume of ammonia solution of known strength is then introduced, a three-way cock turned and enough hydrogen gas admitted to register the correct pressure on the gages. The charging valve is then closed and sealed.

After placing insulation loosely around the generator and liquid heat exchanger, the unit is placed on the cold test rack, a gas burner is inserted at the bottom of the generator, connections for circulating water are made to the condenser coil, and temperatures developed on the refrigerating side recorded.

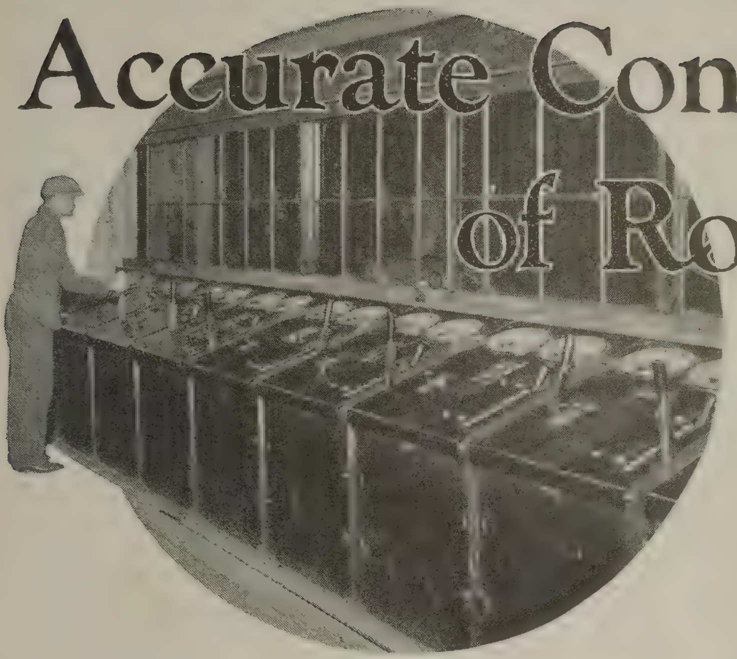
Subsequent assembly operations are of interest. The first step is to place an aluminum casting over the evaporator end of the unit. This casting forms the cooling compartment of the refrigerator and has shelves for the insertion of the trays used in making ice cubes. The unit is then mounted on an insulated board that forms the partition separating the cold part of the refrigerator from the section that contains the heating element. The generator and liquid heat exchanger are then covered with a very heavy layer of heat-insulating material. After being sprayed with a coat of paint and placed in the ice box, the gas burner, thermostat and connections for gas and water are attached. The burner is so designed that the gas will be turned off automatically should the flame be accidentally extinguished. The unit is then given a final cold test, a careful record being kept of the temperature in the cooling compartment of the refrigerator.

Purchase of United States Can Co. by Continental Approved

Stockholders of the United States Can Co., Norwood, Ohio, at a meeting on Jan. 21 voted to accept the offer of the Continental Can Co., Inc., New York, whereby the latter company will take over all of the assets, properties and goodwill of the United States company, the transaction to be effective Feb. 7.

The Continental company has also acquired the Seattle Astoria Iron Works, Seattle, Wash., manufacturer of can making and allied machinery and equipment.

Accurate Control of Rolling Speeds



Introduce Many Operating Economies in New Ten-Inch Merchant Mill Built for Bourne-Fuller Co.

UNUSUAL provision has been made in the new electrically driven 10-in. merchant bar mill at the Union Works of Bourne-Fuller Co., Cleveland, for close regulation of rolling speeds, resulting in less frequent roll changes. Furthermore, it is not necessary to keep as close watch on roll diameters as it would be with constant-speed drive, because when a roll is turned down and slightly reduced in diameter, the speed of the stand can be increased to compensate for the change. No roll changes are necessary in rolling sizes from 7/32 in. to ⅝ in. in round bars or equivalent sections in squares and flats. Mill stands have one-piece semi-steel housings. When rolls are to be changed the entire housing is lifted by crane and taken to the set-up stands. It is claimed that a one-piece housing makes a more solid mill.

With the speed of the finishing train under close control, the lengths of the loops as the steel passes from one stand to another may be so short that light sections have little chance to chill. There is also no time wasted in passing the steel through the four sets of rolls. The mill has been operated at a delivery speed of 1600 ft. per minute when rolling ½-in. rounds, but it is expected that this speed will be increased somewhat. This high speed also helps to prevent chilling of small sections.

The mill is designed for rolling both alloy and plain carbon steel bars. It produces strip, bands, angles and spring steel in straight lengths and coils. The mill will specialize on bars for cold drawing and for nut stock. It replaces two old merchant bar mills, an 8-in. and a 10-in. mill. It will roll rounds from 7/32 in. up to 1¼ in. and corresponding sizes in squares, hexagons, flats and ovals, although it is not the intention to produce sections larger than ¾ in.

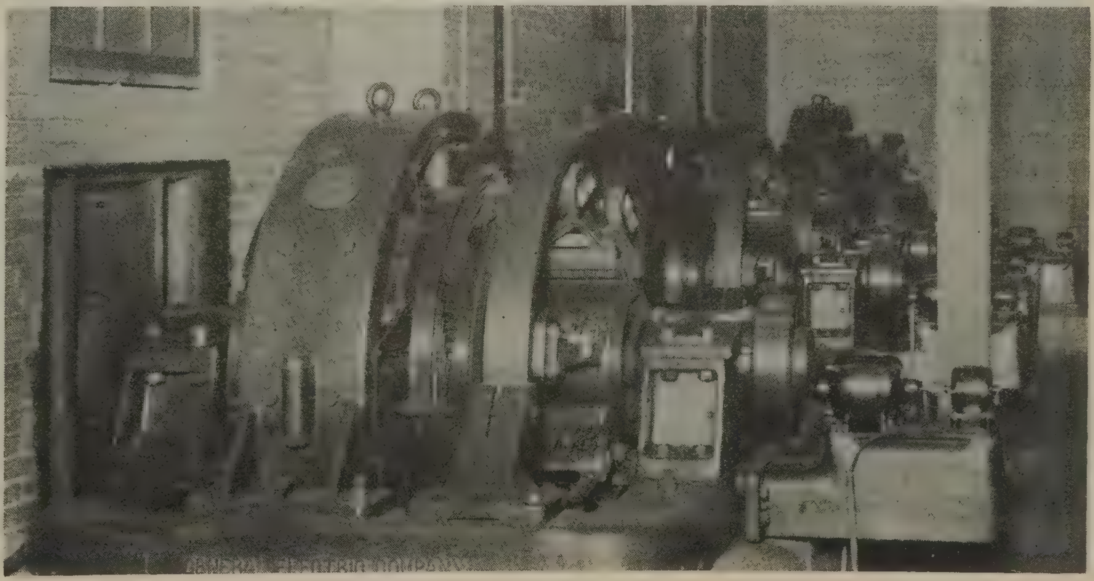
The new mill is semi-continuous, with two groups of four stands of roughing rolls arranged in tandem, and four finishing stands. The first four roughing stands are driven by a single motor. The second group of roughing stands have individual motor drives. Three motors drive the finishing rolls.

Heating Furnace Has Suspended Roof

Billets from 3½ in. down to 1½ in. square in lengths up to 30 ft. are used, and as a rule these are not cut to shorter lengths on leaving the reheating furnace. Instead, the billet is reduced in its full length in one piece, and finished bars that go to the hot bed are cut to length by a flying shear. Bars that are coiled are not cut, but coiled their full length. The new heating furnace is 32 x 32 ft. and fired with producer gas. Billets are charged endwise into the side of the furnace over a table having rollers mounted in roller bearings. Inside the furnace the rollers are water cooled and operated by motor-driven worm gears. Billets are pushed sidewise through the furnace on skids, not water cooled.

The roof is entirely supported by structural steel members located along the sides of the furnace, a construction which permits side wall repairs without dis-

INDIVIDUAL Drive Motors on Roughing Stands Nos. 5, 6, 7 and 8 Are Placed Close Together and Speed Set as Desired Is Maintained by Electrical Interlock



turbing the roof. Air, but not the fuel, is preheated by passing through regenerative chambers. Reversal of the flue gases is done at intervals by water-cooled sliding dampers and mushroom valves. Hot billets are discharged by an ejector gripped by motor-driven pinch rolls, the bottom roll being raised and lowered by an air cylinder. The furnace was designed by Oliver Luetscher, Peru, Ind., and, excepting the auxiliary equipment, was built by Bourne-Fuller Co. Small mill-type direct-current motors for this and other equipment were furnished by Westinghouse Electric & Mfg. Co.

Eight Roughing Mills in Two Sets of Four

The end of the heated billet, when pushed from the furnace, is gripped by motor-driven pinch rolls that deliver it to the first roughing stand. An up-and-down shear is located between the furnace and first roughing rolls, but, as previously stated, billets are usually rolled full length.

The roughing mill is continuous, eight stands in tandem, each with 12-in. rolls. The first four stands are driven by one 500-hp. motor with a combination bevel gear and pinion drive, thus avoiding the use of spindles. The motor drives through a gear reduction set and double flexible Fast couplings, one 15 ft. and the other 9 ft. in length, to a line shaft. Bevel gears on this shaft mesh with bevel gears on the ends of the pinion shafts. Several advantages are claimed for this arrangement: (a) floor space is saved by making the mill stand a compact unit, (b) backlash is avoided and (c) the usual lost motion in the coupling box is eliminated. The long coupling was used so the motor could clear an existing building column.

The second group of four 12-in. roughing stands are driven by individual motors (as shown in the illustration) through gear reduction sets. These mill stands are on unusually close centers for individually driven units designed to roll small sizes, but are spaced farther apart than most continuous group-driven mills for small merchant bars and rods. Stands Nos. 5, 6 and 7 are driven by 300-hp. motors. Stand No. 8 requires a 500-hp. motor, because a heavy draft is taken here when rolling spring steel, angles, flats and some special sections. All mill motors and control equipment were furnished by General Electric Co.

Three Motors Drive Four Finishing Stands

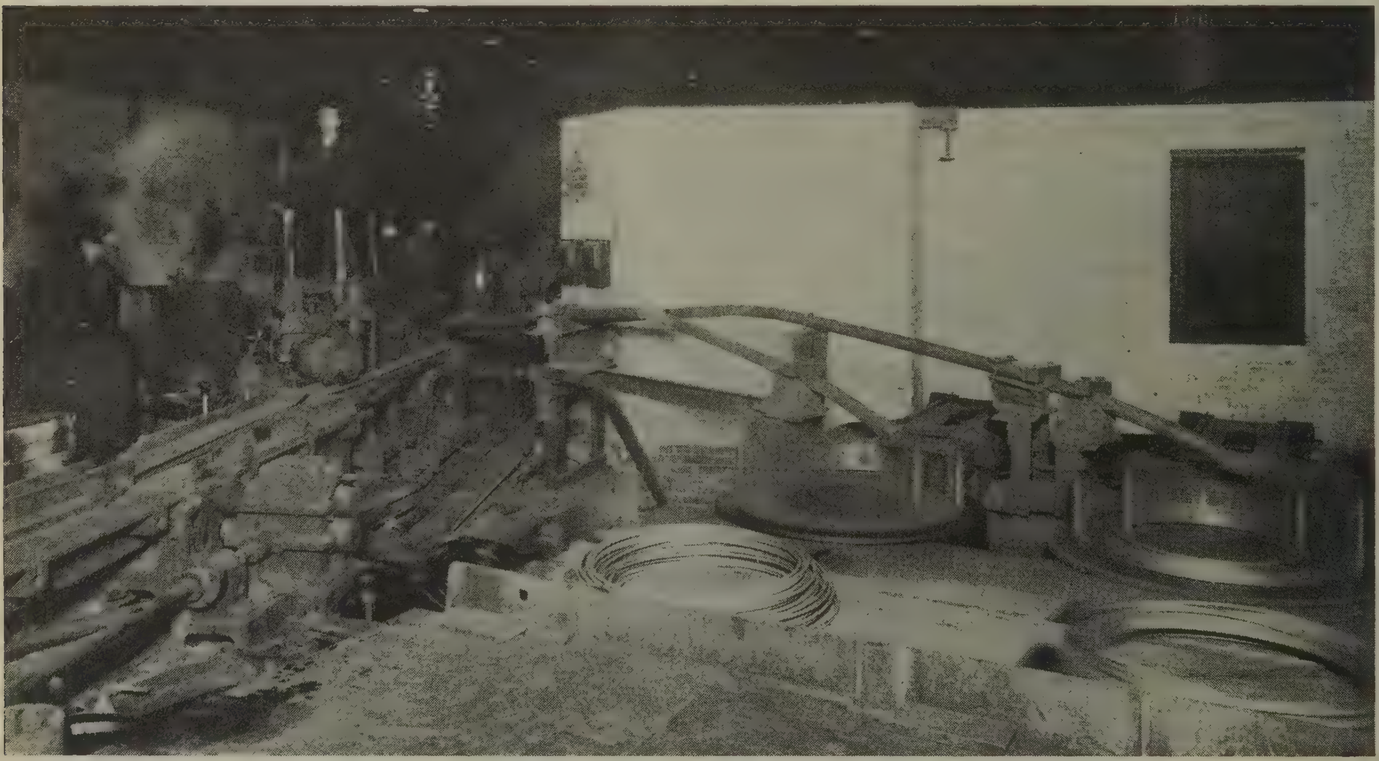
The finishing mill consists of four 10½-in. looping stands. Stands Nos. 9 and 10 are driven by one 500-hp. motor and stands Nos. 11 and 12 are individually driven by motors of the same rating. The first three stands are located side by side. Stand No. 12 is set back of the others, because sufficient space was not available for the driving motors. A repeater is usually used for delivering the steel from No. 8 to No. 9 stand and a repeater will also be placed between stands Nos. 10 and 11.

Unique Speed Control

Each mill motor has an individual magnetic control panel so any one stand can be started or stopped. A unique method is used for regulating the speeds of the four motors that drive Nos. 5, 6, 7 and 8 stands. When each of these stands is driven at the proper speed, the bar as it passes through the rolls is kept under tension but not stretched or looped. Because of the close centers, speed is controlled by a synchronous tie between the motors, which in reality takes the place of interlocking gears. It is obtained by individual balance-type vibrating speed regulators, which not only maintain a synchronous tie among the four motors, but also maintain the correct speed set for each motor within close limits. This speed-regulating equipment may be taken out of service by the operation of a transfer switch and the motors placed under hand control.

Control of the whole mill is from a house at the side, whence the operator has a good view of all the stands. This house is on the mill floor level, due to insufficient head room to permit the usual elevated pulpit. The control board, shown in the head piece of this article, is of the bench board type. There are two methods of speed regulation, one through the regular motor speed adjustment for large differences in speed, and the other through a field rheostat, which is used for making finer speed adjustments. A rheostat is located beneath each motor.

The control board is equipped with an ammeter for each motor to indicate the load carried, a tachometer to indicate the speed and a master switch for starting and stopping. Separate mill speeds are scheduled for every size of bar being rolled. Knowing the size of the section, the operator sets the controls to secure the predetermined speeds and with the field rheostat makes minor speed variations as necessary. This applies particularly to the second roughing set, in which the bar is passing through all four stands at one time and a slight variation from the proper speed of any one



Bars for Coiling Are By-passed to Right. Flying shear directly in front of operator cuts long bars in lengths which can be handled on cooling bed

Runout with Automatic Cooling Bed at Right, and Facilities for Pack-Annealing Spring Steel at Left

stand will cause the steel either to buckle or stretch.

Direct current for driving the mills and various auxiliary equipment is derived from two motor-generator sets made by General Electric Co. Each consists of a 1000-kw., 250-volt, direct-current generator driven by a 1400-kva., 2300-volt synchronous motor with 80 per cent power factor. The motor-generator sets and the motors that drive the roughing stands and Nos. 9 and 10 finishing stands are located in a motor room at the side of the mill. The individual motors that drive stands Nos. 11 and 12 are located in the control room on the opposite side of the mill. All mill motors are the same type and have a speed range of 267 to 800 r.p.m.

Automatic Control Beyond Last Finishing Pass

Movement of the bars is automatic from the time they leave the last finishing stand until they reach the bar shears. A control on the runout table kicks the bar to the flying shear, a second control delivers the bar from the runout table to the hot bed, and when it drops on the first notch of the hot bed the latter is set in motion. A control pulpit is located at the side of the hot bed, but the only duties of the attendant are to watch the movement of the steel and operate control levers should any of the automatic controls fail.

The flying shear located at the delivery end of the last finishing stand is of the Rendleman type and consists of two circular cutters rotated by two adjustable-speed motors. Another motor raises and lowers the upper cutter. Cutters are set at an angle of 45 deg. to the line of travel, the bar is moved sideways through a swinging trough until it is caught in the cutter blades, and the bar is sheared while in motion at any delivery speed. The shear has a capacity for cutting 1-in. rounds and squares, or flats up to ⅜ x 4 in.

Bars that are to be coiled are not sheared but diverted from the finishing mill runout to one or two motor-driven reels. Reels are of the pouring type, and coils are pushed off mechanically to a conveyor leading to the storage building. An overhead traveling crane then places the coils in cars or in piles on the floor. Material is usually reeled into 300-lb. coils, although the coilers have a capacity of 500 lb. Two strip coilers with motor-driven reels are also provided for coiling material rolled in strip sizes.

Straight bars from the last finishing stand are cut to length on the flying shear and carried on a double runout table to the hot bed shown in the view. This table has individually motor-driven rolls, synchronized with the finishing mill. Runout rollers and motors are equipped with roller bearings. From the runout table the steel is automatically discharged on the hot bed, 250 ft. long. It is of the double type, with 10 ft. notched bars on one side. A hand-type bed 12 ft. wide on the opposite side is provided for pack-annealing spring steel.

From the hot bed the bars are delivered to shuffle bars and run-off rollers, and thence to shears. There are three bar shears. One takes care of the hand bed. one the mechanically operated bed and the third is for shearing angles. A transfer table takes angles from the run-off rollers to a straightening machine before reaching the third shear.

The new mill was designed by N. K. Hartford, general superintendent Bourne-Fuller Co., and C. A. McDowell, superintendent of the Union Works. It was built by the United Engineering & Foundry Co., Pittsburgh, which also supplied the hot bed, tables, flying shear and other mill equipment.

Rates on brass, bronze and copper articles from Baltimore to points in Official Classification territory are not unreasonable, according to a proposed report made recently to the Interstate Commerce Commission, Washington, by Examiner E. P. Hurley. Complaint was made against the rates by the Baltimore Tube Co., Inc., Baltimore.

Freight car requirements for iron and steel products in the first quarter of 1928 will amount to 466,363 cars, according to an estimate by the car service division of the American Railway Association. Actual requirements during the first quarter of 1927 were 472,495 cars, the association's estimate being a decrease of 1.4 per cent.

New Plant Widens Scope of Output

Chicago Foundry Now Makes Greater Variety of Non-Ferrous Castings—Some Economies in Handling Materials

INCREASE in plant capacity, a broader field for its products, larger sizes of individual castings and heats from a wider range of non-ferrous metals, are the major results obtained by abandonment of an old plant and construction of a new foundry and machine shop by the Hills McCanna Co., 2349 Nelson Street, Chicago.

The property acquired for the new project is now about one-half under roof, affording space for a large expansion of output. Comparatively speaking, individual shipments from this plant will always be small in tonnage, therefore switch track facilities have not been provided, and incoming materials and products are trucked to and from the plant.

The foundry is a brick and steel structure, 66 ft. wide by 200 ft. long, with roof trusses spanning from wall to wall without intermediate columns. The furnace room is separated from the molding room by a brick wall. Eleven oil-fired furnaces are now installed and operating and space remains for the addition of five units. The furnaces are designed for 200-lb. pots. The melting time varies from 55 min. to one hour.

The foundry floor is divided down the center by a main aisle, on either side of which are the molding skids. On both sides of this aisle, near the furnace room, are the light casting floors. Equipment installed at that end of the building includes standard types of molding machines, a Pridmore stripper, two electrically operated sand riddles and a sand mixer. Small molds are made in steel flasks furnished by the Sterling Wheelbarrow Co., Milwaukee, Wis. In all there are 21 molders' stations on small work and two molders are employed at the heavy casting pit. The floor is made of concrete except where the large molds are made.

The heaviest individual casting poured to date weighed 3400 lb., but with the additional furnaces which may be installed in the future it will be possible to produce castings weighing 6000 lb. each.

On one side of the aisle is the core room and the core ovens, and directly opposite are the gate and riser cutting-off machines and the sand-blast equipment. The day core oven is designed with six drawers, each 3 ft. x 6 ft., and the night oven, which is loaded by a truck that is moved in and out of the furnace on a track, measures 8 ft. x 10 ft. inside. These ovens are oil-fired and may be operated simultaneously or separately as occasion demands. They were built by the Foundry Equipment Co., Cleveland. Two band and two hack saws constitute the gate cutting equipment. Castings are cleaned in a revolving barrel sand blast machine installed by the American Foundry Equipment Co., Mishawaka, Ind.

A duorail system for handling materials extends from the furnace room over the center aisle to the far end of the main foundry room. One 5-ton and two 1-ton hand-operated overhead cranes traverse the molding room on one side of the aisle, and a 1-ton crane of the same type operates over the molding floors on the opposite side of the aisle. The 5-ton crane is installed over the heavy-work pit. The 5-ton crane cannot travel beyond the limits of that pit, but the 1-ton cranes on that side of the aisle can be moved over the track that serves the 5-ton crane. The equipment was furnished by the Atlas-Chicago Co., Chicago. Hot metal is delivered from the furnace room to the desired location in the center aisle by the duorail system and it is then transferred to one of the hand-operated cranes.

On leaving the foundry the visitor goes through the shipping department, past the pattern storage, the assembly benches and the tool room to the machine shop, which is a well lighted and ventilated room, 66 x 200 ft. Of special note is the width of the aisles and the distance between machines. Much of the equipment was moved over from the old plant. Three new machine tools and a heavy-duty turret lathe were installed.

Castings are placed in elevated boxes in the foundry and moved by lift trucks, that were built by the Barret-Cravens Co., Chicago, to the machine shop and finally to the store room. A monorail system extends from the store room to the shipping department.

Melting furnaces, core ovens and the central heating plant are furnished with fuel oil from a central pumping station. All oil burners, pumps and auxiliary equipment were furnished by the North American Mfg. Co., Cleveland. A low-pressure boiler furnishes steam to the oil heater and the unit heaters in the shop. Each of the two oil pumps is rated at 200 gal. per hr., and the oil pipes are so arranged and by-passed that either or both pumps may draw oil from one or the other of two storage tanks. The oil pressure is maintained at 50 lb., and its temperature is raised to 100 deg. Fahr. The oil lines to the burners in the plant are so laid out that there is a constant circulation of hot oil, the return or overflow connection being made to the storage tanks. An oil-fired auxiliary hot water heater, which is connected with the oil heater, is installed for use when the low-pressure boiler is out of service. A Nash Engineering Co., South Norwalk, Conn., vacuum pump is located in the radiator return line to the boiler. The Dwyer Equipment Co., Chicago, furnished the overhead, fan-equipped unit heaters that distribute warm air throughout the various shop departments.

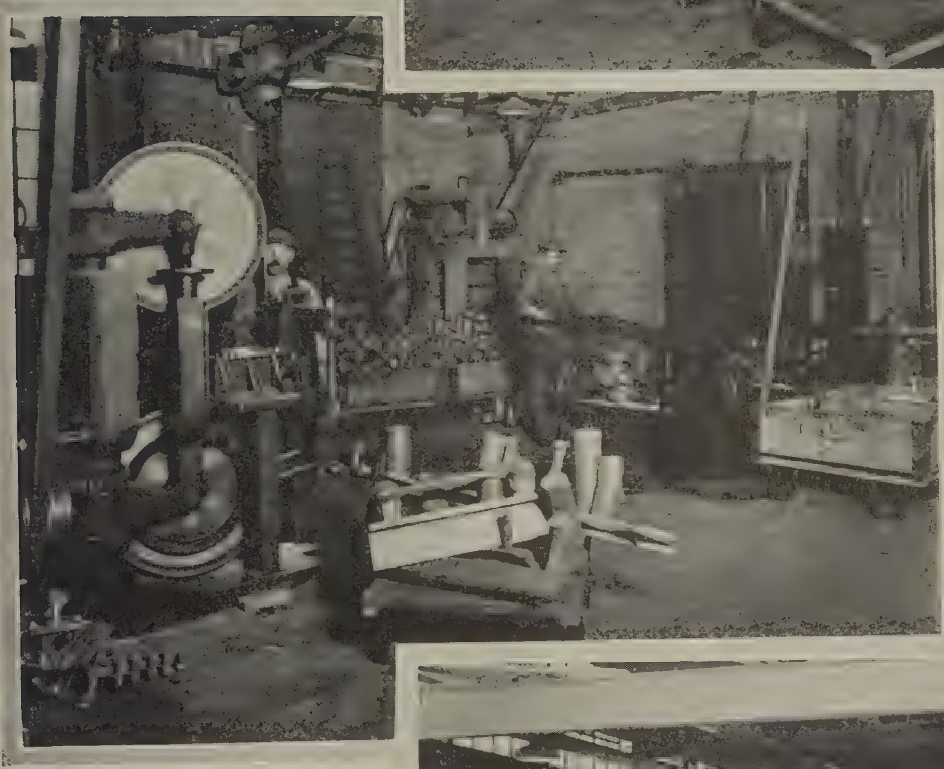
This plant is equipped to handle the more difficult non-ferrous metals, specializing particularly in aluminum-bronze; various nickel mixtures, including Monel and copper; nickel, iron and chromium alloys that find use in special fields. Complete service, from the making of patterns to the completely cast and machined part, is available. This company makes no effort to specialize in ordinary red brass jobbing work. Design and construction of this plant were supervised by Frank D. Chase, Inc., Chicago, engineers.

Why Steel Hardens

A handsomely printed brochure has been issued by the American Society for Steel Treating, Cleveland, containing the second Edward DeMille Campbell memorial lecture, by Dr. Zay Jeffries, entitled "A Contribution to the Theory of Hardening and the Constitution of Steel." The lecture was very briefly abstracted in THE IRON AGE's report of the Detroit convention of the society, contained in the issue of Sept. 29, 1927, page 867.

Departments in a New Chicago Foundry

WIDE Aisles and Liberal Passageways Between Machines Facilitate the Rapid Movement of Products by Means of Lift Trucks



SPECIAL Machinery Makes Short Work of Gate and Riser Cutting. The sand blast equipment is near at hand

MONORAIL Systems and Overhead Cranes Eliminate Much Hand Work. The shop is warmed by unit heaters located along the walls and above the workmen's heads

Prices of Steel and Other Products

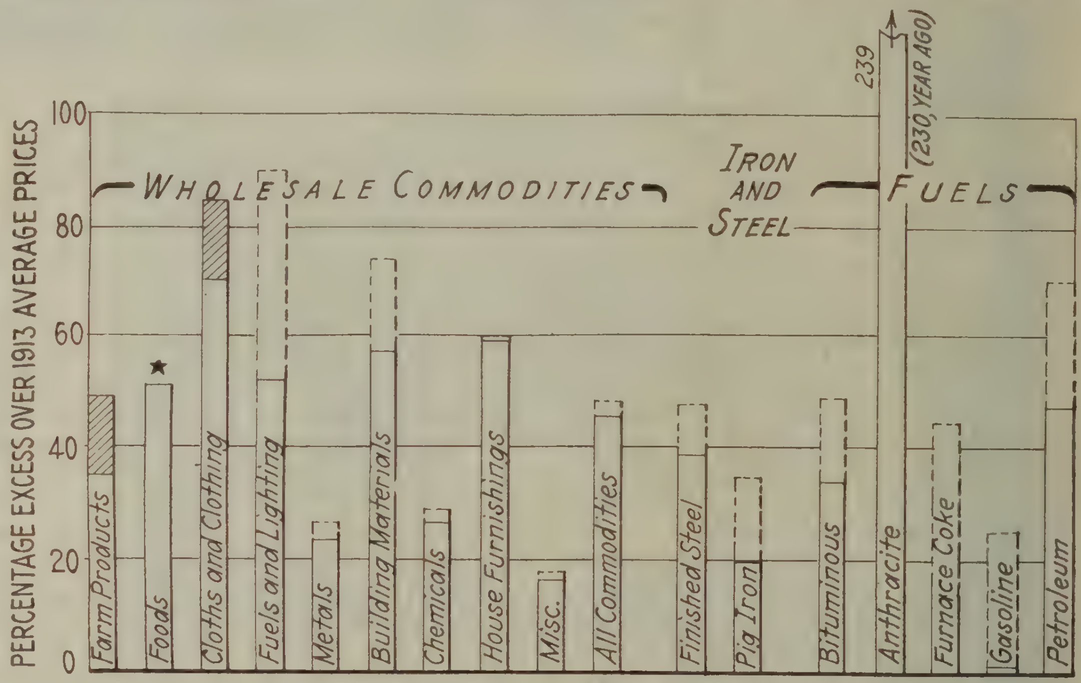
Metals Lower Than Most Other Commodities—Changes in Past Year—Probable Future Course of Prices

BY SIDNEY G. KOON*

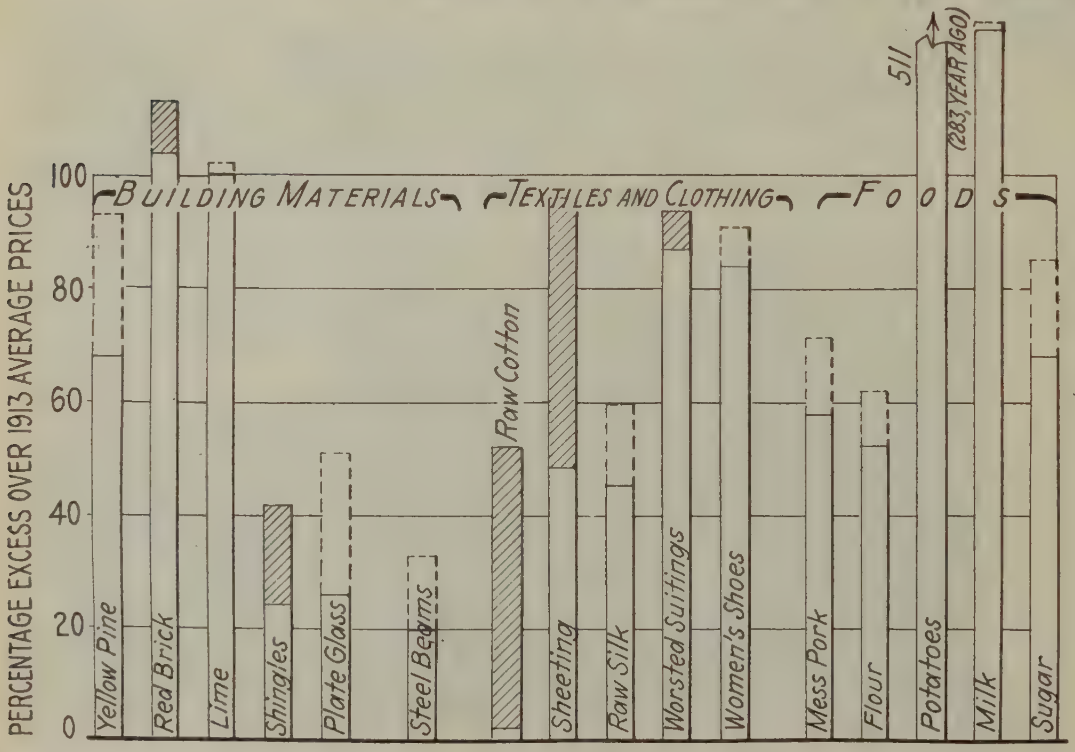
DURING the past year there was a fairly steady drop in prices of pig iron and finished steel. At the same time, there was a moderate drop in prices of commodities in general, as reported by the United States Bureau of Labor Statistics. The situation was a little mixed, however, by reason of the fact that a number of the commodity groups reported upon by the bureau showed considerable increases during the year—enough, almost, to offset the declines made in other groups.

Again, as in many cases when these studies have been published† in the past, we find the metals at a much lower level relative to pre-war than are most of the other commodities. Thus steel beams are only 20 per cent higher than in 1913, whereas building materials in general are 57 per cent higher, clothing is 85 per cent and house furnishings are 59 per cent higher, and commodities in general are 45½ per cent higher. In some instances the divergences are much greater than this. Brick is more than twice the 1913 price. Potatoes are about six times as high as they were 15 years ago. Milk, building lime, worsted suitings, cotton sheeting and women's shoes are about double the 1913 level, while anthracite is more than three times as high as it was at that time.

Without regarding 1913 as essentially correct in its



Prices of "All Commodities" Have Lowered Since a Year Ago, as Shown by the Dotted Top of the Column. Finished steel, a little lower than the general average, is below last year. Items with cross-hatching are higher than a year ago, to the extent of the hatched area. Foods show no change. Metals are among the lowest priced items of all



Steel Beams Are Only 20 Per Cent Higher Than in 1913; But All the Other Items in This Diagram (Left) Are From 42 to 511 Per Cent Higher. Brick, shingles, cotton, sheeting and suitings are now above the prices of a year ago, as shown by cross-hatching. Dotted tops of columns indicate that last year's prices were higher than now relationship of prices of various commodities, the changes which have taken place since then are shown in the diagrams and on the table. That year has formed a standard basis of comparison for a long period of time and gives us a logical relative by which we can compare prices of products differing greatly in characteristics. It is on that basis, therefore, that the present figures and those of a year ago are studied.

---

*Associate editor, THE IRON AGE, New York.

†See THE IRON AGE of Jan. 13, 1927, page 142; July 2, 1925, page 8; Jan. 1, 1925, page 46; June 26, 1924, page 1870, Jan. 3, 1924, page 108, and several earlier dates.

Changes in the Past Year

DURING 1927 there was a reduction in prices of four of our five items in the fuel group and an increase in the other one. There was a reduction in prices of three items of our building material group and an increase in the other two. There was a reduction in prices of two of our textile and clothing group and increases in the other three. There was a reduction in prices of four of our food items and an increase in the other one.

Thus the trend is difficult to define, except by use of the weighted average of the Bureau of Labor Statistics. That average one year ago stood at 148.1, compared with 145.5 now, both being based on 100 as the average of 1913. Thus the decline has averaged a little under 2 per cent. Corresponding with this there has been a reduction of nearly 12 per cent in pig iron, of 10 per cent in steel beams, and of about 5½ per cent in finished steel. Both the pig iron and the finished steel figures represent THE IRON AGE composite prices.

Aside from the labor statistics price indexes, which are in index form only, all other prices in the table are quoted both in money values and in indexes based on 1913 averages. Consequently there is opportunity to relate each item to each other item, as may be desired, in studying the movement of these typical commodities. Twenty-three items are compared, in addition to the ten indexes of the bureau. These items cover several principal groups of products and each in itself is typical within its own group.

Prices quoted are drawn from a variety of sources, including market reports of trade publications and official reports from Washington. Steel beams, finished steel, pig iron and furnace coke are taken from THE IRON AGE weekly quotations. All of the prices have been translated into three diagrams, two of which show the individual items. These indicate not only the relation of present prices to those of 1913, but also their relation to those of one year ago.

These two diagrams are based on the excess of their several prices over those of 1913. A shaded area at the top of a column indicates that today's price is higher than that of a year ago. The excess is measured by the height of the area shaded. Where today's price is lower than a year ago, that fact and its extent are shown by dotted lines, above the solid lines which represent the relation of the present price to that of 1913.

Steel Prices Well Liquidated

IN the third diagram the history of prices of certain groups of commodities, together with steel beams, is traced across a period of several years. Both finished steel and steel beams are considerably lower than the all-commodity group of the bureau. They were higher for a time in 1923 and 1924, but otherwise have been continuously lower and usually considerably lower (except that the finished steel composite was just above the "all-commodities" level at the break of 1926-27). They are still further below the reported prices of building materials and clothing materials.

It follows that the prices of finished steel, and particularly the price of steel beams, have been more nearly liquidated than have the prices of most other commodities. They have been consistently lower than many of the materials covered in the survey, but this has been in large measure at the expense of profits.

Taking up some of the separate items, we find fuels, except for gasoline, ranging from 14 to 239 per cent above 1913. Gasoline is up only 1 per cent. Building materials are higher than pre-war by percentages varying from 26 to 113. Textiles and clothing prices exceed those of 1913 by 45 to 96 per cent. Foods are higher than in 1913 by margins varying from 52 to 511 per cent.

RELATIVE PRICES OF MANY MATERIALS

Item	Prices Quoted Average, 1913	One Year Ago	Recent Figure	Index Number (1913=100) Peak, 1920	Recent Figure
Farm products	100	134.6	....	247	148.4
Food, etc.	100	151.1	....	248	151.0
Cloths and clothing	100	169.9	....	346	184.6
Fuels and lighting	100	190.2	....	281	151.8
Metals and metal products	100	126.5	....	203	123.2

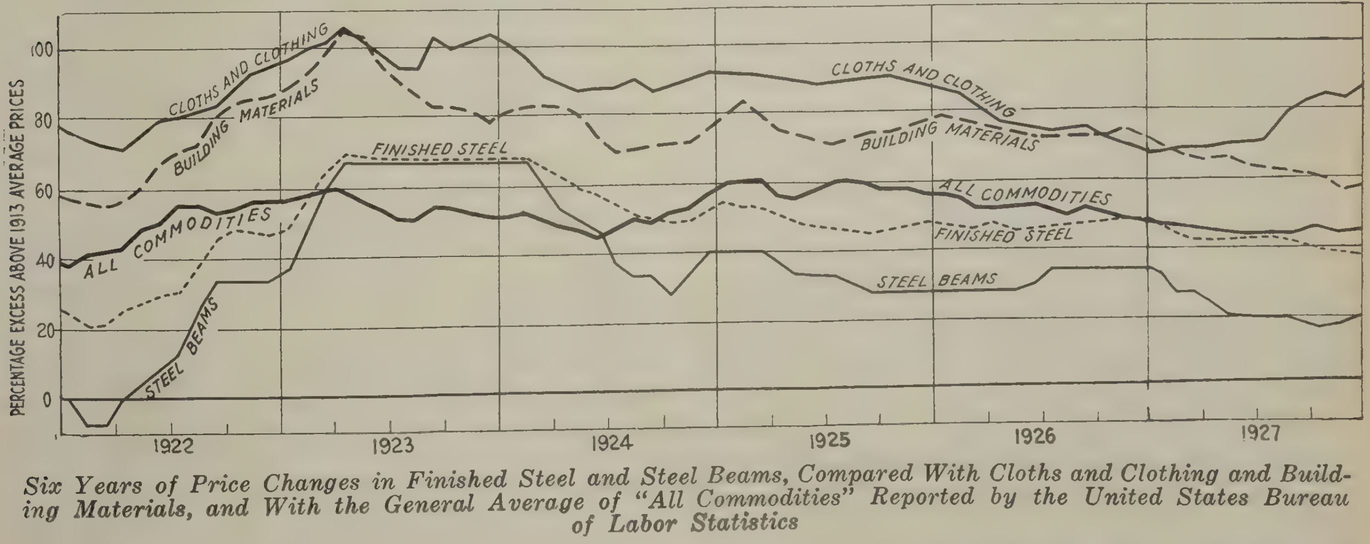
Chemicals and drugs	100	128.5	....	213	126.1
House furnishings	100	159.9	....	275	159.4
Miscellaneous	100	117.7	....	208	116.6
All commodities	100	148.1	....	247	145.5
Finished Steel	1.663c.	2.453c.	2.314c.	239	139
Pig Iron (composite)	$14.70	$19.88	$17.59	325	120
Steel Beams	1.50c.	2.00c.	1.80c.	207	120
Fuels:					
Bituminous coal	$1.34	$2.00	$1.80	746	134
Anthracite	3.82	12.62	12.94	209	339
Furnace coke	2.41	3.50	2.75	735	114
Penna. petroleum	1.79	3.05	2.65	341	148
Gasoline	16.8c.	21.0c.	17.0c.	185	101
Building Materials:					
Yellow pine	$28.50	$55.00	$48.00	237	168
Red brick	6.56	13.86	13.97	333	213
Lime	4.43	8.96	8.85	268	200
Shingles, red cedar	1.97	2.43	2.79	334	142
Plate glass	31.8c.	48.0c.	40.0c.	258	126
Textiles and Clothing:					
Raw cotton	12.84c.	13.05c.	19.45c.	341	152
Sheeting	7.3c.	10.8c.	14.3c.	390	196
Raw silk	$3.65	$5.84	$5.30	445	145
Worsted suitings	1.38	2.59	2.68	392	194
Women's shoes	2.17	4.15	4.00	380	184
Foods:					
Mess pork	$20.93	$36.00	$33.00	225	158
Flour	4.62	7.50	7.00	352	152
Potatoes	61.4c.	2.35	3.75	721	611
Milk	3.5c.	7.9c.	7.87c.	243	225
Sugar	3.46c.	6.4c.	5.8c.	536	168

Little change has occurred in the level of the all-commodities figure in nearly six years. Since April, 1922, it has not once been below 144, nor above 161. During the 68 months its average level has been about 152. The latest available figure, that for November, is about 4 per cent less than the average. At no time



Six Years of Price Changes in Finished Steel and Steel Beams, Compared With Cloths and Clothing and Building Materials, and With the General Average of "All Commodities" Reported by the United States Bureau of Labor Statistics during the six years has the level departed by more than 6 per cent from its average.

Influences Affecting Future Prices

THOSE who look for a gradual subsidence of prices during the next quarter century base their opinions upon historical evidence. Such a course has been followed by prices during the years following every major upheaval of the past century and more. Well informed opinion, however, does not anticipate any steady or uninterrupted downward trend. That the trend will be downward is widely believed, but it is almost certain to be interrupted by minor humps in the curve, caused by various circumstances which are unpredictable.

Many commodities probably never will approach again the price level which obtained in 1913. Some things will reach that level or go below it. As a matter of fact, automobiles are below it today; so is rubber. Gasoline is close to it, and there have been periods since the war when steel beams have touched a figure lower than the average of 1913.

In general, however, the much enhanced labor and taxation costs following the war are expected to prevent a reduction in the prices of many commodities below levels considerably above those which formerly obtained. There is little expectation of a deflation or liquidation of labor prices. Much has been done in reducing labor costs per unit of product, but labor cost per hour of effort is likely to remain pretty close to its present level.

Costs per unit have gone down through a variety of influences. New methods of manufacturing have had their effect. New methods of management have been almost equally important. Methods of handling materials, improvement in design, improvement in characteristics of materials used, and in tools, all have been responsible for certain shares in the result. There is a definite point, however, beyond which savings of this character cannot proceed. In some respects and in some industries this point seems to be approached now. Standardization of product in other industries, however, may achieve great savings before many years have gone by.

In general, while prices of some commodities may show a slight tendency downward during the next few months, it is believed that there will be sufficient upward movement to offset, either wholly or in large part, the downward tendency of the other items. Steel prices in particular are believed to be lower with regard to other prices, and with regard to costs of production, than they should be. Whether this situation receives correction during the coming year remains to be seen. That is should be corrected, however, is easily discernible from earnings statements of companies.

Superhardening of Heat-Treated Steel

By Subjecting Them to Impact of a Cloud of Balls, Thus Producing a Work-Hardened Surface—Any Soft Spots Revealed by a Roughened Area

BY EDWARD G. HERBERT*

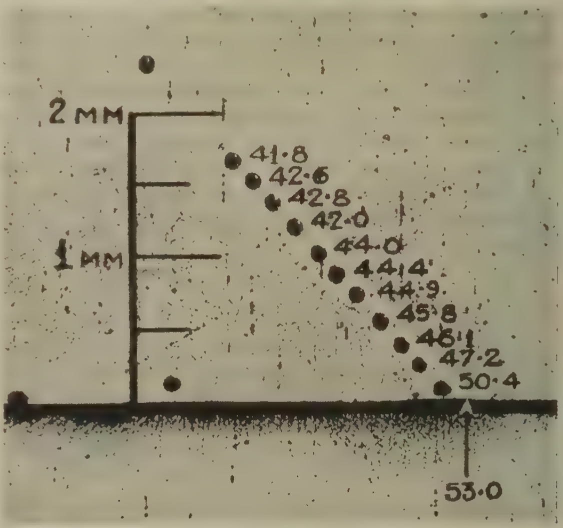
WHEN studying the work-hardened surfaces of railroad rails and locomotive tires, the author attempted to induce similar hardness under the ball of the pendulum hardness tester in the following manner: After the first test, the pendulum is tilted to the right, then to the left, then back to the vertical position, and a second hardness test is made on the same spot. Successive tests showed progressive increases in hardness up to a certain maximum, and thereafter a slow softening. A summary of results† on various articles follows:

	Original Hardness		Maximum Hardness Induced by Testing		Hardness of Surface of Worn Article	
	Herbert	Brinell	Herbert	Brinell	Herbert	Brinell
Locomotive tire	26.4	264	32.0	320	34.2	342
Rail	25.2	252	35.5	355	33.1	331
Clash gear (oil hardened) .	36.3	490	57.1	771	58.5	790
Worm gear (case hardened) ...	49.4	667	82.2	1110	49.4	667
Cam (case hardened)	60.2	815	85.2	1150	86.0	1160

†Presented in a paper before the September, 1927, meeting of the (British) Iron and Steel Institute, entitled "The Work-Hardening of Steel by Abrasion."

These figures (together with microscopic studies) indicate that a metal surface, even if hardened by heat treatment, may be superhardened by work if the conditions of abrasion are so severe as to cause some plastic flow of metal below the abraded surface. (Note that the worm gear did not have a surface hardened by use, since it was subjected to no impact when in operation.) Such plastic flow can occur in very hard steel. Consequently it was thought probable that articles of hard steel could be superhardened beforehand as a means of resisting wear, and the result of the inquiry was the invention of the "cloudburst." Its significance may be explained thus:

Physicists tell us that we are immersed in an atmosphere consisting of molecules flying about with high velocity and constantly colliding with each other and with us. I will ask you to imagine an atmosphere whose molecules consist of small, hard, steel balls, flying about with high velocity and colliding with each other and with any object immersed in it. An article placed in such an atmosphere will be subjected to a rapid succession of blows, and if a certain relationship exists between its hardness and the atmospheric pressure—that is, the momentum of the balls—its surface will be compressed uniformly without being sensibly indented.



Diamond Time Hardness Numbers Showing Surface Hardening by Cloudburst on Heat-Treated Nickel-Chrome Steel

The article, if of hard steel, will thus become incased in a thin superhardened layer. If the velocity of the balls be now slightly increased, the hardened layer will still resist indentation, and will be further increased in hardness and in thickness. By gradually increasing the velocity of the balls, a superhardened layer can be produced, intensely hard on the surface and gradually decreasing in hardness throughout its thickness, which may be about 2 mm. As there is no abrupt change of hardness there is no tendency for the layer to flake or scale off in service, a type of failure common in case-hardened articles. The actual hardness that can be thus produced depends upon the superhardening capacity of the steel, which is easily measured with the pendulum hardness tester, and the ball velocity required to produce this hardness can be determined by experience.

---

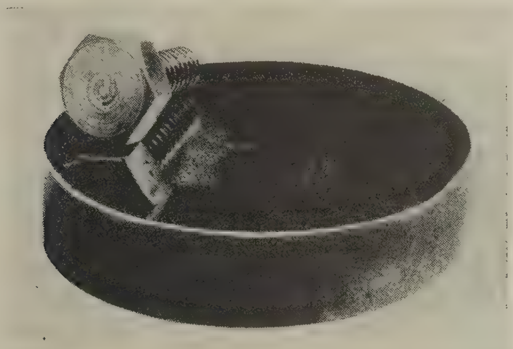
*Edward G. Herbert, Ltd., Levenshulme, Manchester, England.

Method of Superhardening by Impact

For producing the steel ball atmosphere two methods have been employed. In one, the balls are caused to fall into the chamber from a height which can be varied. Continuous circulation of balls is maintained by means of an elevator and conveyor.

In the other method, the balls roll down a slight incline and are thrown in an upward direction by the vanes of a rotor whose speed can be varied, and with it the speed of the flying balls. After entering a rubber-lined chamber in which the work is placed, the spent balls again roll down the incline, thus maintaining a continuous circulation.

Just as there is a relationship between the original hardness of the steel and the initial ball velocity which compresses the surface without indenting it, so there is a relationship between the "maximum induced hardness" of the steel, as measured with the Herbert pendulum, and the final ball velocity which is sufficient to produce maximum hardness, but is insufficient to indent the superhardened surface. Any further increase of velocity would merely roughen the surface without increasing its hardness, and the whole superhardening process must therefore take place between these two limiting velocities.



Polished Mild Steel Disk Case-Hardened (Except for H on Top) and Superhardened. Process leaves mirror surface unharmed, but pits softer areas

The process can, of course, be applied to produce a work-hardened layer on any metal, by adjusting the initial and final ball velocities to its original hardness and its "maximum induced hardness." The fact that articles of very hard steel can be superhardened by working was discovered independently by Hultgren, who turned it to practical account in the superhardening of steel balls.

Quantitative measure of the hardness and depth of superhardening is given in the figure, which is a micrograph (magnified 20 diameters) of a section cut perpendicularly to the superhardened surface of a heat-treated nickel-chrome steel. Eleven pendulum test impressions are shown in a depth of 1.7 mm., and an average surface hardness of 53 is found. (Diamond time hardness 53 equals 715 Brinell.) The original surface hardness was 38.8, equivalent to 525 Brinell.

A Method of Quantity Testing for Hardness

The atmosphere of steel balls was invented and investigated as a means of superhardening. The investigation has revealed another effect of equal importance.

The initial ball velocity is so adjusted to the hardness of the work that it is just insufficient to indent the surface.* It follows that if any part of the work is soft, its surface will be indented and roughened.

If, for example, a quantity of hardened steel articles are placed in a ball atmosphere of correct pressure, it will be found on removing them that any soft articles or any soft spots can be easily distinguished by their indented appearance.

We have here a new process, which may be called "cloudburst hardness testing," whereby large quantities of hardened articles can be tested for hardness, all at once, and all over, and without marking them, except on the soft spots. The existing cloudburst testing machine makes 200,000 hardness tests per minute. But this is only a small machine, and the number of tests can be increased indefinitely.

Where quantities are sufficient to warrant it, the work can be carried through the testing chamber on a conveyor, and when it emerges the soft pieces can be picked out like rotten cherries from a tray of ripe fruit.

As an instance of the way soft spots may be revealed (as well as the unharmed surface remaining after cloudburst superhardening) a photograph is reproduced of a piece of mild steel, case hardened, polished and superhardened. The letter H had been painted without protective compound before carburizing and was decidedly softer than the surrounding surface. The cloudburst roughened the softer surface and rendered it easily visible. The reflection of the steel screw shows the mirrorlike superhardened surface.

Reducing Tube Mill for Seamless Steel Tubing

A new reducing mill for the manufacture of seamless steel tubing, which has several unique features, has been brought out by the Wellman-Seaver-Morgan Co., Cleveland. In following established methods in the manufacture of tubing it is said to be rather difficult and expensive to make the smaller sizes, i.e., sizes smaller than 2½ in. outside diameter. In the ordinary methods of manufacturing this tubing it is the common practice to pierce and roll the blanks at approximately 3 in. outside diameter, and then to reduce the diameter in a continuous duo roll mill. In this mill each successive roll stand has its axis at 90 deg. to the preceding stand, to eliminate the rib formed at the meeting of the rolls, and also to reverse the pressure on the tube.

The newly designed mill has three rolls in the same plane in each housing. Each roll incloses 120 deg. of the circumference of the tube. The gears are mounted on roller bearings which, together with the gearing, are completely inclosed and run in oil.

The roll stands are all practically alike except that the roll assembly is shifted 180 deg. in each succeeding stand. The drive shaft always comes out in a horizontal line on the same side of the mill, and these shafts are driven through speed reducers by variable-speed motors, each stand having its individual motor. This, it is stated, permits exact regulation of speed and the handling of various gages and materials at the correct speeds. It is claimed that higher reductions per pass and higher quality of product are obtained, and that the maintenance cost is reduced. Application has been made for patents covering various features of the mill.

The Wellman company recently has been broadening its line of tube-making machinery. It has designed machinery for the production of hot-rolled seamless tubes up to 16 in. in diameter and as small as 1 in. in diameter, both by the Pilger method and the American or automatic rolling method. It is stated that the latest and most modern practice of both European and American mills has been embodied in these machines.

The first regional meeting of manufacturers and distributers of power transmission equipment, supplies and accessories will be held at 6.30 p. m., Feb. 3, at the Poor Richard Club, 1319 Locust Street, Philadelphia.

Low-Cost Pig Iron Means Highest Output per Furnace

From Larger Hearths, Better Selected Raw Material, and with More Efficient Utilization of Existing Auxiliaries and By-Products

BY W. A. HAVEN*

BLAST FURNACE men during 1927 as for several years past have concentrated on the difficult problem of keeping down costs during a period of reduced output. All items of equipment have been studied in an effort to replace labor with machinery, to eliminate delays and prevent accidents. Electrically operated devices for automatically gaging the furnace, dumping the bells and controlling the blast temperature have made their appearance. Stopping the tap hole at ten pounds blast pressure is being done regularly with steam guns of multiple cylinders. The indestructible tuyere has not yet been found, but the ultimate of continuous operation, 24 hours daily without reducing blast pressure, seems not far ahead.

Old Stacks Reconstructed with Larger Hearths

Economies have resulted from improving the quality of the raw materials, especially coke, from profitable disposition of the gas and slag by-products, and particularly from an increase in the size of the old stacks. Making more pig iron per furnace has always been a favorite procedure with American furnacemen, but harder blowing must now be strictly consistent with economy in ore and fuel. Much larger furnaces have resulted.

Recent enlargement has been chiefly by increasing the hearth diameter and straightening up the bosh. The name "large hearth" has always followed the furnaces with the largest size hearth, but the term has now come to signify furnaces having not less than 20 ft. hearth diameter. Furnaces of this size were built at South Chicago about ten years ago but their peculiar fitness for the economic production of large tonnages was not fully appreciated at that time. In 1925 and 1926 a number of furnaces were blown in having hearth diameters of from 20 ft. to 21 ft. 6 in.

In 1927 the large hearth furnaces established entirely new standards for productive capacity. Under the same conditions which got 500 tons per day from a 16-ft. furnace, or 600 tons from an 18-ft. furnace, the 21-ft. 6-in. furnaces have consistently made more than 750 tons per day; doing so with equally good furnace practice. A tendency to higher dust losses may be accounted for by the failure of stack and top dimensions to keep pace. Large hearth furnaces take a high blast temperature without difficulty and their coke rates have been as good if not better than smaller units. Blast pressures have been higher in some, but in others just as low as on the smaller furnaces. Tendencies to hang and slip have been if anything somewhat less, operating conditions generally less troublesome, and working conditions around the bosh improved.

Largest Hearth Now 24 Ft. 6 In.

Furnacemen were and still are somewhat amazed by the announcement that one company had blown in a furnace during 1927 having a hearth diameter of 24 ft. 6 in. This was done by a typical though extreme case of fitting a very large hearth to a moderate sized stack. The columns were moved out, and big jackets and mantel installed. One or more rings of new and heavier platework, sloping outward at the bottom, connect up the old shell to its new support. The top of the shell and superstructure are oftentimes undisturbed in such reconstructions.

The old and satisfactory relationship between hearth and top diameter cannot be preserved when rebuilding in this manner. One fundamental condition for proper stock distribution of fine northern ores must be preserved, namely: 2-ft. clearance between bell and furnace wall. With the large furnace in question the limitation seems to have been a 12-ft. 6-in. bell, which resulted in a top diameter of only 17 ft. A very disproportionate stack volume results, but nevertheless some record tonnages have been obtained.

With a fair quality of raw materials, a 24-ft. 6-in. furnace should easily do 850 tons per day. Since it is ordinarily feasible to increase the "normal" tonnage of any stack at least 20 per cent by physical and chemical betterment of ore and coke, it is safe to predict that this will be the forerunner if not itself the first American furnace to produce 1000 tons daily. It is no great step from a reconstructed unit of large hearth to one having other dimensions in the successful proportions found in smaller stacks. The lines of such a furnace might be somewhat as shown on the sketch.

Sintered Ore Will Increase Tonnage

It appears, however, that the distinction of operating the first 1000-ton furnace will not be for American furnacemen. The Germans are said to have furnaces making even more. It is of particular interest that it has been accomplished not by making the furnaces larger, although this is also being done, but chiefly by improving the quality of the raw materials, particularly ore. In certain cases a large portion of the ore mixture is sintered. In this way fines are almost eliminated, and a raw material exceptionally high in iron (about 68 per cent) is obtained. Large American furnaces, if supplied with rich sintered ores, would produce far more than anything yet achieved here or abroad.

Growing appreciation of these benefits may be considered a feature of the past year. Burdening northern New York furnaces with 100 per cent sintered magnetite has been accompanied with such economies in fuel and increased output, as to justify that district in the unusual procedure of sintering all the ore. These ores in their natural occurrence are extremely hard to reduce, even after crushing to a very objectionable degree of fineness, yet sintering makes a material so satisfactory for blast furnace use that sintered magnetite of a certain grade is now marketable as far west as Ohio.

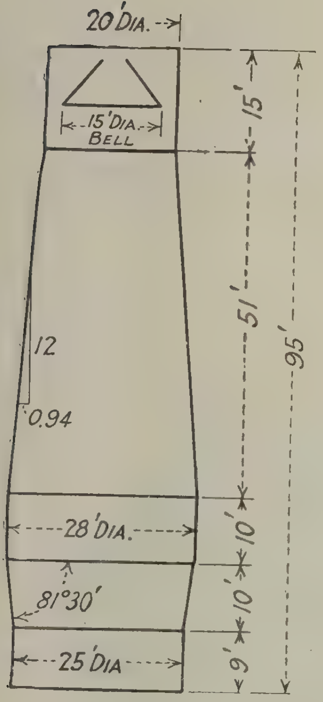
Progress with Flue Dust Problem

In 1927 several plants have been added to the list of those equipped for sintering flue dust. It is gratifying that the many problems in handling this obnoxious material are steadily being solved. Its extreme dryness and fineness has been at the start of this trouble; an excellent procedure is watering the material in a dust-tight conveyor-mixer as it passes from dust catcher to car. By this means, dumping the dust catcher is practically dustless and in subsequent handling the dust is but little more troublesome than fine ore. Proper cooling and moistening before reaching the sintering plant helps in the final hydrating before the dust reaches the sintering pan.

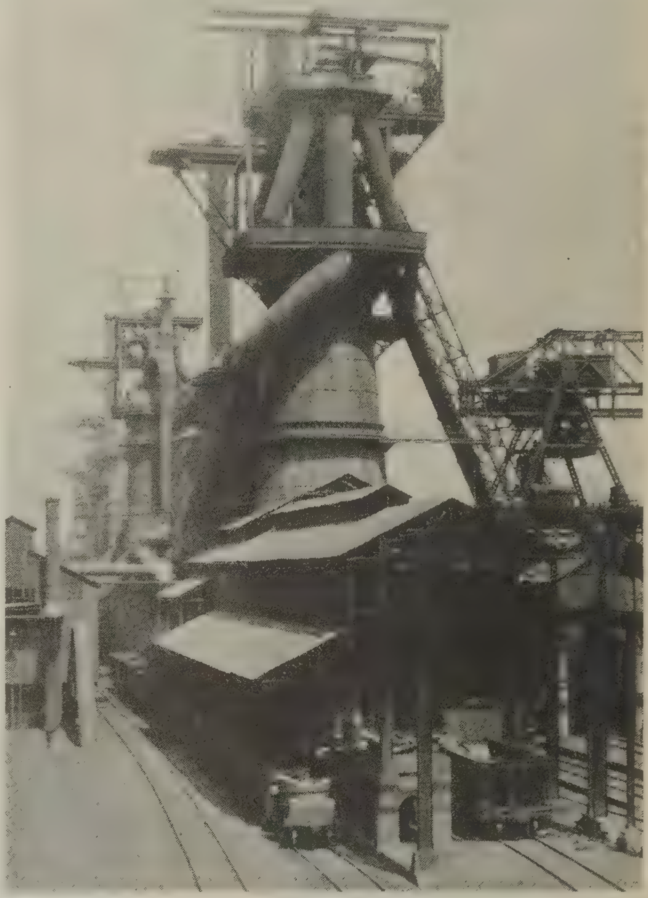
---

*Superintendent of Northern Furnaces, Republic Iron & Steel Co., Youngstown, Ohio.

Excessive amounts of carbon in the dust is another drawback. Good results have recently been obtained with as little as 4½ per cent, whereas something more than 6 per cent was formerly considered essential. As high carbon dust is generally due to dirty or soft coke, the betterment of blast furnace fuel will also help solve the peculiar problems of flue dust.



At Left is a Sketch Showing Proposed Lines for a Blast Furnace to Have an Average Capacity of 1000 Tons per Day



The View at the Right Shows an American Blast Furnace After Remodeling from 16 ft. Hearth Diameter to 21 ft. 6 in. By this means capacity was increased from 500 to 750 tons per day

Improved Stove and Burner Performances

Large hearth furnaces have influenced the design and construction of such equipment as stock houses, stoves, blowing engines, cast house devices, ladles and gas burners. More than one plant has found the auxiliary equipment inadequate for the increased demands of stacks rebuilt to produce fifty per cent greater tonnage.

In stove design the problem has been to heat from 50,000 to 70,000 cu. ft. per min. of wind to 1300 deg. Fahr. or higher. Nothing less than 300,000 sq. ft. of heating surface will suffice, which means at least four stoves unless very small checkers are used. As the tendency, without justification perhaps, is away from the 3½-in. checkers to a medium size of 4 or 5 in., a return to four stoves is the usual procedure.

Pressure burners have helped meet the increased load upon the blast heating equipment. Two or three times the amount of gas formerly used may now be passed through each stove. By this means three stoves meet the requirements of some very large furnaces; other plants have secured much higher blast temperatures than with burners of the old aspirating type. But overloading the stoves to the point of increasing stack temperatures is not economical, so ample checker work is no less desirable than before.

Continued efforts are being made to provide cleaner gas for heating stoves and boilers, to recover waste heat and to increase gas burning efficiency. A marked advance has been a successful apparatus to transfer heat from the stack gases into the cold wet gas from the washers. By this means heat lost in washing is partly replaced and the sludge nuisance is eliminated, as entrained moisture is converted into water vapor. Several installations of this type are in operation.

Boiler house equipment had had some of the attention it has so long deserved. Most boilers fired with furnace gas today have less than 60 per cent efficiency, and a maximum of about 115 per cent rated capacity, whereas with modern improvements these units may be driven to more than 150 per cent of rating and their efficiency brought above 70 per cent. In this way increased gas from big furnaces may be utilized without installing additional boilers.

It is a matter of regret that a by-product of such proved utility as slag should fail to net a profit to the industry, but at least the cost of slag disposal is being substantially reduced. Nearly all plants are now equipped to prepare slag for some commercial purpose, usually in the hard form for road building, concrete construction or railroad ballast. Efforts are being made to produce slag of a grade that will be a preferred material in these lines of work.

Total Practical Capacity Highest in History

In blast furnace construction the policy of conservatism has been observed. Several old plants have been scrapped and few new ones built. Such has been the success, however, of the larger furnaces, better raw materials and improved types of auxiliary equipment, that the country's potential capacity for producing pig iron remains greater than ever before.

New Automatic Chucking Machine

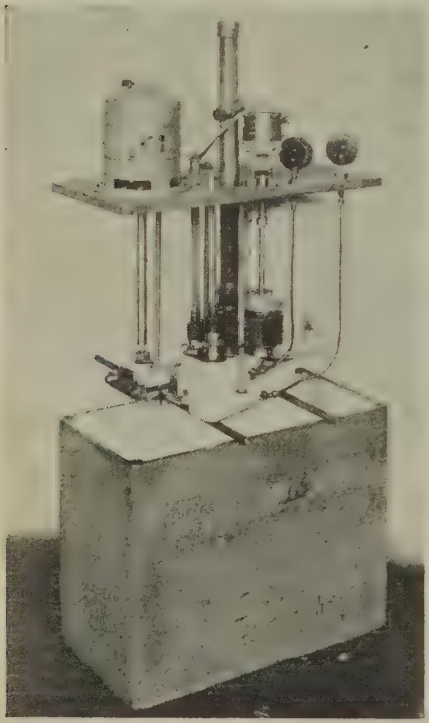
Feed of Tools is by Means of Two Tool-Carrying Bars Having Longitudinal and Semi-Rotative Movement —Hydraulic Chucking Employed

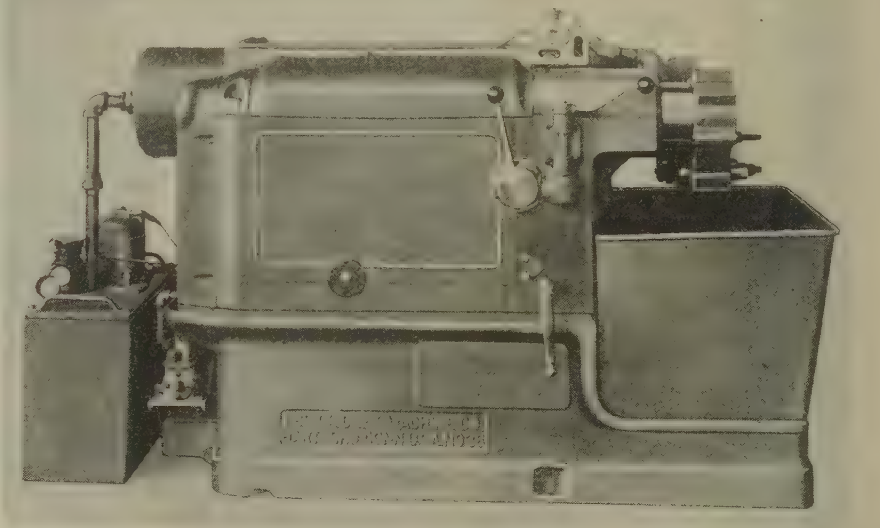
SIMPLICITY of tool set-up is a feature of a new chucking machine which has been brought out by the Gridley Machine Co., Hartford, Conn. The machine is of single-spindle work-revolving type and is designed for boring, turning, facing and forming operations on forgings such as the races of anti-friction bearings, etc. The swing is for chucks up to 10 in. in diameter and work up to 8 in. in diameter.

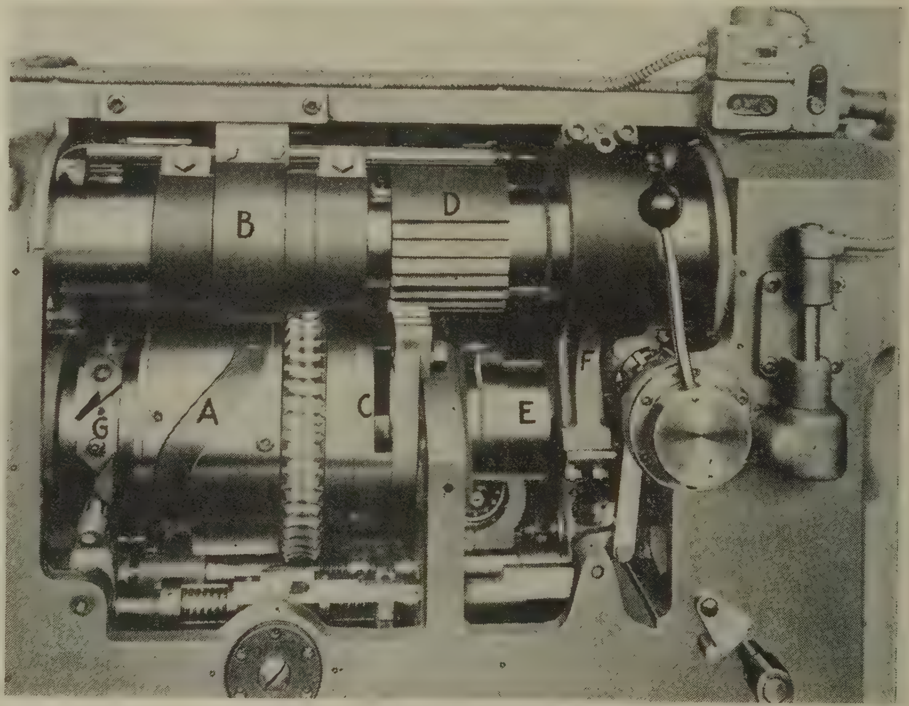
The general arrangement of the machine may be noted from the several views reproduced herewith. In this design two tool-carrying arms are mounted on the ends of tool slides or sliding bars of large diameter, one bar on each side and parallel with the work-holding spindle and chuck. No other moving parts are exposed during machining operations, the other mechanisms being inclosed within the cabinet of the machine. At the left-hand end of the machine is the hydraulic unit that actuates the work-holding chuck, and at the right-hand end, beneath the tool-carrying arms, is the chip box. The latter rests on rollers located in the front extension of the base, which rollers facilitate pulling of the chip box on to the platform of a truck, when the box is to be emptied. Observable also from the illustration of the operating-side of the machine is the central grouping of all controls.

The sliding bars or tool-operating slides are carried in split adjustable bearings at the front and the rear of the cabinet. They have independent semi-rotative and longitudinal movement, and each slide is independent of the other, being actuated by cams mounted on separate camshafts. The arrangement of the tool-operating mechanism may be seen from the close-up view herewith, which shows the mechanism as observed from the operating side of the machine when the covers have been removed. All rotating members are mounted on ball bearings and all moving parts are flood-lubricated.

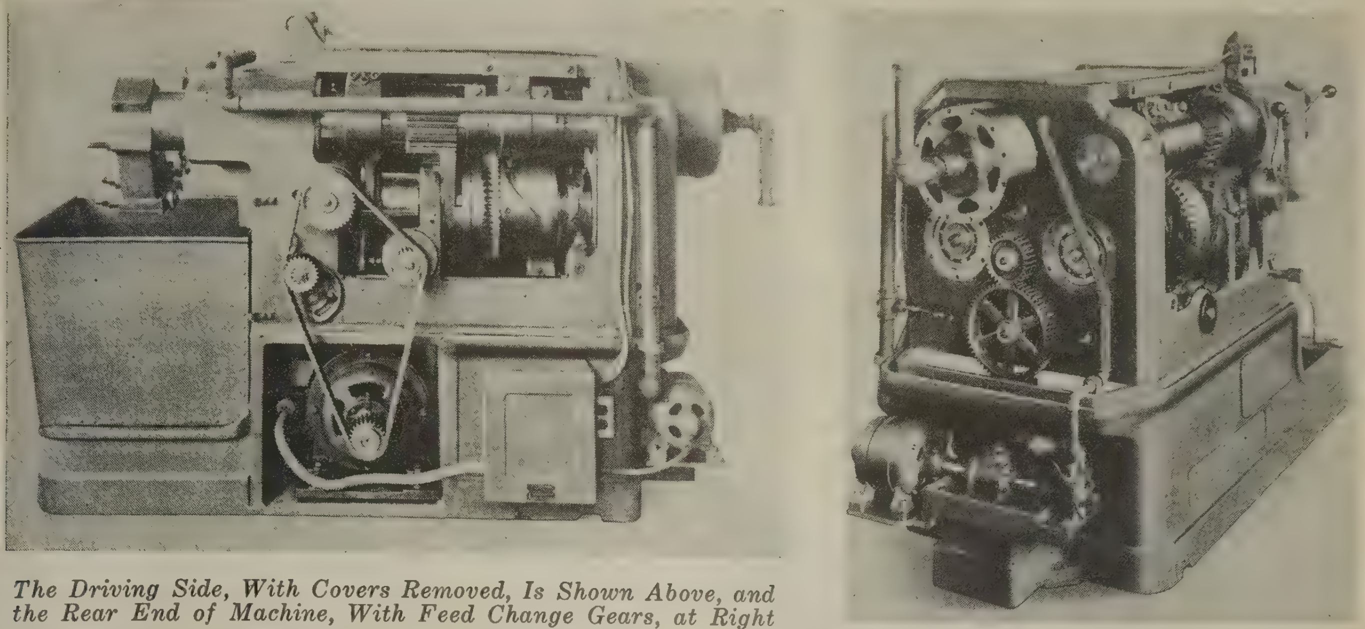
Longitudinal movement of the tool slides, parallel to the center line of the work, is by means of cam *A* and part *B*, which surrounds the tool slides, but does







THE Operating Side of the Chucking Machine, With Covers in Place, Is Shown at the Upper Right. The close-up view shows the arrangement of cams, etc., on the operating side of the machine. The components of the hydrau chucking unit may be noted from the open view above



The Driving Side, With Covers Removed, Is Shown Above, and the Rear End of Machine, With Feed Change Gears, at Right

not grip it. This has lengthwise movement along a fixed guide and is confined between two collars. By this arrangement longitudinal movement may be transmitted to the bar without restriction of the semi-rotative movement.

The semi-rotative movements of the tool slide and tool-carrying arms attached to them, by which the cutting tools are swung to and from the work, are produced by the segment gear and pinion *D* (actuated by cam *C*) and cam *E*.

The cutting tools are positioned before they start to cut by means of the segmental pinion, the gear sector and the face cam. The wide-faced pinion *D*, with teeth cut on part of its periphery, is keyed to the tool slide and is in constant mesh with the gear sector below it. This gear sector derives a periodic swinging movement from the face cam *C*.

Cam *E* imparts semi-rotative movement to the tool slide during the cutting operation, except in the case of straight turning. It is splined to the camshaft and is mounted on the end of the shaft so that the cam may be conveniently removed and replaced by others of different shape. While the tools are cutting the hardened steel bearing piece of the lower end of the arm of part *F* rests upon the periphery of cam *E*. This part, *F*, is attached to the tool slide and moves with it.

Movement of the tools on the opposite tool slide is controlled by the camshaft on the other or driving side of the machine. It is the same as that shown in the close-up view except in the shape of the cams. The cam corresponding to cam *G* serves to stop and start the work spindle and to control the supply of coolant.

The drive arrangement may be noted from the accompanying view of the driving side with covers removed. From the motor in the base, the drive is by silent chain to the upper sprocket which is on the end of the wormshaft. The latter drives the work spindle, and through the spindle and change gears, drives the camshafts when the latter are in slow motion. Upper sprockets of different diameters provide for changes of spindle speeds, compensation for variations in length of driving chain being made by adjusting the sprocket at the left. Fast motion of the camshafts is obtained by the small sprocket at the right and clutches that are actuated by cam *G*. The latter serves to change the motion from fast to slow and vice versa, as required. The ratio of the change gears, a set of which is regularly furnished, determines the rate of the slow rotation of the camshafts, which is equivalent to the rate of feed of the cutting tools. The fast motion of the camshaft returns and repositions the tools.

Before the start of the cycle of operations the positions of the cams and other parts are as shown in the close-up illustration. When the starting lever of the machine is moved, cam *C* actuates the gear sector, which rotates the bar and moves the arm *F* so that the bearing piece of the latter is in line with the periphery of cam *E*. This movement swings the tool-carrying arm and brings the cutting tool toward the work.

The whole slide is then moved toward the left by cam *A*, which advances the tool to the cutting position. The gear sector is released by cam *C*, and the bearing piece of arm *F* is allowed to rest on the periphery of cam *E* for the remainder of the cycle. The motion of the camshaft is then changed from fast to slow by means of cam *G*.

For parallel boring or turning, a cylinder is used for cam *E*, which produces no further tangential advance of the cutting tool during its traverse to the left. If the cut is taper, cam *E* will have a constant rise, and if it is to be irregular the cam will be made accordingly. If the cut is entirely one of forming, the slide will be advanced to its extreme left position by cam *A*, and held stationary while the tool is advanced tangentially to the work by the rise of cam *E*.

Coolant is pumped to the tools and lubricating oil forced to the horizontal pipe on top of the cabinet by means of two pumps which are mounted on the rotor shaft of the motor located at the end of the base of the machine. The horizontal pipe for lubricating oil is perforated and serves to spray oil continuously over the mechanism within the cabinet. The reservoir for the coolant surrounds the motor and extends into the base under the chip box. The lubricating oil reservoir is also inclosed in the cabinet.

The floor space occupied by the machine is 33 x 78 in., and the weight is approximately 6800 lb.

Hydraulic Chucking Employed

The hydraulic unit for actuating the work-holding chuck is of the company's design. It is designated as the model HU 200, and has been placed on the market recently for use on screw machines, automatic lathes and other equipment on which air-operated chucks or fixtures have been employed. The unit is self-contained and is designed to stand on the floor and connect with the machine by a single pipe, which conveys the oil. A motor lead to the source of power and the mounting of a switch at the operating position completes the installation of these units. By means of the switch the operator may open or close the chuck or fixture in a fraction of a second and can vary the constant pressure maintained to suit the holding power required for the particular work.

The unit, an open view of which is shown in a separate illustration, includes a small rotary pump which is directly driven by a ¼-hp. motor and serves to maintain constant pressure on the chuck cylinder. This pressure may be adjusted quickly up to 150 lb. per sq. in. While the work is being held in the chuck, the pump, by means of a piston by-pass valve, builds up in an accumulator, the energy to actuate the cylinder piston at high-speed when new work is placed in the chuck. The time of opening or closing the chuck is less than ½ sec.

Actuation of the chuck at will is by means of a heavy-duty tumbler or momentary contact switch controlling a solenoid piston valve. The piston valve, pump, piston by-pass valve, accumulator relief valve, accumulator and manifold are suspended from the cover plate of the tank and submerged in the lubricating oil that fills the tank. The gages on the cover plate of the tank indicate the cylinder and accumulator pressures. Any leaks that might occur in the cylinder packing are returned to the unit through a small flexible tube.

NEW ROLL GRINDER

Forced Feed Table Lubrication Among Features of 24-In. Swing Machine

FORCED feed table lubrication has been provided on the 24-in. swing self-contained plain roll grinder illustrated, which has been added to the line of Cincinnati Grinders, Inc., Cincinnati.

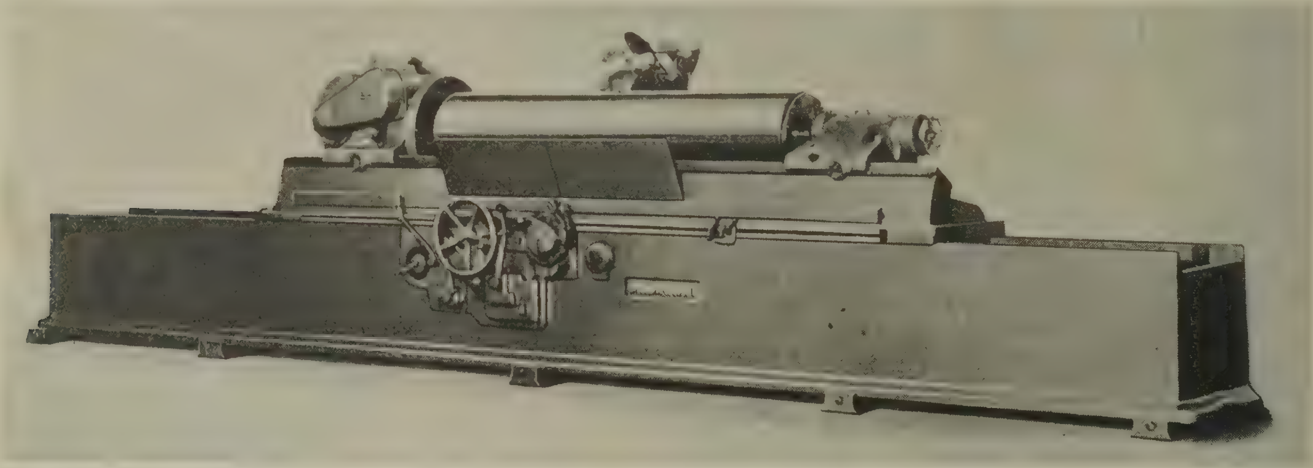
The machine is available in 13 different lengths from 48 to 336 in., each larger size being 24 in. longer than the preceding. In method of control, the new machine resembles the company's 12- and 16-in. plain grinders. The weight of the grinder illustrated is 30,000 lb. net. The distance between the center of the V-guide and the center of the flat bearing of the table is 20½ in.

The system of oiling the table guides is unusual. Instead of oil-distributing pockets with rollers in the bed, the V and flat table ways are flooded with filtered oil from a pump which is geared directly to the drive shaft. The oil is pumped from a central tank to the table guides at about 4 lb. pressure and distributed through oil grooves cut on the under side of the sliding table. These grooves extend the length of each table bearing and are open at the ends. In this way the oil pressure is constant throughout the length of the table, and regardless of how short the traverse the ways are always flooded with clean oil. In draining back to the central tank, the oil passes through a settling chamber on each end of the bed, and a Purolator which removes the grit and dirt. This system of table lubrication is incorporated under lease from the Gray Planer Co., Cincinnati. Lubrication of other parts of the machine is centralized at a few points, and requires infrequent attention.

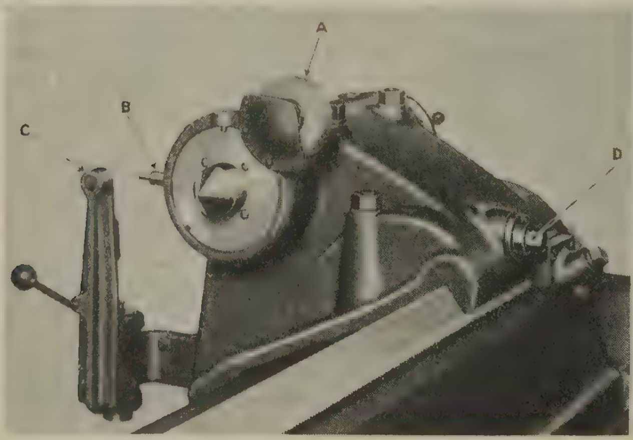
Standard machines are built with single tables, but machines up to 144 in. between centers have been designed with two tables, one an upper work table or swivel table and the other, the lower, a sliding table. The swivel table is designed with the large bearing areas to provide maximum stability, and tapers 12 ft. in length may be ground. On single-table machines a set-over construction in the footstock takes care of any misalinement between centers. Short tapers may be ground if the cutting face of the grinding wheel is dressed to the desired degree and then brought straight into the work. The table is traversed by means of steel gearing with a safety friction clutch, which comes into operation if the machine is jammed. This clutch also functions at each reversal of the table.

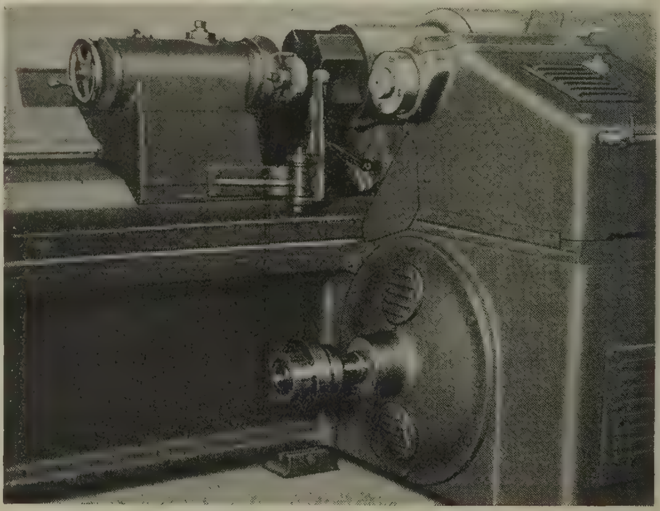
The wheel head is of heavy design, and is mounted on large V and flat bearings. A 30-hp. motor mounted on the outside of the machine is coupled to the main drive shaft by a flexible coupling. The spindle is driven from the main shaft with a multiple-strand Texrope drive which runs over idlers in order to permit of adjusting the wheel slide. Inspection of the moving parts of the drive is facilitated by openings in both the wheel head and bed.

The weight of the wheel head plus the downward pull of the Texropes is said to hold the slide on the ways even under the heaviest cuts. The wheel slide guide is a generously proportioned V bearing and the infeed



Roll Grinder With Cast Iron Sleeve in Grinding Position. On the footstock, below, A is the wheel truing fixture; B the diamond holder; C the radius truing fixture; and D the set-over screw. The flexible motor coupling is shown at lower right





screw is mounted directly on the center of the V. The wheel head is balanced with a large counterweight to assure smooth infeeding and accurate sizing.

The grinding wheel spindle is mounted in half bearings of bronze, the upper halves acting as safety caps on the spindle. The spindle is lubricated automatically by oil which is lifted out of a reservoir in the wheel slide and carried into distributing pockets in the spindle cap by means of centrifugal slingers on the spindle. The spindle is made from a chrome-nickel steel forging, heat treated, and ground to a high finish; it is designed to carry a wheel 12 in. wide if necessary. End thrust is taken up by a double-thrust ball bearing which may be adjusted while the spindle is running. It is claimed that this type of spindle mounting is free from chatter.

Table traverse speeds, 12 in number, are obtained through hardened steel sliding gears mounted on hardened shafts with integral multiple splines. The gear box is mounted on the back of the bed of the machine, and speeds are controlled by a single lever from the left front of the machine.

The grouping of all controls within easy reach of the operator, making it unnecessary for him to move from a central position, is a feature emphasized. A mirror attachment is provided to enable the operator to see the point of contact between the wheel and the work without bending over the machine. The headstock is controlled by a rheostat, located on the right front of the machine, which in turn operates through a dynamic braking panel.

Power is transmitted to the faceplate through Texrope drive, worm and large worm wheel. A 3-hp. 230-volt d.c. motor is employed and the speed of the faceplate ranges from 11 to 96 r.p.m. The work headstock is of dead center type and is held in place on the table by three clamping bolts, while the footstock has two. Where direct current is not available, a 3½-kw. 230-volt d.c. generator with rheostat is built into the machine.

In addition to the set-over screw construction provided to facilitate parallel grinding on the single table machines, the footstock is said to be unique in that it is equipped with two types of wheel truing devices. A roll type truing fixture can be mounted on the large diameter behind the work center, or a diamond can be used as wanted. The radius truing fixture bolted to the footstock shown in the close-up illustration of the footstock rounds the edge of the grinding wheel for grinding fillets on rolls. Both head and footstock are adjustable on the table by hand-operated rack and pinion. The tailstock spindle, operated by a handwheel, has a full length adjustable bearing to compensate for wear.

A power driven center grinder, driven from the headstock, for regrinding work centers is standard equipment. The coolant pump is of centrifugal type and is arranged so that its bearings do not come in contact with the water. The coolant nozzle is carried on the front of the wheel guard. Adequate water guards and wedge blocks for alining the grinder on its foundation are regularly furnished.

Steels for Ammonia Synthesis

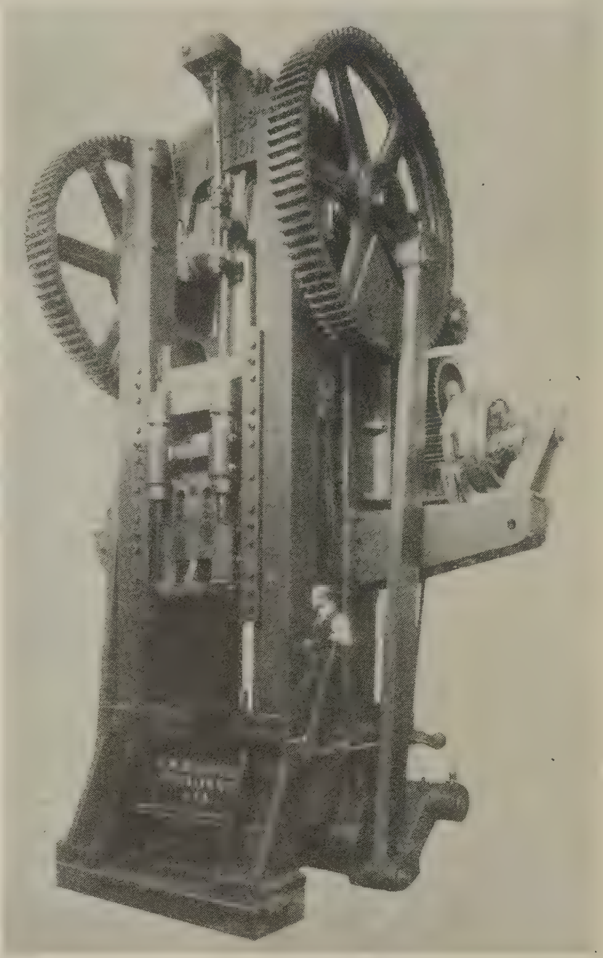
Technologic Paper No. 361 of the Bureau of Standards covers in considerable detail the material presented to THE IRON AGE readers Dec. 1, 1927, page 1518. J. G. Thompson, the author of the article noted, together with J. S. Vanick and W. W. Sveshnikoff, wrote the Bureau's publication, entitled "Deterioration of Steels in the Synthesis of Ammonia."

The Struthers-Wells Co., Warren, Pa., is now manufacturing standardized types of heat exchangers for oil refineries, chemical and process work, power, by-product and coke plants, etc. These standard heat exchangers are claimed to have high fluid and vapor velocity, well developed turbulence, removal tube bundle, a high practical heat transfer rate and full allowance for expansion and contraction. A new bulletin describing these is available on request.

Large Double-Action Press for Cutting and Drawing Heavy Metal

A special single-crank double-action power press, which, weighing approximately 400,000 lb., is the largest machine of this type ever built by the E. W. Bliss Co., Brooklyn, N. Y., is shown in the accompanying illustration. The diameter of the crankshaft is 18 in. at the bearings and 21 in. at the pins. The machine is designed to draw and lift out work up to a depth of 11 in., and is adapted for the cutting and drawing of heavy metal. It has a capacity of 1000 tons, divided as follows: 500 tons on the blank-holder and 500 tons on the plunger.

The press is of tie rod construction, the entire working strain being taken by the four large steel tie rods which tie the crown, bed and uprights together. The arrangement is such that if desired the inner and outer slides can be locked together and the press used as a single-action press for work requiring a pressure of 1000 tons. This change is made by driving two pins through the blankholder and plunger slides and removing two keys in the connecting rods, actuating the blankholder slide, which rods are made in two pieces for this purpose.



The Crankshaft Is 18 In. in Diameter at the Bearings and 21 In. at the Pins. The machine will draw and lift out work to a depth of 11 in.

When used as a double-action press the blankholder is operated by long links inside the housing which are connected to a crankshaft in the bed. The crankshaft is operated by the main gears through a toggle motion, has four crank pins, two of which are used to operate the blankholder and two to operate the positive liftout in the bed. Adjustment of the blankholder is by four large adjusting screws and plunger adjustment is made by a 15-hp. motor mounted on the crown. The machine is driven by a 125-hp. motor and it is triple geared and has twin drive.

Dimensions are as follows: Distance between housings, 60 in.; distance from the bed to blankholder, stroke down, adjustment up, 42 in.; and distance from the bed to the plunger, 48 in. The stroke and adjustment of the blankholder, respectively, is 11⅝ in. and 8 in.; of the plunger, 24 in. and 8 in.; and of the knockout, 11⅝ in. and 7 in.

42-In. Heavy Engine Lathe Has Improved Headstock and Carriage

The Niles Tool Works Co. division of the Niles-Bement-Pond Co., Hamilton, Ohio, is adding to its line a 42-in, heavy engine lathe having improved features, particularly in the headstock and carriage. The actual swing of the machine is 43 in. and the length of bed is 32 ft. The drive is by a 20-hp. variable speed motor, but may be increased to 25 hp. or more, according to the service required.

Main spindle bearing dimensions have been increased about 40 per cent and other parts correspondingly. All gears in head are now of steel. The forged faceplate gear ring, also of steel, is of the same diameter as the outside of the faceplate and is shouldered and bolted to the faceplate. The faceplate is forced on the spindle by a hydraulic press and fits against the large flange on the spindle to which it is also bolted to give additional strength and rigidity.

Four mechanical changes of speed are obtainable in the lower half of the headstock for either a. c. or d. c. motor drive, which in conjunction with the variation in motor speeds for d. c. drive, gives faceplate speeds ranging from 1.9 to 231 r.p.m. For a. c. drive the top half of box has six additional mechanical changes, making 24 changes, ranging from 1.5 to 169.5 r.p.m. The pinion for the faceplate drive is located directly under the tool line in order to assure a smoother drive. Direct drive to the spindle is made through a large gear pressed and keyed on to the spindle next to the front spindle bearing. This is the only drive gear on spindle. The use of sleeves on the spindle has been eliminated. All gears and bearings in the head are supplied with forced lubrication by a pump which is driven from the driving gears, the pump being direct connected so that when machine is started oil is forced to the gears and bearings. The pump is bolted to a combination cover and bracket and may be removed by taking out four bolts. The head is oil tight and dust proof and attention has been given to oil leakage by placing drains and covers at points where this is most likely to occur. An oil indicator is located in a prominent position so that the operator may see that the headstock oiling system is functioning properly. All gears in the headstock are close against a bearing and there are no overhung gears in the drive.

On this machine the spindle thrust bearing is carried in a separate unit outside of the headstock so that it can be made of adequate proportions to assume the load and to give ready access for inspection and adjustment. The thrust is taken on a hardened and ground block with a special bronze washer on the spindle. The thrust plates dip in an oil compartment, oil being carried by slingers over the surface of the bearing. Adjustment is made by spanner wrench on two nuts on the ends of the bolts carrying the thrust bracket.

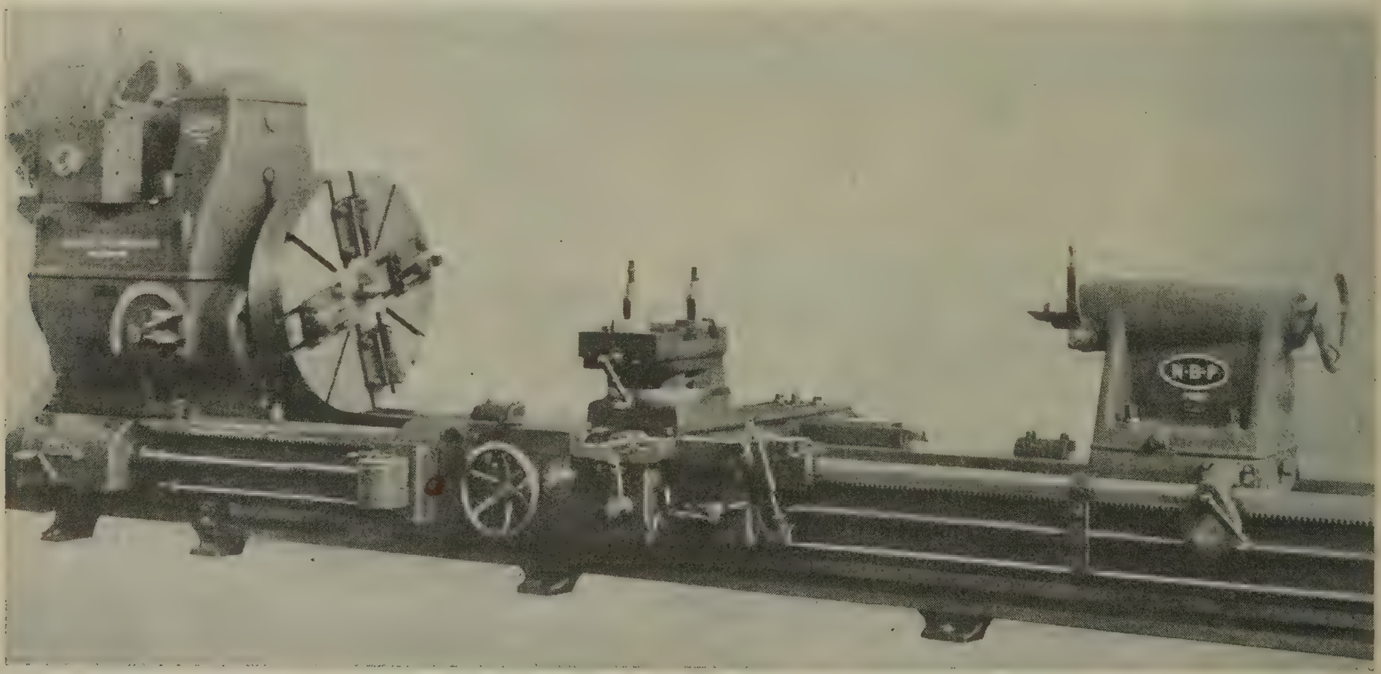
With the d. c. drive the faceplate is stopped quickly by dynamic braking. In the a. c. drive a mechanical brake incorporated in the gear box is operated from a motor control lever on carriage. Moving the lever to the "off" position automatically applies the brake. A jog button is provided on the headstock for slightly turning over the gears while shifting and for inching the faceplate in setting up or inspecting work.

The motor pinion shaft is supported between two bearings independent of the armature shaft bearings so that the motor bearings are not subject to load from the gears.

The carriage apron is of new design. The carriage is supported on the bed on V tracks, but the bridge also has a flat bearing on the inner edge of front shear, giving a solid bearing directly under the tool. The carriage is gibbed underneath the track at the front and the back and can be securely clamped in position when cross feeding. A graduated swiveling tool slide with four clamping bolts and tool straps is regularly furnished instead of the two poppet tool holders shown. Provision is made for power angular feed, which may be supplied as an additional feature, and power rapid traverse to carriage is also optional. A separate reversing motor used for the latter is mounted on a bracket on the carriage and connected by gearing with feed rack. The rack pinion may be withdrawn when cutting threads.

The apron is a one-piece casting assembled as a self-contained unit. An oil reservoir is provided in the top, the oil being led to all gears and bearings through brass piping. This reservoir is filled through holes in top of carriage. Feeds are engaged and reversed by sliding gears and positive tooth clutches. The lead screw is splined the full length and drives a double fine tooth clutch which engages either one of two bevel gears. The clutch is moved by lever at the front of the apron. This provides means of changing the direction of the feed or for stopping the feed by throwing it into neutral.

A lever for securing either cross or longitudinal feed is located at the side of apron. This lever controls a sliding gear which in one position is in engagement with the cross feed gear and when thrown in the other direction connects with the gear train to the rack for longitudinal feed. The lever for engaging the lead-screw nut is interlocked with the feed. All gears in apron are of steel and are doubly supported on large shafts. The rack pinion also has a bearing at its outer end. The feed gear box provides four changes of feed and threads by sliding gears and clutches. Change gears for additional feeds and threads are furnished.



The Actual Swing of the Lathe Is 43 In. The main spindle bearing dimensions have been markedly increased and all gears in the head are now of steel. The carriage apron is of new design

Price Cutting Threatens Prosperity

Half of American Industry Operating at a Loss—Stabilizing of Bolt and Nut Market Indicates What Can Be Done in Other Lines

BY CHARLES J. GRAHAM*

PROFITLESS prosperity had its innings in 1925 and 1926 and reached its climax in 1927 and, in so doing, brought forcibly to our attention the threat contained in its continuance by the abnormal number of business failures during that period.

The failures in dollars reached the stupendous figure of two billion in 1925, two billion two hundred million in 1926 and up to the end of August, 1927, one billion seven hundred and forty-five million. If the same average continued over the last four months of 1927, the figures for the year would show the staggering total of two billion seven hundred and sixteen million dollars.

In 1926, 41 per cent of all corporations doing business in the United States did business at a loss. In 1927, when all the returns are in, this will probably grow to close to 50 per cent.

In 1926 there was 23c. lost for every dollar earned. In 1927 this figure will, in all probability, be very materially increased, and, if such a condition were permitted to continue, it would eventually have but one answer—complete demoralization, great national suffering and another long period of readjustment.

There is no argument against the economic unsoundness of one-half of our business institutions doing business at a loss, and it goes without saying that to correct such a condition is our greatest national problem. Its solution means the one great accomplishment we must all strive for if it is our desire to keep America in her present position as a world power.

The problem *must* be solved if we are to stabilize and perpetuate present labor conditions in the United States both from the standpoint of employment and the return to labor.

We all have come to a full realization of the fact that satisfactory labor conditions and present high wages are responsible for the degree of prosperity we have had, and any underlying condition which would affect in any way our ability to keep up the present rate of employment or of wages paid would have the effect of cutting down buying power, would restrict production, and the inevitable result would be a long period of depression, of suffering and of dissatisfaction.

We have now reached the turn of the road. The best brains of American business—political, social and economic—are now face to face with this problem and undoubtedly with such intensive study it will be solved, and every business man in America has his responsibility and his place in the eventual solution of it.

How Losses Were Turned to Profits in Bolt and Nut Industry

The bolt, nut and rivet industry, which I represent, had its baptism of fire in 1924, when its losses were running into such figures that practically the entire industry was facing complete annihilation. This caused the best brains in our industry to combine in an effort to bring about a "right about face" and study its individual problems as an industry, and it has accomplished rather remarkable results.

From an industry loss of 12 million dollars in 1924, we have, by consistent cooperative effort in every way possible, converted this loss into a profit of approximately six millions of dollars per year in 1925, 1926 and 1927; a change of 18 millions of dollars per annum on an invested capital of about 150 million dollars.

Six million dollars profit on such an investment is not sufficient, but it is a move in the right direction and, by further effort along constructive lines, we hope to bring about a condition whereby we will finally make a return consistent with manufacturing necessity and be able to make not only a fair return for our stockholders, but a return sufficient to enable us to keep abreast of the times in modernization of equipment.

This has been done under the handicap of a very large overproduction; 55 per cent of our equipment will supply the present normal requirements of bolts, nuts and rivets in the United States.

The same problem that we had in 1924 is now facing many other industries, and the same result we have attained can be accomplished by all if they put the same sincere constructive effort into it that we have done.

Selfishness Greatest Evil in Competitive Lines

We made a complete scientific study of the reasons behind such a condition. We found that the greatest underlying evil we were up against was the evil that is sapping the life out of practically all competitive lines of American industry today, and that evil is selfishness.

We found that we were conducting our individual companies on a basis that had lost all semblance of decency or fairness—fairness to ourselves, our competitors, our customers or to the world at large.

We have entirely revolutionized our business methods. We have dug in deep and brought to the surface all of the evils we could find and have killed them one by one. We have developed a degree of unselfishness never before attained either in our industry or any other we know anything about.

What has been the result other than a return in dollars? We can look the world in the face today with a degree of pride, our competitors are our friends rather than our enemies and we are conducting our business on a higher ethical plane than ever before and have created the same honest conduct in our business as heretofore ruled in our social lives.

We have gone further than this. We have started a movement which we feel has solved the distribution problem in our own industry and, if the same plan is followed by all other industries, it will be the greatest automatic stabilizer of business and labor conditions of anything heretofore attempted.

Organization of Agencies of Distribution a Boon

Our distribution plan is very simple but very effective. We have been brought to realize the importance of the jobber in the proper and economical distribution of our merchandise.

During the period of ruthless competition culminating in our financial distress in 1924 we had ignored the existence of the jobber and became his chief competitor, thereby creating in him an enemy and becoming the chief aggressor in the rapid decline of our markets brought about entirely by our lack of appreciation of his importance to us.

Beginning early last year and finishing only last week, a committee of eight of the leading executives of our industry toured the entire United States. We have held meetings with the jobbers in 36 cities, representing every important jobbing center, and have now converted the jobber from an enemy to a friend and have made him a supporter of our markets rather than

(*Concluded on page* 378)

*President Bolt, Nut and Rivet Manufacturers Association, Pittsburgh. Abstract of address before the Pennsylvania State Chamber of Commerce at Harrisburg, Pa., Jan. 25.

Youngstown-Inland Steel Merger

Combined Companies, with Ingot Capacity of 5,000,000 Tons Annually, Will Rank Third in Size in Country

THE long-discussed merger of Youngstown Sheet & Tube Co. and the Inland Steel Co. was concluded on Jan. 25 and there now remains only the working out of some minor details to complete a combination that will put under control of one management capacity capable of producing 5,000,000 tons of steel ingots annually and which has plants located in Youngstown and the Chicago district making a well-rounded line of finished products. The new company in size will rank next to the Steel Corporation and the Bethlehem Steel Co.

Directors of the Yougstown Sheet & Tube Co. and the Inland Steel Co. on Tuesday approved the merger. A special Sheet & Tube stockholders' meeting to ratify the action has been called for March 15. Inland Steel has decided to retire, effective April 1, its outstanding $10,000,000 of preferred stock, at $115 per share, making payment from its own assets. The charter under which Sheet & Tube operates as an Ohio corporation is to be amended in pursuance of the terms of merger, and the name changed to the Youngstown-Inland Steel Corporation.

The Youngstown company in Youngstown produces sheets, bars, pipe and wire products, while in its Chicago district plants it makes pipe and tin plate, having only last year started up a modern tin plate plant of 24 mills. The Inland Steel Co. capacity nicely complements the Youngstown line, with rails, structural shapes, both light and heavy, bars, rods, plates and sheets, besides capacity for spikes, bolts, nuts and rivets.

New Shares to Be Exchanged for Present Shares

The new corporation will issue 3,200,000 shares, of which 2,000,000 shares will be given to present holders of the common stock of the Youngstown company on a basis of two new shares for one old, and the other 1,200,000 shares will go to holders of Inland common stock on a basis of one new share for one old share.

"In order to adjust net assets to be contributed by the respective companies," the official announcement reads, "the Youngstown Sheet & Tube Co. will declare a dividend to the aggregate amount of $1,250,000 to be distributed to holders of its common stock and the Inland Steel Co. will declare a dividend of the aggregate amount of $6,000,000 to be distributed to holders of its common stock.

Youngstown Sheet & Tube Properties

The Youngstown Sheet & Tube Co. operates iron and steel making plants at Hubbard, East Youngstown, Struthers, Youngstown, Warren, and Zanesville, Ohio; East Chicago, Ind., and South Chicago and Evanston, Ill. The company owns under lease the Newport-Bonnie mines and the Palms-Anvil-Keweenaw group on the Gogebic Range in Michigan and the Isabella Mine on the Marquette Range in the same State. It also has partial ownership in a number of ore properties in Minnesota and Wisconsin operated by Pickands, Mather & Co., and owns and operates the Mayville mine on the Iron Ridge Range in Wisconsin.

Products Are Widely Diversified

Products of the Sheet & Tube Company include iron and zinc ores, lead and zinc concentrates, coal and limestone, coke and coke oven by-products, sulphuric acid, basic, Bessemer, malleable, foundry, forge, and high and low phosphorus pig iron, blooms, slabs, billets, sheet bars, muck bar, skelp, socket iron, merchant bars and angles, concrete reinforcing bars, agricultural implement shapes, spring steel bars and springs, black, galvanized, blue annealed, automobile, furniture, full-finished and special finished sheets, formed roofing and siding sheets, universal and sheared plates, wire rods, plain, galvanized and copper coated wire, woven-wire fence and concrete reinforcing fabric, galvanized, polished, blued and cement coated wire nails, wire staples, wire hoops, barbed wire and flexible steel armored electrical cable, black and galvanized steel pipe, oil well casing, tubing, drive and line pipe, boiler tubes, rigid steel conduit, conduit elbows, couplings and unions, and oil and water well tools and supplies.

Mills in Youngstown District

At the Hubbard, Ohio, works are two blast furnaces having an annual capacity of 325,000 tons of foundry, basic and malleable pig iron.

The Campbell works, East Youngstown, Ohio, has four blast furnaces with a capacity of 900,000 tons annually. The by-product coke plant consists of 306 Koppers ovens, by-product recovery plant and Semet-Solvay benzol plant, with an annual capacity of 1,500,000 net tons of coke and 4,000,000 gal. of light oil. The Bessemer department of the steel works contains two 12-ton Bessemer converters and five cupolas. In the open-hearth department are 12 100-ton basic open-hearth furnaces, 36 gas producers and three hot metal mixers. The plant has a capacity of 780,000 tons of Bessemer and 840,000 tons of basic open-hearth steel ingots.

In the rolling mill department are 24 double puddling furnaces, two busheling furnaces, two rotary squeezers, 16 four-hole soaking pits, nine slab heating furnaces, five continuous producing gas and coke oven gas fired heating furnaces equipped with 49 gas producers, one 40-in. and one 44-in. two-high, one-stand blooming mills, an 18-in., two-high, 10-stand continuous billet mill, an 18-in., two-high, eight-stand continuous sheet bar mill, a 10-in., two-high, 10-stand continuous skelp mill, a skelp mill with 20-in., three-high, one-stand roughing and 16-in., two-high, three-stand finishing, a skelp will with 18-in., three-high, two-stand and 18-in., two-high, one-stand, two 29-in., three-high, two-stand merchant bar mills, one 30-in. x 72-in. universal plate mill, one sheet and one pair furnace and 14 combination sheet and pair furnaces, 15 hot, black sheet mills, four cold mills, eight double-box annealing furnaces, four plunger pickling machines, six galvanizing pots, tube mill with six butt-weld furnaces, five lap-weld furnaces and four galvanizing pots. The plant has an annual capacity of 688,400 tons of hot rolled finished products including 600,000 tons of black pipe and 88,400 tons of black sheets, 800,000 tons of skelp and 50,000 tons of couplings.

At the Struthers, Ohio, works are three continuous heating furnaces; one 10-in. two-high, 16-stand wire rod mill, one 12-in., two-high, nine-stand bar mill, one 9-in., two-high, 12-stand bar mill, wire mill with 206 wire drawing blocks, 192 wire nail machines, nine straightening and cutting machines, 48 barbed wire machines, 17 wire fence machines, 13 wire hoop machines, three wire galvanizing pans and nail galvanizing equipment. In the conduit department are two electro-galvanizing units for lap-weld and butt-weld pipe. The plant has a capacity of 370,000 tons of hot rolled products, including 250,000 tons of merchant and concrete bars and 120,000 tons of wire rods.

The Brier Hill Works, Youngstown, acquired by the purchase of the Brier Hill Steel Co., March 1, 1923, has three blast furnaces, which have an annual capacity of 550,000 tons of basic pig iron. The by-product coke plant consists of 84 Koppers ovens, a by-product recovery plant and a Koppers benzol plant. The annual capacity is 370,000 net tons of coke and 1,000,000 gal. of light oil. The open-hearth department has 12 basic

JAMES A. CAMPBELL has been active in the steel business since 1891, when he became superintendent of the Warren mill of the former Trumbull Iron Co. Then followed various connections in an operating capacity until in 1901 he was made vice-president and general manager of the Youngstown Sheet & Tube Co. In 1903 he was elected president.

L. E. BLOCK has spent his entire business life in the coal and iron business. He was treasurer and director of the Inland Coal & Washing Co. from 1897 to 1905, becoming vice-president and treasurer of the Inland Steel Co. in the latter year and in 1919 he was elected chairman of the Inland board of directors.

P. D. BLOCK began his iron and steel experience with the Block-Pollak Iron Co., Chicago and Cincinnati, in 1888. In 1903 he became vice-president and treasurer of the Inland Steel Co. and in 1919 was elected its president.

open-hearth furnaces, with an annual capacity of 780,000 tons of steel ingots. In the rolling mill department are six continuous heating furnaces, three normalizing furnaces, eight four-hole soaking pits, one 40-in., two-high, one-stand blooming mill, one 24-in., two-high continuous mill, one 24-in., two-high, six-stand merchant mill, one 32 in. x 84 in. sheared plate mill with one stand two-high and one stand three-high, one 40 in. x 110 in. three-high, one-stand sheared plate mill, eight sheet and eight pair furnaces, eight hot black sheet mills, two trains of cold rolls of four stands each, 16 box annealing furnaces, and four pickling machines. The plant has a capacity of 700,000 tons of semi-finished products and 430,000 tons of finished products, including 370,000 tons of sheared and universal plates and 60,000 tons of black sheets.

At the Western Reserve Works, Warren, Ohio, acquired with the Brier Hill Steel Co., are two pair furnaces, five combination sheet and pair furnaces, two two-high jobbing mills with one roughing stand and one finishing stand each, five hot black sheet mills, eight stands of cold rolls, four box annealing furnaces, four blue annealing furnaces and one pickling machine. The plant has a capacity of 70,600 tons of black sheets.

Plants in Chicago District

The two blast furnaces at the Indiana Harbor works, East Chicago, Ind., which were acquired by the purchase of the Steel & Tube Co. of America in June, 1923, have an annual capacity of 468,000 tons. The coke plant consists of 120 Semet-Solvay coke ovens, a by-product recovery and a benzol plant, with an annual capacity of 648,000 net tons of coke and 2,880,000 gal. of light oil. The steel works has two 15-ton Bessemer converters, four 75-ton basic open-hearth furnaces, one 600-ton mixer and three cupolas. It has an annual capacity of 600,000 tons of Bessemer and 240,000 tons of basic open-hearth steel ingots. In the rolling mills are five slab reheating furnaces, one Morgan continuous heating furnace, six soaking pits, one 35-in., two-high, one-stand blooming mill, one 28-in., two-high, one-stand billet mill, one 10-in., two-high, 11-stand continuous skelp mill, one 30 in. x 88 in., two-high, one-stand sheared or universal plate mill, two butt-weld and three lap-weld furnaces, and one galvanizing pot. The plant has a capacity of 280,000 tons of slabs and 200,000 tons of billets and 370,000 tons of finished products, including 130,000 tons of plates and 240,000 tons of black pipe.

The four blast furnaces at the South Chicago Works, South Chicago, Ill., have an annual capacity of 810,000 tons.

The Evanston works, Evanston, Ill., consist of two butt-weld furnaces and one galvanizing pot. The plant has an annual capacity of 72,000 tons of black pipe. The Zanesville works, Zanesville, Ohio, consist of two lap-weld and two butt-weld furnaces and two galvanizing pots. It has an annual capacity of 120,000 tons of black pipe. Both of these plants were acquired with the Steel & Tube Co. of America.

Properties and Products of Inland Steel Co.

The Inland Steel group consists of the Indiana Harbor works, plants Nos. 1 and 2, Indiana Harbor, Ind.; a rail steel bar mill at Chicago Heights, Ill., and sheet mills at Milwaukee. The Indiana Harbor plant covers 600 acres and 800 acres of vacant property is held in Porter County, Indiana. These tracts are served by the New York Central, the Pennsylvania and the Baltimore & Ohio railroads. The company owns 8000 acres of coking coal land in Jefferson County, Illinois, and 2000 acres in Pennsylvania. Ore properties are owned and leased in the Mesabi and Cuyuna ranges of Minnesota. The company also owns an interest in the Inland Steamship Co., which operates three 10,000-ton ore boats.

The principal Inland products are basic, malleable and foundry pig iron, coke and by-products, steel ingots, slabs, blooms, billets and sheet bars, rails, heavy and light structural shapes, merchant and concrete bars, rods, universal and sheared plates, black, galvanized and blue annealed sheets, rivets and railroad track supplies.

Blast Furnace Capacity 965,000 Tons

At the Indiana Harbor works are four blast furnaces—No. 1 completed in 1907, No. 2 in 1912, No. 3 in 1917 and No. 4 in 1926. Their annual capacity is 965,000 tons. Steam is furnished by 10 boilers rated at 10,500 hp. The sintering plant has a yearly capacity of 35,000 tons, and the slag granulating plant of 650,000 tons. The by-product coke plant consists of 204 Koppers ovens with an annual capacity of 900,000 tons of coke and 3,000,000 gal. of light oils.

In the steel plant, which is completely electrified, is the following equipment: 14 100-ton and 12 60-ton basic open-hearth furnaces, a 600-ton mixer, 35 soaking pits, one 40-in., one 36-in. and one 32-in. blooming mills, a 28-in. rail and structural mill, a 24-in. billet and sheet bar mill, a 24-in. jobbing shape mill, a 24-in. Morgan continuous sheet bar and billet mill, a 24-in. Morgan continuous billet and slab mill, an 18-in. merchant mill, an 11-in. to 8-in. Morgan continuous bar mill, a 32-in. sheared plate mill, two jobbing mills, 16

This Issue in Brief

Changes losses into profits for an entire industry by solving distribution problem. Instead of competing with distributers, the bolt, nut and rivet manufacturers cooperate with them. Antagonism has given way to support, prices have been stabilized, and the industry has been put on a profit-making basis.—Page 378.

Thin film of rust acts as a protective coating to prevent further corrosion. All metal surfaces corrode a little, says metallurgist. Rust-resisting metals owe their noncorrodibility to the fact that a protective film forms on the surface and automatically brings to an end corroding action. — Page 377.

Superhardens steel parts by subjecting them to shower of small steel balls. Tiny blows work-harden the steel and produce a thin, super-hardened layer. Soft spots in hardened articles are readily revealed, as the steel balls will clearly mark any unhardened surface.—Page 333.

America sold less steel abroad in 1927 than in 1926, but bought more. Steel exports were 1.69 million gross tons, 8 per cent below 1926. Imports were 398,385 tons, 1.5 per cent above 1926.—Page 379.

Industrial locomotive tests reveal that coal consumption is 572 lb. an hour. Under steady operation water consumption is 450 gal. an hour.—Page 380.

Iceless refrigerating units made almost wholly of welded stampings and thin-walled tubing. Welding is found to be especially suitable in making gas-tight joints.—Page 321.

Low-cost pig iron means large-hearth blast furnaces. Big furnaces have justified themselves, for they operate easily and economically, says blast furnace superintendent. Prophesies that 1000-ton per day furnace will soon be here.—Page 334.

Synchronizes motor speeds by means of electric interlock. Individual balance type vibrating speed regulators govern speed of motors on new Bourne-Fuller rolling mill, so that bars are kept under tension but are not stretched or looped between passes.—Page 326.

Can prices come down to prewar levels? Many things probably never will approach again the 1913 figures, with enhanced wages and higher taxation.—Page 332.

Millions saved in manufacturing economies have been wasted in faulty distribution methods. Reaction has set in, says trade association head, and business is beginning to devote to distribution the attention it deserves.—Page 378.

Sizable gain is made in pig iron output. Estimated daily production in January was 92,467 tons, a gain of 5507 or 6.3 per cent over December. Estimates indicate that the increase in number of furnaces in blast is 16, largest gain in two years.—Page 349.

One-half of all corporations lost money in 1927, says Bolt, Nut and Rivet Manufacturers' Association head. The problem of making industry profitable for the majority must be solved if labor conditions are to be stabilized and buying power maintained.—Page 341.

Foreign purchases of American machinery steadily increasing. We sold 435.5 million dollars' worth of machinery abroad in 1927, a gain of almost 9 per cent over 1926, and the second only to 1920, when prices were considerably higher.—Page 382.

Are prices governed by percentage of productive capacity operating? No, indicates editorial writer, for in some finished steel products one branch may operate at a higher rate than others and yet have poorer prices.—Page 346.

"Of what value is all our efficiency in production if we do not distribute efficiently, economically and effectively?" asks Eugene G. Grace. Urges engineers to study merchandising and distributing problems.—Page 372.

Ten companies now control about 82 per cent of the steel-making capacity of the United States. Recent mergers further concentrate steel production among the large producers. Five companies have more than two-thirds of the total capacity. —Page 347.

Activity in automotive industry is steadily growing. Increase in volume of steel bookings in Detroit area has been running about 4 per cent a week since early in January. Ford payroll now numbers 89,788 workers.—Page 366.

Prices of metals and metal products relatively low compared with pre-war figures. The average is only 23.2 per cent above 1913, while the average of all commodities is 45.5 per cent, or twice as high.—Page 330.

Prices and Productive Capacity

PRODUCERS of almost any commodity are prone to regard price cutting in their selling market as fundamentally due to an excess of productive capacity. Those who assert that market troubles arise from the efforts of competitors to operate at higher rates than the state of demand permits really take the same ground. The common saying is that producers are "trying to secure an economical operation."

If a proper study could be made it probably would be found that several important influences induce price cutting or prevent prices from advancing to a level fair to the producers. Certain facts are obvious from a rapid survey. One is that the amount of price cutting or the unsatisfactoriness of prices in different commodities is not in direct relation to the apparent excess of capacity. In finished steel products one branch may operate at a higher rate than another and yet have poorer prices. Similar instances can be found among the manufacturing consumers who are customers of the steel mills.

Another case in point is the custom of measuring the steel industry's operation in terms of percentage of steel ingot capacity, even though steel ingots are the one commodity the steel industry does not sell. Its sales are of finished products and of semi-finished steel, each line having its individual market. It is common knowledge that the total rolling and finishing capacity in the United States is quite in excess of the total ingot-making capacity. If demand should mount in all lines relative to the respective finishing capacities a point would soon be reached calling for the full ingot tonnage without the finishing departments' being able to run full.

While most manufacturers would seek a higher operation to reduce unit cost, this idea should be more critically examined. It is illogical, for the simple reason that there is no critical rate of operation which brings a disproportionately sharp reduction in costs. Costs are better at 60 per cent than at 50 per cent and likewise they may be better at 90 per cent than at 80 per cent. Andrew Carnegie went further, endeavoring to sell more than assumed capacity and then driving mills to break their records. Nowadays mills seldom succeed in getting a higher operating rate at the expense of competitors. But who will say that if they did they would not be tempted to try to go further and further, courting an encounter with the impossible?

Price cutting is often blamed on especially severe competition in one or more lines. Of course there are chance differences in personnel in various industries, but these differences are commonly overestimated. Some industries do have less intelligent and more aggressive competitors than others. But human nature is much the same all around, and if the personnels were exchanged it is probable that the marketing conditions might stay much the same.

In the case of steel mill products a very important price factor is that mill customers must resell the bulk of the tonnage in their respective markets, and these markets have their individual difficulties. For this reason a group of consumers may slip into a lower market and call upon the mills for relief or, faced by a mill demand for higher prices, may feel themselves unable either to absorb the advance or to pass it along. Thus the mills have a definite stake in influencing their customers to seek better prices.

AMERICAN machinery was shipped abroad in 1927 in greater quantity than ever before. Expressed in dollar values 1920 was higher, but the margin of $28,000,000—6½ per cent—was much less than the enhancement of prices in the immediate post-war period. The total exports in the year just closed were $435,476,000. This compares with a shade under $400,000,000 in the preceding year and with $463,000,000 in 1920. Since 1922, when the total was $239,000,000, there has been a continuous and fairly uniform gain year by year. This increment has averaged $39,000,000 a year. As recently as 1916 a new high record was made at $226,500,000, which was reported as far in excess of any preceding year. That the shipments were so high in 1927 was due in part to record exports of agricultural machinery; shipments of machine tools in 1927 almost doubled the total registered in 1926.

Steel Mergers and Steel Output

NOW that the merger of the Youngstown Sheet & Tube Co. and the Inland Steel Co. is virtually assured and the purchase of the Trumbull Steel Co. by the Republic Iron & Steel Co. has been ratified by stockholders, the grouping of large units of steel production has been carried to a point where ten companies will control about 82 per cent or 47,497,000 tons, out of the 58,000,000 tons per annum of theoretical steel-making capacity in the United States. Five of these companies have total capacity of almost 41,000,000 tons, the smallest of the group being rated at nearly 2,000,000 tons, while in a secondary group are five other producers whose totals are between 1,000,000 and 1,750,000 tons each. The ingot capacities of the ten companies are:

	Tons
United States Steel Corporation	23,046,000
Bethlehem Steel Corporation	7,900,000
Youngstown-Inland Corporation	5,040,000
Jones & Laughlin Steel Corporation	3,000,000
Republic-Trumbull companies	1,950,000
American Rolling Mill Co.	1,750,000
Central Alloy Steel Corporation	1,400,000
Wheeling Steel Corporation	1,273,000
Colorado Fuel & Iron Co.	1,138,000
Corrigan, McKinney Steel Co.	1,000,000
Total	47,497,000

If the Youngstown-Inland and Republic-Trumbull properties should be brought together later under one ownership, a possible development toward which there is as yet no definite move, the total ingot capacity of the combination, amounting to 6,990,000 tons, would still be exceeded by the Bethlehem Steel Corporation's rating of 7,900,000 tons.

Of a little less than 11,000,000 tons of ingot capacity that is left to all of the steel companies not included in the ten above listed, there are thirteen whose totals range between 300,000 and 1,000,000 tons a year. These are:

	Tons
Crucible Steel Co. of America (including Pittsburgh Crucible Steel Co.)	950,000
International Harvester Co.	700,000
Lukens Steel Co.	686,500
Pittsburgh Steel Co.	600,000
Weirton Steel Co.	570,000
Donner Steel Co.	540,000
Alan Wood Iron & Steel Co.	529,000
Otis Steel Co.	421,000
Sharon Steel Hoop Co.	400,000
Interstate Iron & Steel Co.	375,000
Granite City Steel Co.	360,000
Bourne-Fuller Co.	300,000
Andrews Steel Co.	300,000
Total	6,731,5

While most of these thirteen companies make only one or two products each, instead of the diversified lines in which the larger groups are engaged, they are well distributed geographically and help to preserve a competitive situation which allays any fear of monopolistic tendencies in steel production. Recent industrial history confirms the opinion, before expressed in these columns, that large consolidations of capital and facilities have brought with them a greater degree of responsibility toward the public, including that share which purchases the products of the steel mills.

The smaller manufacturing units in the steel industry, although numerically of importance, own only 6½ per cent of the total steel-making capacity. It is in this group, however, that mergers may now be looked for, such as the one recently consummated by six Ohio sheet companies under the name of the Empire Steel Corporation. This company, while having only 185,000 tons of steel-making capacity, has upward of 400,000 tons of finished steel capacity when relying upon other companies for some of its raw product.

In the major steel products—rails, plates, shapes, bars, tubular goods, sheets and wire rods—the five leading producers under the new line-up will predominate to a degree which is well illustrated by the following table, giving in the first column the collective capacities of the five companies and in the second column the estimated capacities of all plants combined:

	COMBINED CAPACITY OF FIVE LEADING PRODUCERS, TONS	ESTIMATED CAPACITY OF ALL PRODUCERS, TONS
Rails	3,672,000	4,529,500
Plates	5,119,000	6,877,000
Shapes	3,784,000	4,434,000
Bars, hoops, bands, etc.	9,148,000	18,048,100
Tubular goods	3,646,000	5,501,500 (welded and seamless)
Sheets and tin mill black plate	3,645,000	8,710,700
Wire rods	2,886,000	4,494,800

In the Chicago district the Youngstown-Inland combine will have 240,000 tons of rail-making capacity out of a total of 1,373,000 tons; 330,000 tons in plates of a total of 1,566,000 tons; 285,000 tons in shapes of 914,000 tons; 360,000 tons in bars, hoops, bands, etc., of 3,732,000 tons; 265,000 tons in sheets and light plates of 530,500 tons; 312,000 tons in pipe of 738,000 tons. Tubular products lead in the capacity at Youngstown, with 600,000 tons.

The acquisition of the Trumbull company will give the Republic Iron & Steel Co. a total of about 650,000 tons in bars, strips, hoops and bands and 260,000 tons in sheets.

Seamless Pipe Lines Next

SUPPLANTING of welded pipe by the seamless product is progressing steadily and the manufacture of seamless pipe up to 24 in. in diameter, which means an invasion of the pipe line field hitherto controlled by the welded product, is now at hand. This development will repeat history.

Some years ago seamless steel captured the boiler tube market, and the demand for welded steel and welded iron tubes is now small by comparison with what it was a decade ago. Seamless drill pipe and casing have also been making a constantly stronger bid for use in oil and gas wells, and are now being used almost to the exclusion of welded pipe in Western fields and other producing districts where the oil lies at great depths below the surface and is reached only after piercing thick strata of rock.

Up to date none of the seamless pipe manufacturers in this country has made pipe more than 13 in. in outside diameter; 10 in. has been the more common limit. In this respect, European producers have been turning out sizes up to 20 in. in diameter by a process different from that likely to be used in this country. It is generally conceded that American manufacturers have found best success after supplanting the European method of making a large tube with what is popularly referred to as the "automatic" mill, and there is little doubt that the future development for tubes up to 24 in. in diameter will follow along this line. Two installations of this sort are now in contemplation in the Pittsburgh district which will increase the size to 24 in. in diameter. Plans are under way for even larger seamless pipe for high-pressure work, and like tubular products demanding high-class metal without welds.

Profits from Collateral Advantages

NEARLY 50 years ago it was proved that solid carbon dioxide could not compete with water ice as a refrigerant. Mathematicians skilled in thermodynamics demonstrated that, while it would absorb twice as much heat and was therefore worth twice as much, carbon dioxide ice required much more than twice as much energy to solidify it as it took to freeze water. In other words, it would cost more to make it than it could be sold for. Therefore men looking for new business ventures turned to other lines of endeavor.

But more recently some others (who perhaps were unaware of the scientific reasons why they couldn't succeed) manufactured some solid carbon dioxide and marketed it under the trade name of "dry ice." In a short time in actual use it was found that instead of replacing twice its weight of ice, as theory indicated, in certain services it replaced ten times its weight! The thermodynamical demonstration wasn't wrong, but the theoretical computer did not realize that the gas evaporating from the refrigerant was itself an excellent insulator against outside heat. Other collateral advantages, such as lower shipping weights and ability to use one-time paper containers, have warranted many consumers to pay enough for the new refrigerant to make its production a profitable business.

This is not written with the intent of advertising dry ice, but to indicate what an essential part collateral advantages play in successful marketing. If solid carbon dioxide had the same utility as water ice (as assumed by the physicists of last century) it could not compete. But unsuspected utilities, the collateral advantages of the substance, enhanced its value.

In fact, collateral advantages are the selling points which market most modern devices. Old but usable equipment is made obsolete by newer designs with collateral advantages. Possession of a washing machine and steam dryer does not mean that the laundress's wages will be less than if she worked with a wash tub, boiler and clothes line; the collateral advantage to the owner is that the housewife thereby becomes less dependent upon the laundress's whims. An oil furnace isn't particularly cheap, either to install or operate, but it is far more comfortable to set a clock and thermostat in the evening than it is to rise early in the cold morning and shake down the grates.

These homely illustrations serve to fortify the point that selling purely on a price basis is not so profitable as when the article or commodity has valuable collateral advantages which warrant a premium. Obviously various metal industries will do well to extend this principle of marketing to their own production. Not that it hasn't been done already, but the principle is worthy of wider and more intensive application, and warrants some extensive studies by many producers.

Certain instances come to mind. Malleable castings get preference when their easy and uniform machinability is properly appreciated. The copper and brass industry is marketing increasing amounts of pipe, sheets, and moldings on the basis of permanence and beautiful surface—frequently an entirely collateral advantage where the expected life of the structure is limited. Such collateral advantages of all-steel car bodies as "squeaklessness" and safety in collision warrant their adoption for automobiles no less than passenger cars and at a higher price. Broad-flanged beams, the so-called H-beams, effect such economies in the design and fabrication of structural steel work that they often get a premium over the older I-beam sections.

Prosperous is the industry that can find these collateral advantages for its product, and is astute enough to charge its customers for values received.

Why Our Capital Leaves Home

OUR large and increasing foreign loans have created various strong reactions, but one of the important phases of the movement has received slight attention. It is commonly overlooked that these loans furnish a test of our own industrial progress and show it to be less than might well be desired.

The strongest reaction to the outflow of capital has been one of criticism. It is charged that if we continue this lending the returns earned cannot come in, for in the long run, it is said, they would have to be in kinds of merchandise that we do not wish to import. Suspicions have been expressed that we have been slipping into the lending of additional sums to cover interest and that the inevitable result will be a compounding of interest, uncollectable after a period of years.

These contentions cannot be dismissed. But, whereas this criticism began several years ago, it is encouraging to note that the net total of our loans last year was greatly in excess of the interest charges and the loans made a new high record. Estimates just made of foreign loans in 1927 minus redemptions run above one and a half billion dollars, making our total foreign investments at this time about 13 billions. Investments in the United States held abroad, however, probably total in excess of three billions.

Another strong reaction to this exportation of capital, one of criticism and indeed of complaint, has been that our lending to foreigners helps them industrially and will place them in a stronger competitive position, whereby our merchandise export trade may be injured.

These two points are well worth considering, and they have been considered. Another phase has received little attention, but it is very important:

How does it come about that capital is attracted abroad—why does it not stay at home? It has always been recognized that there is "a disinclination in capital to emigrate," and economists have even attempted to estimate the "disinclination," sometimes putting it as high as a 2 per cent difference in expected return.

In addition to the bare facts as to totals, there are two late trends—one, diminished profits from our home investments last year and, second, increased foreign loans. With a diminishing supply of capital, we export more! Emphatically, there is something to be looked into.

When this country was young, capital flowed into it and the process was considered natural. Have we now grown so old industrially that the rest of the world has an average age less than ours? There are data by which we may consider the point. The last Department of Commerce *Review* estimates private American investments abroad at the end of 1926 at $11,215,000,000, divided in the following proportions:

	Per Cent
Europe	26.8
Latin America	40.1
Canada and Newfoundland	25.0
Asia, Australia, Africa, etc.	8.1
Total	100.0

The division seems natural enough. Europe is old, Latin America and Canada are new, and industrially the rest of the world is in early stages.

If there were such a thing as a collective national mind, it would be natural to ask what eventual benefits we expect to derive from the investments, i. e., what do we expect to buy for ourselves with the money? It cannot be construction at home, or we should use the capital itself for constructing. It cannot be goods, for we do not want more foreign merchandise. The natural inference is that foreign loans are increasing because of a lack of opportunities for profitable investment at home.

Sharp Gain in January Pig Iron Output

Estimates, Collected by Wire, Show Daily Rate 5507 Tons or 6.3 Per Cent More Than December—Net Gain of 16 Furnaces

PRELIMINARY estimates of the January pig iron production, gathered by wire on Tuesday, Jan. 31, indicate a sharp increase over December. With the output for the last day or two calculated by producing companies, the production of coke pig iron last month was 2,866,468 gross tons, or 92,467 tons per day. This compares with 2,695,755 tons, or 86,960 tons per day, in December, also a 31-day month. The January increase in daily rate was therefore about 6.3 per cent.

The feature of the January operations was the net gain of 16 furnaces. The incomplete returns indicate that 20 furnaces were blown in and four blown out or banked. This is the largest net increase in many months, the nearest approach having been one of 14 furnaces in December, 1925. The United States Steel Corporation is credited with 13 of the 20 furnaces blown in, seven being Carnegie Steel Co. stacks and five furnaces located in the Chicago district. Only one Steel Corporation furnace was blown out, giving that organization a net gain of 12 stacks for the month. There were six independent steel company stacks blown in and two blown out, with one merchant furnace started up and one shut down. According to the data, there were 185 furnaces operating on Jan. 31.

Actual data for the January output will be published in THE IRON AGE Feb. 9. The table gives the estimated production by districts for January and the three months preceding.

Pig Iron Production by Districts, Gross Tons

	Jan. (31 days)	Dec. (31 days)	Nov. (30 days)	Oct. (31 days)
New York and Mass.	203,859	199,726	212,778	232,422

Total	2,866,468	2,695,755	2,648,376	2,784,112

Railroads Ordered to Revise Rate Provisions on Scrap

WASHINGTON, Jan. 31.—Railroads in Official Classification territory have been ordered by the Interstate Commerce Commission to revise present tariff provisions with respect to scrap iron and steel. The commission took this action in a decision made public last Friday in which it upheld a complaint of the Wrought Washer Mfg. Co., Milwaukee, against the assessment of rates on old material which in most instances were those applicable on manufactured iron and steel and were generally fifth-class rates. The complainant had asked application of scrap rates and sought reparation on that basis. The findings of the commission mark a victory for scrap iron dealers and consumers, who for a long period have held conferences with railroad representatives and with the commission, asking for revision of the existing provision which describes scrap iron as "scraps or pieces of iron or steel having value for remelting purposes only." The commission on numerous occasions has supported this definition.

In announcing the decision in the Wrought Washer case the commission tentatively suggested the following rule for consideration by the carriers:

> Rates apply on pieces of iron or steel, separate or combined and in their original form or otherwise, which are chiefly valuable for remelting or fagoting, which can not be damaged by breakage, and which can be transported in open cars without damage from exposure: Provided, however, that these rates will not apply on iron or steel which, although chiefly valuable for remelting purposes, is in the form of raw or unfinished material for which other rates are specifically provided.

The distinction between the present provision and the one proposed is that the latter does not limit the definition of scrap to material which is fit for remelting purposes only.

The Wrought Washer Mfg. Co. does not remelt old material, but reheats it, and after rerolling, shearing and sorting, makes washers from about 30 per cent, while the remainder is converted into washers without reheating. The commission held that the rates charged the company should not exceed the billet rate and called upon the railroads to apply the new rates beginning March 21. Reparation also was awarded.

Iron and Steel Markets

Prices, Output, Demand Increase

Advance in Wire Products Follows That on Plates, Shapes and Bars—Blast Furnace Operations Gain—Further Broadening of Consumption

A MARKED increase in blast furnace operations in January, fresh price advances and further evidences of heavier consumption reflect the growing strength of the steel market.

The rapidity of recent gains in steel mill operations is given fresh emphasis by the blast furnace statistics. A net gain of 16 active furnaces in the month, all of them steel works stacks, is indicated by telegraphic reports to THE IRON AGE on Jan. 31. The nearest approach to this increase in recent years was a gain of 14 furnaces in December, 1925.

The Steel Corporation alone blew in 13 furnaces in the month and put out one, a net gain of 12. The operations of this producer's plants now average 84 per cent, as against 82 last week and 75 three weeks ago.

Encouraged by expanding business and, no doubt, more determined to get better prices as a result of the poor showing of earnings for the last quarter of 1927, steel producers have announced fresh advances in quotations. Following the lead of the Steel Corporation subsidiary, all makers of wire nails and plain wire have marked up prices $2 a ton. Most of the leading producers of automobile body sheets have restored the former base of 4.15c., Pittsburgh, or $3 a ton above the recent ruling price, and there is more general acceptance of the $3 increase on cold-rolled strip announced by a leading mill two weeks ago.

The advance of Jan. 19 on plates, shapes and bars stimulated specifying and drove in considerable pending business. This reaction was most pronounced at Chicago, where the sales total for the week has been exceeded only twice in the past two years and the increase in specifications has pushed production up to 88 per cent of ingot capacity.

From Chicago also come more definite indications of the gradual abandonment of short-term buying. Diminishing caution on the part of consumers is reflected in longer commitments and corresponding improvement in mill scheduling.

Evidences of broadening demand are seen in the better showing in lines that have been lagging, notably pipe and tin plate. Pipe mill operations have increased to 70 per cent of capacity, as compared with 60 per cent a week ago. Three orders for line pipe in early prospect total 300,000 tons, one alone calling for 150,000 tons. An export inquiry for 15,000 tons of pipe is active, and an order has been taken by an independent producer for 4000 tons for Ontario, Canada.

In tin plate, specifications are expanding, and requirements this year, according to reports from the canners' convention in Chicago, promise to exceed those of 1927.

Wire mills are running at 70 per cent, which represents virtually a peak rate of operation in view of the surplus of producing capacity. Demand for wire products has improved materially, and some mills are booked for 30 days.

The automotive industry has reached a good rate of production, although not running at capacity. The payroll of the Ford Motor Co. numbered 90,000 as of Jan. 27, an increase of 4000 since Jan. 14.

Railroad buying remains a major market factor. A Western road has placed 14,000 tons of rails and Chicago mills are still figuring on 75,000 tons. The Central Railroad of New Jersey ordered 13,494 tons from the Bethlehem Steel Co. Track accessories booked at Chicago total 25,000 tons. The Pennsylvania Railroad has purchased 600 passenger cars, an unusually large order for such equipment, and freight cars bought by three roads number 1250. For repairs to 1000 cars the Norfolk & Western is inquiring for 8000 tons of plates and small shapes.

Out of nearly 45,000 tons of fresh structural inquiry, 27,000 tons is for railroad work. The Santa Fe alone will place 20,000 tons of bridge work. Awards of fabricated steel total 29,000 tons, including 4500 tons for a bridge at Vicksburg, Miss., and 3300 tons for New York subway work.

Pig iron shipments are increasing in some districts, reflecting better conditions among foundries, but sales, except at Cleveland, have not been conspicuously large. Lake Erie furnaces sold 24,000 tons in the week, much of it in small orders. Large stock piles on furnace yards are a deterrent to price advances. While current quotations are being fairly well maintained, there are occasional concessions on the larger tonnages, true particularly when furnaces of different districts meet in competition.

Total production of pig iron in January, according to preliminary estimates, was 2,866,468 gross tons, or 92,467 tons per day, a gain of 5507 tons or 6.3 per cent over the 86,960 tons per day in December. The net gain of 16 furnaces brought the total active at the end of the month to 185.

Exports of machinery from the United States in 1927 amounted to $435,476,591, a gain of 9 per cent over 1926, the largest total since 1920 and the second largest total ever shipped abroad. Machine tools exported from the United States in 1927 represented nearly double the value shipped in 1926, having been $12,538,313, against $7,104,277.

Finished steel, on the basis of THE IRON AGE composite price, has advanced to 2.336c. a lb., after holding at 2.314c. for six weeks. It is now higher than at any time since early last October, but is 2½ per cent below the level of a year ago. Pig iron remains for a third week at $17.67 a ton.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

---

*The average switching charge for delivery to foundries in the Chicago district is 61c. per ton.

Pittsburgh

Price Advances on Wire Products and Auto Body Sheets

PITTSBURGH, Jan. 31.—The steel trade has been engaged in consolidating its gains and in building its price line for second quarter business. Strip steel producers have stronger price ideas on the hot-rolled product and the advance announced a week ago by a large maker of cold-rolled strips has since been followed by all other manufacturers. An advance of $3 a ton has been announced on automobile body sheets to 4.15c. per lb., and this has been accompanied by a stronger effort to place the market on the basis announced several weeks ago, but which had not been attained because of the willingness of some mills to take additional orders at the prices ruling in December. Another swing in the same direction is an advance of $2 per ton in wire and wire products, applying to all except woven wire fence.

Since the mills are heavily committed for this quarter in these several products, the price changes can be interpreted as indicating that steel manufacturers are determined to place second quarter business upon a more profitable basis than that now passing through the mills. The advance of Jan. 19 on plates, shapes and bars has continued in the past week to stimulate specifications on old business and to bring in contracts from buyers who were inclined to withhold signing them in the belief that they would do as well on spot purchases. Not a mill in this district now has a price of less than 1.85c., on plates, shapes and bars, and while comparatively little business is being done at that figure, mills will go no lower on new orders and there is strong possibility that a further advance may be sought as the time comes for writing second quarter tonnages.

Business in bars, plates and shapes has improved materially as buyers have become convinced of the firm intention of manufacturers to get at least a fair profit for their steel. There has, however, been no change in the general attitude of purchasers toward the market and the fact that it is still difficult to schedule rolling mills more than a week ahead is evidence that many buyers still believe in the buying-for-consumption policy.

Specifications against old and lower-priced orders in other products continue to come in well and the trend of both steel works and rolling mill operations continues upward. For this and nearby districts, ingot production may now be placed at between 75 and 80 per cent of capacity. The Carnegie Steel Co. has added six blast furnaces to its active list since a month ago, while the Pittsburgh Crucible Steel Co. and Republic Iron & Steel Co. each has put on one furnace.

Activity still is lacking in pig iron, scrap and fuels, and while iron prices hold steady, presumably because of slightly less steel company selling, prices of the other materials are soft.

Pig Iron.—Only a small-lot business is being done in pig iron. Some fair-sized tonnages of basic iron, sold by one steel company to another, have been moved, but this business is largely non-competitive, except that the seller has had to make prices more attractive than the nominal quotation of Valley furnaces. The buyer gets the benefit of a considerable saving of freight as between the shipping furnace and those in the Valleys. In Bessemer, foundry and malleable iron, sales have been chiefly in one or two car lots and at recent prices. Agents of charcoal iron producers have written up considerable business with roll makers for shipments over the first half of the year and it is estimated that the amount is close to 10,000 tons.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	$17.25 to 17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—Steel manufacturers seem to have largely supplied their immediate needs of ferromanganese by purchases and specifications in December to escape the price advance. Current shipping instructions embrace only moderate tonnages. Consumers in this district do not take seriously the reports that higher prices for ferromanganese are immediately ahead.

Semi-Finished Steel.—There is a fairly good movement of billets, slabs and sheet bars in keeping with the fact that the non-integrated sheet, tin plate and strip mills now are having a good operation. Little of the business in these forms, however, is subject to open market competition, buyers being satisfied to adhere to regular sources of supply. Wire rods have been advanced $2 a ton along with the advance in wire and wire products, the new quotation being $44, base Pittsburgh or Cleveland. Pipe skelp is priced at 1.85c., but there is hardly enough business to provide a test.

Bars, Plates and Shapes.—While no considerable amount of business yet has been done at the advanced price recently announced, the market does not appear quotable at less than 1.85c., since all makers in this and nearby districts now are quoting that figure, and they are strengthened in their price position by the heavy accessions to order books resulting from the advance. Bar orders have notably increased in the past week or 10 days. In plates and shapes there is also evidence that buyers take seriously the stand manufacturers lately have been taking on prices. Structural steel inquiry is fairly good, but awards are rather light. The Norfolk & Western is asking prices on approximately 8000 tons of plates and small shapes for repairs to 1000 cars.

Rails and Track Supplies.—The order book of the local standard-section rail producer was further swelled by the distribution of the Nickel Plate order. That road is yet to act on its inquiry for spikes and tie plates. In general, the demand for track supplies is a little slow, but most makers have fair-sized orders booked for late shipment. Spike prices are irregular and easy, but on tie plates and rails prices are well maintained.

Wire Products.—The American Steel & Wire Co., as of Jan. 25, advanced all wire products, except woven wire fence, $2 per ton, putting nails to $2.65, base, per keg, Pittsburgh or Cleveland, and plain wire to $2.50, base, per 100 lb., those points. Other makers have since followed suit. The effect of the advance has been to stimulate specifications on first quarter contracts carrying the former prices and to drive to cover a good many buyers who had not signed contracts for this period. Jobbers still have low-priced tonnage, notably nails, coming to them on orders placed late last year and now will have access to first quarter contract tonnage. It will take a little time for these supplies to get into consumption and the common belief is that the new prices will not be fully effective before the second quarter.

Tubular Goods.—There is a steady, although gradual, increase in the demand for standard-weight pipe, but no appreciable gain is observed in the orders for oil country goods, except possibly from California, where there is fairly extensive drilling of old fields in the expectation of tapping oil at depth. This demand helps particularly the sale of seamless casing and drill pipe. Reports from the oil industry are more cheerful, with reports of a premium being offered for the high gravity oil of the Seminole, Okla., field. An effort now is being made to extend the curtailment program in that field for another three months. No less than 2000 miles of line pipe is embraced in gas pipe line projects now under consideration. There are lines projected from Amarillo, Tex., to Omaha and to Kansas City; from Monroe, La., to St. Louis; from Wyoming to San Francisco and from the latter city to Los Angeles. Pipe prices still show some irregularity.

Sheets.—Makers generally are taking a firmer stand on prices and most of the leading producers of automobile body sheets have since a week ago restored the former base price of 4.15c., Pittsburgh, while almost all makers have taken a stand at 2.90c., base Pittsburgh, on black, 3.75c., base, on galvanized, 2.10c., base, on blue annealed under 40 in. wide, and 2.20c., base, on sheets wider than 40 in. These prices may be regarded as second quarter quotations, since the mills generally are so well obligated, and, by the same token, buyers are so well covered for this quarter that not much possibility exists for the higher prices to become effective promptly. Buyers are specifying well, but new business is light.

Tin Plate.—Reports from the canners' convention in Chicago suggest a common belief that the excess stocks of canned fruits and vegetables will be pretty well used up before the new crops come in. The natural inference is that tin plate requirements will be greater this year than last. At present there is expanding tendency in specifications on contracts and mill operations easily average 75 per cent of capacity.

Cold-Finished Steel Bars and Shafting.—Business holds up remarkably well and is being helped by the fact that a good many buyers who did not believe that the advance announced for this quarter would hold have been impressed by the recent advance in hot-rolled bars.

Hot-Rolled Flats.—Makers are growing stronger in their price ideas, and while there continues to be business at 1.85c., base, for wide material and 2.05c., for narrow, most makers now regard 1.90c. and 2.10c. as their minimum. Specifications on old orders are coming in well.

THE IRON AGE Composite Prices

Finished Steel

Jan. 31, 1928, 2.336c. a Lb.

One week ago	2.314c.
One month ago	2.314c.
One year ago	2.396c.

No. 28, f.o.b. Pittsburgh	2.90c. to 3.00c.
No. 28, f.o.b. Chicago dist. mill	3.00c. to 3.10c.

Automobile Body Sheets

No. 20, f.o.b. Pittsburgh	4.00c. to 4.15c.

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill primes	4.10c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.25
Standard cokes, f.o.b. Gary and Elwood, Ind.	5.35

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)

(Per package, 20 x 28 in.)

8-lb. coating I.C.	$11.20	25-lb. coating I.C.	$16.70
15-lb. coating I.C.	14.00	30-lb. coating I.C.	17.75
20-lb. coating I.C.	15.30	40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. Pittsburgh, Chicago or Ohio Mill)

S. A. E. Series Numbers		*Base Per* 100 *Lb.*
2100*	(½% Nickel, 0.10% to 0.20% Carbon)	$2.90 to $3.00
2300	(3½% Nickel)	4.00 to 4.10
2500	(5% Nickel)	5.00 to 5.25
3100	(Nickel Chromium)	3.00 to 3.10
3200	(Nickel Chromium)	4.75 to 5.00
3300	(Nickel Chromium)	6.75 to 7.00
3400	(Nickel Chromium)	6.00 to 6.25
5100	(Chromium Steel)	3.00 to 3.10
5200*	(Chromium Steel)	7.00 to 7.50
6100	(Chrom. Vanadium bars)	4.00 to 4.15
6100	(Chrom. Vanad. spring steel)	3.50 to 3.75
9250	(Silicon Manganese spring steel)	3.00 to 3.15
	Carbon Vanadium (0.45% to 0.55% Carbon, 0.15% Vanad.)	4.10 to 4.20
	Nickel Chrome Vanadium (0.60 Nickel, 0.50 Chrom., 0.15 Vanad.)	4.05 to 4.20
	Chromium Molybdenum bars (0.80—1.10 Chrom., 0.25—0.40 Molyb.)	4.00 to 4.25
	Chromium Molybdenum bars (0.50—0.70 Chrom., 0.15—0.25 Molyb.)	3.05 to 3.10
	Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)	4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in. the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

---

*Not S. A. E. specification, but numbered by manufacturers to conform to S. A. E. system.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 *Lb*
Spikes, $\frac{9}{16}$ in. and larger	$2.70 to $2.80
Spikes, ½ in. and smaller	2.70 to 2.80
Spikes, boat and barge	2.90 to 3.00
Tie plates, steel	2.25
Angle, bars	2.75
Track bolts, to steam railroads	3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count,	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel			*Iron*

Hot Rolled

2 and 2¼ in.	37	3¼ and 3½ in.	50
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Cold-Rolled Strips.—All makers in this district have gone along with the advance announced a week ago by the American Steel & Wire Co. of 3.15c., base, for lots of 1 to less than 3 tons, subject to a deduction of 25c. per 100 lb. for lots of 3 tons or more. Specifications are good on old orders.

Old Material.—The market still is dull and easy. While it is doubtful that any consumer could buy heavy melting steel at less than $15, it is a fact that none will pay more and dealers have succeeded in picking up fair-sized lots for delivery at one point in the district at $14.75. The general market may be appraised at $15 for this grade, with variations either way in keeping with the destination. Blast furnace scrap is weak and $11 is about all that can be obtained. The February scrap list of the Baltmiore & Ohio contains 14,150 gross tons and that of the Norfolk & Western 4100 gross tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$14.75 to $15.25
Scrap rails	14.25 to 14.75
Compressed sheet steel	14.00 to 14.25
Bundled sheets, sides and ends	13.00 to 13.25
Cast iron carwheels	14.00 to 14.50
Sheet bar crops, ordinary	15.00 to 15.50
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	14.75 to 15.25
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	10.50 to 11.00
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	16.75 to 17.00
Railroad coil and leaf springs	16.75 to 17.00
Rolled steel wheels	16.75 to 17.00
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.00
Short mixed borings and turnings	11.00
Cast iron borings	11.00
No. 2 busheling	10.00 to 10.25
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.00 to 15.25
Malleable Grades:	
Railroad	14.75 to 15.25
Industrial	14.25 to 14.75
Agricultural	13.75 to 14.25

Bolts, Nuts and Rivets.—Better demand is developing for bolts and nuts from the railroad car builders. Jobbers also are specifying with a little more freedom. Rivets still are slow. Prices are firm on all products.

Coke and Coal.—Declining production of soft coal does not bridge the gap between supply and demand and prices still are weak under the effort of producers to find a market. Lump gas coal, nominally priced at $2.10 per net ton at mines, has sold at $2 and even less in some cases. Slack coal again is plentiful and down in price. The coke market still suffers from limited demand. Light offerings of beehive oven coke do not stay the decline in prices because by-product coke still is freely obtainable. Single carloads of beehive oven furnace coke can be sold at $2.75, but on large lots $2.65 is about all that can be obtained. Foundry coke ranges from $3.75 to $4, with occasional sales of especially good brands at a little more.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.

Wire, black soft annealed, base per 100 lb.	$3.00 to 3.10
Wire, galvanized soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Shifting Currents in Pig Iron Imports

Imports of pig iron in December, at 14,299 tons, showed a decline of less than 4 per cent from December, 1926, in spite of the fact that imports for the calendar year 1927 were less than 30 per cent of the corresponding total in 1926. December imports in 1927 were nearly one-seventh of the total for the first 11 months, whereas in 1926 the December tonnage was only one-twenty-ninth that of the 11 months.

India furnished more than half the total incoming tonnage in December, contrasted with only 203 tons last year. In December, 1926, Germany furnished more than two-thirds of the total, contrasted with none a year later. As a matter of fact, Germany's pig iron shipments reaching the United States in December, 1926, were greater than the total from Germany reaching the United States in the entire year 1927.

In the 12 months India has furnished us with just over half our total imports. Netherlands has supplied almost half the remainder and Great Britain more than half that not furnished by India and Netherlands. In contrast with this, Germany led in 1926 with more than one-third the total. Great Britain was second, India third, and Netherlands fourth.

Truscon Steel Co. to Build $350,000 Plant in Europe

YOUNGSTOWN, Jan. 31.—To take advantage of cheaper steel costs and cheaper labor in Europe, the Truscon Steel Co. has decided to build a European fabricating plant, which will likely be located in Belgium, President Julius Kahn announced this week, on his return from a European trip. The unit will be similar to the plant built by the company in 1927 at Los Angeles at an approximate cost of $350,000. The new plant will ship to Europe, Africa, China, Australia and India. It will be built this year.

At Youngstown, the company is extending its steel window and sash departments, wire mesh fabrication and metal lath plants, by 50 per cent at an estimated cost of $400,000. This work will be finished by May 1.

President Kahn states that the earnings in 1927 will show profits of 30 per cent on the company's common stock of $10 par value, against 38½ per cent in 1926. The annual meeting, scheduled for the second Tuesday in February, will be postponed 30 days.

The Illinois Steel Co. and the Inland Steel Co. have adopted new cards on extras for assembling and handling bars and small shapes. All specifications of less than 4000 lb. each of a size are subject to the following lump sum extras which will be added to the net price of the material: Less than 4000 lb. down to and including 2000 lb. take a lump sum extra of $4; less than 2000 lb. down to and including 1000 lb. take an $8 extra, and less than 1000 lb. takes a $12 extra. The old extras were $3, $6 and $10 respectively.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

F.o.b Pittsburgh or Youngstown

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and over	$33.00
Rerolling, under 4-in. to and including 1¾ in.	$33.50 to 34.00
Forging, ordinary	38.00 to 39.00
Forging, guaranteed	43.00 to 44.00

Sheet Bars

	Per Gross Ton
Open-hearth or Bessemer	$34.00

Slabs

	Per Gross Ton
8 in. x 2 in. and larger	$33.00
Smaller than 8 in. x 2 in.	34.00

Skelp

	Per Lb.
Grooved	1.80c. to 1.85c.
Sheared	1.80c. to 1.85c.
Universal	1.80c. to 1.85c.

Wire Rods

	Per Gross Ton
*Common soft, base	$42.00 to $44.00
Screw stock	$5.00 per ton over base
Carbon 0.20% to 0.40%	3.00 per ton over base
Carbon 0.41% to 0.55%	5.00 per ton over base
Carbon 0.56% to 0.75%	7.50 per ton over base
Carbon over 0.75%	10.00 per ton over base
Acid	15.00 per ton over base

Upset hex. cap screws, S.A.E. thread	85 and 5
Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Large Steel Sales and Specifications—Ingot Output at 88 Per Cent

CHICAGO, Jan. 31.—Immediate effects of recent price advances in plates, shapes and bars are sales that have been exceeded only twice in the last two years within a like period. These sales and an increase in specifications have made necessary an ingot output of 88 per cent of capacity. Another blast furnace has been lighted at Gary. This is the sixth steel works furnace that has been brought in since Jan. 1 and it makes the total count of active stacks 27 out of 36 in this district. Steel deliveries average about three weeks. Confidence among users is prompting them to make known their requirements farther in advance and this affords producers an opportunity to rearrange rolling schedules to accommodate the late comers or those who suddenly find their immediate needs have not been fully covered. At the same time producers hint at discouragement of small-lot orders by the announcement of an advance in extras for assembling and handling bars and small shapes. A better credit situation throughout most of the agricultural districts is reflected in orders for wire products. Nails, a dormant commodity until a week ago, are in good demand and stocks in producers' hands are low for this time of the year. Automobile plants are again stepping up production following a check in output during the first few days of the national automobile shows.

Pig Iron.—Shipments of foundry iron continue to grow heavier and it is of interest that malleable foundries are taking a larger share of local furnace output. Chicago producers are holding rigidly to $18.50 for deliveries in and near Chicago and to the North. Firmness in prices is lacking to the West and South. A central Indiana user closed for 1000 tons with a producer east of this district at a price that eliminated Chicago competition. Current sales are in good volume and for the most part represent a growing interest in second quarter requirements. Specifications for silvery iron are unusually large.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Ferromanganese remains at $100, seaboard, though reports have been circulated that the price would be advanced $5 at once. Specifications for ferrosilicon are liberal. Spiegeleisen is bringing $32, base, Hazard, Pa., in the 19 to 21 per cent grade.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Plates.—The Pennsylvania purchase of passenger cars is impressive in size, but it holds out little promise of steel tonnage for Western mills. In some quarters it is reported that about 150 of the coaches may be built in Western shops. An order for oil tanks has added 5000 tons to the books of a Western mill and definite inquiry has come out for 2000 tons of tank plates. This is the third successive week of fair specifications for car builders.

Mill prices on plates per lb.: 1.95c. to 2.05c., base, Chicago.

Structural Material.—Railroad requirements hold the center of attention in this market. The Santa Fe announces that its 1928 bridge program will require 20,000 tons of steel and the Northern Pacific will use 2000 tons. A railroad viaduct near Chicago calls for 1300 tons and a bridge for the Missouri-Kansas-Texas Lines will take 500 tons. The Garment Center Building, Chicago, taking 2400 tons, is said to have been awarded to the McClintic-Marshall Co. As a whole, the structural material market is active and gives promise of heavier shop operations before spring. Fabricators are making a stiff stand for better prices.

Mill prices on plain material per lb.: 1.95c. to 2.05c., base, Chicago.

Rails and Track Supplies.—A Western railroad has closed for 14,000 tons of standard-section rails. Fresh inquiry is developing slowly as the end of the rail buying movement is in sight. Business before Chicago mills, however, is not less than 75,000 tons. Orders for light rails are running ahead of the first month of last year, but the total business in this commodity is of small proportions. The railroads are now willing to take heavy shipments of track accessories and operations have been speeded to conform closely with rail output. Orders for track accessories totaled 25,000 tons. New inquiry is in small volume.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Bars.—Recent advances in prices appear to have had the effect sought by producers in that sales in soft steel bars are unusually heavy, comparing favorably with the best weeks in many months. The demand is widespread and well balanced, with a widened circle of users. Judged by the demand for steel, the agricultural implement industry is in full swing. In some quarters a check was reported in the manufacture of automobiles, but it has had practically no effect on Chicago mills. The automotive industry is making a close study of its March requirements. An improvement is noted in the demand for iron bars, prices on which are steady at 1.90c., Chicago. Alloy bar mills are busy and deliveries are extended. Late in getting under way, the demand for rail steel bars is hitting a fair stride. Individual specifications are small but numerous, and they are causing mills no little trouble in maintaining reasonable rolling schedules, at the same time conforming to promised delivery dates. Backlogs are small and producers have been hesitant either to advance the price above 1.80c., Chicago Heights mills, or to increase mill operations more than a nominal amount.

Mill prices per lb.: Soft steel bars, 1.95c. to 2.05c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Sheets.—A widespread demand for sheets has necessitated an expansion in hot-mill operations, but specifications are at close range and producers can foretell operations only a week in advance. Deliveries are prompt, ranging 10 days to two weeks, depending on the product. Prices are steady under small scale buying.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Cast Iron Pipe.—Fresh inquiry gives promise of an accurate check on prices in tonnage lots. Recent sales have been small at prices that range from $28 to $30, Birmingham. Springfield, Ohio, is taking bids on 4400 tons of 36-in. class B pipe, and Madison, Wis., will purchase 600 tons of 6 to 12-in. class B pipe. Other inquiry is for 400 tons by Rochester, Minn., and an unstated tonnage by Conneaut, Ohio. The American Cast Iron Pipe Co. is reported to be low bidder on 1000 tons of 6-in. to 24-in. centrifugal pipe at Minneapolis. Deliveries are a trifle easier, ranging from 20 to 30 days.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $34.20 to $36.20; 4-in., $38.20 to $40.20; Class A and gas pipe, $4 extra.

Wire Products.—Effective Jan. 25 the leading producer of wire and nails advanced quotations $2 a ton. Chicago delivered prices to jobbers in carload lots are now $2.70 on common nails and $2.55 on plain wire. Galvanized and cement coated nails and staples and spring, galvanized and barbed wire and plain fence wire were also advanced $2 a ton. No change was made on woven wire fencing or steel posts. It was announced that the new prices were for acceptance on contracts for specification and delivery up to and including March 31. The last two weeks was marked by rapid strengthening in this market. The spring buying movement, which often does not get in full swing until February, has already grown to considerable proportions. Mill stocks were of fair size and well balanced early in January, but as the month comes to a close producers are depending on current output to fill orders and buyers are not getting the service in deliveries that they had become accustomed to in recent months. Mill output has been advanced to 67 per cent of capacity. Demand for wire products is widespread, being particularly good in the South and in the Middle States. Shipments of nails are heavy. Reports from the Northwest are more promising. Prices for wire products are given on page 353.

Wire Rods.—Local producers announce a price advance to $45, Chicago. New buying is in small volume, but specifications are liberal.

Hot-Rolled Strip.—Competition remains keen in this commodity and lower prices are the rule rather than the exception where desirable tonnages are at stake. Minimum prices for 6 in. and narrower are 2.20c., or occasionally a shade lower, and 2c. is not uncommon on wide strips. New buying is quiet, but specifications are of fair size.

Reinforcing Bars.—Shop operations have been reduced steadily and now do not average over 50 per cent of capacity. The outlook, however, is favorable. Projects that have been active remain so and each week finds a number of new developments in the hands of estimators. The Illinois State roadway program for 1928 is unusually large and already about 200 tons of rail steel bars has been placed for construction that will be begun in the early spring. Rail steel bar mills have revised price schedules on work of that kind and are now asking 1.85c. for slab reinforcement and 1.95c. for bars that go into culverts and bridges. Recent lettings and new projects are shown on page 369.

Coke.—Demand for by-product coke for foundry use is increasing. Prices are steady at $9, f.o.b. local ovens, and $9.50, delivered in the Chicago switching district.

Bolts, Nuts and Rivets.—A feature of this market is an advance in output to 70 per cent of capacity, following liberal releases by the automotive trade, manufacturers of farm implements and car builders. Railroad buying also is active. Large rivets are quoted at $2.85, Chicago, for immediate or future delivery.

Cold-Rolled Strip.—Sales of this commodity are small and afford no real test of price advances announced a week ago. The greater portion of large users and many small buyers had placed contracts at the old quotations. Specifications are liberal.

Old Material.—The Chicago scrap market is now displaying signs of strengthening. This is not a reflection of large consumer interest, but of miscellaneous inquiry by many buyers of small tonnage. With yards operating at reduced capacity, it is not always possible for dealers to cover short sales as rapidly as is their wish. The net result of this situation is that prices being paid by brokers have held close to a dead level for the past week and indications are at hand that higher prices may be paid in the near future. Railroad shipments are a trifle heavier. Dealers and consumers continue to bid against each other on lists and the general level of prices paid to railroads is on a par with two weeks ago when the market reached its highest point of interest and large consumer buying was active. In consequence the margins on recent orders are narrow. Active bidding for cast iron borings has advanced prices paid by dealers to $11 a gross ton. Offerings of rerolling rails by the railroads are large. The Santa Fe sold 1200 tons this week and tonnage of this grade on track is fully equal to the demands of local mills. Lists offered this week include 50,000 tons by the Pennsylvania; 4500 tons by the Burlington, and a blank list by the New York Central.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	14.25 to 14.75
Hydraulic compressed sheets	10.75 to 11.25
Drop forge flashings	9.75 to 10.25
Forged, cast and rolled steel carwheels	15.50 to 16.00
Railroad tires, charging box size	16.25 to 16.75
Railroad leaf springs, cut apart	16.25 to 16.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	14.50 to 15.00
Coil springs	16.50 to 17.00
Electric Furnace Grades:	
Axle turnings	13.00 to 13.50
Low phosphorus punchings	14.25 to 14.75
Low phosphorus plate, 12 in. and under	13.50 to 14.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	10.25 to 10.75
Short shoveling turnings	10.25 to 10.75
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	15.00 to 15.50
Cupola Grades:	
Steel rails less than 3 ft	15.25 to 15.75
Angle bars, steel	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	13.75 to 14.25
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	14.00 to 14.50
Iron arch bars and transoms	18.75 to 19.25
Iron car axles	21.50 to 22.00
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	11.00 to 11.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.25 to 9.75
No. 2 busheling	4.25 to 4.75

Foundry Equipment Orders Higher

Based on reports from 16 companies, members of the Foundry Equipment Manufacturers' Association had net orders in December amounting to 106.2 per cent of the average monthly shipments of 1922-23-24. Shipments were at 110.4 per cent and unfilled orders represented 103.5 per cent of a month's average output. Orders were the highest since June, but considerably below the average of the first six months of 1927. In December, 1926, gross orders amounted to 181 per cent, compared with 106.8 per cent in the corresponding month of 1927.

The plant of the British-American Metals Co., manufacturer of brass and copper boiler tubing, Plainfield, N. J., was destroyed by fire on Jan. 29. It will be rebuilt.

New York

Large Inquiries for Steel Pipe—Pig Iron Demand Increasing

NEW YORK, Jan. 31.—Demand for pig iron is not only increasing, but there are evidences that some melters are preparing to make speculative purchases, believing that prices are headed upward. For example, a melter who has never bought more than 1000 tons at a time offers to pay cash for several times that tonnage for delivery as needed. Several buyers who have just recently placed orders are in the market for additional iron. The Thatcher Co., for instance, is asking for quotations on 1500 tons of No. 2 plain for its Garwood, N. J., plant and 1000 tons of No. 2X for its Newark, N. J., foundry for delivery during the remainder of this quarter. The Eastern Malleable Iron Co., Naugatuck, Conn., is inquiring for 2500 to 3000 tons of malleable. W. P. Laytham of W. P. Laytham & Sons Co. and the Eagle Iron & Brass Foundry, Inc., Passaic, N. J., is asking for prices on 3000 to 5000 tons of high silicon iron. The American Tube & Stamping Co. division of the Stanley Works, Bridgeport, Conn., is reported to have closed against an inquiry for 3000 to 5000 tons of basic. Total sales in this territory during the week are estimated at 8500 tons. Ruling quotations on Buffalo foundry iron remain at $17, base furnace, while eastern Pennsylvania foundry ranges from $19 to $19.50, base furnace.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.89 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Finished Iron and Steel.—A line pipe inquiry for 150,000 tons, an inquiry for 15,000 tons of pipe for export, a sale of 4000 tons of pipe for Ontario, Canada, and a rail order of 13,494 tons are among the outstanding developments of a more active steel market. Representatives of steel companies express satisfaction with the volume of incoming business, which, though largely in the form of specifications against contracts rather than new business, is of a more urgent character, indicating that buyers are influenced not only by their own expanding requirements but also by the extension of deliveries on some products. There is a good deal of room for improvement in the tonnage received by Eastern mills for plates and shapes, but the volume is slightly larger on these products as well as on bars. Sheets and strip steel are in good position from the mill point of view, and in some instances makers of sheets are not promising shipments in less than three or four weeks. Eastern mills have generally followed the advance of $1 a ton, quotations now being 2.14½c. on shapes and 2.17¼c. per lb. on plates, delivered New York. Bars are now 2.19c., New York. The Central Railroad of New Jersey has ordered from the Bethlehem Steel Co. 10,830 tons of 130-lb. and 2664 tons of 100-lb. rails.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c.; plates, 2.17½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Reinforcing Bars.—The McClintic-Marshall Co. will furnish 500 tons of bars for a section of the subway in Manhattan, and Igoe Brothers will provide 250 tons for a warehouse at Garden City, N. Y. The volume of smaller jobs placed during the last week has been small. On Feb. 7 the mill price will be advanced $1 a ton to 1.95c. per lb., Pittsburgh. The Youngstown warehouse price is unchanged at 2.20c. or 2.57½c., on cars at New York. Out of New York warehouse the price is 2.80c. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons and 3.24c. for less than 2 tons, all delivered at job.

Warehouse Business.—Orders are smaller and less numerous than earlier in the month. Effective Jan. 25, black and galvanized sheets have been reduced to 4c. per lb., base, for black and 4.70c. per lb., base, for galvanized. New Jersey jobbers are still quoting 4.20c. per lb., base, for black and 4.95c. per lb., base, for galvanized.

Cast Iron Pipe.—Yonkers, N. Y., has purchased about 370 tons of 6 and 8-in. water pipe and some export business has been booked, including a small tonnage for a private user in Cuba and about 2000 tons for Manila, P. I. Bids on about 8000 tons of cast iron pipe for Camaguey and Santiago, Cuba, recently reported placed with the French maker, are understood to have been rejected and a new inquiry will be issued. Prices are fairly firm, but show no tendency to advance.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Coke.—Demand is small and prices are unchanged at $4 per net ton, Connellsville, for foundry grade and $2.75 to $3 per ton, Connellsville, for furnace coke. Delivered prices are: To northern New Jersey, $8.03;

CARNEGIE LIBRARY OF ATLANTA

to New York or Brooklyn, $8.79; to Newark or Jersey City, $7.91. By-product coke continues at $9 to $9.40 per net ton, delivered Newark or Jersey City.

Old Material.—Prices of all grades are substantially unchanged. Business is confined to small transactions and shipments on old contracts. Some export business is in prospect if prices offered by foreign buyers are increased slightly. Japanese exporters have been purchasing old rails and are still in the market for No. 1 heavy melting steel, while agents of German mills have been inquiring for No. 1 heavy melting steel. Machine shop turnings are being purchased at $10.75 to $11 per ton, delivered eastern Pennsylvania. Stove plate is quoted at $12.50 per ton, delivered.

Dealers' buying prices per gross ton, New York:

No. 1 heavy melting steel	$10.00 to	$10.85
Heavy melting steel (yard)	6.75 to	7.25
No. 1 heavy breakable cast	11.25 to	12.00
Stove plate (steel works)	8.75 to	9.00
Locomotive grate bars	8.75 to	9.00
Machine shop turnings	6.75 to	7.50
Short shoveling turnings	7.00 to	7.50
Cast borings (blast furnace or steel works)	6.75 to	7.50
Mixed borings and turnings	7.00 to	7.50
Steel car axles	16.00 to	16.50
Iron car axles	23.75 to	24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)		8.75
Forge fire	6.50 to	7.00
No. 1 railroad wrought	10.50 to	11.00
No. 1 yard wrought, long	9.00 to	9.50
Rails for rolling	10.50 to	11.00
Cast iron carwheels	11.25 to	11.75
Stove plate (foundry)	8.75 to	9.00
Malleable cast (railroad)	10.00 to	10.50
Cast borings (chemical)	11.00 to	11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.50 to	$14.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.50 to	12.00
No. 2 cast (radiators, cast boilers, etc.)	11.00 to	11.50

Cleveland

January Steel Business Larger Than December's for Some Mills

CLEVELAND, Jan. 31.—January has made a very good showing in the volume of finished steel business, which with some mills was larger than during December, when specifications for January shipment were heavy. The volume of business with a number of the mills during the closing week of the month did not hold up to that earlier in the month. This statement applies to sheets and strip steel as well as to the heavier forms of finished steel. Consumers specified heavily early in the month and many have not yet felt the need of issuing additional specifications.

The automotive industry is under good operation, although not going at capacity. As automobile manufacturers and parts makers generally are under contract for the first quarter, very little new business is coming from this source.

Structural inquiry has fallen off. The advance to 1.85c., Pittsburgh, on steel bars, plates and structural material is being adhered to. Few sales have been made at the advance, as most buyers covered at 1.80c., Pittsburgh. Local mills quote steel bars at 1.85c., Cleveland. A Cleveland plate mill has followed the advance to 1.85c., Pittsburgh.

The award of 57,800 tons of structural steel by the Cleveland Union Terminals Co., a New York Central Railroad interest, reported last week, for various construction work in connection with the Cleveland Union Depot project, about completes, for the present at least, the buying of structural steel for this project. However, the laying of new tracks is expected to require considerable steel for grade elimination work, but this steel may not be bought until next year. The total amount of structural steel purchased for this project, including the 57-story Terminal Tower Building, one section of which is now completed and occupied, the station proper, several viaducts, a lift bridge, a railroad bridge across the Cuyahoga River and valley and several commercial buildings, is approximately 108,000 tons. Of this, various contracts placed with the American Bridge Co. aggregate 95,800 tons. The Mount Vernon Bridge Co. has taken 10,200 tons and the McClintic-Marshall Co. 2000 tons.

Pig Iron.—Sales by Cleveland interests amounted to 24,000 tons the past week, or a gain of 5000 tons over the previous week. Furnaces took many small orders from consumers who are following a hand-to-mouth policy in buying. Not much business has been booked for the second quarter and sales for that delivery are expected to fall below those for the first quarter, as considerable fourth quarter iron was carried over to this quarter and many consumers will carry over first quarter iron to the second quarter. Most producers shipped in January as much iron as they made, but some producers still have fairly large stock piles. Some furnaces shipped more iron during January than during the corresponding month last year and others about the same amount. Shipments to the automotive industry in the Michigan territory continue heavy. Prices are unchanged. Producers are willing to take second quarter business at current prices. A Muncie, Ind., foundry placed 2000 tons of malleable iron for the second quarter, dividing it among four furnaces at a delivered price equivalent to a $17 Lake furnace price, although a Cleveland producer had to shade its price to $16.50 to overcome a 50c. freight disadvantage. For delivery in the territory adjacent to Cleveland $17 is being maintained. Furnaces are holding quite generally to $18 for foundry and malleable grades for Michigan delivery, but $17.50 has not disappeared. Sales include 500 tons of basic iron by a Lake furnace to a north central Ohio steel foundry.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Semi-Finished Steel.—A $2 a ton price advance to $44, Cleveland, has been made on wire rods for the remainder of the first quarter. Many consumers covered at $40 before the last price advance. Sheet bars, slabs and billets are unchanged at $33, Cleveland. Specifications are good.

Sheets.—While a fair amount of new business is coming out, mills are depending largely on specifications received earlier in the month to keep them operating at close to capacity. Outside of the automotive field the demand is only moderate. A few inquiries are coming out for March shipment. While most leading manufacturers are holding to regular prices, concessions of $2 a ton from these prices have not disappeared, or 2.80c., Pittsburgh, on black sheets in common grades and 2c. on blue annealed. Galvanized sheets are unchanged at 3.65c., Pittsburgh. A Cleveland producer has advanced auto body sheets to 4.15c., but others are still on a 4c. base.

Strip Steel.—Some makers have followed the advance on cold-rolled strip steel of $3 a ton, now quoting 2.90c., Cleveland, for 3 tons or over, and 3.15c. for 1 to 3 tons, but 2.75c. and 3c. have not disappeared. Fender stock is irregular, ranging from 4.15c. to 4.20c., Cleveland. Specifications are good but there is little new business, as nearly all consumers are under contract for the quarter. Hot-rolled strip is firm at 1.85c., Cleveland, for material 6 in. to 12 in. wide, and at 2.05c. for narrower than 6 in. Most shipments on contract are being made at lower prices.

Wire Products.—A price advance of $2 a ton on nails and wire has been announced by all the leading pro-

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.50c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb	$2.90
No. 9 galvanized wire, per 100 lb	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

ducers to apply on business taken during the remainder of the first quarter. New prices are $2.65 per keg, Cleveland, for nails and $2.50 per 100 lb. for plain wire. Before the advance, buyers not fully covered for the quarter were allowed to place supplemental orders and consequently little business will be taken for the current quarter at the higher prices.

Reinforcing Bars.—Awards include 1600 tons for a factory building in Toledo. Work in connection with the Cleveland Union Terminals project will require 2000 tons in addition to 1600 tons still pending. Local warehouse prices are irregular. Rail steel bars are unchanged at 1.65c., mill.

Warehouse Business.—Sales show a fair gain. Prices are being firmly maintained and there is talk of an advance on sheets.

Coke.—Cold weather has stimulated the demand for by-product coke for domestic use. The price is unchanged at $4.50, Ohio ovens. Heating coke is moving slowly, with $2.75 the ruling price at Connellsville for early shipment. Connellsvile foundry coke is unchanged at $3.75 to $5.10, ovens.

Bolts, Nuts and Rivets.—Demand for bolts and nuts is fair, holding to the gain reported earlier in the month. Rivet specifications, which have been light, improved somewhat during the week. Little new business is coming out for either product, as buyers generally are under contract. Prices are firm.

Old Material.—Demand is limited to small-lot purchases by dealers to cover old orders. Prices are no lower except on No. 1 busheling. Plenty of scrap is coming out at ruling quotations and some of the mills are not taking material as freely as early in the month, shipments having been received faster than needed. Small-lot purchases were made by local dealers during the week at $14 and $13.50 for Nos. 1 and 2 heavy melting steel and at $10.50 for blast furnace scrap. No. 1 busheling scrap has declined to around $11, Cleveland, reflecting the weak market on this grade in Detroit.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75

Philadelphia

New Steel Orders Small—Eastern Mills Quoting on New Price Bases

PHILADELPHIA, Jan. 31.—Mills are receiving a steady flow of specifications against contracts for plates, shapes and bars, but purchasing at the new price levels is limited to occasional small tonnages, most consumers having covered their requirements for the present quarter. Plates and bars are firm, but there is still irregularity in shape prices because of hang-over projects. On new business all eastern Pennsylvania mills are now quoting on the advanced basis.

Pig iron is quiet and the only test of $19.50 per ton, base, on foundry iron has been in purchases of carload lots or a few hundred tons. With most mills carrying fair stocks of scrap on their yards, the old material market continues quiet. The list of the Pennsylvania Railroad, bids on which open Feb. 1, offers close to 45,000 tons of scrap.

Iron and steel warehouses in this district have adopted a list of quantity extras on iron and steel bars and small shapes.

Pig Iron.—Consumers of foundry iron are fairly well covered so that present purchasing is only of occasional carload lots, on which the price of $19.50 per ton, base, is apparently quite firm. There is some inquiry in the market for malleable iron, including a small tonnage for a Baltimore foundry. Small sales of low phosphorus iron continue. Importers of British low phosphorus report that their prices have been advanced about 50c. a ton to $23.50 to $24 per ton, duty paid, Atlantic port. No sales of basic are reported.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.		$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.		20.76
East. Pa. No. 1X		21.26
Basic (delivered eastern Pa.)	$19.50 to	20.00
Gray forge	19.75 to	20.25
Malleable	21.00 to	21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to	24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to	24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to	25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to	25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Mills are maintaining the new basis of 1.85c. per lb., base, Pittsburgh, or 2.17c. per lb., Philadelphia, but activity is principally in specifications against existing contracts at the former schedule.

Shapes.—All eastern Pennsylvania mills have advanced to the new level of 1.85c. per lb., Pittsburgh, 2c. per lb., Bethlehem, 1.97½c. per lb., Pottsville, or 2.12c. to 2.13c. per lb., delivered Philadelphia. With contracts at lower prices still in existence, occasional shading still appears. An obstacle to greater firmness is the fabricated material market, bids in which have not yet reflected the upward movement in shapes. In addition to sizable bridge contracts, local fabricators have in prospect the projected Fox theater and office building for Seventeenth and Market Streets, estimated to cost $11,000,000.

Plates.—Prices are being quoted at 2c. per lb., Coatesville, or 2.10c. per lb., delivered Philadelphia, and all eastern Pennsylvania producers are now on the new basis. Specifications against contracts are liberal, but new business is limited.

Sheets.—Blue annealed sheet prices are steady at 2.10c. per lb., base, with widths greater than 40 in. taking a 10c. per 100-lb. extra. Both black and galvanized sheets, however, still exhibit occasional weakness. A motor company is reported to have obtained a concession on black sheets; galvanized sheets also have been slightly shaded.

Warehouse Business.—Demand for material from warehouse stocks is small. A list of quantity extras adopted by the warehouses selling iron and steel bars and small shapes applies the base price to orders for 2000 lb. or more. For 1500 to 1999 tons the extra is

13c. per 100 lb.; for 1000 to 1499 tons, the extra is 30c. per 100 lb. and for less than 1000 lb. the extra is 50c. per 100 lb. Iron and steel bars are being quoted at 2.40c. per lb., base, and shapes at 2.40c. to 2.60c. per lb.

Ferromanganese.—Quotations continue unchanged at $100 per ton, seaboard. Both British and domestic sellers are inclined to discount recent reports that a small advance in price was contemplated.

Imports.—In the week ended Jan. 28, a total of 696 tons of pig iron was received at this port from India. Steel arrivals included 339 tons of structural shapes and 8 tons of steel bars from Belgium; from France, 42 tons of steel billets, 24 tons of bars and 22 tons of structural shapes and 35 tons of hoops and bands; from the United Kingdom, 6 tons of hoops and bands.

Old Material.—Prices of all grades are unchanged. One eastern Pennsylvania consumer with sufficient tonnage of stove plate, machine shop turnings and yard steel is offering to make further purchases at 50c. less than was recently paid, but no transactions are reported at the lower level. The list of the Pennsylvania Railroad, bids on which open Feb. 1, offers close to 45,000 tons of iron and steel scrap.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	15.25 to	15.75
Bundled sheets (for steel works)	10.50 to	11.00
Machine shop turnings (for steel works)		11.00
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast boring (for steel works and rolling mill)		11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars		13.00
Stove plate (for steel works)		13.00
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to	18.50
Couplers and knuckles	16.00 to	16.50
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.00 to	10.50
Machine shop turnings (for rolling mill)	11.00 to	11.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to	13.50
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire	11.00 to	12.00
Steel rails for rolling	15.00 to	15.50
Cast iron carwheels	15.50 to	16.50
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	15.00 to	15.50

Steel Corporation Fails to Earn Common Dividend

Fourth Quarter Earnings Lowest Since Last Quarter of 1924—Bethlehem Profits Also Show Decrease

EARNINGS of the United States Steel Corporation for the last quarter of 1927 were $31,247,529, roughly $10,000,000 less than in the preceding quarter, and the lowest since the fourth quarter of 1924, when earnings of $30,939,912 were shown. In the corresponding quarter of 1926 the corporation earned $53,502,525.

In terms of the present common stock issue of 7,116,235 shares, earnings in the past quarter, after payment of preferred stock dividend, amounted to $1.05 per share, and for the first time since the third quarter of 1924 common dividend requirements were not met. Additional common stock recently issued does not account for this fact as the deficit for the quarter ended Dec. 31, 1927, was $4,963,499, or considerably higher than the additional dividend requirements necessitated by the common stock increase.

Based upon quarterly statements for the year, the indicated surplus available for common and preferred dividends, after all other charges, is $87,845,456. This compares with $116,667,404 in 1926 and with $90,602,653 in 1925. After dividend requirements which were declared for the present quarter at the usual rate of 7 per cent yearly, balance to surplus for 1927 amounted to $12,812,134. In 1926, $25,783,238 was added to surplus after an appropriation of $30,000,000 for improvements and additions to plants and property.

The following table shows earnings in recent years by quarters:

Quarters	1927	1926	1925	1924
First	$45,584,725	$45,061,285	$39,882,992	$50,075,445
Second	46,040,460	47,814,105	40,624,220	41,381,039
Third	41,373,831	52,626,826	42,400,419	30,718,415
Fourth	31,247,529	53,502,525	42,630,840	30,939,912

Bethlehem Earnings Also Show Decrease

The Bethlehem Steel Corporation also showed a decrease in earnings for 1927, its net income amounting to $15,826,142 or $5.02 per share of common stock, as compared with $20,246,167 or $7.48 a share in 1926. In the past quarter Bethlehem profits were $2,371,371, equivalent to 37c. per share on the common stock. This compares with $2,788,053 or 61c. a share in the preceding quarter, and with $4,481,316 or $1.55 a share in the fourth quarter of 1926.

Earnings of Other Companies

The Crucible Steel Co. of America had net earnings in 1927 of $5,617,145, compared with $6,547,731 in 1926. The Gulf States Steel Co. earned $756,402 in 1927, as compared with $799,792 in the preceding year. This company's earnings in the fourth quarter of 1927 were $234,994, compared with $150,182 in the preceding quarter, and with $234,852 in the fourth quarter of 1926.

The Superior Steel Corporation reported a deficit for 1927 of $189,847, compared with net profits of $271,817 in 1926. The deficit in the fourth quarter of 1927 was $73,223, compared with $32,608 in the preceding quarter and with profits of $5,712 in the last quarter of 1926. The Virginia Iron, Coal & Coke Co. also had a deficit in 1927, which amounted to $170,291, compared with net profits of $84,022 in the preceding year.

EARNINGS FOR FOURTH QUARTER OF THE UNITED STATES STEEL CORPORATION

	Earnings Before Charging Interest on the Subsidiary Companies' Bonds Outstanding	Less: Interest on the Subsidiary Companies' Bonds Outstanding	Balance of Earnings
Oct., 1927	$12,526,787	$657,317	$11,869,470
Nov., 1927	10,281,777	656,845	9,624,932
Dec., 1927	10,408,428	655,301	9,753,127
	$33,216,992	$1,969,463	

Total earnings after deducting all expenses incident to operations, also estimated taxes and interest on bonds of the subsidiary companies		$31,247,529
Less, charges and allowances for depletion and depreciation, applied as follows, viz.:		
To depletion and depreciation and sinking funds on bonds of subsidiary companies	$10,623,859	
To sinking funds on United States Steel Corporation bonds	2,940,068	
		13,563,927
Net income		$17,683,602
Deduct: Interest for the quarter on United States Steel Corporation bonds outstanding	$4,115,658	
Premium on bonds redeemed	323,969	
		4,439,627
Balance		$13,243,975
Add: Net balance of sundry receipts and charges, including adjustments		550,858
Total		$13,794,833
Dividends:		
Preferred, 1¾ per cent	$6,304,920	
Common, 1¾ per cent	12,453,412	
		18,758,332
Deficit for the quarter		$4,963,499
Balance of surplus for nine months ended Sept. 30		17,775,633
Balance of surplus for the year		$12,812,134

Birmingham

New Steel Tonnage Developing at a Satisfactory Rate

BIRMINGHAM, Jan. 31.—Only a small amount of new iron tonnage is coming in. Birmingham furnaces continue to quote foundry iron on a $16 base. The Woodward Iron Co. changed its basic furnace back to foundry on Jan. 25 and is now operating these on foundry. Seventeen furnaces are in blast in Alabama, 10 on foundry, six on basic and one on recarburizing iron. It is expected that the Tennessee company will place a Bessemer furnace in blast within a short time. All but the six Ensley furnaces of the Tennessee company are now idle.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil	$16.00
No. 1 foundry, 2.25 to 2.75 sil	16.50
Basic	15.00

Finished Steel.—New tonnage is developing at a satisfactory rate and the market has a firmer tone. Business lately has been encouraging and prospects for the next several months are good. The Tennessee Coal, Iron & Railroad Co. has been gradually increasing open-hearth production at its Ensley works and now is operating eight and nine. At the Fairfield works the number is unchanged at four. The Gulf States Steel Co. continues with four. Structural steel fabricators report little change in market or operations.

Cast Iron Pipe.—Tonnage is pending from two cities in Florida and one in North Carolina. Minneapolis and New York each placed around 1000 tons with Birmingham plants. All pressure pipe producers report that small business is accumulating at a steady rate. Market conditions have improved during the past 10 days.

Coke.—Moving in fairly good volume. Price remains at $5.

Old Material.—Business is somewhat improved and inquiries are increasing. Prices are unchanged.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00 to 8.50
Stove plate	13.00 to 14.00
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	15.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Youngstown

Sheet Makers Taking Stronger Stand on Prices

YOUNGSTOWN, Jan. 31.—Steel business has been going on as usual, despite the fact that the mergers involving companies in this district have been getting the attention of the executives and have been the principal topics of trade discussions. Steel manufacturers report a considerable improvement in sales, production and shipments as compared with the closing months of last year and they are hopeful for the future. The automotive industry, which means so much to the district on account of the preponderance of sheet-making capacity, is not yet buying freely and there is the expectation that as automobile production moves upward, steel requirements must expand very substantially. No complaint is heard as to the movement of bars and small shapes, which are firmly held at the new base of 1.85c., Pittsburgh, on new business and on which it is commonly believed still higher prices will be reached on second quarter contracts. Mills are beginning to take a stronger stand on sheet prices, and while competition and the fact that buyers were covered pretty heavily for this quarter at lower prices makes impossible getting the full first quarter prices, it seems to be the intention of makers to get 2.90c., base, Pittsburgh, 3.75c., base, and 2.10c., base, respectively, for black, galvanized and blue annealed sheets on second quarter business.

Good specifications are coming to the tin plate mills in the district, which now have orders sufficient to sustain an operation of slightly over 75 per cent of capacity. Output of this product in this district will be materially increased by changes that are to be made in the operation of the Trumbull works, where through partial use of the continuous strip mill for breaking down slabs it is planned to double the present output of the Trumbull and Liberty mills, which now have a rated annual capacity of 2,500,000 base boxes.

There is a seasonal increase in the demand for standard weight pipe, and the leading producer still has a good order book in line pipe, but the general average is kept down by the continued lack of activity in oil country goods. An effort is being made to extend the curtailment of oil production in the Seminole, Okla., field for another three months with the expiration of the present agreement on March 31. If this move is successful it probably will mean drilling operations in other fields and a demand for well pipe, but failure would mean the release of so much oil now capped that the effect would be fresh weakness in oil prices and little or no drilling elsewhere. Line pipe promises to be the backbone of pipe business next spring and summer as the lines now pending amount to no less than 2000 miles, for which 200,000 tons is probably a conservative estimate, since much of the pipe is of large outside diameter.

Semi-finished steel is not moving with much snap at present, but this is explained by the fact that sheet bars constitute most of such business and the principal buyers are the companies that have been combined in the Empire Steel Corporation. The working out of details of that merger have engaged those interested to the exclusion of other matters. Sheet bar makers still call the market $34, mill, or $34.50, delivered Youngstown district.

Pig iron is not doing much. Weakness in the Pittsburgh market has had the effect of restricting local purchases of scrap.

Steel works operations in the so-called Youngstown district are running from 70 to 75 per cent of capacity. Since the first of the month the Carnegie Steel Co. has put on three blast furnaces, two Ohio and one Farrell, while last week Republic Iron & Steel Co. started up its No. 4 furnace at Hazleton. The latter has written off its No. 1 furnace and now has only four workable stacks. Through improvement in equipment and in practice, these four furnaces are producing as much iron as formerly was obtained from five, while the No. 2 stack, rated at 600 tons a day, has been averaging more than 800 tons daily during the past three months and has on several days gone over 900 tons.

With the absorption of Trumbull Steel Co. by Republic Iron & Steel Co., the name of the former will disappear and the plant at Warren, Ohio, will be known as the Trumbull or Warren works of the Republic company. A number of Trumbull men now located at Warren will come to Youngstown. The new personnel of the combined companies will be announced within the next two weeks.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, $\frac{7}{16}$-in. and smaller, 100 lb. or more	70
Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

St. Louis

Steel Business at Greatly Improved Rate—Pig Iron Melt Increasing

ST. LOUIS, Jan. 31.—Shipments of pig iron are being well maintained, but sales are light. Of the sales by the Granite City maker, 500 tons went to a district user of malleable, 750 tons of foundry grades went to a central Illinois melter, 400 tons of foundry to a St. Louis consumer and 250 tons of this grade to a Kansas City melter. Most of the sales were for first quarter shipment.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Because of the increase in pig iron melt, there has been a better demand for metallurgical coke, and shipments are holding up well. The trade in domestic grades is slow.

Finished Iron and Steel.—The Granite City mill reports that since Jan. 1 business has been coming in better than at any time during the last five months; that its production of ingots is about 85 per cent of capacity. Its sheet and tin mills are operating at full capacity and its plate operations are at 65 per cent of capacity. Warehouse business is quiet, although there is an improvement over December sales. Structural fabricators' business is still very light.

Old Material.—Heavy offerings by railroads and country dealers which weakened the market a week or so ago have been absorbed and prices are steadier. The only change this week is a decline of 50c. a ton on railroad springs. There has been some buying of melting steel and stove plate. Railroad lists include: Pennsylvania, 40,000 tons; Chicago, Burlington & Quincy, 4500 tons; Union Pacific, 2000 tons; Big Four, 1960 tons; New Orleans & Great Northern, 230 tons; Standard Oil of Indiana, 125 tons; Missouri Pacific, 120 cars; Chicago, Milwaukee & St. Paul, 40 carloads, and Mobile & Ohio, 32 carloads.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$12.50 to $13.00
No. 1 locomotive tires	14.00 to 14.50
Heavy shoveling steel	12.50 to 13.00
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.25 to 14.75
Railroad springs	14.50 to 15.00
Bundled sheets	9.00 to 9.50
No. 2 railroad wrought	12.50 to 13.00
No. 1 busheling	10.50 to 11.00
Cast iron borings	9.25 to 9.75
Iron rails	14.00 to 14.50
Rails for rolling	15.25 to 15.75
Machine shop turnings	8.00 to 8.50
Steel car axles	20.00 to 20.50
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	11.50 to 12.00
Steel rails, less than 3 ft.	15.75 to 16.25
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	15.50 to 16.00
Railroad malleable	12.50 to 13.00
No. 1 railroad cast	14.00 to 14.50
Stove plate	13.75 to 14.25
Agricultural malleable	12.50 to 13.00
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

Buffalo

Inquiry for 2500 Tons of Malleable—Steel Operations Increase

BUFFALO, Jan. 31.—The principal pig iron inquiry is from Eastern Malleable Co., Naugatuck, Conn., for 2500 to 3000 tons of malleable. The New York Air Brake Co. is in the market for 400 to 500 tons of malleable, following its recent purchase of 1000 tons of the same grade for its Watertown, N. Y., plant. While malleable has been held at $17.50, this price has lately been shaded on sizable business and better than $17 has been done by a buyer outside the Buffalo district. On foundry iron $17 is being shaded on eastern shipment, though holding firmly in this district. Some miscellaneous small inquiry is coming out and shipments are said to have increased. The Donner Steel Co., which banked a furnace recently, has the stack back in blast. The Hanna Furnace Co. has blown out one of its two stacks on Hamburg Street.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	$17.00 to 17.50
Basic	17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Good specifications are reported by sheet makers, automobile business being particularly active. Black sheets are firm, with more business being placed at 2.90c. Automobile body sheets are firm at 4c., and some business has been taken at 4.10c. Sheet mill operations are at 85 per cent. Improved mill operation is reported. The Donner Steel Co. has increased its active open-hearth furnaces to six and Bethlehem's Lackawanna plant has been operating 21 out of 24 open-hearths for some time. Demand for bars, shapes and plates is fair. Heavier buying of bolts and nuts is reported.

Old Material.—There has been some buying of heavy melting steel, including a 3000-ton transaction. A Buffalo consumer paid between $15.25 and $15.50 for this tonnage. Some inquiries have come out for low phosphorus billet and bloom ends, but no large tonnages have been sold. An offer of $10.75 is being made by a local consumer for short mixed turnings and borings; another consumer at a point taking a 63c. freight rate from Buffalo offered $11 for this material when last in the market. Short shoveling steel turnings for electric and blast furnaces have advanced to $11 to $11.50. A sale of steel rails, 3 ft. and under, at $17 to $17.25, is recorded.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades

No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	13.50 to 14.00
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.50 to 14.00
Hand bundled sheets	9.00 to 9.50
Drop forge flashings	11.50 to 12.00
No. 1 busheling	13.50 to 14.00
Heavy steel axle turnings	12.75 to 13.25
Machine shop turnings	9.00 to 9.25

Acid Open-Hearth Grades

Railroad knuckles and couplers	16.00 to 16.50
Railroad coil and leaf springs	16.00 to 16.50
Rolled steel wheels	16.00 to 16.50
Low phosphorus billet and bloom ends	15.75 to 16.00

Electric Furnace Grades

Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	11.00 to 11.50

Blast Furnace Grades

Short shoveling steel turnings	10.75 to 11.00
Short mixed borings and turnings	10.50 to 11.00
Cast iron borings	10.50 to 11.00
No. 2 busheling	9.00 to 9.50

Rolling Mill Grades

Steel car axles	16.75 to 17.25
No. 1 railroad wrought	12.50 to 13.00

Cupola Grades

No. 1 machinery cast	14.50 to 15.00
Stove plate	13.00 to 13.25
Locomotive grate bars	10.50 to 11.00
Steel rails, 3 ft. and under	17.00 to 17.25
Cast iron carwheels	13.00 to 13.50

Malleable Grades

Railroad	15.00 to 15.50
Agricultural	15.00 to 15.50
Industrial	15.00 to 15.50

Canada

Iron and Steel Industries Report Improved Business

TORONTO, ONT., Jan. 31.—Improvement continues to feature business in the iron and steel industries of Canada. Makers of railroad rolling stock equipment have recently closed large orders and other business of a like nature is pending. Rail mills are operating at capacity on orders closed late in 1927, and it is stated that both the Algoma Steel Corporation, Sault Ste. Marie, Ont., and the Dominion Iron & Steel Co., Sydney, N. S., have sufficient orders on hand to keep rail mills going at the present rate until about June 1.

Pig Iron.—Forward buying has fallen off because most melters are covered up to the end of March and some to the end of June. Hand-to-mouth buyers are responsible for the greater part of current demand for foundry and malleable iron. A small number have increased their daily melt. Orders for 100 to 200 tons are fairly common, and inquiries are being received for as high as 500 or 600 tons for immediate delivery. Deliveries against contract are also being speeded up. Imports of iron are holding to a high level. The Algoma Steel Corporation will soon blow in No. 4 blast furnace to take the place of one damaged recently by an explosion. Prices have become firmer and shading is gradually disappearing.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	25.00
No. 2 foundry, sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—The quiet state of the market has had a softening effect on some prices in Toronto and Montreal. Toronto dealers have recently purchased heavy melting steel at $8.50 per ton as against a former price of $9. A few other lines have been purchased below present market quotations. In the Montreal market dealers are now offering $20 per ton for wrought iron axles and $18 for steel axles as against former prices of $21 and $19 respectively. Other prices are unchanged. Shipments to United States buyers are running into larger tonnages than a month or six weeks ago.

Dealers' buying prices:

Per Gross Ton	Toronto	Montreal
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	6.00
Boiler plate	7.00	7.00
Heavy axle turnings	7.50	7.50
Cast borings	7.50	6.00
Steel turnings	7.00	6.50
Wrought pipe	5.00	6.00
Steel axles	14.00	19.00
Axles, wrought iron	16.00	21.00
No. 1 machinery cast	....	16.00
Stove plate	....	12.00
Standard carwheels	....	14.50
Malleable	....	13.00
Per Net Ton		
No. 1 machinery cast	15.00	....
Stove plate	9.00	....
Standard carwheels	13.00	....
Malleable scrap	13.00	....

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, 3/16-in. and over	3.15c.
Small angles, under 3/16-in.	3.55c.

Cement coated nails, 100-lb. keg	3.35

San Francisco

Southern Pacific Buys 3200 Tons of Track Spikes and Bolts

SAN FRANCISCO, Jan. 28 (*By Air Mail*).—Bookings of iron and steel products this week were mostly small lots. Considerable new work, however, is being figured on or is about to come out. The most important award of the week involved nearly 3200 tons of track spikes and bolts for the Southern Pacific Co., San Francisco.

Pig Iron.—Sales and inquiries are confined to unimportant lots. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

---

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Shapes.—Pending business calls for more than 20,000 tons. The largest inquiry involves about 5000 tons for a department store in Oakland. Prices continue firm at 2.35c., c.i.f.

Plates.—Demand for plates is practically at a standstill. No awards of importance or new inquiries have developed. Several Northwestern pipe line projects requiring over 3000 tons are expected to come up for figures in the near future. Producers are quoting 2.25c., c.i.f.

Bars.—The Pacific Fruit Express Co. has bought 475 tons of merchant bars and bands. The largest concrete bar award called for 200 tons for a dormitory at the University of California, Berkeley, and was booked by the Steel Service Co. Pending business does not involve a large total. Prices in the San Francisco district on out-of-stock material continue weak and as low as 2.25c. continues to be quoted in some instances.

Cast Iron Pipe.—Awards of cast iron pipe this week, with one exception, called for lots of less than 100 tons. R. H. Downer, San Diego, was awarded 155 tons of 4 and 6-in. class B pipe for improvement of Boundary Street, San Diego, Cal. Chowchilla, Cal., purchased standard pipe instead of 188 tons of 4 to 8-in. class B pipe. Pending business exceeds 3500 tons. Inquiries include 261 tons of 4 to 8-in. class B or centrifugal pipe for Pasadena, Cal., bids on which open Feb. 2; 137 tons of 4 to 10-in. class B pipe for Modesto, Cal., and 119 tons of 8-in. class B pipe for Eureka, Cal., bids on which go in on Feb. 7. During the past week bids were received on 264 tons of 4 to 8-in. class B pipe for the improvement of Voltaire Street, San Diego, Cal. Bert Noble was low bidder.

Track Material.—The Southern Pacific Co., San Francisco, has placed 28,000 kegs of track spikes, 2800 tons, and 3200 kegs of track bolts, 320 tons, with unnamed producers. No action has yet been taken on its inquiry for 4500 tons of tie plates. Bids were opened this week for the rehabilitation of the municipal railway system at Phoenix, Ariz., and Claude Fisher of Los Angeles submitted the only bid. This work involves 1500 tons of 70 and 75-lb. standard T rails.

Coke.—Sales and inquiries are limited to small lots. Prices continue unchanged.

Prescribes New Rates on Steel Products to Oklahoma and Texas

WASHINGTON, Jan. 31.—Rates, based on those prescribed in the Consolidated Southwestern cases, were prescribed by the Interstate Commerce Commission in a decision made public last Saturday to apply on shipments of iron and steel products, in carloads, from points in Pennsylvania, Ohio, Indiana, Illinois, Missouri, Kansas, Kentucky, Tennessee and Alabama and on shipments of iron or steel wire rope, in carloads, from Kansas City, Mo., to destinations in Oklahoma and Texas. The decision involved a number of complaints and after declaring existing rates unreasonable, provided for reparation.

Boston

Cold-Rolled Strip Prices Revised—Pig Iron Quiet—Scrap Weak

BOSTON, Jan. 31.—Pig iron sales the past week probably did not exceed 2000 tons, of which the Mystic stack took fully half. For the little business closed there was practically no competition. Furnaces east of Buffalo held to prices equivalent to $16.50 to $17 a ton, base Buffalo. Sales included 300 tons of Lake charcoal iron at $24 a ton, base furnace. A Massachusetts foundry is still negotiating for 1000 tons of No. 2 plain and No. 2X iron, and there is somewhat more inquiry for small tonnages with deliveries running into the second quarter. The most encouraging news is that the New England iron melt is increasing, particularly among the largest foundries.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$21.41 to	$21.91
Buffalo, sil. 2.25 to 2.75	21.91 to	22.41
East. Penn., sil. 1.75 to 2.25		23.15
East. Penn., sil. 2.25 to 2.75		23.65
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Coke.—By-product domestic coke was in excellent demand the past week owing to low temperatures and small stocks in distributers' hands. Domestic coke is selling on a basis of $8.50 a ton on cars, Everett, Mass. Specifications against first half foundry coke contracts are increasing. Foundry coke remains at $11.50 a ton, delivered within a $3.10 freight rate zone.

Cast Iron Pipe.—Malden, Mass., has awarded 300 tons of pipe to an unnamed foundry. Lowell, Mass., closed bids on Jan. 28 for 100 tons of 6 to 12-in. pipe, and Leominster, Mass., closes this week on 300 tons of 16-in. Gardner, Mass., closed bids several days ago on 150 tons of 6 and 8-in. pipe, but no award has been made, and Stone & Webster, Inc., has yet to close on 2000 tons of gas pipe. Private business slowed up somewhat the past week, but is still of fair proportions. The market for small pipe remains firm, but concessions are still available on large dimensions. On private business 4-in. pipe is selling at $45.10 to $46.10 a ton, delivered common Boston freight rate points, and 6 to 12-in. at $41.10 to $42.10. The usual $5 differential is asked on class A and gas pipe.

Cold-Rolled Strip Steel.—New England makers of cold-rolled strip have revised their quotations to conform to the new prices recently named by mills in the Pittsburgh and Cleveland districts. Current specifications are satisfactory in volume. Most Eastern mills have a good tonnage on their books. The Worcester mill is now quoting 3.30c. per lb. for lots under 3 tons and 3.05c. for larger lots.

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.
Structural shapes—	
Angles and beams	3.365c.
Tees	3.365c.
Zees	3.465c.
Soft steel bars and small shapes	3.265c.
Flats, hot-rolled	4.15c.
Reinforcing bars	3.265c. to 3.54c.
Iron bars—	
Refined	3.265c.
Best refined	4.60c.
Norway, rounds	6.60c.
Norway, squares and flats	7.10c.
Spring steel—

	Per Cent Off List
Machine bolts	50 and 5
Carriage bolts	50 and 5
Lag screws	50 and 5
Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Warehouse Business.—Wire nails out of warehouses are no higher despite the recent mill advance of $2 a ton to $2.65 per keg, base. A large stock held by one jobber is still offered at the old prices.

Old Material.—Prices for most kinds of scrap are steady and unchanged despite a falling off in business. Railroad wrought, however, is 50c. a ton lower, and $6.26 a ton on cars is the average price for steel turnings, as against $6.50 a week ago, although some recent sales were made at $6.60. For forge flashings $6.50 a ton on cars is the average price today, but sales were made the past week at $6, $7 and $7.25. One local firm is paying $13.50 to $14 a ton for shafting for Pennsylvania delivery, but a majority of dealers are not doing better than $13 to $13.50. Shipments of chemical borings are on old orders only, and the market is 50c. a ton lower. Textile cast is in liberal supply at $14 to $14.50 a ton delivered New England points, with few takers. Some business recently was closed at slightly better prices for Pennsylvania delivery. The Boston & Albany Railroad yesterday closed bids on approximately 1000 tons of miscellaneous material, and the Boston Elevated Railroad today on 1000 tons of girder rails and two cars of small scrap.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to	$9.25
Scrap rails	8.50 to	8.75
No. 1 railroad wrought	10.00 to	10.50
No. 1 yard wrought	8.00 to	8.50
Machine shop turnings	6.00 to	6.25
Cast iron borings (steel works and rolling mill)	6.00 to	6.25
Bundled skeleton, long	6.00 to	6.50
Forge flashings	6.50 to	7.00
Blast furnace borings and turnings	6.00 to	6.25
Forge scrap	6.00 to	6.50
Shafting	13.00 to	13.50
Steel car axles	15.50 to	16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	8.00 to	8.50
Rails for rerolling	10.00 to	10.50
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$14.00 to	$14.50
No. 1 machinery cast	14.50 to	15.00
No. 2 machinery cast	12.50 to	13.00
Stove plate		11.00
Railroad malleable	13.00 to	13.50

Cincinnati

Sheet Mill Operations Gain—Scrap Market Weakens

CINCINNATI, Jan. 31.—While pig iron consumers are specifying at a moderate rate against first quarter contracts, fresh sales have been of small volume and the market is devoid of sizable inquiries. There has been a slight gain in foundry operations, but the current basis of production is not considered satisfactory. A local dealer has sold 500 tons of foundry iron to an Indiana melter and a like amount to another company in this district. The price structure remains unchanged, with the Lake Erie sellers quoting from $16.50 to $17, base furnace, and southern Ohio makers asking $19, base Ironton. Southern iron is firm at $16, base Birmingham. Movement of Jackson County silvery iron has been slow.

The Hamilton Coke & Iron Co., Hamilton, Ohio, will begin operation of its blast furnace and by-product coke ovens in April. By that time construction of the railroad from the site of the plant to the East Side works of the American Rolling Mill Co. at Middletown will be completed and the new furnace will begin supplying hot metal to the East Side open-hearths. When the furnace is lighted, the American Rolling Mill Co. is expected to blow out one furnace at Columbus and may continue, temporarily at least, the operation of the second Columbus furnace on foundry iron for the merchant trade.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25		$20.89
So. Ohio malleable	$20.14 to	20.89
Alabama fdy., sil. 1.75 to 2.25		19.69
Alabama fdy., sil. 2.25 to 2.75		20.19
Tennessee fdy., sil. 1.75 to 2.25		19.69
Southern Ohio silvery, 8 per cent		26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—The gradual expansion of operations among consuming industries is proving of benefit to producers of finished steel. Many contract customers are authorizing the release of first quarter tonnages, while other buyers have been forced to come into the market and pay the new prices. The lack of major building projects is being felt in structural steel. Small fabricators are taking an increasing number of awards ranging from 100 tons downward, and so far as work on hand is concerned, are in the best position in several months. Bars, structural shapes and plates are quoted at 1.85c., base Pittsburgh, for first quarter delivery. In the sheet market conditions are regarded as satisfactory, with specifications and orders in January considerably in excess of those in January, 1927. The American Rolling Mill Co. reports that bookings in the past 30 days have been substantially greater than its producing capacity and that sales have been well distributed among all classes of buyers. The demand for its specialty grades of sheets has been particularly heavy, the volume of orders having been sufficient to carry operations well through the remainder of the quarter. All of the company's plants are operating on a basis which approaches full capacity. Prices are being well maintained on black and blue annealed sheets, which are quoted at 2.90c. and 2.10c., base Pittsburgh, respectively. On galvanized sheets, however, irregularities still are reported from the South, where concessions of from $1 to $2 a ton have been given. Sellers of wire goods have announced an increase of $2 a ton in common wire nails and in plain wire. The former is now priced at $2.65 a keg, Pittsburgh or Ironton, and the latter at $2.50 per 100 lb., Pittsburgh or Ironton. Consumers with first quarter contracts are protected at the old prices.

Reinforcing Bars.—New billet bars are quoted at 1.85c., base Pittsburgh, and rail steel stock at 1.75c., base mill.

Warehouse Business.—January closes with shipments out of local warehouses running about 5 per cent ahead of those in the corresponding month of 1927. The number of orders placed recently has been large, but the tonnage in the aggregate has been unsatisfactory. Prices are firm.

Coke.—By-product foundry coke will continue during February at the present price of $7.50 per net ton, f.o.b. ovens, or $9.62, delivered Cincinnati. In domestic grades walnut size is quoted at $5, ovens; No. 2 nut at $4.50 and egg at $5.50. At Detroit there will be no change in quotations the coming month. Shipments of foundry coke to automobile foundries are well maintained, but demand from jobbing foundries has been light. Prices of New River and Wise County beehive foundry coke are firm, although sales in this territory have been small.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates: $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—There has been a reaction among dealers, who find that mills will buy material only if concessions are made from present prices. Therefore it is the opinion of the trade that quotations are likely to dip slightly. The Norfolk & Western has put out a fair-sized list.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.75 to $12.25
Scrap rails for melting	12.50 to 13.00
Loose sheet clippings	9.00 to 9.50
Bundled sheets	9.50 to 10.00
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.50 to 9.00
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.50 to 8.00
Rails for rolling	13.00 to 13.50
No. 1 locomotive tires	13.50 to 14.00
No. 1 railroad wrought	11.50 to 12.00
Short rails	17.00 to 17.50
Cast iron carwheels	13.00 to 13.50
No. 1 machinery cast	16.00 to 17.00
No. 1 railroad cast	13.50 to 14.00
Burnt cast	8.00 to 8.50
Stove plate	9.25 to 9.75
Brake shoes	10.00 to 10.75
Railroad malleable	12.75 to 13.25
Agricultural malleable	12.25 to 12.75

Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb.	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

Detroit

Steel Requirements Increasing in Motor Industry and Other Lines

DETROIT, Jan. 31.—The demand for steel in the Detroit district continues steadily upward, and while the automotive industry is the largest factor, industrials generally are increasing steel consumption. As nearly as can be estimated, the increase in volume of bookings has been running about 4 per cent a week since early in January.

The general offices of the Ford Motor Co. were moved this week from Highland Park to the new $2,000,000 administration building at Fordson. The Ford payroll has been climbing steadily and now numbers 89,788, as of Jan. 27. The increase since the previous report, Jan. 14, is 3729, and this recruiting program is expected to continue until production has reached 2000 cars a day.

The Hudson Motor Car Co. has signed a contract for an additional two-story building, 80 x 640 ft., which will be rushed to completion. A number of divisions of the machine shops of the Hudson Motor Car Co. have recently been put on a two-shift a day basis, and a few divisions on full 24-hr. operation. A full night force is in process of organization.

The advance in bars, shapes and plates to 1.85c., Pittsburgh, is driving in a number of small orders.

An advance of 50c. per ton has been obtained on several small sales of pig iron.

The market on old material shows no further signs of weakness.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$12.00 to $12.50
Boring and short turnings	9.00 to 9.50
Long turnings	7.75 to 8.25
No. 1 machinery cast	16.00 to 17.00
Automobile cast	18.00 to 19.00
Hydraulic compressed sheets	10.75 to 11.25
Stove plate	11.50 to 12.50
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	10.00 to 10.50

Increased Freight Rates on Steel Drums Ordered Canceled

WASHINGTON, Jan. 31.—Proposed increased freight rates on iron or steel barrels or drums in carload lots from points on and north of the Ohio River and on and east of the Mississippi River and from Memphis and Nashville, Tenn., to New Orleans and points in the Mississippi Valley territory taking the same or related rates were found by the Interstate Commerce Commission not to be justified, in a decision announced last Saturday. The suspended schedules were ordered canceled, but without prejudice to the filing of new ones naming the same proposed rates to apply on new iron or steel barrels or drums of United States Standard gage No. 19 or thicker, in minimum-weight car lots of 13,000 lb. per 36-ft. 6-in. car, subject to Rule 34 of the Consolidated Classification. The carriers were given permission to establish the proposed sixth-class rates on old iron or steel barrels or drums of any thickness.

NON-FERROUS METAL MARKETS

The Week's Prices

Cents per Pound for Early Delivery

	Jan. 31	Jan. 30	Jan. 28	Jan. 27	Jan. 26	Jan. 25
Lake copper, New York	14.25	14.25	14.25	14.25	14.25	14.25
Electrolytic copper, N. Y.*	13.87½	13.87½	13.87½	13.87½	13.87½	13.87½
Straits tin, spot, N. Y.	54.62½	54.87½	....	55.25	54.75	55.12½
Lead, New York	6.50	6.50	6.50	6.50	6.50	6.50
Lead, St. Louis	6.30	6.30	6.30	6.30	6.30	6.30
Zinc, New York	6.02½	6.02½	6.02½	6.02½	6.02½	6.02½
Zinc, St. Louis	5.67½	5.67½	5.67½	5.67½	5.67½	5.67½

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, Jan. 31.—Activity is not pronounced in any of the markets. There has been very little demand for copper, but prices are firm. Sales of tin have been moderate at receding quotations. The lead market is steady. Demand for zinc is fairly good, with the market a little stiffer.

Copper.—Very little demand is reported from either domestic or foreign sources, so much so that prices are largely nominal. Electrolytic copper is firm at 14.12½c., delivered in the Connecticut Valley, with only one custom smelter reported willing to shade this price to about 14.05c. to 14.07½c. Copper Exporters, Inc., continues to maintain its official quotation at 14.50c., c.i.f. usual European ports. Lake copper is quoted unchanged at 14.25c., delivered.

Copper Averages.—The average price of Lake copper for January, based on daily quotations in THE IRON AGE, was 14.25c. The average price of electrolytic copper was 13.85c., refinery, or 14.10c., delivered in the Connecticut Valley.

Tin.—Sales for the week ended Saturday, Jan. 28, were light at about 850 tons. Dealers were the principal buyers, consumers being uninterested. Yesterday, Monday, the market was also sluggish, with only 50 tons changing hands, and today conditions have been similar. The only feature of the market is the fact that sales at Singapore continue in good volume. Official data of deliveries into consumption will not be available for a day or two, but American estimates place the total for January at 5415 tons. Prices in London today were about £3 to £4 per ton less than a week ago, with spot standard quoted at £247 7s. 6d., future standard at £247 5s., and spot Straits at £247 15s. The Singapore price today was £252 10s. Spot Straits tin was quoted today at 54.62½c., New York.

Lead.—A moderate business is reported at 6.27½c. to 6.30c., St. Louis. The market is steady and producers are not forcing the issue, but maintaining their quotations. The leading interest continues to quote 6.50c., New York, as its contract price.

Zinc.—Ore prices at Joplin advanced last week to $37, but there was not a corresponding increase in the price of prime Western zinc. The market, however, is a little stronger at 5.67½c., St. Louis, or 6.02½c., New York, but possibly this could be shaded in some cases to 5.65c. Some producers report a fair volume of business each day in the past week, but in most cases the metal has to be offered to the consumer. Sales of ore last week at close to 12,000 tons were about equal to the production, stocks still being very high but remaining in strong hands.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—Consuming demand continues in fair volume. Chinese metal for spot and early future delivery is quoted at 11.25c., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in ingots, is quoted at 23.90c., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Jan. 31.—This market is moderately active and prices, with the exception of tin, have held firm. For the most part current sales are for delivery in February. The old metal market is a trifle more active and prices are steady.

Prices, per lb., in carload lots: Lake copper, 14.25c.;

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	57.00c. to 58.00c.
Tin, bar	59.00c. to 60.00c.

tin, 56.50c.; lead, 6.35c.; zinc, 5.75c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.25c.; pewter, No. 1, 34c.; tin foil, 40c.; block tin, 50c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

RAILROAD EQUIPMENT

Pennsylvania Orders 600 Passenger and Baggage Coaches—1250 Freight Cars Purchased

Purchase of 600 passenger and baggage coaches by the Pennsylvania was the outstanding feature of the week's market. The Central of Georgia and the Chesapeake & Ohio have each placed orders for 500 freight cars and the Norfolk & Western will build 250 gondolas in its own shops. Details of the week's business follow:

Long Island Railroad has ordered 10 baggage cars from American Car & Foundry Co.

St. Louis Southwestern has placed six caboose car underframes with Virginia Bridge & Iron Co.

Fruit Growers Express has purchased 240 refrigerator car underframes from Pressed Steel Car Co.

Pennsylvania Railroad has placed orders for 613 passenger and baggage coaches, distributed as follows: 50 passenger coaches, with Pressed Steel Car Co.; 150 passenger coaches, with Standard Steel Car Co., 88 passenger coaches, with Bethlehem Steel Co.; 125 baggage cars, with American Car & Foundry Co.; 85 baggage cars, with St. Louis Car Co.; seven gas-electric cars, with J. G. Brill Co.; six gas-electric cars, with Pullman Car & Mfg. Corporation, and 20 passenger and baggage, 12 passenger coaches, 45 baggage-scenery and 25 horse-express cars, with its own shops.

Lehigh & New England has placed orders with American Car & Foundry Co. for repairs to 200 50-ton hopper cars.

H. C. Frick Coke Co. has ordered repairs to 641 70-ton hopper cars, distributed as follows: 137, with American Car & Foundry Co.; 274, with Greenville Steel Car Co.; 137, with Standard Steel Car Co., and 89, with an unnamed builder.

Central of Georgia has ordered 500 gondola cars from Tennessee Coal, Iron & Railroad Co.

Illinois Central has ordered two air dump cars from Differential Car Co.

Chesapeake & Ohio has ordered 200 70-ton steel hopper-bottom gondola cars from American Car & Foundry Co. and 300 similar units from Richmond Car Works.

Norfolk & Western will build 250 gondola cars and 30 locomotive tenders at its Roanoke, Va., shops; this railroad is also taking bids on rebuilding 1000 57½-ton hopper cars.

Chicago Great Western has ordered 50 stock car and five caboose car underframes from Bradford Corporation.

New England Fuel & Transportation Co. has purchased 50 mine cars from Bethlehem Steel Co.

Texas & Pacific has ordered two all-steel private cars from American Car & Foundry Co.

Nashville, Chattanooga & St. Louis has ordered two 70-ton combination passenger-baggage cars and two 70-ton baggage cars from American Car & Foundry Co.

St. Louis-San Francisco has purchased 15 steel baggage and mail and five steel baggage cars from American Car & Foundry Co.

Union Pacific will buy six gas-electric cars and eight trailers.

Great Northern has ordered five combination baggage and mail gas-electric cars from J. G. Brill Co.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	9.75c.	11.00c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.75c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	4.25c.	4.75c.
Zinc	3.75c.	4.25c.
Sheet aluminum	12.75c.	14.50c.
Cast aluminum	12.75c.	14.50c.

REINFORCING STEEL

New Projects Include 2000 Tons for Cleveland Bridge—Awards of Only 5600 Tons

New projects totaling more than 3000 tons were larger than in the previous week, but less than in other weeks since the first of the year. The largest inquiry was 2000 tons for the Cuyahoga bridge in Cleveland. Awards of 5600 tons included 1600 tons for the Willys-Overland Co. factory building in Toledo, Ohio, and 500 tons for the Nassau-Broad Street subway in New York. Awards follow:

East Boston, 475 tons, Border Street outlet, to Concrete Steel Co.

New York, 500 tons, section of Nassau-Broad Street subway; from Marcus Contracting Co., general contractor, to McClintic-Marshall Co.

Garden City, N. Y., 250 tons, warehouse for Great Atlantic & Pacific Tea Co., to Igoe Brothers.

Chicago, 300 tons of rail steel bars, apartment building at 222 Chestnut Street, to Inland Steel Co.

Chicago, 400 tons of rail steel bars, apartment building at Kenmore and Lawrence Avenues, to Inland Steel Co.

Chicago, 200 tons of rail steel bars, Lawyers Building, to Inland Steel Co.

Toledo, 1600 tons, Willys-Overland Co. building, to Building Products Co., local.

Chicago, 310 tons of rail steel bars, apartment building at 5346 Cornell Avenue, to Inland Steel Co.

State of Illinois, 500 tons of rail steel bars, State road work, to Olney J. Dean & Co.

St. Louis, 600 tons (380 tons rails, 120 tons billets), Arsenal Street viaduct, to Laclede Steel Co.

San Francisco, 475 tons merchant bars and angles for Pacific Fruit Express, to unnamed company.

Oakland, Cal., 100 tons, Women's Athletic Club, to San Francisco jobber.

Berkeley, Cal., 200 tons, girls' dormitory, University of California, to Steel Service Co.

Orland, Cal., 331 tons, Stony Gorge Dam, 286 tons to Laclede Steel Co. and 45 tons to Pacific Coast Steel Co., instead of 286 tons and 45 tons respectively to Pacific Coast and Laclede companies as reported last week.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

Chicago, 200 tons, Stop & Shop Building.

Chicago, 200 tons, apartment building at 5421 Cornell Avenue; William Reichert, architect.

Chicago, 200 tons, laboratory for University of Chicago.

Chicago, 300 tons, garage; Fox & Fox, architects.

Chicago, 130 tons, Edgewater Hospital; Dwight D. Wallace, architect.

Jefferson City, Mo., 130 tons, office building for Missouri Highway Commission.

Cleveland, 2000 tons, deck structure for Cuyahoga River bridge.

The Youngstown Sheet & Tube Co., Youngstown, has purchased the entire capital stock of the Associated Supply Co., 724 Pacific Electric Building, Los Angeles, pipe distributer, but will continue to operate the company under its own name. Bernard Dunn, vice-president of the company, will be manager.

FABRICATED STRUCTURAL STEEL

Santa Fe Bridge Requirements 20,000 Tons—Awards Total 29,000 Tons

With the inquiry of the Atchison, Topeka & Santa Fe Railroad for 20,000 tons for 1928 bridge work, new business developed in the last week amounted to 44,750 tons. The week's awards of 29,000 tons included 4500 tons for a bridge at Vicksburg, Miss., and 3300 tons for subway work in New York. Awards follow:

Detroit, 1700 tons, building for city water board, to Mahon Structural Steel Co.

Philadelphia, 300 tons, Northeastern Title & Trust Co. building, to Bethlehem Fabricators.

Providence, R. I., 1100 tons, Court House, to Lehigh Structural Steel Co.

Cambridge, Mass., 605 tons for Lever Brothers; warehouse, 475 tons, to New England Structural Co., and plant alterations, 130 tons, to Boston Bridge Works, Inc.

Boston, 150 tons, McMillan stores on Newbury Street, to Lehigh Structural Steel Co.

Leominster, Mass., 100 tons, theater, to James H. Tower Iron Works, Providence.

Springfield, Mass., 400 tons, hotel, to Levering & Garrigues.

Rutland, Vt., 150 tons, bridge, to American Bridge Co.

Scarsdale, N. Y., 200 tons, school, to American Bridge Co.

New York, 3300 tons, section of Nassau-Broad Street subway, to McClintic-Marshall Co.

New York, 2200 tons, addition to Savoy Plaza Hotel, Fifth Avenue and Fifty-ninth Street, to American Bridge Co.

New York, 1200 tons, loft building on West Thirty-sixth Street, to Harris Structural Steel Co.

New York, 700 tons, apartment building on East Fifty-ninth Street, to Paterson Bridge Co.

New York, 600 tons, overhead drive on Park Avenue at Grand Central Station, to Taylor-Fichter Steel Construction Co.

New York, 300 tons, Woolworth Building at Vesey and Church Streets, to Harris Structural Steel Co.

Croton, N. Y., 400 tons, highway bridge, to unnamed local fabricator.

East Orange, N. J., 800 tons, apartment building, to McClintic-Marshall Co.

East Orange, 900 tons, apartment building, to Hedden Iron Construction Co.

Lancaster, Pa., 400 tons, passenger station for Pennsylvania Railroad, to McClintic-Marshall Co.

Washington, 1200 tons, telephone building, to Lehigh Structural Steel Co.

Hopewell, Va., 1000 tons for Atmospheric Nitrogen Corporation, to Lackawanna Steel Construction Corporation, Buffalo.

Cincinnati, 250 tons, building for Meyer Packing Co., to L. Schreiber & Sons Co.

Vicksburg, Miss., 4500 tons, bridge for Vicksburg Bridge & Terminal Co., to Virginia Bridge & Iron Co., Birmingham.

Chicago, 2400 tons, garment center building, reported to have been taken by McClintic-Marshall Co.

Chicago, 350 tons, Naylor Spiral Pipe Co., to Midland Structural Steel Co., local.

Chicago, 340 tons, Wieland Dairy Co., to A. Bolter's Sons, local.

Starved Rock, Ill., 1700 tons, lock gates on Illinois River, to Independent Bridge Co., Pittsburgh.

Milwaukee, 300 tons, rebuilding Wells Street viaduct for Milwaukee Electric Railway & Light Co., to Milwaukee Structural Steel Co.

Toronto, Ont., 1300 tons, *Toronto Star* Building, to Dominion Iron & Steel Co.

San Francisco, 180 tons, plain material for Pacific Fruit Express Co., to unnamed interest.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

Philadelphia, 520 tons, Uptown Theater for Stanley Co. of America; general contract to Cramp & Co.

Newark, N. J., 2000 tons, station at Journal Square, bid in.

Boston, 270 tons, bridge over Boston & Albany Railroad.

Middletown, Conn., 200 tons, savings bank.

New York, 1000 tons, apartment building on Fifth Avenue.

New York, 1200 tons, tanks for the Pan-American Co.

Jamaica, N. Y., 1000 tons, theater.

Jamaica, 500 tons, public library.

New York Central Lines, 3350 tons, four steel car floats; Dravo Contracting Co., Pittsburgh, low bidder. New bids to be asked on 10 steel derrick lighters and five steel deck scows.

Pittsburgh, 5500 tons, Thirty-first Street bridge, bids opened Feb. 2.

Atchison, Topeka & Santa Fe, 20,000 tons for 1928 bridge work.

Northern Pacific Railroad, 2000 tons, bridges.

Bogalusa, La., 200 tons, building for Bogalusa Paper Co.

Corpus Christi, Tex., 400 tons, dock shed.

Missouri-Kansas-Texas, 500 tons, bridges.

Chicago, 1800 tons, Sheridan Towers apartment hotel; Holabird & Roche, architects.

Chicago, 900 tons, apartment building at 1325 Astor Street.

Schiller Park, Ill., 1300 tons, viaduct for Minneapolis, St. Paul & Sault Ste. Marie.

Des Moines, Iowa, 1400 tons, building for Bell Telephone Co.

Burlington, Iowa, 325 tons, steel wharf boat for Burlington Dock Board; St. Louis Steel Construction Co., low bidder.

Boise, Idaho, 233 tons, bridge over Clark Fork River, Sanders County; bids opened.

San Francisco, 800 tons sheet piling, Coyote Point bridge; bids being taken.

Oakland, Cal., 100 tons, warehouse on Peralta Street; bids received.

Youngstown-Inland Steel Merger

(Concluded from page 343)

hot black sheet mills, eight stands of cold rolls, 19 box annealing furnaces, and six galvanizing pots.

Ingot Capacity of 1,800,000 Tons

The plant has an annual capacity of 1,800,000 tons of steel ingots, 1,416,000 tons of semi-finished products, 240,000 tons of rails, 150,000 tons of heavy structural shapes, 132,000 tons of light structural shapes, 40,000 tons of universal plates, 160,000 tons of sheared plates, 300,000 tons of merchant and concrete reinforcing bars, 50,000 tons of blue annealed sheets, 140,000 tons of black sheets, 75,000 tons of galvanized sheets and 30,000 gross tons of rivets and track bolts, nuts and spikes.

At Chicago Heights the company operates a 14-in. rail slitting bar mill with an annual capacity of 60,000 tons of rail steel bars. At Milwaukee the company has 10 hot black sheet mills, five stands of cold rolls, four double-box annealing furnaces and five galvanizing pots. The yearly capacity of this plant is 60,000 tons of sheets.

Republic-Trumbull Consolidation Approved

THE absorption of the Trumbull Steel Co. by the Republic Iron & Steel Co. also has been approved by the stockholders of those companies and on the basis of exchange announced when the controlling interests in these companies reached an agreement several weeks ago. Common stockholders of the Trumbull company are to receive one share of Republic common stock for six shares of Trumbull common stock and the basis of the preferred stock exchange of the companies is one share of Republic common for one and six-tenths of Trumbull preferred. This involves the issuance of 300,000 additional common shares of Republic common stock.

The work of putting the two companies together now is in progress and details as to personnel of the combined companies will be announced in the next week or ten days. The name of the new company will be the Republic Iron & Steel Co. and the name of the Trumbull Steel Co. will be dropped. The Trumbull plant will be devoted to the production of strip and tin plate, the plan being to double its capacity for tin plate production. Many of the men now at Warren, Ohio, the location of the Trumbull plant, will be transferred to Youngstown, which will be the location of the general offices.

PERSONAL

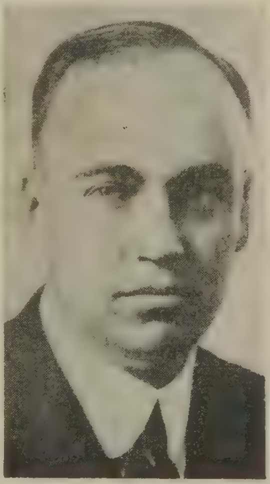
New Link-Belt Vice-Presidents

George P. Torrence, George L. Morehead, Frank B. Caldwell and W. C. Carter, whose appointments as vice-presidents of the Link-Belt Co., Chicago, were announced in THE IRON AGE of Dec. 29, all have been associated with the company for a number of years.

G. P. TORRENCE

G. L. MOREHEAD

Mr. Torrence, who will have charge of the company's operation and sales at Indianapolis, with headquarters in that city, is a graduate of Purdue University. Before joining the Link-Belt Co. in 1911 as a draftsman at its Indianapolis works, he was identified with the Marion Malleable Iron Co., Marion, Ind.; the Air Lord Tie Co., Little Rock, Ark., and the Westinghouse Air Brake Co., Pittsburgh. In 1915 he was transferred to the general sales department at the Link-Belt Chicago office, and was made manager of the department in 1918. He became sales manager at Chicago in 1919, and the following year was transferred to Indianapolis. He was made general manager of the Indianapolis plant in 1925.



F. B. CALDWELL

W. C. CARTER

Mr. Morehead will have charge of Eastern operations and sales, with headquarters at Philadelphia. He was graduated from the University of Missouri in 1902 and joined the Link-Belt organization in 1906. He was successively maintenance engineer, superintendent of construction and chief engineer at the Chicago plant, and in 1919 became assistant manager of the Ewart plant, Indianapolis. In 1920 he became general manager of that plant and five years later was transferred to Philadelphia as manager of the plant in that city.

Mr. Caldwell, who will be in charge of the Chicago plant and of sales offices in that territory, was graduated from Cornell University in 1912 and was associated for a number of years with the H. W. Caldwell & Son Co. He was vice-president of that company prior to its merger with the Link-Belt Co. He was later assistant to the chairman of the latter company and sales manager for the Chicago plant products. He became general manager of that plant in 1927.

W. C. Carter will have general charge of production at all plants, with headquarters at Chicago. He became identified with the company immediately after his graduation from the University of Illinois and until 1909 was supervisor of the drafting and engineering department at Chicago. Later he became construction engineer, and in 1911, superintendent of the Chicago plant, holding that position until 1926, when he became assistant general manager. He was appointed production manager of the company and its subsidiaries in October, 1927.

—

Guy Hubbard has resigned as associate editor of *Mechanical Engineering*, New York, to become advertising manager of the National Acme Co., machine tool builder, Cleveland. Mr. Hubbard received his technical training at the University of New Hampshire, and began his active association with the machine tool business in 1915 in the shop and drafting room of the Windsor Machine Co., Windsor, Vt. During the war he served in the Ordnance Department of the Army. As a member of the headquarters staff of the American Society of Mechanical Engineers, Mr. Hubbard has been concerned primarily with matters related to machine tools and production. He is a director of the Machine Tool Congress of the National Machine Tool Builders' Association.

GUY HUBBARD

—

James A. Henry has been named general manager of sales, strip steel sheet department, Weirton Steel Co., Weirton, W. Va., succeeding Joseph F. Savage, who recently resigned. Mr. Henry had been assistant general manager of sales since about the middle of last year and previously had been Detroit district sales manager for the Columbia Steel Co. and the Wheeling Steel Corporation. His headquarters will be in Weirton, but he will continue to spend much time in Detroit.

—

H. W. Seymour has been elected a director of Crane Co., Chicago, to succeed L. P. Ordway, resigned. L. B. Peeples has been made a vice-president. Other directors and officers have been reelected.

—

Henry D. Sharpe, Brown & Sharpe Mfg. Co., Providence, R. I., has been reelected president of the Community Fund of Providence.

—

Leonard F. Cowell has been appointed Chicago district manager for the Lamson & Sessions Co., bolt and nut manufacturers, Cleveland, and William M. Olsen has been appointed to fill a similar position in the Detroit territory, the company having opened new district offices in both cities. The Chicago office is at 1016 Straus Building and the Detroit office at 4-228 General Motors Building. Mr. Cowell for 15 years was connected with the sales organization of Kirk-Latty Co., Cleveland, which was absorbed some time ago by the Lamson & Sessions Co. Mr. Olsen was with the Kirk-Latty Co. for 17 years.

E. A. Bayton, who has been in charge of the Detroit sales office of the Lees-Bradner Co., Cleveland, manufacturer of gear-cutting and grinding machinery, has been appointed sales manager of that company.

Roy H. Smith has been elected president and treasurer of the Kent Machine Co., Cuyahoga Falls, Ohio, manufacturer of bolt-threading and other machinery.

Charles H. Longfield, sales manager of the Lamson & Sessions Co., Cleveland, has been elected a director of that company.

Fred J. MacMackin, secretary-treasurer of the Andrews Iron & Steel Corporation, Utica, N. Y., has been made general manager of the company. George W. Andrews continues as president.

W. H. Lewis was reelected president of the Pennsylvania Engineering Works, New Castle, Pa., at the annual meeting held recently. Other officers elected are W. S. Wheeler, vice-president and treasurer; S. B. Cleal, secretary, and Lee E. Allen, chief engineer.

Roy Cosbey, for four years comptroller of the Wadsworth Electric Mfg. Co., Inc., Covington, Ky., has been elected secretary and a director of the company, succeeding the late Richard J. Dibowski. Before becoming associated with the Wadsworth company, Mr. Cosbey was identified with the Joslin-Schmidt Co., the Cincinnati Milling Machine Co., the Modern Foundry Co., and Ernst & Ernst, all of Cincinnati.

M. B. Mathley, for many years representative in the Chicago territory for the Roller-Smith Co., 233 Broadway, New York, has been appointed exclusive sales agent in that territory, succeeding M. Frankel. W. J. Schuhmann, who has been connected with the company's New York office, has been transferred to the works at Bethlehem, Pa. Albert Milmow, Latonia Building, Charlotte, N. C., has been appointed agent for the Roller-Smith Co. in North and South Carolina. S. H. King has been added to the sales force in New York.

Harold Ingram has been appointed superintendent of roll shops, Homestead works, Carnegie Steel Co., succeeding W. C. Oberg, recently promoted to superintendent of all roll departments of the company. Mr. Ingram was Mr. Oberg's assistant for several years.

Capt. Alby O. Ackard, superintendent of river transportation for the Carnegie Steel Co., Pittsburgh, was appointed commodore of the Carnegie fleet at the annual dinner of the company by James A. Farrell, president of the Steel Corporation, who was the principal guest at the dinner. Captain Ackard was born in Pittsburgh in 1866 and has been with the Carnegie company since 1917, first as captain of the steamer Duquesne and, since 1919, as general superintendent of river transportation.

A. M. MacFarland has been added to the staff of the Lincoln Electric Co., Cleveland, as general sales and development engineer. During the early years of the war he was engaged in consulting engineering practice, and later was assigned by the Navy Department to supervise the construction of marine propelling machinery for naval units. After the war he became interested in the design and development of percussive and automatic arc-welding equipment, and during the last seven years obtained about 30 patents in the welding field.

John T. Seaver, formerly a partner in the firm of Ridenour, Seaver & Kendig, Cleveland and Pittsburgh, consulting engineers, has formed J. T. Seaver, Inc., Fairmount-Cedar Building, Cleveland, to act as sales agent in the sale of material-handling and other heavy machinery.

Henry H. Peck has been appointed district sales manager in New York for the Eagan-Johnson Steel & Iron Co., Crum Lynne, Pa., maker of carbon and alloy steel castings. He will have offices at 114 Liberty Street.

William A. Rockenfield, recently general manager of the Baldwin Chain & Mfg. Co., Worcester, Mass., and identified with other manufacturing projects in a consulting capacity, has been appointed vice-president of the High-Speed Hammer Co., Inc., Rochester, N. Y., and will devote his time to engineering and sales.

J. F. Naylor was elected president of the Keystone Forging Co., Northumberland, Pa., at a recent meeting of the board. He succeeds J. J. Axilrod, who severed his connection with the company last April. Mr. Naylor has been works manager for the Keystone company for three years and previously was associated with the J. H. Williams Co., at Brooklyn, for 20 years.

F. O. Schramm has been appointed assistant general sales manager of the Eastern division of the Pressed Steel Car Co., with headquarters in New York, and F. L. Johnson has been made assistant general sales manager of the Western division, with headquarters in Chicago.

C. H. Heist has been appointed general manager of the Mayville Iron Co.'s plant, Mayville, Wis., succeeding J. H. Means, resigned.

John H. Watson, Jr., President of Corrigan, McKinney Steel Co.

John H. Watson, Jr., was elected president of the Corrigan, McKinney Steel Co., Cleveland, at a meeting of the directors Jan. 30 to fill the vacancy caused by the death of J. W. Corrigan. Mr. Watson, an attorney and close friend of Mr. Corrigan, had been secretary of the company. J. E. Ferris, vice-president in charge of finances and treasurer, was elected secretary.

Mr. Watson issued an announcement that the company would continue to be operated as an independent, that the policies of Mr. Corrigan will be followed and that the management of the business and properties will be conducted by the present organization. The announcement stated that the elections were made unanimously by the board on which every stock interest of the company is represented. Mr. Corrigan owned a majority of the stock.

Mr. Watson was named in Mr. Corrigan's will as one of the two trustees of his estate, the other being the Union Trust Co., Cleveland. The trustees are given full control of Mr. Corrigan's interests in the steel company and all associated companies. The only restriction is a provision in the will that none of Mr. Corrigan's stock in the steel company is to be sold during his widow's lifetime without her consent.

The death of Mr. Corrigan was followed by rumors that the company would be merged or purchased by another interest. Cleveland banks are largely interested in the Corrigan, McKinney steel plant by their ownership of preferred stock of the McKinney Steel Holding Co., which is secured by Mr. Corrigan's stock ownership in the original McKinney Steel Co.

Obituary

William N. Bancroft, organizer of the Dibert, Bancroft & Ross Co., Ltd., New Orleans, electric steel foundry, died on his farm near Los Angeles, on Jan. 24. He was 57 years of age.

Edwin M. Drummond, since 1910 president of the Drummond Mfg. Co., 1214 West Main Street, Louisville, Ky., died suddenly on Jan. 22, aged 60 years. He was graduated from the Stevens Institute of Technology, Hoboken, N. J., and immediately became associated with his father in the Drummond company. He was a member of the American Society of Mechanical Engineers and of the Engineers and Architects Club of Louisville.

URGES STUDY OF SELLING

Eugene G. Grace Says Distribution Problem Is Present-Day Challenge to Engineers

THE steel industry of Pittsburgh paid a great compliment to Eugene G. Grace, president Bethlehem Steel Corporation, in heavy representation at the forty-seventh annual banquet of the Engineers Society of Western Pennsylvania at the William Penn Hotel, Pittsburgh, Jan. 30, at which Mr. Grace was the principal speaker. The attendance reached a total of fully 1400 and the presence of men prominent in the steel industry gave the gathering a character similar to that of meetings of the American Iron and Steel Institute. None of the steel companies of the district was unrepresented.

Taylor Allderdice, president National Tube Co., was toastmaster, and William G. Clyde, president Carnegie Steel Co., was at the speakers' table, while T. M. Girdler, president Jones & Laughlin Steel Corporation, also was in the assemblage.

Mr. Grace, taking as examples the late Gen. George W. Goethals, W. W. Atterbury, Herbert Hoover, John Hays Hammond and Charles M. Schwab, drew an interesting picture of the characteristics of these men that had made them leaders of industry as well as of the engineering profession with which they were affiliated. His remarks were in part as follows:

> In the careers of the men to whom I have referred we find typified the development of the chief problems of engineering. The first is to shape and direct the forces of nature and thus to bring the world's resources to add to the comfort and welfare of mankind. That, in a word, is the problem of production. Engineers have made a supreme contribution to the solution of that problem. But I feel that we have two somewhat newer branches of engineering which must command more and more of our attention. Those are what might be termed commercial and human engineering. Of what value is all our efficiency in production if we do not distribute efficiently, economically and effectively? And of what value is any of it unless we can add to the happiness and deeper satisfaction of those engaged in industry, as well as those who enjoy its products?
>
> I predict that the outstanding advances in business over the next 10 years will be in improved merchandising and distributing methods. Herein lies a wide field of opportunity for the engineer.

E. H. H. Simmons, president of the New York Stock Exchange, told of the machinery of that organization and the part it had played in the upbuilding of industry in affording a means whereby the shares and bonds of American companies could be sold to the investing public. He defended speculation and the speculative investor, saying that when the securities of a new industry appeared there was only the speculative investor to take them, since the permanent investor was timid and not disposed to tie up funds in securities about which there was any doubt as to dividends. He paid a tribute to the frank publicity policy of the Steel Corporation in matters of corporate information and especially its quarterly report of the number of shares held by banks and brokerage firms and those in the names of individuals. In 20 years holdings of Steel Corporation common stock have changed from one-third in the hands of the public and two-thirds in banking and brokerage names to 80 per cent in individual names and the remainder in speculative accounts.

Wright Company Gets Large Government Order

WASHINGTON, Jan. 31.—The Navy Department has awarded a contract for the construction of 100 nine-cylinder air-cooled aircraft engines, with spare parts, to the Wright Aeronautical Corporation, Paterson, N. J. The engines will be installed in 25 new coast patrol planes being built by the Douglas Co., Santa Monica, Cal. Each plane will carry two engines and the remainder of the order will be used as spares.

Grinding Machinery Makers Consolidate

The Wilmarth & Morman Co., Grand Rapids, Mich., manufacturer of grinding machinery, has consolidated with the Covel-Hanchett Co., Big Rapids, Mich., maker of grinding and saw and knife-fitting machinery. Prior to Jan. 1, the latter company was known as the Machinery Co. of America. It operates plants at Big Rapids and Benton Harbor, Mich. The Grand Rapids office of the Wilmarth & Morman Co. will be discontinued and the company will operate as a division of the Covel-Hanchett Co.

Russian Railroad Delegation Places Orders for Equipment

Purchases of railroad-building equipment are being made in the United States by a delegation of railroad men from Soviet Russia, according to an announcement by S. M. Ivanoff, chairman of the delegation, at the office of the Amtorg Trading Corporation, 165 Broadway, New York. Its first purchases consisted of steam shovels, gas locomotives, drilling supplies and a number of automobiles. Equipment is being bought for the new Turkestan-Siberian Railroad, which, Mr. Ivanoff announced, will cost about $110,000,000 to build, including rolling stock. The road, about 900 miles long, will extend from the sub-tropical region of Soviet Turkestan to southern Siberia and will shorten by two-thirds the distance between Tashkent, the center of Turkestan, to Novosibirsk, the capital of Siberia. Considerable additional equipment will be bought after the delegation has visited plants in this country making such equipment. The delegation will also make a study of the New York Central, Baltimore & Ohio and Northern Pacific railroads.

Pacific Coast Fabricating Plants Are Merged

The steel fabricating, crane and bolt and rivet departments of the Judson Mfg. Co., Emeryville, Cal., and the Pacific Rolling Mill Co., San Francisco, steel fabricator, have merged and will be operated under the name of the Judson-Pacific Co. The Judson Mfg. Co. was organized in 1882 and for many years has operated open-hearth furnaces, rolling mills and a fabricating plant and will continue to operate the steel-making departments. The Pacific Rolling Mill Co. was organized in 1868 and at first rolled bars from pile scrap. It was the first company on the Pacific Coast to install an open-hearth furnace. In 1897 it began operating as a fabricating plant only.

The Judson-Pacific Co. has been incorporated in Nevada with physical assets of $1,500,000. Officers are: Carlos J. Maas, president; E. B. Noble, vice-president and treasurer; A. E. Wilkens, vice-president and general manager; Paul F. Gillespie, vice-president in charge of sales. The combined capacity of the fabricating plants at San Francisco and Emeryville is 25,000 tons a year.

McClintic-Marshall Co. Buys Steel Fabricating Plant on Pacific Coast

The McClintic-Marshall Co. has purchased the Central Iron Works, San Francisco, and will operate the plant under the name of the McClintic-Marshall Co. Central Works. The Central Iron Works was organized by A. A. Devoto in 1900 and is one of the important steel fabricating plants on the Pacific Coast. Mr. Devoto will be general manager; A. B. Charlton, manager of works, and Harry Mortenson, formerly of the Mortenson Construction Co., San Francisco, secretary. This gives the McClintic-Marshall Co. two plants on the Coast, one in Los Angeles.

Higher Prices in European Markets

Particularly on Continent, Stiffer Prices Accompany Swedish Strike—Tin Plate Weakness Expected

(By Cable)

LONDON, ENGLAND, Jan. 30.

THERE has been improved demand for Cleveland pig iron since consumers have realized that makers are unlikely to reduce prices in view of the stiffening of Continental quotations. Considerable activity was noticeable last week including the covering of requirements on contracts up to June.

Export business is still quiet. East coast hematite is dull and as stocks are large makers are keen sellers. The North Lonsdale Iron & Steel Co. has blown out its remaining Ulverston blast furnace. Durham coke prices have stiffened as a result of increased export sales. Foreign ore is quiet.

A strike at Swedish iron ore mines may affect the market by forcing German consumers to purchase North African and French ores. Finished iron and steel are quiet generally and plate mills are seeking orders. Several more shipbuilding contracts have been placed and domestic mills are seeking the orders for the steel material involved.

Tin plate is quiet. Although inquiry is moderate, consumers are expecting lower prices. Most works, however, are still due to complete their compulsory three weeks suspension and the association has agreed to prolong the plan and will require the closing of works for an additional three weeks during the period beginning March 1.

Galvanized sheets are moderately active. Bombay has bought some fair tonnages and Calcutta is inquiring. Prices are firm. There is a good demand from Japan for No. 28 gage black sheets and there have been some small sales of thin gage sheets. No. 24 gage black sheets are generally quiet and makers are accepting lower prices.

The Continental market is strong as a result of improved export business, establishment of French sales offices for semi-finished material and beams and the strike in the Swedish ore fields. The North British Locomotive Co. has secured a contract for 29 locomotives for South Africa and the same railroad has awarded 10 locomotives to Italian makers.

FRENCH PRICES IRREGULAR

Domestic Buyers Evidently Well Stocked—Export Trade Quiet—British Pig Iron Competitive

PARIS, FRANCE, Jan. 13.—Despite the good prospects for increased business at the beginning of the year, the market has been steadily growing quieter and there is a tendency toward weakness in prices. Revival of the comptoir for heavy rolled products is expected to bring about more firmness, but until there is a genuine reduction of stocks held by consumers and the franc is legally stabilized a lasting revival of business is not anticipated. Another unfavorable factor in the situation is the high cost of production, caused in part by the heavy taxes borne by industry, the prospect of increased freight rates and the probability of revised laws on workers' insurance. Export trade is quiet, and prices have developed a slight downward tendency.

Pig Iron.—Purchasing of phosphoric foundry iron by domestic users has been declining since the first of the month. Nevertheless producers have increased the tonnage available for domestic consumption in January from 30,000 to 33,000 tons. Hematite is moving in moderate tonnages as negotiations for the formation of an international syndicate continue. An advance in foundry iron prices is expected in some quarters, but there are also reports that coke may decline, which would justify a reduction in pig iron prices. Competition for foreign trade is keen, particularly from British furnaces, which are still quoting low prices on foundry and hematite iron.

Semi-Finished Material.—Export business is limited to a few small tonnages of billets and blooms, but demand for sheet bars has shown slight improvement. Blooms are quoted at £3 17s. 6d. to £4 2s. ($18.88 to $19.97) per ton. Billets are nominally £4 3s. 6d. to £4 7s. 6d. ($20.33 to $21.31) per ton, f.o.b. Antwerp.

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0	17½s.	to	£0	17¾s.	$4.27	to	$4.33
Bilbao Rubio ore*	1	0½	to	1	1	4.99	to	5.11

(a) Nominal.

Sheet bars are quoted at £4 7s. to £4 8s. 6d. ($21.19 to $21.55) per ton, f.o.b. Antwerp.

Finished Material.—Reports that negotiations for the formation of a comptoir controlling heavy rolled products had been successful immediately affected the market. Prices began to advance and soon afterward demand declined, as consumers evidently had sufficient stocks. In consequence, prices have become irregular, although mills are not seeking tonnage for prolonged delivery, expecting a reaction upward when the comptoir is actually formed. Beams are quiet at £4 7s. to £4 7s. 6d. (0.96c. to 0.97c. per lb.), and quotations on merchant bars are easier at £4 16s. 6d. to £4 17s. 6d. per ton (1.06c. to 1.07c. per lb.), f.o.b. Antwerp. Demand for wire rods is good, and an advance in prices by the Wire Rod Syndicate has been expected but has not yet developed. Mills producing hot-rolled hoops are heavily engaged with tonnage booked in the past few weeks. First quarter prices on rails have not yet been established. The export statistics of the Government on rails are being studied by the rail comptoir, which points out that fully 40 per cent of total exports was made up of relaying rails sold by the railroads and scrap rails exported by dealers in old material and so classified to avoid coming under the scrap export quota. Prices of light and heavy gage sheets are unsteady, but medium gages still show a slight tendency to advance in the domestic market. For export, sheet prices are unchanged.

GERMAN PRICES ADVANCED

Added Cost of 8-Hr. Day Brings Increase—Unemployment Insurance a Burden—Mills Busy

Berlin, Germany, Jan. 13.—The expected advance in domestic steel prices was made effective Jan. 12. It is the first general revision of domestic prices since the formation of the Ingot Steel Syndicate in 1925. The reason for the advance was a reduction by Governmental order of the working day from 10 to 8 hr. without an accompanying reduction in wages. The increase in prices is much smaller than had been expected, advances of from 10 to 20 per cent having been predicted in some quarters. The conservative character of the price revision was probably due to current evidence that business is beginning to decline. Railroad car loadings have been considerably smaller recently, and the latest report on unemployment shows a total of 1,046,000 out of work, compared with 450,000 in October, 1927. The total, however, was smaller than in the corresponding week in 1927, which showed 1,748,000 unemployed.

Actual advances are limited to certain products. Steel bars and shapes are up 3 m. (72c.) per ton. Price rebates granted by mills in Westphalia to consumers in southern Germany to offset higher freight rates have been reduced from 6 m. ($1.43) to 4 m. (95c.) per metric ton. Thus, structural shapes of Thomas steel are now 134 m. ($31.92) per ton, f.o.b. Oberhausen, instead of 131 m. ($31.20) per ton, and steel bars are 137 m. ($32.63) per ton, f.o.b. Oberhausen, instead of 134 m. ($31.92) per metric ton.

Prices Still Low

These advances in prices are not expected to afford much aid to French and Belgian exporters to Germany, and no objections are looked for from German manufacturers producing chiefly for export. The increased difference between German domestic and world market prices has been adjusted, as in the past, by advances in the rebates paid by the steel syndicate to exporting manufacturers.

In announcing the revision of prices, producers have pointed out that, although steel prices based on an index of 100 in 1914 are only 124.4, the general price index in Germany is about 140. The index for production machinery is 133.9, and for coal, 130.7.

The threat of a strike in the steel industry or suspension of the mills as a result of the 8-hr. day controversy has finally passed. But steel mills, as well as manufacturers in other branches of industry, complain that the new system of unemployment insurance is unsatisfactory. Pay for unemployment is based on the average wages earned in the three months preceding unemployment. As a result, it is claimed, men who have been drawing high wages and are unemployed because their work is seasonal prefer drawing unemployment pay to accepting work in some other branch of industry at a lower wage. It is also contended that contributions to the insurance funds are a heavy burden on industry.

Steel Mills Well Booked

Conditions are still good throughout the steel industry, and, according to the ministry of trade, there had been no appreciable reduction in the prosperity of the country on the first of the current month. Producers of various products have orders booked ahead for about the following periods: producers of pig iron, three months; producers of steel ingots, two and a half months, and of semi-finished products, three months; rail mills, one to one and a half months; structural mills, one and a half months; bar mills, three months, and sheet mills, one to two months. Orders are still being booked in satisfactory volume.

Ship yards are not so well engaged as they were last summer. The total capacity of all yards is about 1,000,000 tons of shipping. Current contracts are for something less than 500,000 tons, compared with the summer total of close to 700,000 tons.

Mills in the Ruhr are preparing to negotiate with Russian oil monopolies for the delivery of line pipe and other oil field materials, as well as the aid of German technical men.

German Mills to Offer Special Products Here

Hamburg, Germany, Jan. 14.—Following the decision of the United States Treasury Department that German steel is not being dumped in the United States, mills here have been endeavoring to regain some of the trade with American consumers that was lost to French, Belgian and Luxemburg mills while the dumping question was under investigation.

German mills are evidently inclined to abandon the business in structural shapes and bars to the French and Belgian mills, as competition is extremely severe. Their activity is, therefore, directed toward increasing sales of seamless tubes, sheets, hoops and other high-grade products.

Swedish Ore Interest Controls French and African Mines

Stockholm, Sweden, Jan. 12.—Formation of the Aktiebolag Hematit Stockholm, a new iron ore company, has attracted considerable attention. It is a subsidiary of the Grangesberg Oxelosung Aktiebolag, the largest producer of ore in Sweden. The new company has purchased Dutch and British interests in certain North African iron ore mines and more recently bought a majority interest in leading French iron ore companies.

German Decision Extends Time on Machinery Claims

Hamburg, Germany, Jan. 14.—A recent decision of the Supreme Court on claims in the machinery trade is of considerable importance to foreign sellers of machinery to German users. The decision of the court was that claims as to the quality of a machine should be made within one week of putting the machine in operation and not, as has been the practice in the past, two weeks after receipt of the machine. This leaves the time when a claim may be presented indeterminate, as a machine may not be placed in actual operation for some time after it is received.

LEAD AND ZINC IN 1927

Output of Zinc Decreased While That of Lead Increased Slightly

THE output of primary domestic desilverized lead in 1927 was about 375,000 tons; of soft lead about 240,000 tons, and of desilverized soft lead about 61,000 tons, making a total output from domestic ores of about 676,000 tons of refined lead, according to statistics compiled by the United States Bureau of Mines. Corresponding figures in 1926 were 366,413 tons of desilverized lead, 258,565 tons of soft lead, and 55,707 tons of desilverized soft lead, making a total of 680,685 tons. The output of lead smelted and refined from foreign ore and bullion was about 131,000 tons, as compared with 118,256 tons in 1926.

The total primary lead smelted or refined in the United States in 1927 was thus about 807,000 tons, as compared with a total of 798,941 tons in 1926—a gain of about 1 per cent. The output of antimonial lead in 1927 was about 16,000 tons, as compared with 22,524 tons in 1926.

Imports of refined pig lead for 11 months amounted to 2442 tons, of which 1764 tons came from Mexico. Exports of lead of foreign origin amounted to 111,835 tons, as compared with 67,660 tons exported in the entire year 1926. Exports of lead of domestic origin amounted to 2233 tons, as compared with 4276 tons exported in 1926. Exclusive of stocks of lead at smelters and refineries, and estimating the amount of lead exported with benefit of drawback, for which figures are not available, it is calculated that the new supply of lead made available for consumption in 1927 was about 685,000 tons, as compared with 717,653 tons in 1926.

Less Zinc Last Year

Output of primary metallic zinc from domestic ores in 1927 was about 575,000 tons and that from foreign ores was about 13,000 tons, a total of 588,000 tons, as compared with 611,991 tons from domestic ores and 6431 tons from foreign ores, a total of 618,422 tons in 1926. In addition to the output of primary zinc, there was an output of about 45,000 tons of redistilled secondary zinc, as compared with 40,799 tons in 1926, making a total supply of distilled and electrolytic zinc in 1927 of about 633,000 tons, composed of 192,000 tons of high-grade and intermediate, 71,000 tons of select and brass special, and 370,000 tons of prime Western zinc.

Imports of slab zinc for 11 months amounted to only 24 tons. The exports of slab zinc made from domestic and foreign ores amounted to 48,273 tons, including 3625 tons of rolled zinc. The apparent consumption of primary zinc in 1927 was about 522,000 tons, as compared with 557,026 tons in 1926.

The total number of retorts at the 24 zinc smelters that operated during all or a part of the year was about 120,000. Of that number about 73,000 were reported in operation at the end of November and about 73,000 were expected to be in operation at the end of the year. At the end of 1926 there were 89,496 retorts in operation at these 24 plants.

MANGANESE ORES IN 1927

Domestic High-Grade Ore Output Declines Again—Larger Manganiferous Ore Shipments

DOMESTIC shipments of manganese ore containing 35 per cent and more of metallic manganese totaled in 1927 approximately 43,600 gross tons, valued at $1,142,000, according to preliminary figures compiled by the United States Bureau of Mines. This is a decrease of 6 per cent from the 1926 shipments of 46,258 tons. A decrease in average value per ton of all ore shipped in 1927 is due in part to the decreased world's price of metallurgical ore and also to the decreased shipments of chemical ore in comparison with those of metallurgical ore. The shipments of metallurgical ore amounted to 26,000 tons, valued at $416,000, while those of 1926 were 26,530 tons, valued at $379,893. The shipments of chemical ore in 1927 amounted to 17,600 tons, valued at $726,000, while those of 1926, were 19,728 tons, valued at $848,770.

The quoted price of high-grade manganese ore in 1927 decreased materially in the latter part of the year. Quotations for foreign ore, crude, have been approximately 33c. per unit, whereas the average price of 1926, Atlantic seaboard, was 39c. per unit.

Ore Imports Declined

Figures furnished by the Bureau of Foreign and Domestic Commerce show that during the first 11 months of 1927 the metallic content of imported ore was 276,823 tons. The gross tonnage of ore was 554,382 tons. This includes importation from Cuba. Assuming that the imports for December were at the same rate as during the first 11 months, the total ore importation was approximately 605,000 tons as compared with the total imports of 738,000 tons in 1926. The decrease in imports is attributed in the main to the decreased manufacture of steel during the year, and possibly to the draft on stocks in the hands of consumers.

Manganiferous Iron Ore Shipments Large

Shipments of domestic ore containing from 10 to 35 per cent of manganese (ferruginous manganese ore) in 1927 were 134,000 tons, valued at approximately $609,000, as compared with 364,312 tons, valued at $1,179,429, in 1926. The domestic shipments of ore containing from 5 to 10 per cent of manganese (manganiferous iron ore) in 1927 were 1,317,000 tons, valued at $3,306,000, as compared with 835,412 tons, valued at $1,934,381, in 1926. The changes indicated are largely explained by the fact that much of the output in Michigan and Minnesota averages about 10 per cent, being classified in some years as ferruginous manganese ore, in other years as manganiferous iron ore. A large quantity of manganiferous iron ore produced in Wisconsin in 1927 containing slightly more than 5 per cent manganese is included in the above figures, whereas the corresponding output in 1926 fell below this grade and has not been included because classed as iron ore.

The apparent outstanding features of the year have been the increase in the domestic manufacture of spiegeleisen and the increased production and consumption, relative to the production of steel, of ores having a low metallic manganese content. While the combined production of ferruginous manganese and manganiferous iron ores in 1927 differs but slightly from the production of 1926, the gross tonnage of steel produced decreased.

Canadian Pig Iron Output Showed Seven Per Cent Loss in 1927

"Tonnage of pig iron produced in Canada during 1927, amounting to 709,697 gross tons, was 7 per cent lower than in the previous year, but the output of steel showed considerable improvement at 907,638 tons, compared with 776,888 tons in 1926," says the report of the Dominion Bureau of Statistics.

"The gain in steel production was due mainly to the increase in tonnage required for rails and other railroad equipment, and to a better demand from the construction, machinery and agricultural implement industries. The decline in pig iron production must have been accompanied by a depletion of stocks on hand at the various works, since the bulk of the pig iron made in Canada goes into the manufacture of steel, and the aggregate output of steel was up 17 per cent. Imports of pig iron showed an increase to 45,833 net tons (40,922 gross tons) from 29,246 net tons (26,112 gross tons)."

For the month of December the production of pig iron in Canada amounted to 63,197 gross tons, an increase of 66 per cent over the 37,989 tons of November and 17 per cent over the 53,971 tons made in December of a year ago.

SHIPBUILDING SHOWS GAIN

Increase of Nearly 39 Per Cent in 1927—England Far in the Lead

WORLD production of merchant vessels increased sharply during 1927, launchings for the year aggregating over 600,000 gross tons more than for 1926, according to Lloyd's Register of Shipping. Last year's total of 2,285,000 gross tons was the largest recorded since 1922. But the figure is still over a million tons less than that for the last pre-war year, 1913; and is nearly 5,000,000 tons below the peak year of 1919.

While launchings in the United States showed a gain of about 20 per cent last year, as compared with 1926, the increase for Great Britain and Ireland during the same period was over 90 per cent. On the other hand, the 1927 total for all other maritime countries combined showed a slight decline from the 1926 figure. The relative position of these groups is shown in the table, giving the gross tonnage of ships launched:

	1927	1926
United States	179,218	150,613
Great Britain and Ireland	1,225,873	639,568
Other countries	880,588	884,796
World total	2,285,679	1,674,977

Economic Survey, Sponsored by Secretary Hoover, to Be Made

WASHINGTON, Jan. 31.—Far-reaching inquiry into the changes in economic currents is to be instituted by Secretary of Commerce Herbert Hoover, who has appointed a committee of leading business men and economists to supervise the work. Their names will be announced late. Private individuals have subscribed money to pay the expenses of the Bureau of Economic Research of New York in making the fact-finding background. The cooperation of the Department of Commerce will be given. It is proposed to determine the facts with regard to such questions as the shifts in employment, changes in methods of production and distribution, in industry and agriculture, shifts in relative price levels and profits, movements in the business cycle and other allied subjects which bear upon the general business situation. It is expected that the inquiry will take several months. Five years ago a similar survey was made under similar auspices.

Commodity Price Movements Present Confused Picture of Future

Business trends as reflected in wholesale commodity and retail price movements, volume of employment and wage earnings at the present moment present a confused picture and do not indicate what may be expected in the immediate future in way of business recovery, according to the National Industrial Conference Board, 247 Park Avenue, New York.

While underlying conditions are appraised as sound by the Conference Board, it is pointed out that living costs based on retail prices of the necessities of life, which in the past have tended to follow the trend of wholesale commodity prices with a lag of only a few months, as yet have shown no signs of rising; wholesale prices have shown an upward trend since April, 1927. In the view of the board, inasmuch as final consumption determines the permanence of production, the failure of retail prices thus far to reflect a stiffening of demand for goods leaves it at the present an uncertainty whether or not the upward turn of wholesale commodity prices during the past eight months is of a permanent character and actually reflects an increased demand for materials such as would foreshadow increasing industrial activity.

The volume of employment in industry has been definitely on the downward trend since July, 1920, and at the close of 1927 was approximately 20 per cent less than at the peak in 1920. Most of this decline, however, took place during a period of increasing industrial production and is known to have been due largely to increased mechanization of industry. There are no statistics available indicating to what extent the thus created labor reserve has found employment in other occupations, or to what extent it has been offset by immigration restriction. But it is significant, the board points out, that despite the decline in the volume of employment wage earnings of those employed in industry have shown marked stability at a high level which, during 1925, 1926 and 1927, averaged 116 per cent higher than in July, 1914. This, the board concludes, does not reflect pressure by an increasing labor reserve on the employment market.

Simplified Practice Results in Large Saving to Industry

WASHINGTON, Jan. 31.—Growth of simplified practice in industry is shown in a report issued by Ray M. Hudson, assistant director Bureau of Standards, in reviewing the 1927 activities of the commercial standards group of the bureau. There were completed during the year 18 new simplified practice recommendations, bringing the total projects completed to 80.

That simplification yields benefits sufficient to attract manufacturers, distributers and consumers alike, says Mr. Hudson, is demonstrated in the high degree of adherence shown by recent reviews of 15 of the simplified practice recommendations already promulgated. The report shows that accepters representing an average of 82.61 per cent of the total volume of the industry affected are following the simplified practice schedules. Further evidence that simplification is proving of great value to manufacturers and purchasers, it is pointed out, is found in the increased number of associations accepting the completed recommendations. The list of association indorsers grew from 686 to 868 during the year, the individual concerns from 2775 to 6676.

Among other experiences cited in connection with this form of waste elimination are those pertaining to a metal lath manufacturer, who reported a reduction of $140,000 in his inventory, and a manufacturer of eaves trough and conductor pipe, who reported a $30,000 reduction in his inventory. A manufacturer of die head chasers reported a 20 per cent reduction in his inventory, while another reported a reduction of 65 per cent.

Mr. Hudson reports that in eight of the 80 simplifications savings are estimated by leaders of the affected industries to be around $300,000,000 annually, of which $250,000,000 is said to be saved in the softwood lumber industry. Among the estimates are the following:

	Reductions		Estimated
	From	To	Annual Saving
Die head chasers	*100	*25	500,000
Die head chasers	*100	*25	500,000
Sheet steel	1819	263	2,400,000
Reinforcing bars	40	11	4,500,000
Range boilers	130	13	5,500,000

*Per cent.

Russian Iron and Steel Output in November

HAMBURG, GERMANY, Jan. 14.—Production of iron and steel by the Union of Soviet Socialist Republics in November, 1927, was 251,944 metric tons of pig iron and 331,400 tons of steel ingots. There were 57 blast furnaces in operation and 169 open-hearth furnaces. The output of finished products totaled 253,941 metric tons. Iron ore production in November was 308,432 tons, and manganese ore output, 63,554 tons.

Classified listing of Canadian automotive, electrical, hardware, radio, machinery, iron and steel, and other manufacturers is contained in the tenth annual edition of Fraser's Metal Products Directory, published recently by the Fraser Publishing Co., Montreal. Included are statistics on manufactured products in Canada, showing their 1927 value to have been $3,000,000,000. Iron and steel products accounted for $500,000,000.

RUST CHECKS RUSTING

Corrosion-Resisting Metals Develop Impervious Protective Coating Automatically

At a meeting of the Compressed Gas Association, held in New York, Jan. 23, C. E. MacQuigg, of Union Carbide and Carbon Research Laboratories, Long Island City, N. Y., exhibited a unique model showing clearly the mechanism of corrosion according to the electrolytic theory. It consisted of a bank of about 250 flashlight globes, each located immediately behind a small hole in a cardboard screen. These globes were of different colors and properly wired to a four-step flashing mechanism and lead storage battery so that, when in operation, a shower of green sparks, representing hydrogen ions, fell out of a portion of the screen, corresponding to the solution, toward the bottom, representing a piece of iron. Here they met another shower of white sparks indicating electrons flowing along the iron bar, and were mutually extinguished. Similarly, streams of other colored sparks denoted the flow of hydroxyl ions from the solution, iron atoms from the bar, oxygen from the air, and the precipitation of iron hydrate.

Extracts from Mr. MacQuigg's paper, "Notes on the Corrosion of Metal," follow:

We are apt to think of metals as being insoluble, and so they are, relatively. Generally speaking, we should think of them more properly as being quite ready to go into solution—sometimes very rapidly, as when in a strong acid—at other times very slowly, as when in pure water. When the rate of solution is so gradual that a long time is required for its effect to be noticed and the products remain on the metal, then we speak of corrosion as having taken place.

The rate of solution may differ with the same metal in different solutions, and it is also different for the various metals with the same solution. This latter tendency is called the "electro-potential" of the metal for a given solution. It is a measure of the relative strength of the force which tends to send electrically charged atoms (the so-called ions) of the metal into the solution. The greatest such tendency would exist for manganese, and in a lessening scale others would appear in the following order: zinc, ferrous iron, nickel, lead, tin, ferric iron, copper, silver, platinum, gold. Gold is the lowest and therefore would tend to go into solution (i. e., "corrode") the least of all these metals in this particular environment.

Protective Films

There is, however, another factor which tends to prevent corrosion in some metals: a condition developed at the surface which arrests all further corrosion. In other words, a protective film is formed on the surface of such metals, and this automatically brings to an end the corroding action when it is continuous and self-renewing. Examples of such are found in aluminum and the stainless steels or rustless irons which contain chromium, nickel, cobalt or silicon. These metals actually do have a marked tendency to go into solution (witness their positions in the electro-potential lists), but in a great many environments the products of the chemical action are deposited on the surface of the metal and are so amazingly effective in sealing off further action that a bright metal surface will remain so indefinitely.

A large number of factors come into the complex reactions of corrosion which are so simplified in the electrolytic theory. Some of these are not clearly understood as yet, and others, while clearly recognized, cannot be evaluated in any given instance because of lack of sufficient information. For instance, it is known that most metals, even in the worked condition, are somewhat porous, that is, they have numerous minute or even submicroscopic pores which go from the surface down into the interior of the metal. These pores will generally act to hasten or stimulate corrosion because they tend to give rise to so-called concentration cells, or local pockets in the corroding medium where the chemical concentration is sufficiently different from that over the general surface of the metal to give rise to a most marked speeding up in corrosion. Such pitting may result in perforations looking as though the metal had been drilled by a tool. This teaches us to avoid laminations or crevices where corrosion may be stimulated.

Protecting Films Must Be Insoluble in Corroding Medium

Protecting films do not always protect. For instance, dilute alkalies do not attack iron, but concentrated alkalies do, since the latter have the power of dissolving the protective coating of oxide which tends to form. Similarly, the protective coating formed by the action of an oxidizing agent on chromium alloys is lacking when the corroding medium is hydrochloric acid; the metal is then rapidly attacked.

With the generally accepted theory of corrosion in mind it is of interest to know what has and can be done to combat corrosion.

There is, first of all, the time-honored method of surface protection; a good example would be the covering of steel by concrete. Coating metal by metal is widely used; sometimes merely by a dipping process, as in galvanizing and tinning. Other protective coatings are put on by means of electroplating, examples being nickel, chromium, silver and cadmium. Instances of the protective value of an oxide coating are found in Parkerizing, calorizing, bluing, Sherardizing, browning and the manufacturing of so-called Russia iron.

The second method of protection has been developed in quite recent years through the use of the chromium and chromium-nickel alloys, which has been growing in a remarkable way. These automatically develop a resistance against any given medium of attack through changes which take place on the surface of the metal itself—a corrodible metal becomes rustless by the very act of rusting. This method is of such importance that, contrary to the assumptions made a few years ago, that extreme purity of metal must be found in order to minimize corrosion, we shall probably swing to the other extreme and develop a very specialized technique in which corrosion resistance will be obtained through alloying.

Dunbar No. 1 Furnace Being Scrapped; Iron Making Site for 138 Years

The Dunbar Corporation, Dunbar, Pa., formerly the American Manganese Mfg. Co., which dismantled its No. 2 furnace late last year, has started to tear down the remaining, or No. 1, furnace. This is the seventh merchant furnace in western Pennsylvania to be scrapped in the past five years. At the beginning of 1923 there were 24 merchant furnaces in western Pennsylvania and the Mahoning and Shenango valleys. In that year the Shenango Furnace Co., Sharpsville, Pa., dismantled its No. 4 furnace, and since then the following stacks have been scrapped: Rebecca furnace, Kittanning Iron & Steel Mfg. Co., Kittanning, Pa.; Alice furnace, Valley Mould & Iron Corporation, Sharpsville, Pa.; Ella furnace, Reliance Coke & Furnace Co., West Middlesex, Pa.; No. 2 furnace, Dunbar Corporation, Dunbar, Pa.; Clinton furnace, Clinton Iron & Steel Co., Pittsburgh, and now No. 1 Dunbar furnace. Of the 17 furnaces still standing only four are in operation.

The passing of No. 1 Dunbar furnace brings to an end an enterprise that was started 138 years ago, as this furnace was the direct successor, and occupied the site, of the second blast furnace built west of the Alleghanies, a stone furnace built in 1790. This stack, known as the Union furnace, was built by Col. Isaac Meason, and was first operated in March 1791. The first furnace, several times rebuilt of stone, gave way in 1870 to an iron-shelled furnace. The furnace now being dismantled was built in 1920.

The American Railway Tool Foreman's Association has changed the dates of its 1928 convention to Sept. 12, 13 and 14. Meetings will be held at the Hotel Sherman, Chicago. F. A. Armstrong, of the Pratt & Whitney Co., 564 West Monroe Street, Chicago, is secretary.

Price Cutting Threatens Prosperity

(Concluded from page 341)

an antagonist, and have pointed out to him the importance to the jobbing industry of a stabilized market not only in our line, but in all other lines he handles.

This plan has been responsible for the creation of the greatest piece of machinery ever put together in the history of the jobbing industry—a piece of machinery which is now in operation in our line and ready and willing to be effective in all other lines of trade which sell either part or all of their product through the hardware jobbing channels.

We have caused to be created 32 jobbers' committees, each headed by an important executive as chairman, each committee covering a particular section and each committee representing all of the jobbing interests of its particular section; therefore, we have 32 committees with 32 chairmen representing the entire jobbing industry of the country as a whole.

This gives an opportunity for cooperative effort in the jobbing industry never before possible and represents collectively a buying power of approximately a billion dollars per year, and such buying power used on a proper basis in an endeavor to stabilize purchases has untold possibilities.

They have had the fact presented to them in as forcible a manner as possible that the radical price cutter in any line is their greatest enemy, and they will do more to stamp out this evil than any other piece of machinery ever created.

They realize the radical price cutter is an enemy not only to themselves in creating liabilities for them where a stabilized prize creates assets, but he is also an enemy to their community, to their source of supply and to the country as a whole.

They realize he is the arch enemy to decent wages, decent living and decent profits. He converts all assets into liabilities, surpluses into deficits and satisfactory tax returns into higher taxes. He is the outstanding evil in everything constructive, and his operations only lead to destruction for himself as well as to others.

We are all interested in lower taxes. The greatest thing to bring about lower taxes is for all industry to make a fair profit, thereby creating for the Government a tremendous increase in tax returns, and a marked increase in buying power will also be created, thereby further increasing our prosperity and, with it, greater returns to our Government in the form of taxes.

Better Distribution Means Sharp Reduction in Costs

The brains of industrial America in the past have been devoted to the upbuilding of industry from a manufacturing standpoint. Untold millions have been expended annually on improved machinery and manufacturing methods to create low-cost production, and we have succeeded beyond our fondest expectations.

During all these years we have neglected a proportionate expenditure of brain power and money in proper methods of selling and distribution, as a result of which we have wasted millions in selling that we have saved in manufacturing, with the result as indicated in my opening remarks, that almost half of our business corporations are now operating at a loss.

Now the reaction has set in, and the same brains that created our manufacturing success are now confining a great deal of their attention to the subject of how to sell and distribute, so that the era of profitless prosperity will be eliminated, and we will go forward on a basis so that all men engaged in business activities—labor, employees of all kinds, executives and stockholders—will receive a satisfactory return for their endeavor.

It seems strange that in all these years our business executives in their struggle for cost reduction have overlooked the greatest single factor in this very important line of any ever undertaken.

Take our industry again as an example, this recent move of ours, in creating the proper channels of distribution of our products, is the greatest we have ever made in cost reduction.

It will mean a marked reduction in our sales expense, and will also go completely through the organization, beginning where actual manufacturing stops—shipping expense, packing expense, clerk hire, accounting, stationery and office supplies—and such savings will eventually react to the benefit of the ultimate consumer.

Steel Shipped 236 Miles by Airplane

STEEL has been shipped by airplane, possibly for the first time. Joseph T. Ryerson & Son, Inc., report that they have just forwarded a rush shipment from Chicago to Iowa City, Iowa. The Iowa City Iron Works telegraphed to the Ryerson warehouse in Chicago for a small quantity of rivets. It was late afternoon and the rivets were needed at once. The order was made up immediately and rushed to the American Railway Express, arriving at the air station in time to catch the 7.50 p. m. airplane express. One hour and 50 min. later the airplane landed in Iowa City, 236 miles away. The rivets were dropped and were in use that night.

Year's Exports Highest Since 1921

Slight Gain Over 1926, Due to Heavy Pig Iron and Scrap Shipments—Finished Steel Exports Lower—Imports Fall Off

WASHINGTON, Jan. 28.—While exports of iron and steel products in 1927 increased only 13,756 gross tons over those for 1926, going to 2,180,969 tons from 2,167,213 tons, imports in 1927 dropped 359,582 tons, or a little more than 34 per cent, declining to 750,467 tons as against 1,110,049. Exports in December, 1927, totaled 168,428 tons, against 177,928 in November, and imports were 64,188 tons and 61,882 tons respectively.

Results of our international trade in iron and steel in 1927 are looked upon as showing that the European Steel Entente and the numerous cartels, instead of making headway in gaining a foothold in the American market, or preventing domestic steel manufacturers from maintaining their foreign markets, lost in both directions in the aggregate.

While the sharpest decline in the import movement was in pig iron, with a total of 133,068 tons in 1927 compared with 445,773 tons in 1926, there were important decreases also in the importation of a number of important finished lines, including steel bars (decline of 12,000 tons), iron bars (1400 tons), rails (46,600 tons), and wire products other than barbed (3250 tons). The decline in imports of rails in 1927 was due largely to a single factor, the 1926 movement, amounting to 62,776 tons as against 16,145 tons in 1927, being made up to an important degree of imports from Germany for the Boston & Maine Railroad.

There were, however, some substantial increases in imports of semi-finished and finished lines in 1927, when compared with 1926. These included wire rods (8000 tons increase), hoops and bands (5300 tons), sheets (5100 tons), structural shapes (40,000 tons) and seamless tubes (all wrought pipe, increased 19,000 tons). The greatest gain was in structural shapes, which increased to 161,848 tons in 1927 as against 121,099 tons in 1926, with the bulk of the tonnage coming from Belgium.

The greatest export movement in 1927 was in tin plate, with 254,131 tons as compared with 250,782 tons the preceding year, and wrought pipe (258,476 tons, against 287,822 tons in 1926). Scrap made the most important gain, going to 238,303 tons from 104,738 tons. Slight increases were made in plates, plain wire and barbed wire and woven wire fencing. Substantial losses were shown in steel bars, galvanized sheets, black sheets, hoops and bands, plain and fabricated structural material, steel rails and welded pipe.

Of the steel exports in December, 61,256 tons went

United States Imports of Iron and Steel Products in December, 1927

(In Gross Tons)

Austria	1,815
Belgium	16,118
Czechoslovakia	22
Denmark	21
France	6,535
Germany	8,404
Italy	4
Netherlands	3,549
Norway	3,308
Poland and Danzig	538
Sweden	2,641
Switzerland	2
United Kingdom	5,276
Canada	7,855
Cuba	53
British India	8,044
Japan	3
Total	64,188

to Canada, while that country, easily the largest consumer of American steel products, took 831,177 tons in 1927, against 833,856 tons in 1926. Japan took 27,054 tons in December and in 1927 took 278,207 tons against 260,361 tons in 1926. There were gains in exports to some South American countries in 1927 over the preceding year, Argentina taking 82,380 tons against 60,105 tons, and Brazil taking 70,635 tons against 62,542 tons. There were losses in exports to Chile and Colombia. Chile took 44,641 tons as compared with 61,642 tons, while Colombia took 59,080 tons as against 71,142 tons.

Japan led by a small margin as the destination of 1927 exports of steel rails, taking 29,474 tons as compared with 29,214 tons for Canada. Canada took 112,147 tons of the 139,632 tons of plates exported last year; 71,559 tons of the 152,175 tons of galvanized sheets exported; 121,514 tons of the 148,069 tons of plain structural material exported; 41,918 tons of the tin plate; 65,399 tons of the 111,121 tons of steel bars and 62,250 tons of the 152,497 tons of black sheets exported, Japan taking 61,849 tons. Japan led as the destination of tin plate exports, taking 54,685 tons.

Of the 14,529 tons of structural material imported in December, Belgium supplied 8664 tons; Germany, 2444 tons; France, 1876 tons; Austria, 1195 tons. Of the 8117 tons of steel bars imported that month, Belgium furnished 3824 tons; Germany, 1954 tons; Sweden, 865 tons. France supplied 2456 tons of the 3112 tons of cast iron pipe imported, while 649 tons came from Belgium. Of the 31,771 tons of manganese concentrates imported, Soviet Russia supplied 15,161 tons; Brazil, 10,160 tons; British West Africa, 2834 tons, and British India, 2691 tons. Of the 8334 tons of ferromanganese imported during the month, Canada supplied 4252 tons; Norway, 2641 tons; United Kingdom, 1441 tons. British India was the source of 8044 tons of pig iron imports; Netherlands, 3451 tons; United Kingdom, 2741 tons.

Of the total imports in December, 16,118 tons came from Belgium, 8404 tons from Germany, 8044 tons from India, 7855 tons from Canada, 6535 tons from France and 5276 tons from the United Kingdom. These six countries accounted for 81 per cent of the total incoming tonnage.

Operation of Industrial Locomotives

Coal and Water Consumption of Saddle-Back Unit Determined in Service Tests—Operated Without Cylinder Cut-Off

BY FRED M. REITER*

TO check the operation of a standard four-wheel, saddle-back, industrial locomotive, made by the H. K. Porter Co., some data were taken and calculations made. The object was to determine coal and water consumption, and note how often the locomotives should refuel and take water. The data were taken as a standard to check the actual operation of the locomotives. Time studies were made to determine the duration of runs, piston speed (obtained from r.p.m. of driving wheels), steam conditions, etc.

In determining water consumption, the cylinder conditions were as follows: Bore, 17¼ in.; stroke, 24 in.; piston rod, 3¼ in. This resulted in a piston area of 233.7 sq. in. at the head end and of 225.4 sq. in. at the crank end, the average being 229.6 sq. in. The total volume of the two cylinders, each revolution of a driving wheel, figures out at 12.8 cu. ft.

Steam at average boiler pressure of 150 lb. gage represented 360 deg. Fahr. The average cylinder pressure was throttled to 60 lb. gage, with 5 per cent moisture. The locomotive was operated with the reverse lever open wide, regulation of speed being made by the operating throttle. Thus no cut-off occurs in the cylinder, although the pressure is considerably reduced.

Consumption of Steam

Density of steam at 60 lb. gage is 0.1721 lb. per cu. ft. The moisture in it weighs 0.0130 lb., making the total weight 0.1851 lb. The average operating speed of the engine was 23 r.p.m., determined by count at the driving wheel. The weight of steam consumed each hour at 23 r.p.m. was 3268 lb. This represents a consumption of 394 gal. of water an hour, to which must be added 12 gal. for the air-brake engine.

Losses included 1 per cent for popping, 2 per cent for blow-off and 7 per cent of steam to the flues for producing draft and for leaks, etc. This makes a total of 10 per cent. Injector steam is not figured, as this is returned to the boiler with the water. Thus the apparent water consumption of 406 gal. an hour figures up to 450 gal. an hour total.

The tank capacity (saddle back) is 1650 gal. Of this amount 210 gal. in the legs of the tank cannot be taken out by the injectors. This leaves 1440 gal. net delivered by the tank. With low water in the boiler, when the locomotive is filled, an additional 610 gal. would be required, making a total of 2050 gal. put in each time the tank is filled.

Dividing this amount by 450 gal. an hour gives 4.54 hours duration of the water supply under steady continuous operation. As the locomotive is idle, between runs, about 40 per cent of all time, including the periods when steam is off and the locomotive is coasting, etc., the overall duration of water per fill is about 7.6 hr.

Heat Units Taken from Coal

Heat input into water at 200 deg. Fahr. to produce steam at 150 lb. gage pressure is 1017 B.t.u. per lb. The total heat per hour to make steam thus figures out at 3,847,311 B.t.u. an hour. About 2 per cent of the water is used for blow-off, having been heated from 200 to 360 deg. This adds 12,160 B.t.u., making the total heat absorption of the boiler 3,859,471 B.t.u. an hour. With a boiler efficiency of 50 per cent, the heat supplied by the coal must be 7,720,000 B.t.u. an hour.

Consumption of coal of 13,500 B.t.u. per lb. calorific value would thus be 572 lb. an hour. Figuring on 40 per cent idle periods, this reduces to 343 lb. The bunker capacity with the fire low before loading and maximum coal taken on was found to be 1700 lb. Thus the duration of one fill or coal supply works out at just under five hours.

Actual operation of the locomotives, when operated with reasonable care, checked these figures closely.

---

*Dayton Power & Light Co., Dayton, Ohio.

Where Steel Exports Went in Nineteen Twenty-Seven

Canada Took 522,034 Tons of Nine Leading Items—Japan Retains Second Position with 158,664 Tons, Followed by Argentina with 58,618 Tons and Cuba with 51,299 Tons

Machinery Exports High in 1927

Second Largest Dollar Value in History—Exceed 1926 by Nearly $36,000,000—Imports Show Slight Gain

WASHINGTON, Jan. 28.—Making a gain of $35,608,101, exports of machinery in 1927 aggregated $435,476,591 as against $399,868,490 in 1926, while imports of machinery and vehicles for the two years amounted to $27,517,361 and $26,211,967 respectively. Imports of the machinery and vehicles listed in THE IRON AGE table totaled $18,603,229 in 1927 and $17,137,056 in 1926. Imports of industrial, office and printing machinery in 1927 were valued at $16,452,625 last year and $16,450,043 the preceding year.

Exports of industrial machinery in 1927 amounted to $201,473,555, against $179,556,215 in 1926, while exports of "other industrial machinery" were valued at $69,048,380 and $55,010,374, respectively. Exports of power-driven metal-working machinery last year were valued at $20,345,478, while in 1926 the value was $14,316,274. Other metal-working machinery to the value of $5,051,314 was exported in 1927 as compared with $4,551,248 in 1926.

Machinery exports listed in THE IRON AGE table reached a value of $38,169,898 in December, against $36,187,195 the month before and $32,111,380 in December, 1926. Industrial machinery to the value of $17,206,531 was exported in December, against $17,101,313 in November and $15,486,344 in December, 1926. Exports of all power-driven metal-working machinery in December were valued at $2,352,753, against $1,202,648 in December of the preceding year, while the respective values of exports of other metal-working machinery were $568,104 and $376,144. Exports of "other industrial machinery" in December, 1927, and the corresponding month of the preceding year were valued at $5,890,035 and $5,260,901, respectively. Respective imports of industrial, office and printing machinery were valued at $1,208,764 and $1,438,565.

Bilton Machine Tool Co. to Be Sold at Auction April 3

Assets of the Bilton Machine Tool Co., Bridgeport, Conn., have been ordered to be sold at public auction on April 3 by Judge Edwin S. Thomas of the United States District Court. The order was issued upon motion of counsel for the receiver of the company. In making the motion, counsel for the receiver said that an offer of $500,000 had been received for the business. The company's property consists of real estate, buildings, plant property, equipment and machinery at Bridgeport.

Machinery Markets and News of the Works

JANUARY TRADE SPOTTY

Good Business Reported by Some While Others Were Disappointed

Railroad Buying in Chicago Appears More Promising—Santa Fe to Issue List of Its Requirements

SOME machine tool manufacturers report that sales in January were considerably ahead of those in December, but the improvement was not shared by all companies, and in a number of instances December volume was not equaled in January. In general the past month was not up to expectations.

Railroad buying of machine tools at Chicago promises to get under way soon. The Santa Fe is about to distribute lists of its 1928 requirements, which probably will be large. Railroad buying so far this year has not been important. In the East the only inquiry of size is that issued a few weeks ago by the Delaware, Lackawanna & Western for about 30 machines. Orders have not yet been placed.

Inquiry from the farm machinery industry is steady and sales to this class of manufacturers, which have been of help in building up volume in Chicago, are expected to continue for several months. Purchasing by automobile companies has not been large, but it is conspicuously better than in the late months of last year. A motor company in the Detroit district has ordered 17 17-in. lathes, raising to a total of 24 the lathes bought by this company in two weeks. Other orders for small lots of tools have come from the Detroit district.

New York

New York, Jan. 31.

BUSINESS continues good with a fair volume of new inquiry and purchasing of single tools. The Mergenthaler Linotype Co., Brooklyn, is still buying equipment. The General Electric Co., Schenectady, N. Y., has been purchasing against a short list of tools and is still to close on a lathe and a 12-ft. planer. The International Motor Co., Plainfield, N. J., is expected to be in the market soon.

Except for the Delaware, Lackawanna & Western Railroad list of about 30 machines, the demand from railroads is light. The New York Central has issued several inquiries for single tools, but is not expected to purchase for several weeks. The Central Railroad of New Jersey has closed on a 30-in. x 16-ft. lathe with the Niles Tool Works.

Recent purchases by industrial users of machine tools have included a 13-in. x 30-in. lathe, two 7-in. x 32-in. bench lathes and a Racine Shear Cut saw by a Chicago manufacturer; four 16 x 36-in., two 16 x 60-in. and one 20 x 48-in. lathes and a No. 2 jig boring machine by a Michigan automobile manufacturer; a 20-in. x 48-in. engine lathe and a No. 2 jig boring machine by a New York State manufacturer; a No. 2 jig boring machine by a company in Syracuse, N. Y.; rebuilt Pratt & Whitney 14-in. vertical surface grinder by a tool maker in Pennsylvania; used 7 x 32-in. Pratt & Whitney bench lathe by a company in New York City; No. 3 Pratt & Whitney die sinking machine by a Detroit manufacturer; No. 2 jig boring machine by a Vermont company; cold saw by a Massachusetts plant; No. 131 Ransom grinder by a New Jersey machinery dealer; 22-in. x 14-ft. Morris lathe by a Pittsburgh manufacturer and four-spindle, drum type milling machine by a Detroit motor company.

Anaconda Copper Mining Co., 25 Broadway, New York, has approved plans for a new electrolytic zinc plant at its properties at Anaconda, Mont., to cost in excess of $500,000.

Seal Lock Burial Vault Co., Forest Hills, L. I., has plans for a one-story plant, to cost approximately $45,000 with equipment. W. J. Boegel, 185 Madison Avenue, New York, is architect.

Harry Harvie, 15 Hillside Avenue, Rockville Centre, N. Y., architect, has completed plans for a one and two-story automobile service, repair and garage building at Rockville Centre, to cost about $200,000 with equipment.

New York Telephone Co., 140 West Street, New York, is arranging an expansion and improvement program to cost $6,444,465, including underground cable plant in Brooklyn; outside plant facilities at Nyack, N. Y., and vicinity; central stations, switchboard equipment, lines, etc., at various points on Long Island, and additional testing facilities in Manhattan.

International Power & Paper Co., operated by International Paper Co., 100 East Forty-second Street, New York, has purchased Newfoundland Power & Paper Co., St. George district, Newfoundland, including a hydroelectric generating plant with capacity of 98,000 hp., paper mill with output of 400 tons per day, and about 2800 square miles of timber and pulp lands on the north coast of Newfoundland. New owner contemplates expansion and improvements in paper mill properties.

Columbia Corrugated Co., 270 Eleventh Avenue, New York, manufacturer of corrugated boxes and containers, has purchased the former air reserve depot of Government at Long Island City, comprising six and a half acres with 12 buildings, on a bid of $963,750, and contemplates establishment of a main plant at that location. It is understood that new structures will be erected.

Avery Garage Corporation, 154 Amity Street, Flushing, L. I., has plans for a one-story service, repair and garage building, 100 x 225 ft., to cost approximately $100,000 with equipment. Daniel Campbell, Jr., address noted, is architect.

New York Dock Co., 44 Whitehall Street, New York, will soon take bids on general contract for a ten-story factory at Joralemon and Furman Streets, Brooklyn, to cost in excess of $400,000. Russell G. Cory, 30 Church Street, is architect and engineer.

American Power & Light Co., an interest of Electric Bond & Share Co., 2 Rector Street, New York, is arranging for an increase in both common and preferred stocks, a portion of proceeds to be used for purchase of Washington Water Power Co., Spokane, Wash., operating hydroelectric power plants and transmission lines in eastern Washington and northern Idaho. New owner plans increased generating capacity and transmission system.

Union Railway Co., 2396 Third Avenue, New York, has authorized plans for a two and one-half story automobile service, repair and garage building at White Plains, N. Y., for bus service, to cost more than $125,000 with equipment. E. H. Faile & Co., 441 Lexington Avenue, are architects.

American Car & Foundry Motors Co., 30 Church Street, New York, is said to be planning establishment of new factory branch at Atlanta, Ga., to be used largely for manufacture of double-decked buses operated in that city by Georgia Power Co.

E. R. Squibb & Sons, 80 Beekman Street, New York, manufacturers of chemicals, etc., have awarded a general contract to White Construction Co., 95 Madison Avenue,

The Crane Market

THERE has been but little new inquiry in the past week, either for electric overhead or locomotive cranes. Some sizable business, however, is still pending. The Public Service Production Co., Newark, N. J., is expected to close in a few days on two 120-ton and one 65-ton overhead cranes. E. L. Phillips & Co., 50 Church Street, New York, have revised inquiry for a 60-ton overhead crane and are now asking for prices on a 40-ton electric crane for the Long Island Lighting Co. There are a number of current inquiries for medium and large capacity locomotive cranes but prospective purchasers are slow to take action.

Among recent purchases are:

Dwight P. Robinson, Inc., New York, 40-ton, 4-motor overhead crane for Gulf States Steel Co., Alabama City, Ala., from Niles Crane Corporation.

Edison-Portland Cement Co., Phillipsburg, N. J., 10-ton crawl-tread locomotive crane from an unnamed builder.

Lockwood, Greene & Co., 1 Pershing Square, New York, 20-ton, 29-ft. 6-in. span, 1-motor overhead crane and 5-ton, 7-ft. 10-in hand power crane for Elizabeth City, Tenn., from Box Crane & Hoist Corporation.

Paramount Finishing Co., Brooklyn, N. Y., ½-ton electric hoist from Box Crane & Hoist Corporation.

Artistic Dyeing Co., Brooklyn, ½-ton electric hoist from Box Crane & Hoist Corporation.

Charles Mundt & Son, Jersey City, N. J., 5-ton electric Hoist from Box Crane & Hoist Corporation.

Spence Iron Foundry, Jersey City, N. J., 1-ton electric hoist from Box Crane & Hoist Corporation.

New England Public Service Co., Lewiston, Me., 35-ton overhead crane from the Whiting Corporation.

for a twelve-story factory and distributing plant, 98 x 164 ft., at 18-30 Columbia Heights, Brooklyn, to cost about $1,000,000 with equipment. Russell G. and Walter Cory, 30 Church Street, New York, are architects and engineers.

Passaic Iron Works, Inc., 119 Fourth Street, Passaic, N. J., has plans for a one-story addition, 40 x 74 ft., to cost close to $20,000 with equipment. Preiskel & Skvarla, Playhouse Building, are architects.

Armstrong Cork Co., Codwise Avenue, New Brunswick, N. J., is considering rebuilding portion of local plant destroyed by fire Jan. 21, with loss close to $50,000 with equipment. Headquarters are at Lancaster, Pa.

Ovens, power equipment, conveying and other machinery will be installed in the three-story addition of Forester Bakery, Inc., Bergenfield, N. J., to cost upward of $100,000. McCormick Co., 41 Park Row, New York, is architect and engineer.

Newark Brush & Scraper Co., 266 Fabyan Place, Newark, has leased a two-story factory forming part of plant of Jennings Silver Co., 390 Nye Avenue, and will remodel for a new plant. Present works will be removed to new location early in March and additional equipment provided. Company has abandoned plans for an addition to present factory.

Board of Education, New Milford, N. J., is considering installation of manual training equipment in new high school to cost $360,000, for which plans will be prepared by Ernest Sibley, Bluff Road, Palisade, N. J., architect.

Public Service Electric & Gas Co., Public Service Terminal, Newark, has acquired 176 acres at West Orange, N. J., and contemplates construction of power substation and switching station on portion of site, remainder of land to be used for high tension transmission lines.

Lerner Brothers, 365 Market Street, Newark, manufacturers of handles, etc., have leased a three-story factory at 39-41 South Sixth Street for expansion and will remove to that location.

Knickerbocker, Cram & Co., Inc., 7 East Forty-second Street, New York, has been organized to succeed Knickerbocker Machine Tool Co., and will handle complete line of machine tools, many of which were formerly sold through discontinued machine tool department of Manning, Maxwell & Moore, Inc. Company's personnel will consist of former employees of that organization.

Panatone Corporation, New York, has been organized to manufacture new type of radio loud speaker and is under engineering management of Industrial Engineering & Finance Corporation, 5052 Grand Central Terminal, New York. Latter company will be in market for wire, magnets, wood-working materials and art cabinets.

Kastwell Foundry Co., Newark, has succeeded to business of Transfer Metal Casting Co., and will continue operation as general jobbing foundry.

Buffalo

BUFFALO, Jan. 30.

PLANS are maturing for a two-story vocational school for Board of Education, Genesee Building, Buffalo, to be known as Burgard Vocational School, to cost $1,000,000 with equipment, and for which bids on general contract will be asked by Ernest Crimi, address noted, architect for the board.

International Oxygen Co., 796 Frelinghuysen Avenue, Newark, N. J., manufacturer of compressed industrial gases, welding apparatus, etc., has begun construction of a new plant at Buffalo, to cost more than $75,000 with equipment. A preferred stock issue has been sold to provide in part for expansion.

Bids have been asked by J. A. Zurn Mfg. Co., Fourteenth and German Streets, Erie, Pa., manufacturer of plumbing equipment and supplies, gas burners, etc., for an addition, to cost close to $250,000 with machinery. Wilbur Watson & Associates, 1614 Prospect Avenue, Cleveland, are architects and engineers.

Niagara, Lockport & Ontario Power Co., Lafayette Building, Buffalo, will construct a steel tower transmission line at Salamanca, N. Y., and vicinity.

Board of Education, Kenmore, N. Y., plans installation of manual training equipment in a three-story addition to high school to cost $700,000, for which bids have been asked on general contract. F. J. and W. A. Kidd, 522-24 Franklin Street, Buffalo, are architects.

Chautauqua Heating Co., Inc., Salamanca, N. Y., recently formed with capital of $25,000 by Harold A. Watkins, Salamanca, and associates, is said to be planning a local factory for manufacture of radiators and other heating equipment.

Wire Wheel Corporation of America, Inc., 1700 Elmwood Avenue, Buffalo, is reported considering expansion in production, now averaging about 40,000 sets of wire wheels per month. Arrangements are being made for stock distribution to provide additional financing.

Syracuse K-U Corporation, 250 Walton Street, Syracuse, N. Y., has been organized to succeed Walker Kitchen Utilities Co. and will continue manufacture of dishwashing machinery and equipment and kitchen utensils. It is at present in market for small amount of equipment and is a buyer of sheet metal from time to time.

E. R. Caldwell & Son Co., Syracuse, N. Y., brass founder and manufacturer of brass castings, will be reorganized with view to wide production. Company went into voluntary bankruptcy last fall and settlement of 25c. on the dollar was accepted by creditors. Harold Coyne, superintendent of Reddin Iron Works, receiver, has been discharged.

Philadelphia

PHILADELPHIA, Jan. 30.

GENERAL contract has been let by Camden Rail & Harbor Terminal Corporation, Camden, N. J., to Cramp & Co., Denckla Building, Philadelphia, for a nine-story cold storage and ice-manufacturing plant, 105 x 285 ft., to cost more than $2,000,000 with equipment. Company was organized recently by Frederick Cohen, Merchantville, N. J., and J. A. Raulerson, 127 South Sixty-third Street, and has disposed of bond issue of $2,250,000, to provide for erection. Mr. Raulerson is president. Moores & Dunford, Inc., 110 East Forty-second Street, New York, is architect and engineer.

John Galbraith, 619 Commerce Street, Philadelphia, manufacturer of wooden and metal-reinforced boxes and containers, has awarded general contract to Schaeffer & Co., 1600 Arch Street, for a one-story addition, 36 x 120 ft., to cost close to $40,000 with equipment.

Norton Co., 3208 Market Street, Philadelphia, manufacturer of grinding wheels and other abrasives, with main plant at Worcester, Mass., has plans for a new local factory branch and distributing plant for which bids will soon be asked on general contract. Ballinger Co., 105 South Twelfth Street, is architect and engineer.

United Gas Improvement Co., Broad and Arch Streets, Philadelphia, is concluding purchase of traction system of

Wilmington Light & Power Co., Wilmington, Del., from American Electric Power Co., New York, latter taking over utility properties at Sioux City, Iowa, heretofore held by first noted company. Extensions and improvements will be carried out in Wilmington district, including power line construction. Properties will continue under directon of Stevens & Wood, Inc., 120 Broadway, New York, engineer, which is now preparing plans for a steam-operated electric generating station near Pennsville, N. J., for Wilmington and other utilities, to cost in excess of $7,000,000.

G. A. Drieling Co., Philadelphia, has been formed with a capital of $25,000 to take over and expand company of same name, with sheet metal works at 1914 North Fifth Street. New company will also manufacture iron and steel products, as well as machine equipment and devices.

Board of Trustees, Lafayette College, Easton, Pa., has engaged C. Z. Klauder, 1429 Walnut Street, Philadelphia, architect, to prepare plans for a new engineering building, with mechanical and testing equipment, to cost $500,000 with machinery.

Keystone Aluminum Die Casting Co., Philadelphia, has been organized by William H. Brown, 6370 Church Road, and Frank Brown, to operate a local plant for production of die-castings and kindred specialties, with capital of $50,000.

C. Edward Smith Hardware Co., 314 East Washington Street, New Castle, Pa., has plans for a three-story and basement storage and distributing plant to cost $55,000. W. J. Eckles Co., Lawrence Savings & Trust Building, is architect.

Harrisburg Gas Co., Harrisburg, Pa., is arranging for an increase in funded debt from $2,500,000 to $10,000,000, of which bonds in amount of $2,500,000 will be sold in near future, a portion of fund to be used for extensions and improvements. Initial work will comprise a budget of $350,000, for additional purification and auxiliary gas plant machinery, pipe lines, etc. L. S. Williams is president.

B. F. Shaw Co., Second and Lombard Streets, Wilmington, Del., manufacturer of pipe, steam fitters' supplies, etc., recently reorganized with W. Miller Shaw as president, has plans for expansion to cost close to $150,000 with equipment, including enlargement in pipe fabricating works.

Scranton Coal Co., Scranton, Pa., is considering rebuilding its equipment and mine supply storage and distributing plant at Dickson City, Pa., destroyed by fire Jan. 25, with loss estimated at $175,000.

L. B. Smith, White Hill, near Harrisburg, Pa., has secured six acres on Gettysburg Road, at terminus of car line, and will operate plant for rebuilding of motor trucks and motor buses.

Keystone Portland Cement Co., Bath, Pa., has work in progress on a new mill near city to cost more than $1,000,000, and will have initial unit ready for service in spring. John Buckland, Allentown, Pa., is president.

Chicago

Chicago, Jan. 30.

RAILROAD buying of machine tools promises to get under way as the Santa Fe starts distribution of inquiries for what appear to be its first large requirements for 1928. Quotations have been asked on a boiler flanging clamp, a 14-in. x 8-ft. tool-room lathe, 54-in. boring mill and a 36-in. x 16-ft. engine lathe. The Burlington is in the market for two double-end axle lathes.

Business in January was slightly better than in December, but well behind expectations of the trade. Fresh inquiry, however, lends hope to dealers that sales will be more brisk in February. Tool room equipment is active and punch presses have moved freely this week. Inquiry from farm implement manufacturers is steady and sales give promise of holding up for several months. Renewed activity is indicated by the Nash Motors Co., Kenosha, Wis.

Commonwealth Edison Co., 72 West Adams Street, Chicago, will build a substation, 140 x 160 ft. to cost $200,000. H. W. Green Construction Co., 9 South Clinton Street, is contractor.

Standard Oil Co., 910 South Michigan Avenue, Chicago, will build a two-story garage, 75 x 118-ft. to cost $35,000.

Plans are being considered by Blake Specialty Co., Sixteenth Avenue and Mill Street, Rock Island, Ill., manufacturer of pipe bends, etc., for one-story addition, to cost more than $25,000 with equipment.

Streator Cold Storage Door Co., LaRue Street, Streator, Ill., contemplates one and two-story addition, to cost close to $40,000 with equipment, and will prepare plans in about 30 days.

Fisher Governor Co., 201 First Avenue, Marshalltown, Iowa, manufacturer of engine governors, etc., has awarded general contract to Lippert Brothers, Boone, Iowa, for two-story addition, 70 x 125 ft., to cost about $50,000 with equipment. H. E. Reimer, 129 East Main Street, is architect.

Rockford Drop Forge Co., Rockford, Ill., has awarded general contract to Linden & Sons, 1110 Tenth Street, for one-story sawtooth roof addition to cost $30,000.

Glacier County Light & Power Co., Cut Bank, Mont., Frank Seal, head, is planning construction of a new generating plant on Two Medicine River, near Cut Bank, with transmission lines for service in Glacier Park, Browning and vicinity, to cost in excess of $175,000.

Iowa Packing Co., Eighteenth and Maury Streets, Des Moines, Iowa, is considering erection of a boiler plant, to cost approximately $100,000 with equipment.

Great Lakes Forge Co., 1212-58 West 119th Street, Chicago, has filed plans for a one-story addition, 90 x 100 ft.

Peoples Gas Light & Coke Co., 122 South Michigan Boulevard, Chicago, is arranging for an increase in capital from $60,000,000 to $75,000,000, a portion of proceeds to be used for expansion and improvements. Company is closing negotiations for purchase of combination water-gas plant and coke oven of Chicago By-Products Coke Co., and will develop enlarged output.

Rapid Roller Co., 800 Austin Avenue, Chicago, has engaged Schmid & Ryan, 77 West Washington Street, architect, to prepare plans for a new factory to cost in excess of $50,000 with equipment.

Lehigh Briquetting Co., Lehigh, N. D., has begun superstructure for its fuel briquette plant. Work will include coal crushing unit, briquetting unit, storage building and bins, machine shop and power house, to cost in excess of $500,000 with equipment. Ralph W. Richardson, Zenith Building, St. Paul, Minn., is engineer.

Rockford Auto Co., Oxford Street, Rockford, Ill., has begun erection of five-story and basement service, repair and garage building, 65 x 156 ft., to cost $135,000 with equipment. F. A. Carpenter, Brown Building, is architect.

Swift & Co., Union Stock Yards, Chicago, meat packers, are said to be completing plans for a new cold storage and refrigerating plant at Altamont, Ill., to cost approximately $80,000 with equipment.

Federal Public Service Co., operating Yankton Light & Heating Co., Yankton, S. D., and other light and power properties, has arranged for bond issue of $1,200,000, a portion of fund to be used for extensions and improvements.

New England

Boston, Jan. 31.

MORE machine tools were sold in January than in December or November, although the market cannot be said to be even moderately active. Sales the past week were confined almost exclusively to used equipment and included a milling machine, No. 18 Bliss press, bench lathe, bench miller, two 14-in. lathes, three drill presses and miscellaneous other equipment to manufacturers in this vicinity, and one No. 20 Garvin and one No. 2 Brown & Sharpe vertical milling machines to Oakland, Cal., interests. More inquiries have been received by local dealers for one, two or three tools, both new and used. General opinion among Boston houses is that there is more active inquiry before the trade than at any period during the past five or six months, and the outlook for sales the next two months is bright.

General business is better in New England than a month ago, which adds to the optimism of the machine tool trade. Orders received by Massachusetts manufacturers in December equaled those of November, according to the Associated Industries of Massachusetts index, which was 93.7 for December. The first full year index showed a falling off of less than 1 per cent in orders for 1927. The index is compiled from reports from 250 companies representing a capitalization of more than $450,000,000 and having at least 125,000 employees. New England machine tool builders in general are busier than a month ago, despite a falling off in export orders.

Pneumatic Drop Hammer Co., Boston, recently installed a battery of pneumatic lift gravity drop hammers at a Newburyport, Mass., plant and has received orders for other hammers from Ohio, Indiana, Greenfield, Mass., Providence and Connecticut manufacturers. To care for increasing demand, company has added to its mechanical equipment.

Smith Co., Milford, Mass., automobile safety devices, is negotiating for purchase of a plant in Hartford, Conn., and expects to move into it about March 1. Company plans to manufacture other automobile accessories, all under newly incorporated name of Smithco Auto Safety Control Co., with capital of $100,000. Robert Smith is president.

Atlantic & Pacific Tea Co. has awarded general contract for a five-story, 105 x 273 ft., warehouse and bakery at Cranston, R. I., for which motors, handling equipment, etc., are required. H. L. Treeman, 1 Fitchburg Street, Somerville, Mass., is in charge.

General Electric Co., West Lynn, Mass., has purchased land on Boston Avenue., Bridgeport, Conn., on which it contemplates erection of a manufacturing plant.

Work has started on a power development for Springfield Railway Terminal Co., Springfield, Vt. Charles T. Main, Inc., 201 Devonshire Street, Boston, is engineer.

Charles H. Tenney Co., 200 Devonshire Street, Boston, engineer, is taking bids on a 35 x 50 ft. boiler plant addition to Brockton Gas Light Co., 54 Main Street, Brockton, Mass., to cost, with equipment, $130,000.

Watertown Builders' Supply Co., 418 Arsenal Street, Watertown, Mass., manufacturer of building materials, has plans under way for a three-story plant to cost close to $40,000 with equipment. H. F. Bryant, 334 Washington Street, Brookline, Mass., is architect.

E. H. Hotchkiss Co., Hoyt Street, Norwalk, Conn., manufacturer of snap fasteners and other metal specialties, is receiving bids for one-story addition, 50 x 132 ft., instead of two-story structure as originally intended, to cost upward of $40,000 with equipment. Ballinger Co., 105 South Twelfth Street, Philadelphia, is architect and engineer.

Richards & Co., Inc., 269 Ludlow Street, Stamford, Conn., manufacturer of lacquers, etc., has begun erection of additions, including two-story extractor and beater units, 30 x 60 ft. and 35 x 65 ft., respectively; boiler house, 80 x 110 ft., and other structures, to cost $85,000, for which general contract recently was let to J. W. Ferguson Co., Paterson, N. J.

New England Public Service Co., Worcester, Mass., has purchased plant and property of Franklin Light & Power Co., Franklin, N. H. Plans are under way for expansion, including transmission line construction. Company is also securing control, it is said, of Tilton Electric Co., Tilton, N. H., and will expand in that territory. Purchasing company is operated by Middle West Utilities Co., Chicago.

Southern New England Ice Co., 48 Edwards Street, Hartford, Conn., will erect one-story plant with capacity of 75 tons per day, to cost close to $100,000 with machinery.

Universal Car Co., North Attleboro, Mass., will soon begin construction of a one-story and basement service, repair and garage building, 65 x 100 ft. Machine shop and parts division will be installed.

Thames Sheet Metal Works, 14-18 Hamilton Street, New London, Conn., has been organized to operate metal fabricating plant. Principal products will be metal ovens, tanks, ducts, breechings, smoke stacks, ventilators, skylights and cornices. Company has plant in operation but will be in market for more equipment and materials.

Pittsburgh

PITTSBURGH, Jan. 30.

JANUARY has been a good month for a few machine tool dealers, but rather lean in point of sales for the majority. There has been good inquiry, but many seem to have been for getting prices on which to formulate requests for appropriations. In the past week distribution of about 10 tools for the Herron Hill High School by the Pittsburgh Board of Education has added to the business of a few firms.

In heavy machinery, inquiry continues better than actual business. Crane builders and makers of rolling mill equipment are very busy in their estimating departments. A seamless pipe mill projected for the McKeesport works, National Tube Co., will probably be installed either at Lorain, Ohio, or Gary, Ind. The hot-rolled strip mill for Sharon Steel Hoop Co., which is understood to be a 13-stand unit, is yet to be placed. A Pittsburgh builder has contract for the new wide strip mill for Wheeling Steel Corporation.

Barton E. Brooke and H. R. Dyer, Dollar Bank Building, Youngstown, Ohio, architects, are preparing plans for a three-story automobile service, repair and garage building at Sharon, Pa., to cost $150,000, for which bids will soon be asked.

Harry G. Blanck, 2716 Veteran Street, Northside, and George D. Gianakos, Monterey and North Avenues, Pittsburgh, have formed Gianakos-Blanck Co., to operate a local plant for manufacture of kitchen and confectioners' equipment, and kindred metal goods.

United States Engineers Office, Pittsburgh, will soon ask bids for turbine engines, pumping equipment and piping for gate structure at Lock No. 6, Allegheny River. Plans have been approved for a power house at this location, and operating machinery also for cover plates.

Borough Council, Springdale, Pa., is considering purchase of water-softening plant for the municipal waterworks, to cost $40,000. J. F. Pierce is borough manager.

Pennsylvania Power Co., Sharon, Pa., has applied for permission to construct a steel tower transmission line across Mahoning River, near Mahoningtown, Ohio. Stevens & Wood, Inc., 120 Broadway, New York, is engineer.

Arrangements are being made by American Window Glass Co., Farmers' Bank Building, Pittsburgh, for resumption of operations at its plant at Bellevernon, Pa., closed for several years. Remodeling is under way and improvements and replacements will be made in equipment.

Joint School Boards of Ebensburg and Cambria Township, Ebensburg, Pa., are considering installation of manual training equipment in a high school to cost $170,000. H. M. Rogers, Johnstown Trust Building, Johnstown, Pa., is associate architect.

South Atlantic States

BALTIMORE, Jan. 30.

PLANS are being completed by George A. Whiting, president Standard Wholesale Phosphate Co., and Standard Acid Works, Inc., Continental Building, Baltimore, and associates for new plant in Curtis Bay Section for production of muriatic acid, to cost in excess of $300,000 with machinery. Same interests operate Consumers Acid Works, Inc., Curtis Bay, now building plant in that district for manufacture of sulphuric acid. Peter S. Gilchrist, president, Chemical Construction Co., Charlotte, N. C., is consulting engineer for new works.

Board of Awards, office of City Register, City Hall, Baltimore, is asking bids until Feb. 8 for materials for repair shops for Department of Education. Joshua R. Jolly, is acting secretary, Board of School Commissioners.

Warwood Ring Co., 200 North Eleventh Street, Baltimore, manufacturer of piston rings, etc., affiliated with Warwood Tool Co., same address, is reported considering erection of a new plant, to cost upward of $75,000 with equipment.

Georgia Steel & Iron Co., Tallapoosa, Ga., is said to be completing plans for works for production of horse-shoes, plate steel specialties and iron products, to cost close to $100,000 with equipment. Local buildings will be remodeled.

Duke Power Co., Charlotte, N. C., is completing plans for a new power transmission line from Canton, N. C., to Greenville, S. C., and vicinity, connecting with a recently completed hydroelectric generating station on Pigeon River, N. C., to cost more than $150,000.

Carolina Rubber Co., Salisbury, N. C., recently merged with Ajax Rubber Co., Racine, Wis., has plans for enlargements to cost upward of $90,000 with equipment. C. H. Waggener has recently been elected vice-president and general manager.

Bureau of Supplies and Accounts, Navy Department, Washington, is asking bids until Feb. 7 for one electric furnace for navy yard at Norfolk, Va., schedule 8413; also for trunnion roller bearings for Washington yard, schedule 8414; for 15,600 steel boiler tubes for Brooklyn Navy Yard, and 15,600 such tubes for Mare Island, schedule 8374, and for one bolt heading machine for Puget Sound yard, schedule 8388.

Crisp County Board of Commissioners, Cordele, Ga., has engaged J. E. Sirrine & Co., Greenville, S. C., and E. S. Killebrew, Albany, Ga., engineers, to prepare plans for a hydroelectric generating plant on Flint River, vicinity of Cordele, to cost $1,250,000 with equipment and transmission system. First noted will act as consulting engineer.

Hickory Wood Products Co., 507 East Third Street, Gastonia, N. C., is said to have leased additional property for new plant for production of tool handles and kindred turned wood products, to cost more than $20,000.

Board of Education, Durham, N. C., is considering installation of manual training equipment in an addition to junior high school to cost $200,000, for which superstructure will soon begin. Milburn, Heister & Co., First National Bank Building, are architects.

Savannah River Electric Co., Greenwood, S. C., has secured permission for a hydroelectric power development on Savannah River, near Clarks Hill, McCormick County, to cost upward of $10,000,000 with transmission system. O. G. Thurlow, Birmingham, is engineer.

P. C. Painter, city manager, Greensboro, N. C., is asking bids until Feb. 7 for ash-handling equipment at municipal pumping plant.

Alfred Carper, Buchanan, Va., is head of a project to establish plant for production of metal automobile license tags and will soon secure prices and information on equipment.

Central of Georgia Railway Co., Savannah, Ga., has plans for a one and three-story storage and distributing plant, 52 x 125 ft., and 40 x 125 ft., to cost $60,000. G. A. Belden is architect.

Virginia Public Service Co., Charlottesville, Va., is planning construction of a transmission line in Natural Bridge National Forest district, Bedford and Amherst Counties, to cost upward of $75,000.

Milwaukee

MILWAUKEE, Jan. 30.

MACHINE-TOOL manufacturers are entering February with perhaps the best prospects for new business that have been before them in several months. January business, while not of large proportions, was better in comparison with any of the preceding six months. An encouraging development was in inquiries, action upon many of which is expected by February or March, with the automotive industries in particular. Foundries and machine shops in this territory report improving demand and employment is gaining.

Rhinelander Paper Co., Rhinelander, Wis., manufacturer of news print and book paper, contemplates installation of an additional machine unit, a new finishing room and a new steam generating plant at an estimated cost of $175,000.

Chamber of Commerce, Clintonville, Wis., is sponsoring organization of a $125,000 corporation to take over plant and good will of the Topp-Stewart Tractor Co., local, and engage in manufacture of highway construction and maintenance equipment, conveyors, etc., also continuing production of tractors. A going company, identity of which is as yet not revealed, has agreed to move its operation to Clintonville as part of new organization. D. J. Rohrer, Harry E. Brooks, C. F. Folkman, Max Stieg and Fred Ruth, Clintonville manufacturers and business men, constitute executive committee.

Common Council, Hartford, Wis., William Radtke, clerk, closes bids Feb. 7 for direct-connected fan and steam engine to deliver 18,000 cu. ft. per min. of air; direct-connected steam driven 25 kw., 120 volts d.c., exciter, and rewinding two electric generator units.

Federal Asbestos & Cork Insulating Co., 931 Thirtieth Street, Milwaukee, has acquired several buildings of former Johns-Manville works at Forty-second and State Streets, and will rebuild entire area as an additional production unit at an estimated cost of $75,000. General contract has been let to the Appleton Construction Co., I.O.O.F. Building, Appleton, Wis.

Mertes Machinery Co., 246 Oregon Street, Milwaukee, manufacturer and distributer of contractors' equipment and machinery, has purchased former plant of Crucible Steel Casting Co., 612 Clinton Street, which it is remodeling for general manufacturing and storage.

Star Pointer Pump Mfg. Co., Menasha, Wis., has changed its corporate title to Twin Cities Plumbing Supply Co., and will devote most of its attention to manufacturing and distributing supplies and materials for plumbing and heating trades.

Indiana

INDIANAPOLIS, Jan. 30.

A ONE-STORY addition, 60 x 100 ft., will be erected to plant of Truck Engineering Co., East Pontiac Street, Fort Wayne, Ind., to cost close to $80,000 with equipment. Work will begin in spring. Guy Mahurin, Standard Building, is architect.

Acme Tool & Machine Co., 924 Fort Wayne Avenue, Indianapolis, has acquired property, 40 x 217 ft., as site for new plant to cost about $35,000.

Oakes-Swenson Co., Indianapolis, recently formed, will operate a metal stamping works at East Nineteenth and Sheldon Streets. Carl G. Swenson and Perry Oakes are heads.

Board of Trustees, Purdue University, Lafayette, Ind., has awarded general contract to A. E. Kemmer, Third and Brown Streets, for a three and four-story service building for mechanical and other work, to cost $75,000. Walter Scholer, Painters' & Decorators' Building, is architect.

Board of Education, Brazil, Ind., plans installation of manual training equipment in a two-story addition to junior high school, to cost $125,000. McGuire & Shook, 941 North Meridian Street, Indianapolis, are architects. Charles P. Keller is superintendent of schools.

W. A. Folger, Fort Wayne, Ind., has plans for a one-story machine and repair shop to cost about $25,000. G. Mahwin, 425 Standard Street, is architect.

J. R. Gratham Motor Sales Co., 541 Washington Street, Gary, Ind., is completing plans for a three-story and basement service, repair and garage building, 75 x 110 ft., to cost $100,000 with equipment. Joseph H. Wildermuth, 583 Broadway, is architect.

Empire Box Co., 518 West Monroe Street, Chicago, manufacturer of paper boxes and containers, has superstructure in progress on a new plant at South Bend, Ind., to cost upward of $150,000 with machinery. W. M. Elwood, Christman Building, South Bend, is architect.

Vulcan Plow Co., Evansville, Ind., has purchased interests of Earl L. Yocum and Fred H. Hand in Hayes Pump & Planter Co., Galva, Ill., acquiring controlling interest in the Hayes company. Acquired plant will be continued in operation and production increased.

Cincinnati

CINCINNATI, Jan. 30.

WITH several notable exceptions, machine tool companies report that sales in January have been light and have not come up to volume attained in December. Inquiries before the trade, however, give promise of better business during February, and builders are of the opinion that buying will increase steadily in the next 60 days.

Purchases by automobile companies continue to hold the center of attention. A maker in the Detroit district has ordered 17 17-in. lathes, this transaction raising to a total of 24 the number of machines contracted for by this company in the last two weeks. Two other Detroit manufacturers have added new machine tool equipment, including drilling machines. From Sweden has come to a local builder an order for four special lathes. Railroads are a negligible factor in the market at the moment, while sales to companies in the general industrial field have been only fair in volume. The Central Railroad of New Jersey has closed for a 30-in. x 16-ft. heavy engine lathe.

Plans are being considered by Wilmington Ice Co., Wilmington, Ohio, for rebuilding plant recently damaged by fire, with loss of more than $25,000 including equipment.

Gummed Products Co., Troy, Ohio, manufacturer of paper goods, has awarded a general contract to A. E. Brown & Son, Troy, for a one-story addition, to cost about $35,000 with equipment.

Harris-Thomas Drop Forge Co., 126 Harshman Street, Dayton, Ohio, has let general contract to Danis-Hunt Co., Dayton, for a one-story addition, to cost approximately $25,000 with equipment.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is taking bids until Feb. 10 for quantity of tools, including micrometer calipers, hacksaw frames, expansion reamers, welding torch, dies, files, etc., circular 206; until Feb. 21 for one bomb trailer, circular 209.

American Glanzstoff Corporation, 180 Madison Avenue, New York, will build a two-story steam-operated power plant, 66 x 112 ft., and 33 x 112 ft., and one-story machine shop, at its new rayon mill at Elizabethton, Tenn.; entire project to cost in excess of $1,500,000. Lockwood, Greene & Co., 100 East Forty-second Street, New York, are architects and engineers.

De Soto Paint & Varnish Mfg. Co., Memphis, Tenn., formerly De Soto Paint Mfg. Co., recently reorganized with increase in capital to $1,000,000, is arranging for expansion, including establishment of department for manufacture of lacquers. W. G. Saunders is president.

United Public Service Corporation, Chicago, has purchased Kentucky Power Co., Maysville, Ky., and affiliated interests operating in northern Kentucky, for about $6,000,000. New owner plans extensions and improvements, including transmission line construction.

Board of Trustees, Ohio State University, Columbus, is asking bids until Feb. 9, for construction of addition to power plant and completion of new chemistry building, to cost $300,000. Joseph M. Bradford, Brown Hall, Campus, is architect; William C. McCracken, Department of Public Works, State House, is engineer.

E. L. Bruce Lumber Co., Thomas Avenue, Memphis, Tenn., manufacturer of hardwood flooring, etc., has plans for a one-story mill addition, 100 x 100 ft., to cost close to $40,000 with machinery.

Newman Mfg. Co., 418 Elm Street, Cincinnati, manufacturer of ornamental bronze and other metal products, has acquired former plant of Safe Cabinet Co., Norwood, with main unit, two stories, 100 x 600 ft., and four side wings, and will remodel for early occupancy. Present business will be removed to new location.

International Aircraft Corporation, Cincinnati, has been organized under Ohio laws to acquire assets and business of International Aircraft Corporation, Long Beach, Cal., latter company having been engaged in aircraft manufacture since 1909. New company has leased plant of Industrial Nitrate Co. at Ancor, Ohio, for establishment of works.

Nash Gas & Diesel Engine Co., 913 East Third Street, Dayton, Ohio, has been formed to manufacture gas and oil engines. It has secured local plant and also has arranged to do work by contract.

Gulf States

Birmingham, Jan. 30.

CONTRACT has been let to Mackle-Shepherd Co., 615 South Twenty-seventh Street, Birmingham, for one-story factory branch and distributing plant, 60 x 220 ft., in Smith Park section for Bates Valve Bag Co., 8200 South Chicago Avenue, Chicago, manufacturer of bag-filling machinery, to cost about $35,000.

Plans have been completed by Weslaco Machine Works, Weslaco, Tex., for establishment of a plant, and equipment will soon be installed in existing building. L. L. Crosby is president.

Montgomery, Ward & Co., Chicago Avenue, Chicago, operating a mail order business, has filed plans for an eight-story factory branch and distributing plant at Fort Worth, Tex., 220 x 360 ft., to cost $1,250,000 with equipment.

Sun Oil Co., Houston, Tex., is completing plans for development of sulphur properties in vicinity of Richmond, Tex., where more than 300 acres has been secured. Initial plant will cost in excess of $1,000,000 with machinery. A housing development for employees is being arranged. Benjamin Andrews will be chief engineer, in charge.

Travis Cottonseed Products Co., 303 East Fifth Street, Austin, Tex., has acquired 10 acres in vicinity of Corpus Christi, Tex., as site for a new cottonseed oil mill, to cost more than $60,000 with equipment.

Fire, Jan. 26, destroyed wagon works at State Penitentiary, Huntsville, Tex., with loss close to $25,000 with equipment. Prison Commission, Col. H. Walker Sales, head, plans to rebuild.

Houston Lighting & Power Co., Houston, Tex., is planning erection of a new power substation to cost close to $200,000 with equipment.

Valley Electric & Ice Co., San Benito, Tex., is completing plans for a new cold storage and refrigerating plant, on 10-acre tract, at Raymondsville, Tex., recently acquired, to cost close to $100,000 with machinery.

Chamber of Commerce, Clarksdale, Miss., is head of project to establish a plant for manufacture of face brick to cost more than $40,000.

M. L. Hampton & Associates, Congress Building, Miami, Fla., architects, have filed plans for a two-story municipal automobile service, repair and garage building, 185 x 245 ft., to cost close to $100,000 with equipment.

Findlater Hardware Co., Chadbourne Street, San Angelo, Tex., has plans for a new storage and distributing plant, 76 x 180 ft., to cost approximately $50,000 with equipment. A. F. Korn and B. M. Morgan, Thomas Building, Dallas, Tex., are associated architects.

Lone Star Gas Co., 1915 Wood Street, Dallas, Tex., has awarded general contract to Austin Co., Linz Building, for a new storage and distributing plant, with meter shop, automobile service and garage department, to cost about $75.000 with equipment.

Crawford Auto Shop, Inc., 2227 First Avenue, Birmingham, has plans for a two-story service, repair and garage building, 140 x 150 ft., to cost approximately $100,000 with equipment. William L. Welton, American Trust Building, is architect.

Rapid Battery Mfg. Co., 1401 James Street, Waco, Tex., will proceed with erection of two-story plant, 70 x 112 ft., to cost about $18,000 with equipment.

Hidalgo Utilities Co., Hidalgo, Tex., has secured a franchise and plans installation of an electric light and power house, and ice-manufacturing plant. A. Y. Baker, Edinburg, Tex., is president.

Galvanizing & Plating Co. of Texas, 3205 Engelke Street, Houston, Tex., has begun operation of its plant for hot dip galvanizing of sheets, plates and structural materials. It is equipped to do commercial galvanizing in any quantity.

Climax Engineering Co., Clinton, Iowa, has appointed Equitable Equipment Co., 410 Camp Street, New Orleans, its sales and service representative in lower Louisiana and Mississippi.

Cleveland

Cleveland, Jan. 30.

SALES fell off the past week, dealers reporting very few orders and not much new inquiry. However, reports from some manufacturers are more encouraging. A local manufacturer of turret lathes continues to take a good volume of business in orders for one or two machines and states that January sales will be the largest of any month in two years. This is partly due to business brought out by the recent price advance, although many orders have been at the new prices. Reports from Detroit indicate a moderate amount of orders for single machines or small lots from the automotive industry.

Virden Co., division of Gill-Virden Co., Philadelphia, formed about a year ago by merger of Virden Co. and Gill Brass Co., is moving from Cleveland to a new plant just completed in Philadelphia. Company manufactures lighting fixtures.

Variety Machine & Stamping Co., 3406 Tate Avenue, Cleveland, is enlarging its plant by erection of an addition, 36 x 60 ft.

Plans are being completed by Steel Improvement & Forge Co., 5003 Windsor Avenue, Cleveland, for new works for drop forge production, to cost close to $100,000. It is understood that standard type units will be used and that no architect will be employed.

Ohio Valley Gas Corporation, Zanesville, Ohio, recently formed to take over and operate natural gas properties in southern Ohio and West Virginia, furnishing service to Hope Natural Gas Co., Zane Gas Co., Zanesville, and other interests, has arranged for bond issue of $1,800,000, portion of proceeds to be used for extensions and improvements, including pipe line construction.

Serugee Rubber Co., Akron, Ohio, John Hatfield, president, recently organized, is completing plans for a new factory at Atwater, Ohio, for manufacture of general rubber specialties, to cost more than $50,000 with machinery.

Cleveland Electric Illuminating Co., Illuminating Building, Cleveland, has filed plans for a four-story and basement power substation, 55 x 125 ft., to cost approximately $100,000 with equipment.

General Tire & Rubber Co., Akron, Ohio, is disposing of a preferred stock issue of $3,500,000, a portion of fund to be used for expansion.

Ice & Fuel Co., Youngstown, Ohio, Paul Hunt, president, is completing plans for a new electrically-operated ice-manufacturing plant, to cost about $120,000 with machinery.

Henn Motor Sales Co., 1290 West 117th Street, Lakewood, Ohio, has awarded a general contract to Austin Co., Cleveland, for a one-story service, repair and garage building, 70 x 185 ft., to cost close to $100,000 with equipment.

Arcade Garage Co., Akron, Ohio, has plans for a four-story service, repair and garage building, 132 x 135 ft., to cost approximately $250,000. Starrett & Van Vleck, 8 West Fortieth Street, New York, are architects.

St. Louis

St. Louis, Jan. 30.

BIDS will be asked at once by Curtiss-Robertson Aircraft Corporation, Bridgeton, Mo., for one-story plant on local site, for manufacture of commercial airplanes and parts, to cost $100,000 with equipment. Company is affiliated with Curtiss Aeroplane & Motor Co., Buffalo, N. Y., and Robertson Aircraft Corporation, Bridgeton. McDonald & Condie, 502 North Taylor Street, St. Louis, are architects.

Ramsey Accessories Mfg. Co., 4375 Duncan Avenue, St. Louis, manufacturer of automobile equipment, has awarded general contract to Atlas Construction Co., International Life Building, for one-story top addition to present factory, 40 x 180 ft., to cost about $25,000 with equipment.

Shampaine Aseptic Furniture Co., St. Louis, operated by A. S. Aloe Co., 1819 Olive Street, has leased portion of building at 1222 Chouteau Avenue, and will establish new plant for manufacture of metal beds and metal furniture.

John F. Brewer, Mountain View, Ark., plans extensions and improvements in local steam-operated electric power house, to include installation of engine, generator and accessory equipment.

Board of Education, Kansas City, Mo., is considering construction of central power station and heating plant to cost close to $100,000 with equipment.

Board of Public Service, St. Louis, is asking bids on general contract until Feb. 14 for one cast iron surge tank, contract 2985; for zeolite water softener, contract 2986; and for one deaerating feed-water heater, vent condenser and auxiliaries, contract 2987. O. D. Tillay is secretary.

Common Council, Kennett, Mo., is considering installation of municipal electric light and power plant, to cost $25,000 with equipment.

Arkansas Cold Storage Co., Little Rock, Ark., is arranging for erection of three-story addition to ice and refrigerating plant, to cost $90,000 with equipment.

Board of Education, Dodge City, Kan., is planning installation of manual training equipment in new three-story and basement high school to cost $250,000, for which bids have been taken on general contract. Mann & Co., Rorabaugh-Wiley Building, Hutchinson, Kan., are architects.

Wilson Power & Light Co., Wilson, Ark., is disposing of bond issue of $250,000, a portion of fund to be used for expansion and improvements, including transmission line construction.

L. J. Kent Boiler & Sheet Iron Works, Springfield, Mo., will build a new one-story plant, 75 x 150 ft., to cost about $40,000 with equipment.

D. M. S. Motor Repair Co., 2615 Warwick Boulevard, Kansas City, Mo., recently organized with capital of $100,000, plans operation of a one-story machine repair and parts works.

Public Service Co. of Oklahoma, Boston Street, Tulsa, contemplates extensions and improvements in ice-manufacturing plant at Grove, Okla., recently acquired, including installation of additional equipment. Transmission line will be built from Afton to Grove.

A. P. Green Fire Brick Co., Mexico, Mo., has begun enlargements in plant to increase capacity about 30,000 fire brick daily, to cost upward of $200,000 with equipment.

Detroit

DETROIT, Jan. 30.

PLANS are being completed by Superior Foundry Corporation, Grand Rapids, Mich., for a one and two-story foundry, 75 x 175 ft., to cost close to $100,000 with equipment. Wernette & McCarthy, Houseman Building, are architects.

City Commission, Grand Rapids, Mich., plans installation of pumping and power equipment, boiler plant, etc., in connection with a sewage disposal plant. Entire project will cost $1,500,000. Financing will soon be arranged.

Douglas & Lomason, 5836 Lincoln Avenue, Detroit, manufacturer of hardware products for automobile bodies, contemplates purchases of forgings and castings, brass, aluminum, sheet steel and other raw materials during next few months.

Jackson Steel Products Co., division of General Motors Corporation, Jackson, Mich., will occupy former local plant of Kelsey-Hayes Wheel Corporation, recently acquired, for production of steel stampings.

Johnson Motor Sales Co., 711 North Saginaw Street, Flint, Mich., has plans for a two-story and basement service, repair and garage building, 70 x 125 ft., and will soon take bids on general contract. MacKenzie & Pratt, Genesee County Savings Bank, are architects.

Oakland Motor Car Co., Oakland Avenue, Pontiac, Mich., is completing plans for a four-story and basement addition, 130 x 200 ft., to cost close to $200,000 with equipment. Albert Kahn, Marquette Building, Detroit, is architect.

Following erection of initial building for its new plant now in progress, Michigan Fertilizer Co., Lansing, Mich., will build a second unit, one story, 27 x 85 ft. Another structure for production of acid is also under advisement.

City Council, Ann Arbor, Mich., is planning a municipal airport, including machine and repair shops, hangars, storage and distributing buildings and other structures, to cost in excess of $100,000. G. H. Sandeberg, City Hall, is city engineer.

Board of Education, Pontiac, Mich., is planning construction of a new two-story and basement industrial arts school, with central steam power plant adjoining, to cost in excess of $325,000 with equipment.

Peter Smith Heater & Mfg. Co., 6209 Hamilton Street, Detroit, recently formed to succeed Peter Smith Heater Co., plans erection of a one-story addition early in the spring, adjoining present plant at Fordson, designed for heater division, which will be removed from present works at 1230 Wilbor Street, following completion. Company is arranging to expand operations and will operate division for manufacture of pressed steel parts. Heater division will be devoted to production for steam railroads and electric cars. Zeno C. Wilkinson, formerly connected with Youngstown Pressed Steel Co., Youngstown, has recently become vice-president and director.

Quartermaster Department, Washington, plans a one-story mechanical and repair shop at Selfridge Field, Mich., and new equipment storage and distributing plant, to cost $85,000. It is understood that bids will be asked late in spring.

Canada

TORONTO, Jan. 30.

WHILE large lists are absent from the machine tool market, a steady flow of orders is being received by builders and dealers for one, two and three tools. Industrial companies in all parts of the Dominion are extending their operations and many have plant additions under way or contemplated. Some improvement is noted in sales to the automotive industry, particularly garages and repair plants. While some large orders have recently been closed from mining interests in northern Ontario and Quebec, it is understood that inquiries in dealers' hands indicate a continued strong buying movement from this source.

Horton Steel Works, Ltd., Bridgeburg, Ont., has plans for an addition, 98 x 305 ft., of reinforced concrete to cost $50,000. New equipment will be purchased. Company manufactures ore bins, boiler breechings, tanks, etc.

Machine shop at Beaverton, Ont., owned by Smith Brothers, was destroyed by fire Jan. 24, with loss to building and equipment estimated at $10,000.

Standard Steel Construction Co., 55 Main Street East, Welland, Ont., will build an addition, one and one-half stories, 30 x 50 ft.

American Cyanamid Co., Stanley Street, Niagara Falls, Ont., has started foundation work on a $200,000 addition, to include a melting plant, 60 x 125 ft., and cooling plant, 60 x 82 ft. Standard Steel Construction Co., Welland, Ont., has contract for structural steel.

J. N. Coupal, Plantagenet Springs, Ont., will start work in spring on installation of a power development plant on Nation River to cost $30,000.

Western Canada

Application has been made by Calgary Power Co., Calgary, Alta., to develop two more power sites on Bow River, between its present Horseshoe Falls plant and Calgary. G. A. Gaherty is managing director.

Northern Light & Power Co., Estevan, Sask., is contemplating power development to cost $5,000,000. Plans call for erection of a station near Estevan where power can be developed from lignite coal.

Pacific Coast

SAN FRANCISCO, Jan. 25.

PERMISSION has been granted Sacramento Pulp & Paper Co., Sacramento, Cal., H. D. Wagnon, 1038 East Tenth Street, North, Portland, president, to issue securities in amount of $500,000, proceeds to be used for new pulp and paper mill in vicinity of Sacramento.

Southern California Edison Co., Los Angeles, is planning extensions and improvements in plant and system at Tulare and vicinity, to cost $325,000. Similar work will be carried out in Santa Barbara territory, to cost about $250,000.

Pacific Fruit Express Co., 65 Market Street, San Francisco, has awarded general contract to Lynch-Cannon Co., Chapman Building, Los Angeles, for one-story ice-manufacturing plant at Fresno, Cal., to cost upward of $500,000 with machinery. Company has taken option on about 200 acres at Tucson, Ariz., as site for ice-manufacturing and cold storage plant, to cost more than $650,000 with equipment. Engineering department is in charge.

Water and Power Commission, 207 South Broadway, Los Angeles, is asking bids until Feb. 28 for electric generators, exciter generator, transformers and auxiliary electric equipment, and hydraulic machinery for municipal power department. James P. Vroman, secretary.

Illinois-Pacific Glass Co., Fifteenth and Folsom Streets, San Francisco, is completing plans for new works at Vernon, near Los Angeles, where 8-acre tract is available, to cost $700,000 with machinery. It is expected to begin work in about 60 days.

Pacific Can Co., 290 Division Street, San Francisco, has begun grading for a new one-story plant, for which superstructure will soon begin, to cost $400,000 with machinery. L. H. Nishkian, Monadnock Building, is engineer and manager of construction.

Great Western Power Co., 530 Bush Street, San Francisco, has acquired about 35 acres near city as site for a steam-operated electric generating plant, with initial capacity of 35,000 kw., to cost upward of $750,000. It will be equipped to use oil fuel. McClellan & Junkersfeld, Inc., 60 Trinity Place, New York, is engineer.

City Council, Sand Point, Idaho, is considering installation of a municipal hydroelectric generating plant on Priest River, where site has been secured, to cost $175,000. H. A. Sewell, Interstate Engineering & Construction Co., Newport, Wash., has submitted estimates of cost.

Southern Pacific Railroad, Eugene, Ore., has awarded contract to H. E. Wilder, Eugene, for a one-story machine shop, 200 x 200 ft., at its local engine terminal, to cost $250,000 with machinery. Two craneways will be built. E. L. King, Pacific Building, Portland, is division superintendent.

Bunting Iron Works, Inc., 820 Parker Street, Berkeley, Cal., is considering erection of a one-story plant, to cost more than $70,000 with equipment.

Faegol Motors Co., Oakland, Cal., manufacturer of automobiles, is arranging for a note issue of $600,000, a portion of proceeds to be used for expansion and financing.

Idaho Power Co., Boise, Idaho, is reported planning construction of a hydroelectric generating station on Snake River, near American Falls, Idaho, to cost $1,700,000 including transmission lines.

Ornamental Iron Works, 900 Republican Street, Seattle, will erect a new one-story building, 64 x 100 ft.

Everett Marine Ways, Everett, Wash., has under construction a machine shop adjoining its welding department. Harold J. Durham is president and manager of company.

Iron Fireman Mfg. Co., Portland, Ore., will soon begin construction of an addition to its plant on East Seventeenth Street.

Foreign

PLANS are being considered by National Argentine Oilfields, Enrique Mosconi, director-general, a department of Government of Argentina, Buenos Aires, for additions and improvements in its oil refinery at La Plata, to include installation of new machinery for cracking and other operations, to cost $900,000. Plant has present capacity for handling 2000 tons crude oil per day.

Synthetic Ammonia & Nitrates, Ltd., Bellingham-on-Tyne, near Newcastle-on-Tyne, England, branch of Imperial Chemical Co., Ltd., London, has plans for two new units with capacity of 50,000 tons of nitrogen per year, to cost more than $5,000,000 with machinery. Expansion is scheduled for completion early in 1930.

Municipal Council, Bydgoszoz, Pomerania, Prussia, Germany, has negotiated a loan of 3,000,000 francs (about $600,000) for extensions and improvements in its power facilities. A new plant will be built, to be equipped with two turbo-generator units of 3500 and 3000-kw. capacity respectively, and scheduled for completion by end of year. Present station will be used for reserve.

Pan-American Petroleum & Transport Co., 120 Broadway, New York, is considering construction of a new oil refinery in Venezuela, with initial capacity of about 75,000 bbl. per day, supplementing an existing refinery of Lago Oil & Transport Co., a subsidiary, near Maracaibo. Thomas Cook is general manager of manufacturing and refining.

City Administration, Riga, Latvia, has authorized plans for a new municipal electric power house and estimates of cost will soon be made. American Consulate, Riga, McCeney Welich, vice-consul, has information regarding project.

A company has been formed to take over Halda Aktb., manufacturer of Halda typewriters, with main factory at Svangsta, Sweden, with capital not less than 200,000 crowns, nor more than 600,000 crowns ($54,000 and $162,000). Plant has been closed for some time and new company contemplates early resumption of manufacture, with installation of additional equipment. American Consulate, Stockholm, Sweden, is understood to have information regarding project.

A sugar manufacturing company at London, England, has acquired property in Chichester district as site for a beet sugar refinery to cost about £400,000 (about $2,000,000). Information at Bureau of Foreign and Domestic Commerce, Washington, reference England, 35-X; also at American Consulate, London, William L. Cooper, commercial attaché.

NEW TRADE PUBLICATIONS

Preheaters.—Gradon Mfg. Co., East Tioga and Memphis Streets, Philadelphia. Folder 710 of 4 pages is devoted to preheaters in the construction of which considerable welding work is done. Standard dimensions and list prices are given for 27 sizes. The units are made both horizontal and vertical.

Ash Gates and Accessories.—Atlas Conveyor Co., 20 South Fifteenth Street, Philadelphia. Bulletin of 8 pages illustrating and describing ash gates of various types for use with furnaces fired by stokers, or otherwise. One type features ashes from pulverized fuel. An ash quencher is described, also.

Combustion Control.—Leeds & Northrup Co., 4901 Stenton Avenue, Philadelphia. Pamphlet of 8 pages reprinting an article from *Combustion*. It deals with fuel control by means of meters of the recording type.

Magnetic Brakes.—Cutler-Hammer Mfg. Co., Milwaukee. Bulletin P-38 of 20 pages. Illustrated description of magnetic brakes, with dimension and clearance drawings, together with specifications of various types suited for a wide variety of purposes. Illustrations are largely of installations, one showing a brake on a blooming mill manipulator finger, at the Inland Steel Co.

Steam Generation.—Combustion Engineering Corporation, 200 Madison Avenue, New York. An 8-page paper by Martin Frisch, dealing with aims and tendencies in steam generation and combustion engineering. Illustrations include cross sections of large generating units, diagrams of performance and illustrations of special equipment to improve performance. Higher steam pressures, higher boiler capacities and higher combustion rates are mentioned as present trends.

Cutter Grinder.—George Gorton Machine Co., Racine, Wis. Form 1090 of 4 pages illustrates and describes a cutter grinder, especially suited to the grinding of small mills, drills and engraving machine cutters. It is operated by a fractional horsepower motor, running at 5000 r.p.m. for the ⅛ hp. or 3400 r.p.m. for the ⅙ hp.

Belting.—F. Raniville Co., Grand Rapids, Mich. Belting manual, 3½ by 5½ in., 48 pages. In addition to price information and data relating to the belting, mechanical leather specialties and other products of the company, pages are devoted to practical suggestions for flat belt users. Other pages list mechanical rules, hp. transmitted, types of belt drives, etc.

Turret Lathe Tooling.—Jones & Lamson Machine Co., Springfield, Vt. Attractive booklet illustrating standard turret lathe tooling on chuck work.

Small Tools.—Gairing Tool Co., Detroit. Booklet 8½ by 11 in., 16 pages, describing and illustrating multiple-operation cutters, spot facers, counter-bores, core drills, etc., as well as the company's fixtures for grinding and salvaging counterbores and core drills.

Woodworking Machinery.—Oliver Machinery Co., Grand Rapids, Mich. Catalog No. 24, 8½ by 11 in., 31 pages, describing the company's Junior line of portable woodworking machinery. The line includes tilting arbor saw benches, band sawing machines, jointers, hollow chisel mortisers, and sanders. Electric glue pots and heaters, babbitt pots, tool grinders and vises are among several other items described.

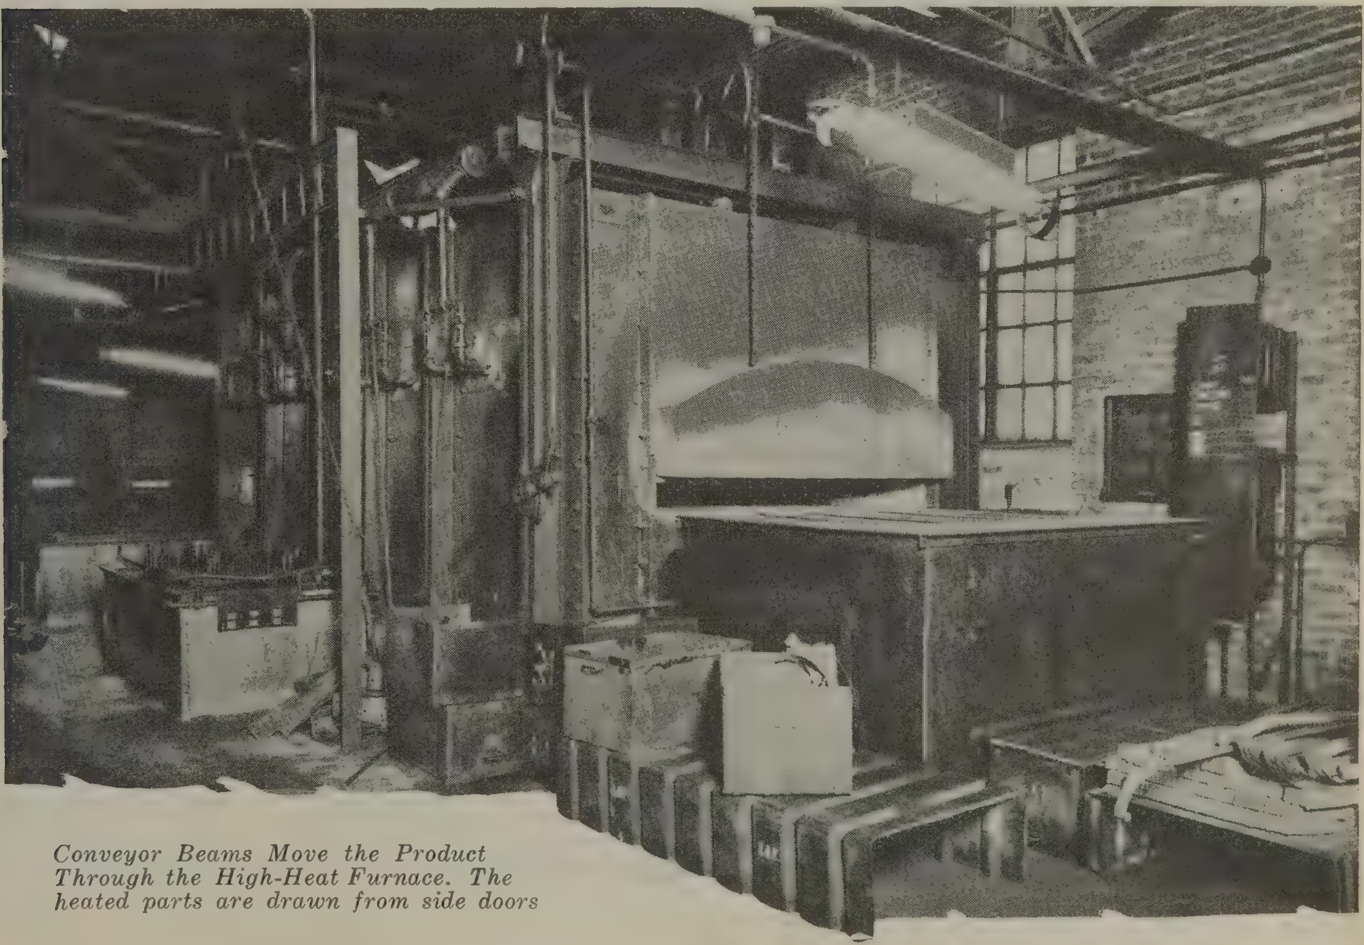
Heat Treating Three Thousand Automobile Bumpers Daily

Furnaces Fired by City Gas Mixed With Air in Central Reservoir—Special Equipment Prevents Distortion in Quenching—Close Control of Temperature a Feature of Chicago Plant

BY ROGERS A. FISKE*

ACCURATE control of furnace temperatures for hardening and close attention to the rate of heating and the time for soaking have successfully brought about marked uniformity in the heat treating of 3000 automobile bumpers a day at the plant of the Stewart-Warner Speedometer Corporation, Chicago. The equipment includes two special conveyor-type, gas-fired furnaces, one for hardening and one for drawing. In the former, temperatures are automatically controlled within limits of 10 deg. Fahr. A conveyor system sets the pace for the progress of the material, and the character of the equipment is such that a high degree of skill is not required of the furnace operators.

Simplicity of the layout is an impressive feature. The furnaces are parallel to each other so that parts that have been heated in the hardening furnace and then quenched are transported across an aisle to the



Conveyor Beams Move the Product Through the High-Heat Furnace. The heated parts are drawn from side doors entering end of the drawing furnace. The operators have ample floor space on which to perform their duties, and the aisles are wide enough to facilitate repairs to the furnaces. The flow of the product is uniform, so that it has not been necessary to provide storage on the floor of the department for parts undergoing heat treatment. The conveyor in the drawing furnace, which is of the chain grate type, extends beyond the discharge gate. As each bumper part comes into view, it is removed by hand and placed with a minimum of motion on a conveyor that delivers it to the grinding and plating departments.

Fuel and Air Mixed in Central Plant

City gas of 530 B.t.u. per cubic foot is used for practically all of the heat-treating operations. To assure a non-oxidizing flame, the gas is mixed with air in a central plant. The proportions are one part of gas to one and one-half parts of air. Furnace operators therefore require little or no knowledge of the principles of combustion, inasmuch as the amount of air content necessary to support combustion is regulated for them. In the gas-mixing department are several compressors, which raise the air-gas mixture to a pressure of 25 oz. per square inch for distribution throughout the plant.

Shears used for cutting stock to the proper length, together with heating furnaces and presses, are located in a room adjacent to the heat-treating department. After being pressed into form, bumper bars, springs, bracket parts and bumperettes are delivered to the operator in charge of feeding the hardening furnace. The conveyor on this furnace projects beyond the feed door, so that the operator works under favorable conditions insofar as radiant heat from the furnace is concerned.

The high-heat or hardening unit is of the conveyor-beam type, i.e., the bar stock is fed into and through the furnace by means of four beams operating through slots in the hearth of the furnace. The principal feature of the conveyor beams is that they are tile-covered; hence no metal projects into the furnace or is subjected to heat.

The motion of the beams is obtained through a cam and crank mechanism, the cams raising and lowering the beams and the transverse motion being obtained through the crank action. The mechanism is so designed that there is no forward or backward travel of the beams during the raising or lowering period. This insures a true rectilinear motion and prevents the material from dragging on the hearth of the furnace, which would tend to wear out the hearth or distort the plates carried on the beams.

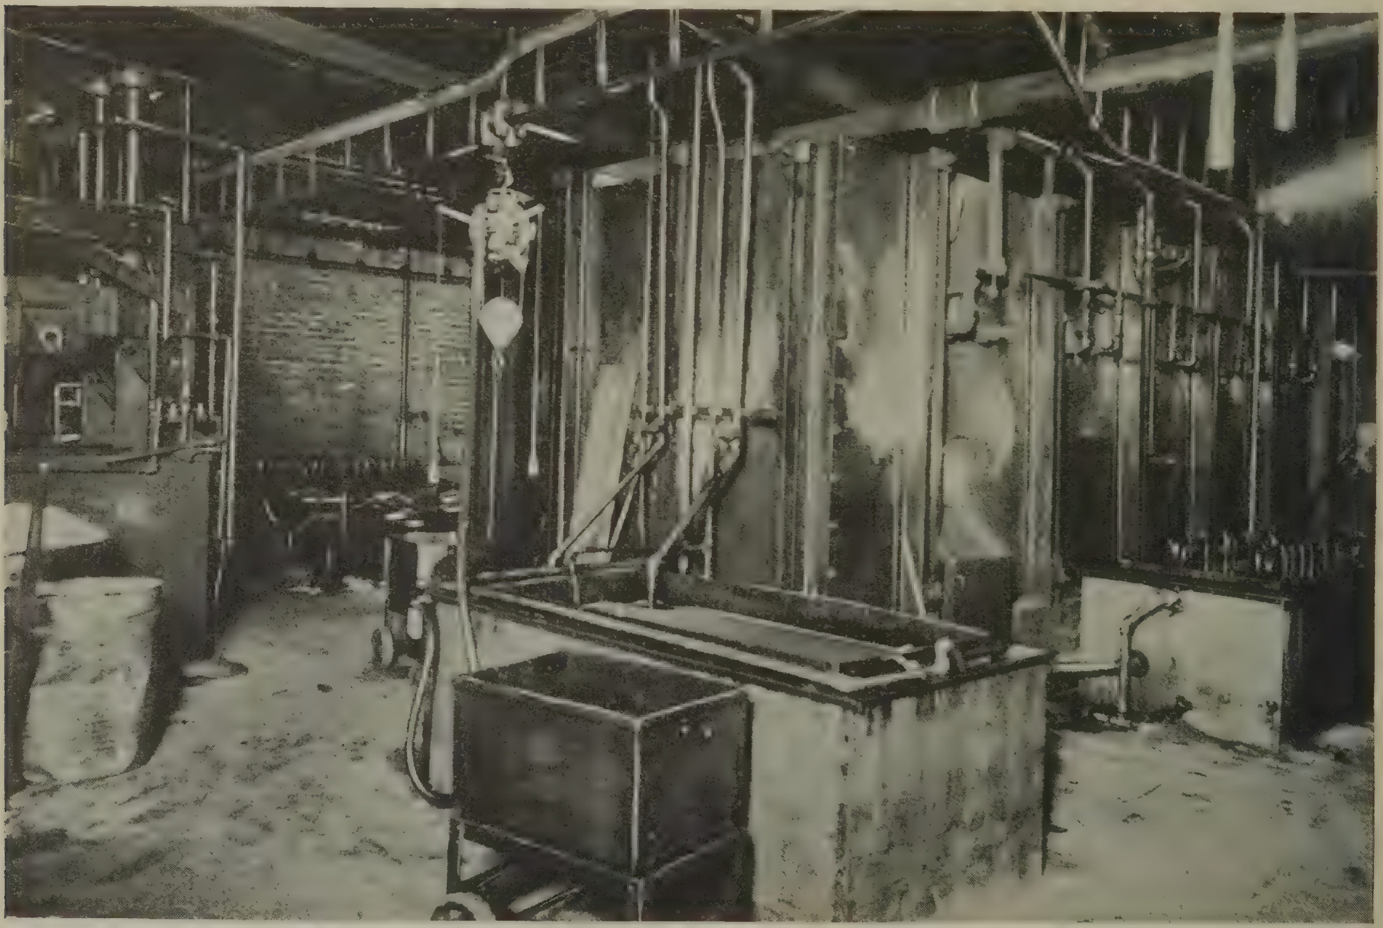
The beams are built of heavy structural shapes, on top of which are clamped the insulation and tile which project into the furnace. The beams are carried on heavy flanged rollers and rocker arms, and approximately 80 per cent of the weight of the beams themselves is counterweighted. All the operating mechanism is under the furnace, where it is accessible for oiling and for repairs.

Overhead Combustion Chamber Insures Uniform Heat

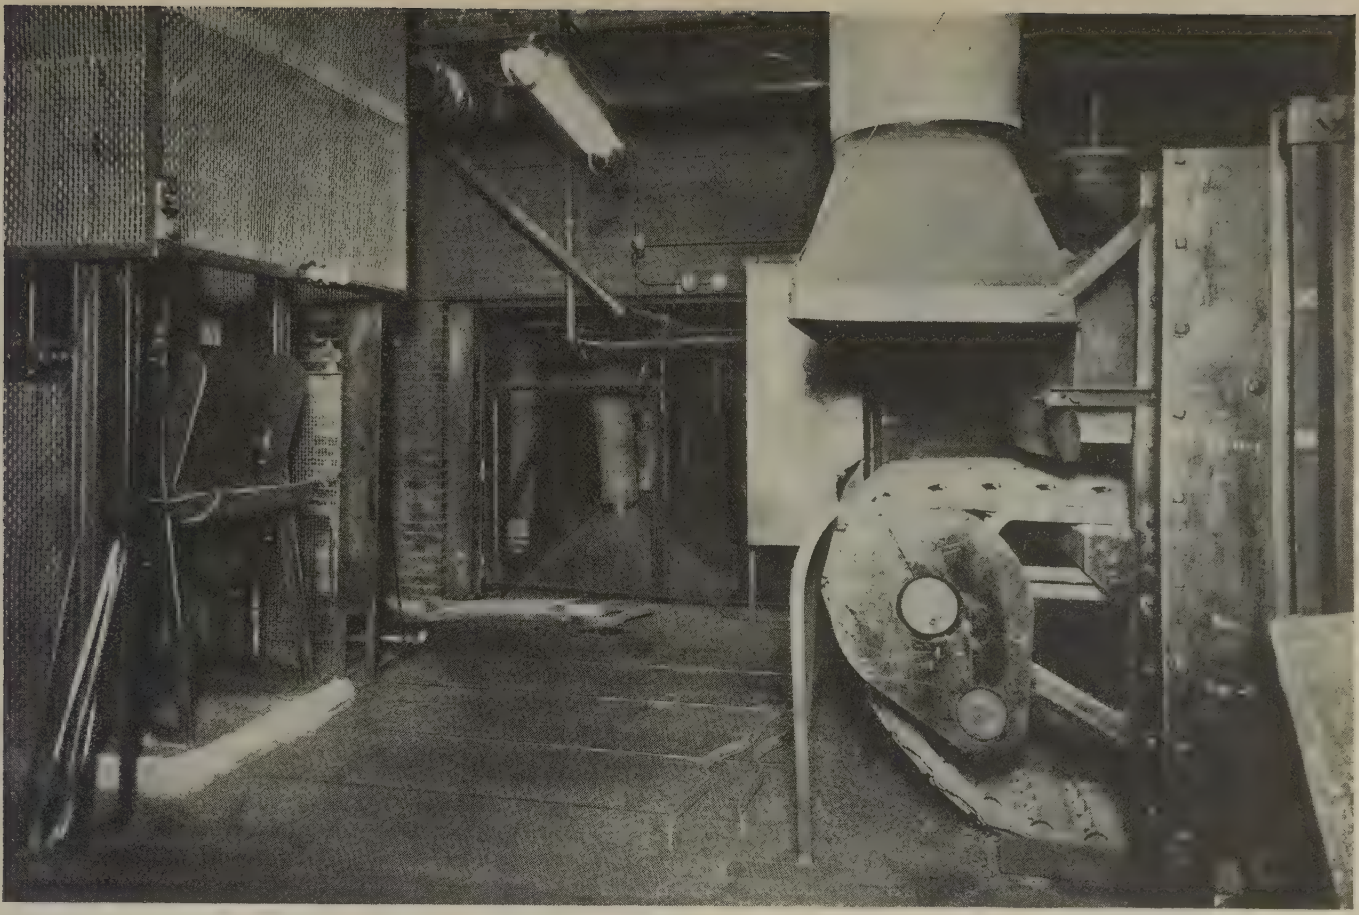
The furnace is constructed with an overhead combustion chamber, separated from the work chamber by a perforated arch, which acts as an accumulator and distributer for the heating gases. The gases are withdrawn from the furnace by means of flues in the side walls, which connect with cross flues under the hearth. This arrangement assures a thorough circulation of the heating gases under the hearth floor and around the beams.

As previously mentioned, this unit is fired with city gas, the burners being arranged in pairs. Each pair of burners is set at an angle so that the flames converge as they enter the combustion chamber. One burner on each pair is controlled by means of a Dixon valve through a Leeds & Northrup recorder controller and thermocouple located in the work chamber immediately under the burners. With this arrangement one burner of each group is running constantly while the other burner is used for control and is either on or off, as the heat condition in the furnace demands.

Parts being heat treated are brought up to 1710 deg. Fahr. during their travel through three-fourths of the length of the furnace, allowing one-fourth of



Water Jacketed Quenching Vats Are Conveniently Located. At the left is a special press the platens of which can be lowered into an oil bath



A Chain Conveyor Transports Bumper Parts Through the Drawing Furnace

the travel time for soaking. The temperature is controlled within 10 deg. Fahr. The length inside of the furnace is 22 ft., and the time of travel through the furnace is 20 min., giving a rate of slightly more than one foot a minute.

Special Press Prevents Distortion During Cooling

Not all parts are completely formed before passing through the high-heat furnace. Therefore a hydraulic press is located near the discharge end of that furnace. The heated parts are drawn through side doors at the end of the furnace, and, if they have already been formed, they are immediately quenched. If additional press work is necessary, the piece is placed, while hot, in the hydraulic press. After the dies have been closed, the platens are lowered into a vat of oil. In this way the part cools while being held by the dies, and distortion resulting from cooling is avoided.

Parts that do not require press work after heating are removed from the furnace and cooled in oil tanks, one of which is located at each side of the furnace at the discharge end. The oil is agitated by a motor-driven pump, by means of which it is delivered to a radiator-type cooler located on the roof of the building. Normally the temperature of the oil bath is held below 100 deg. Fahr. The oil tanks are water-jacketed.

A monorail air hoist is used to transfer the hardened product from the oil drain boards to the draw furnace, which is of the under-fired three-quarter muffled type. It is equipped with a continuous chain grate type of conveyor for handling the work. The conveyor consists of three strands of extra heavy malleable iron roller chain, upon which are mounted especially designed malleable iron interlocking flights. The return strand is directly underneath the furnace, where it is protected from rapid cooling action so that it returns to the furnace well up to heat. This furnace is likewise fired by gas burners, arranged in pairs and controlled as on the high-heat furnace. The drawing temperature is maintained between 900 deg. and 1000 deg. Fahr. The inside length of the furnace is 23 ft. 7½ in., and the time of travel of a single part through it is 25 min., or at a rate of slightly less than a foot a minute. Maximum temperature of the part is reached about 5 min. before it is discharged from the furnace.

Both furnaces have extra-heavy fire brick walls, and they are insulated with 4½ in. of cork insulation brick. The conveyors are driven through fully inclosed spur and worm gear speed reducers, direct-connected to motors. Both furnaces were built by the McCann-Harrison Corporation, Cleveland.

As each part is taken from the conveyor bed of the drawing furnace it is closely inspected for defects and is subjected to a hardness test. If it meets specifications, it is placed on the conveyor for delivery to the grinding room.

Novel Use of Swing Grinders

A point of interest in the grinding room is the use made of swing grinders for finishing the flat surfaces of bumper parts. Opposite each grinder is an oscillating table provided with an automatic ratchet device which gives the table a lateral motion. A number of the bumper parts are secured to the table, and the swing grinder is lowered. Power is applied to the table, which moves backward and forward in a plane at right angles to the axis of the grinding wheel. When the table reaches the end of its travel in one direction and stops momentarily, preparatory to moving in the opposite direction, it is ratcheted to one side so that the grinding wheel will not retrace the path it has just been working on.

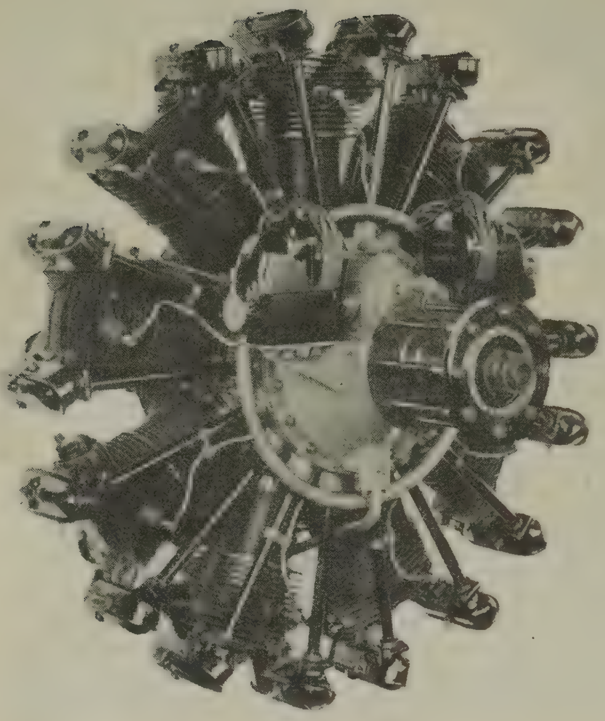
A 6500-hp. reversing blooming mill motor for the South Works, Illinois Steel Co., and a 4600-hp. reversing roughing mill motor for the Tata Iron & Steel Co., Jamshedpur, India, will be furnished by the Westinghouse Electric & Mfg. Co. Each order includes a motor-generator set and switching equipment.

The Lake Superior Mining Institute will hold its twenty-sixth annual meeting in the Oklahoma-Kansas-Missouri zinc-lead field upon invitation of the Tri-State Zinc and Lead Ore Producers Association. The tentative date is April 1 to 6.

Wright "Whirlwind" a High

Interchangeability and
Important Accomplish
Materials and

BY FAY LEONE



WHILE crossing Forty-fourth Street in New York on my way to my office to write this article I was attracted by a large crowd gathered in front of a window. Evidently there was something of great interest inside. I stopped to see what it was. By skirting the crowd which extended well out into the street, I finally gained a point of advantage from which I could see the object upon which their attention was focused. It was a Wright Whirlwind engine. Never have I seen a piece of mechanism which has aroused greater curiosity or commanded more sustained interest on the part of the observers. Truly, Colonel Lindbergh has done a wonderful thing in making America air minded. Naturally the 508 lb. of refined mechanism which created the breeze upon which he flew to Paris comes in for its share of credit and attention.

The Wright Whirlwind, the "W" part of the "We," is well worth careful examination and study. Its story is a story of the triumph of man and metal over the elements. A romance of "making metal fly" which should inspire every metal worker with a new regard for his calling and instill in the minds of the youthful apprentices a still higher regard for engineering thinking and accurate, clean execution.

The Whirlwind engine, familiarly known in the Wright Aeronautical Corporation shop as the J-5 series, is a nine-cylinder air-cooled, static, radial type. It operates on the familiar four-stroke cycle principle. Calling the top cylinder No. 1, the firing order, indicated in a counter-clockwise direction, is 1-3-5-7-9-2-4-6-8. The cylinders have a 4½-in. bore and 5½-in. stroke. Although rated normally at 200 hp. at 1800 r.p.m., the average power developed at this speed is about 223 hp. The engine weighs, dry, 508 lb. Its length is 34 in. and the diameter over all, 45 in. The displacement is 788 cu. in. and the compression ratio, 5.2 to 1. The guaranteed fuel consumption is not more than 0.60 lb. per hp.-hr. at the rated horsepower and the guaranteed oil consumption not over 0.025 lb. per hp.-hr.

Nine Cylinders Drive Single Crankshaft

Before going further it may be interesting to know how each of the nine cylinders, which are equally spaced around the crankcase and operate in the same vertical plane, manages to transmit its power to one revolving crankshaft upon one end of which the propeller is fastened. Perhaps no question is asked oftener of the Wright engineers than "How do you get all the cylinders to work on the same crankshaft?" Well, here is the way it is done. It's very simple after all. A master connecting rod, shown in an accompanying illustration, is fastened in the usual manner at the top end to the piston pin of cylinder No. 1 and at the bottom to a comparatively large crankpin of a single-throw crankshaft which runs in bearings mounted in the crankcase. This master connecting rod carries at its lower end eight minor connecting rod bearings spaced at equal intervals around the periphery and the articulating rods, eight of them, running to the other eight cylinders operate through these minor bearings on the main crankshaft. An inspection of the illustrations will make this operation clear. So carefully has the assembly been designed that even with the very little clearance allowed the mechanism functions perfectly.

This "starfish" type of motor lends itself to many unique points of design and makes possible an interchangeability of parts which is quite remarkable. Also an accessibility which is never more appreciated than in the case of an airplane. The entire Whirlwind motor may be dismantled and inspected or overhauled without taking it out of its airplane mounting. The valve mechanism, ignition and carburetion system are open and in plain sight; they can be reached without difficulty and the equidistant spacing of the cylinders around the circle makes carburetion problems which occur in the ordinary vertical or V-type horizontal engine comparatively easy of solution in this form.

The cylinders are made of high-carbon steel forgings from which the cooling fins are integrally machined in a manner to be explained in a later article. The cylinder head with its integral cooling fins is cast from aluminum-alloy known as the "Y" alloy, composition of which is approximately: Copper, 4 per cent; nickel, 2 per cent; magnesium, 1.5 per cent; iron, 0.75 per cent, and silicon, 0.50 per cent, with the balance aluminum. This casting carries the two valve seats and two spark plug openings. The combustion chamber is hemispherical in shape, the valves are inclined to the axis of a cylinder by an angle of 35 deg. The

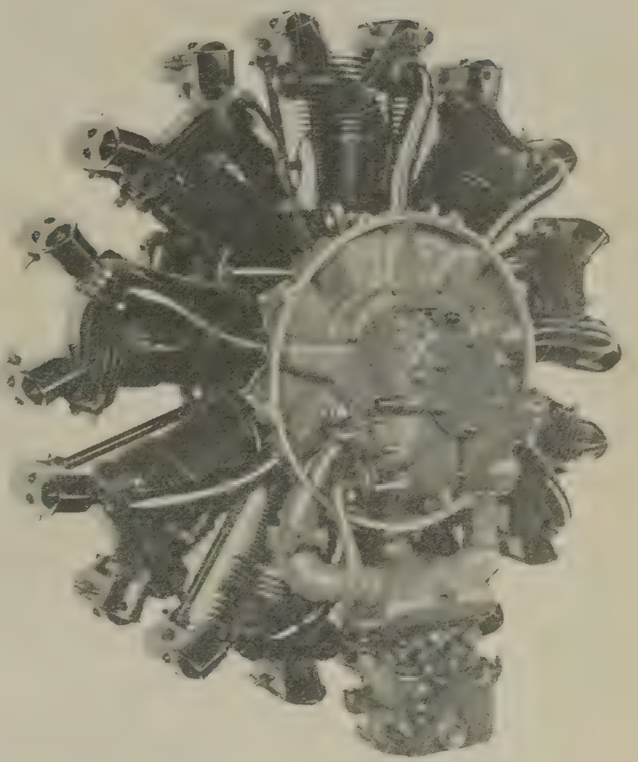
Achievement in Engineering

Accessibility of Parts Are
nents—Some Data on
Operating Costs

FAUROTE*

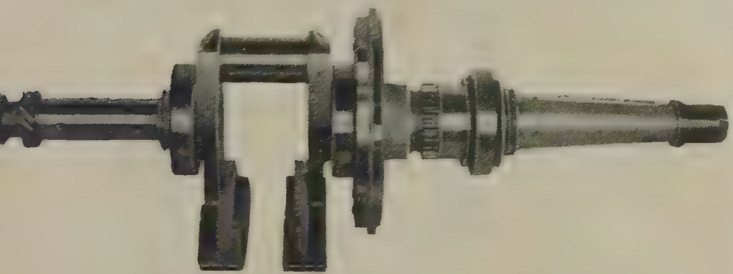


spark plugs are screwed into bronze bushings, diametrically opposite, in the sides of the combustion chamber, on an angle of 10 deg. to the crankshaft axis. The pistons are of heat-treated cast aluminum-alloy and carry four rings, the three at the top being compression rings and the one at the bottom an oil scraper. The piston pins are of hardened alloy steel (S.A.E. No. 6150 or S.A.E. 3250). They are the full-floating type with an aluminum alloy plug in the end to prevent scoring of the cylinder walls. The connecting rods, that is, the master and the eight link rods, are machined from a chrome-nickel steel forging (S.A.E. No. 3140). The master rod is provided with a steel-backed babbitt-lined bearing at the crankshaft end, and the piston pin and knuckle pin bearings of the link rods are of bronze.

Crankshaft a Chrome-Nickel Steel Forging

The crankshaft is of single-stroke counterbalanced type, and is a chrome-nickel steel forging (S.A.E. No. 3140), machined all over. It is hollow throughout its length, the channel being used to distribute oil to all parts of the engine. The counterweights are bolted to extensions of the crank-cheek. There are four bearings, a ball thrust bearing, two main ball bearings and a plain bearing in the rear crankcase section where the oil is admitted. Cam and accessory drive gears, the ball bearings, starting dog, oil slingers, and propeller-hub key are attached to the crankshaft.

The crankcase proper is made up of five aluminum alloy castings. The front section includes the thrust bearing housing, magneto bracket and the magneto and cam driving gears. The intermediate section contains the cam and valve tappet mechanism and the housing for the front crankshaft bearing. The main section which provides the pads for the attachment of the cylinders contains the flange for mounting in the airplane and the housing for the rear crankshaft bearing and intake passages. The rear section contains drives for oil pump, fuel pump, gun synchronizers and tachometers. It also provides a mounting for the engine starter and the housing for the main oil strainer. The intake manifold and oil sump section is an aluminum casting containing space for the accumulation of oil, a flange for mounting the carbureter and the intake passages.



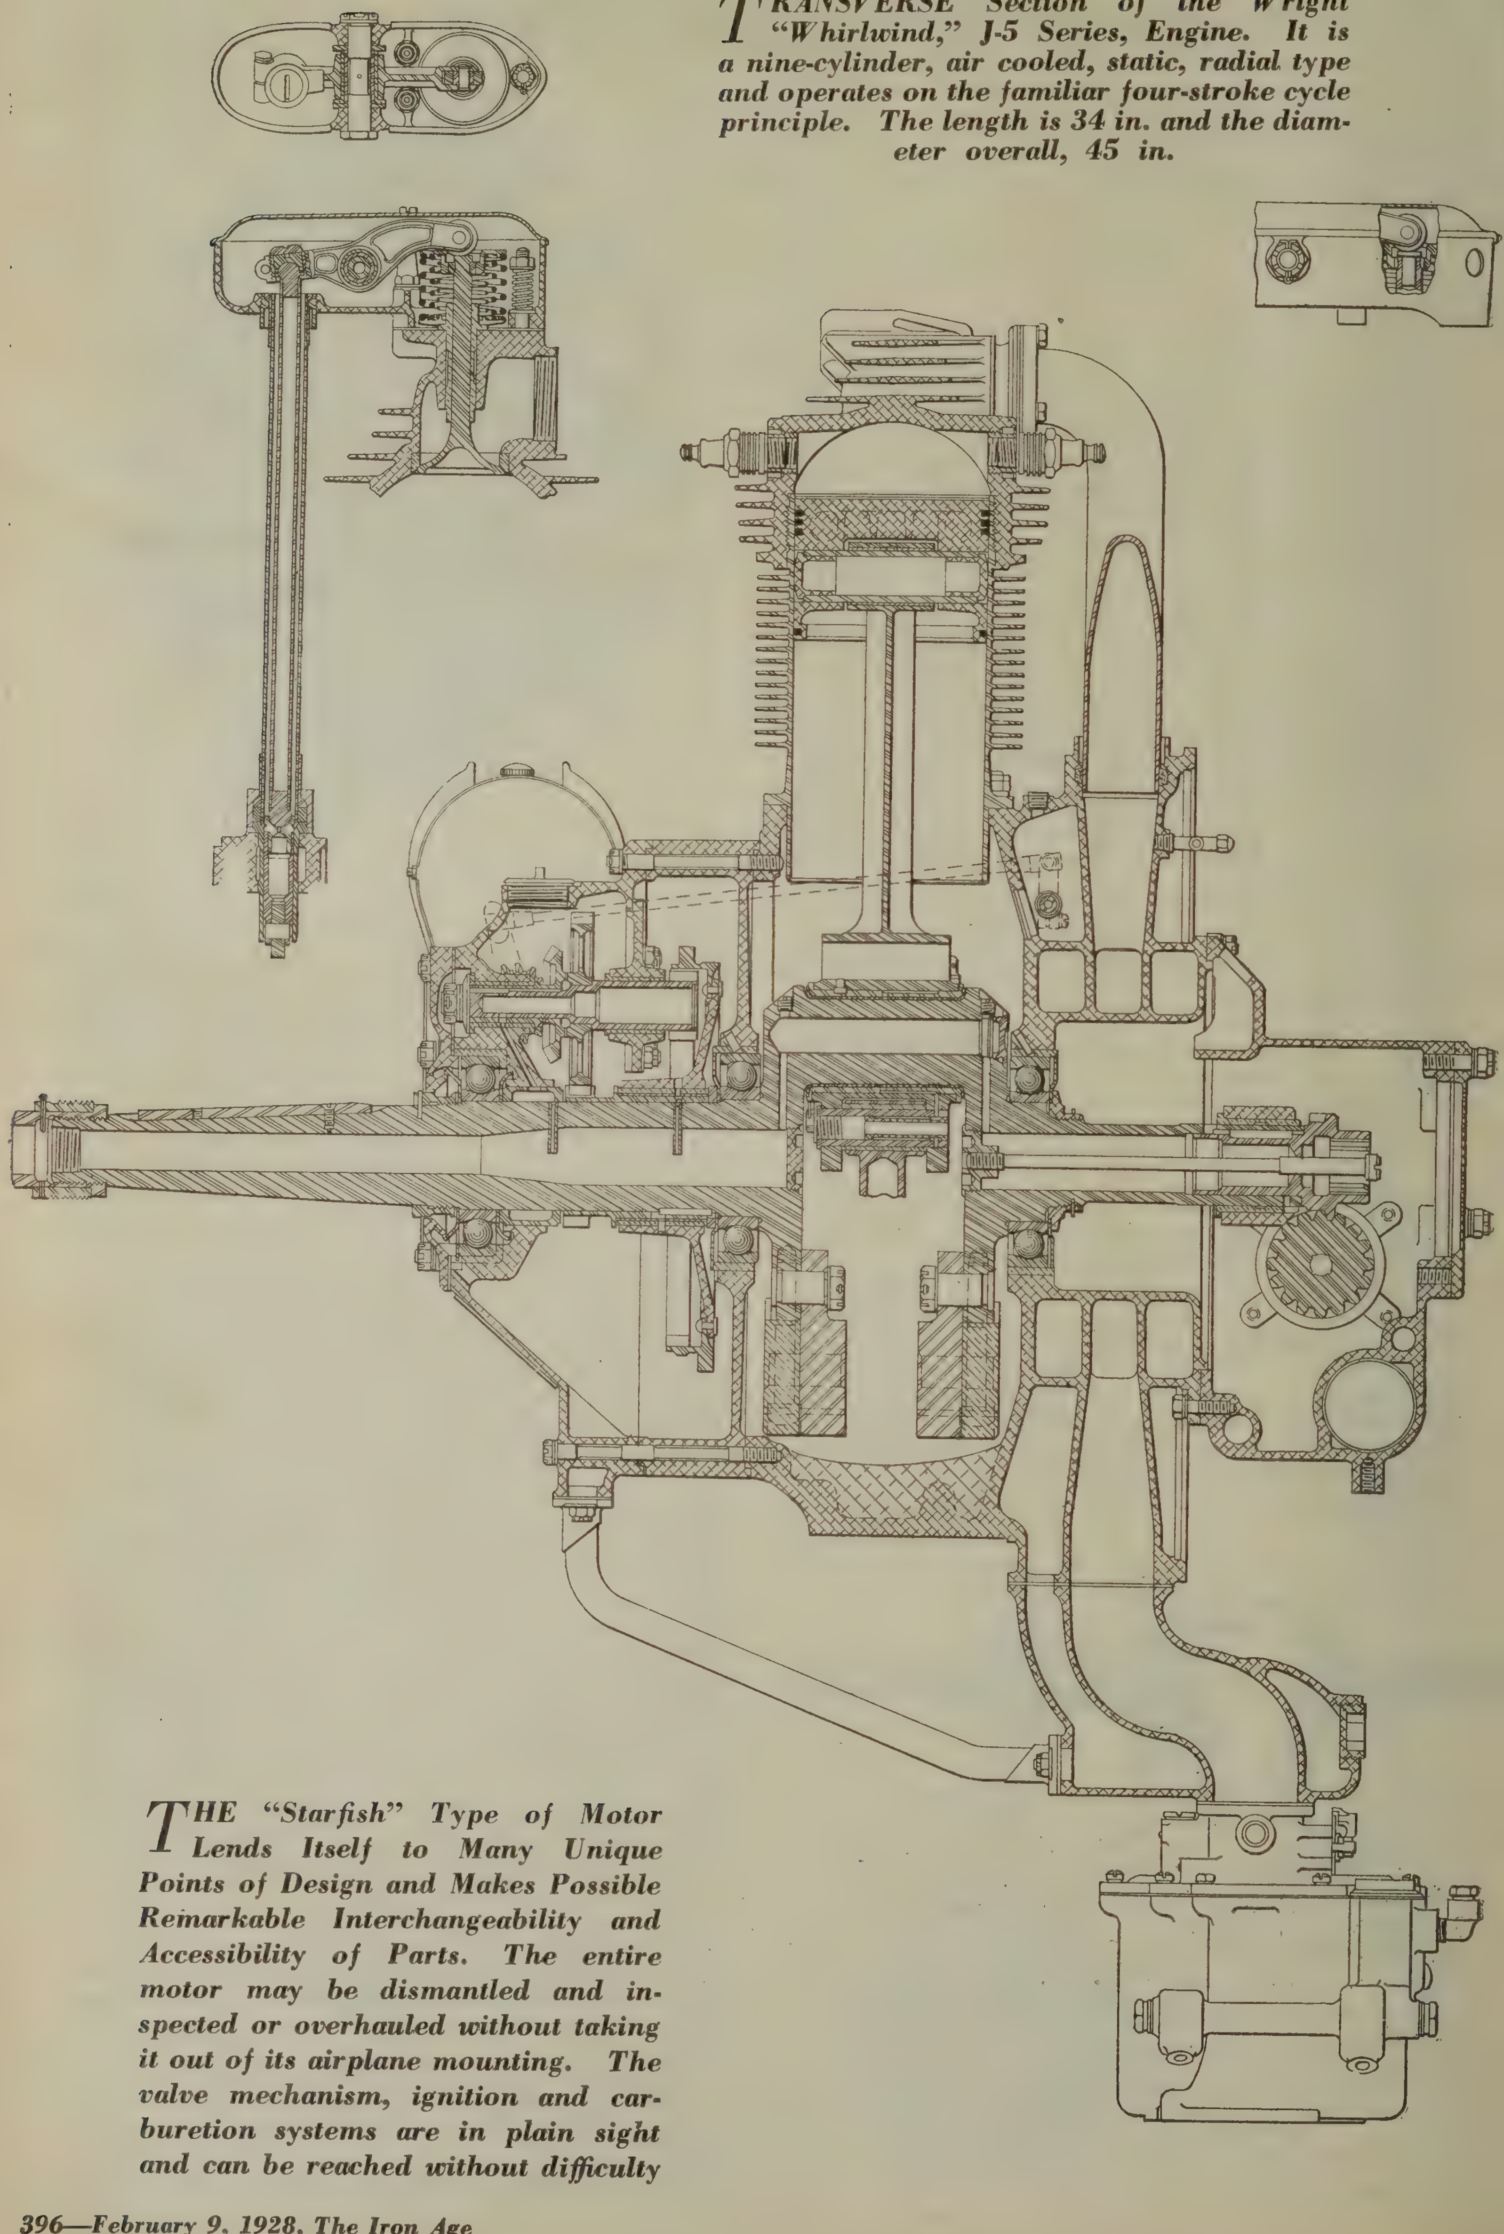
THE Master Connecting Rod and Two of the Eight Articulating Connecting Rods Are Shown at the Left. The master rod is fastened at the top to the piston pin of cylinder No. 1, and at the bottom to the crankpin of the crankshaft shown above.

The assembled engine, front and rear views, is shown at the top of these pages

Inlet and exhaust valves are set at an angle of 70 deg., their heads are flush with the combustion chamber and they rest in valve seats of aluminum bronze of rectangular cross-section. These angular rings are shrunk into a recess in the cylinder head and then rolled over at the top. The valves are of the tulip type and are machined from tungsten steel, the exhaust valve being salt cooled to prevent overheating. Each valve is held in place against its seat by three concentric helical round steel wire valve springs and is operated by a valve mechanism actuated by a cam located in the intermediate crankcase section, through cam followers of the roller type, a push rod and rocker arm; all of which are inclosed. The cam unit runs in the opposite direction from the crankshaft and at one-eighth its speed. It consists of a hardened steel ring with eight lobes on the outside and an internal gear cut on the inside. This is riveted to an aluminum hub riding on a sleeve, which is keyed to the crankshaft. The cam followers are of the roller type operating in forged steel bushings which are a push fit in the intermediate crankcase section. The upper ends of the followers contain hardened steel sockets into which the lower push-rod ball fits. The push rods are of nickel steel tubing with hardened steel balls forced into either end. The upper balls fit into hardened steel cups which are a loose fit inside the clearance adjusting screws at the outer end of the rocker arms. The valve gear is inclosed by rocker arm housings which form the support for the rocker arm pins. Pressed steel covers are used on the rocker arm housing and the push rods are inclosed by tubular steel housings. The intake valve opens 8 deg. early and closes 60 deg. late, while the exhaust opens 60 deg. early and closes 8 deg. late.

Two Scintilla magnetos mounted on the front section of the crankcase supply the ignition, through a duplicate set of heavily insulated high-tension wires inclosed in metal ignition manifold rings, from which two separate wires are taken to each cylinder, one on either side.

A special type of three-barreled Stromberg carbureter has been fitted to this engine and the crankcase has been cored with channels which serve as intake manifolds; the three sets, of three cylinders each, taking their gas from these three annular pas-



TRANSVERSE Section of the Wright "Whirlwind," J-5 Series, Engine. It is a nine-cylinder, air cooled, static, radial type and operates on the familiar four-stroke cycle principle. The length is 34 in. and the diameter overall, 45 in.

THE "Starfish" Type of Motor Lends Itself to Many Unique Points of Design and Makes Possible Remarkable Interchangeability and Accessibility of Parts. The entire motor may be dismantled and inspected or overhauled without taking it out of its airplane mounting. The valve mechanism, ignition and carburetion systems are in plain sight and can be reached without difficulty sages in the main crankcase section. The carbureter is fastened to an oil-jacketed manifold sump attached to the bottom of the crankcase main section.

Lubrication System Unique

The lubricating system is unique. There are three oil pumps of the gear type assembled as a unit located in the crankcase rear section. One of these pumps sucks oil from a tank behind the engine which carries the supply and delivers it under pressure to an annular groove around the rear crankshaft bearing. From this groove the oil enters the crankshaft and then passes through the various channels to the crankpin, knuckle pins, cam and magneto drive bearings. Oil collecting in the crankcase is returned to the oil tank by the other two pumps which clear the rear crankcase section and the main section sump. Oil collecting in the front crankcase section drains to this sump through an external pipe. Thus the lubricating system is of the pressure type except for the cylinder walls and accessory drive gears which are lubricated by splash and spray, the one exception being the rocker-arm pin which is provided with grease gun connection.

Air Heater Operated from Pilot's Cockpit

Pilots' experiences have shown that a carbureter air heater is needed at times to prevent the formation of frost and ice in the carbureter during cold weather operation. Therefore, an air heater is provided which can be operated from the pilot's cockpit by a valve allowing the adjustment of the air temperature entering the carbureter. This heater is of cast aluminum-alloy and is attached to the carbureter by means of six machine screws. There are also provisions for the attachment of a pump so that the fuel may be delivered at the carbureter at any pressure required for successful operation. Provision is also made for two tachometer drive connections and for two oil thermometers. One thermometer is located in the oil cooling sump surrounding the carbureter manifold and indicates the temperature of the oil as it leaves the engine; the other, located in the oil strainer cover, gives the temperature as it enters. Incidentally the oil temperature, under normal conditions of flight, is not allowed to exceed 180 deg. Fahr.

Various other devices, such as self-starters, starters of the geared hand type with booster magneto of the concentric inertia type, either hand or electrically driven, may be attached. These starters are equipped with torque-overload releases to prevent abnormal stresses in the mechanism should the engine backfire while starting. For machines intended for military service Nelson-type machine gun synchronizer drives are available. The company has also developed a special set of overhaul tools and a complete manual covering care and overhauling.

Direct Cost of Operation Less Than 4c. per Mile

It may be of interest to know how much it costs to operate this engine under normal flying conditions. For a cruising speed of 100 mi. per hr. the Wright corporation gives the following figures as the probable direct cost per mile:

	Per Mile
Fuel, 9-12 gal. per hr., at 25c. per gal....	2.50c.
Lubricating oil, 2 qt. per hr., at 70c. per gal.	0.35c.
Engine spare parts and overhaul for first 50,000 miles....................	1.00c.
Probable direct cost per mile..........	3.85c.

"If it is desired to figure the cost of depreciation, it is generally believed that the Wright Whirlwind may be counted on for 1500 hr. of normal service. This figure is based on proper periodic overhauls, approximately every 200-300 hr. and gives a depreciation charge of about 3c. per mile.

"The above figures are approximate, but there are many cases on record where the costs are less than estimated above. For instance, the J-5 series Whirlwind in the world's record endurance flight averaged 7½ gal. of fuel and less than a pint of lubricating oil per hour. One Whirlwind operator using nine engines averaged 10½ gal. of fuel per hour for over 3000 hr. and with a cost of replacement parts for the first overhaul (300 hr.) of only $6.30 per engine. Another operator averaged $16 per engine for replacement parts on about 300 hr. per engine."

A guide book on the design, manufacture and installation of electrical supply equipment has been issued in the shape of the National Electrical Manufacturers' Association Handbook of Supply Standards. This is a revision of previous handbooks of the same series, and is dated October, 1927. There are 231 pages, with 125 illustrations, mostly diagrammatic. The size is 6 x 9 in., and it is sold by the association (420 Lexington Avenue, New York) at $3.50. The book is indexed and contains standards indorsed by nearly 200 manufacturers of a large line of electrical apparatus.

Record Performances of the Wright "Whirlwind" Engine

ENDURANCE RECORD

APRIL 12, 1927, the Wright-Bellanca cabin monoplane, with Clarence Chamberlin and Bert Acosta as pilots, took off from Roosevelt Field, N. Y., and established a world's record endurance flight of 51 hr., 11 min. and 25 sec., exceeding the previous record by approximately 6 hr. The plane took off with a useful load of over 2900 lb., including 385 gal. of fuel.

BYRD

MAY 9, 1926, Commander Byrd and Floyd Bennett flew from King's Bay, Spitzbergen, to the North Pole and return in 15½ hr. A Fokker monoplane, equipped with three Wright Whirlwind engines, was used.

LINDBERGH

MAY 20, 1927, Capt. Charles A. Lindbergh took off alone from Roosevelt Field, N. Y., in his Ryan monoplane "The Spirit of St. Louis" and landed at Le Bourget Airport, Paris, France, 33 hr., 29 min. and 30 sec. later, having covered a distance of 3610 miles. The fuel consumed was 381 gal., and the oil, 11.8 gal.

CHAMBERLIN

JUNE 5, 1927, Clarence Chamberlin, with Charles A. Levine a passenger, completed a non-stop flight from Roosevelt Field, N. Y., to Eisleben, Germany, a distance of 3905 miles, in about 43½ hr. The Bellanca monoplane which had previously established a world's endurance record was used for this flight.

MAITLAND

JUNE 29, 1927, Lieutenants L. J. Maitland and A. F. Hegenberger completed a non-stop flight of 2400 miles from Oakland, Cal., to Oahu, Hawaii, in 25 hr., 50 min. A Fokker monoplane Army transport, equipped with three Wright Whirlwind engines, was used for this flight. The fuel consumed by all these engines was 920 gal., and the oil, 21 gal.

BYRD

JUNE 29, 1927, Commander Byrd, accompanied by Bert Acosta, G. O. Noville and Bernt Balchen, took off from Roosevelt Field, N. Y., in a Fokker monoplane with three Wright Whirlwind engines, for Paris. After arriving over France, they were unable to locate Paris due to the low-lying clouds and heavy rain. Turning back toward the coast, they landed at Ver-sur-Mer, after some 43 hr. in the air.

SMITH

JULY 13, 1927, Ernest L. Smith and Emery B. Bronte took off from Oakland, Cal., in a Whirlwind engined Travel Air Monoplane, and landed on the island of Molokai, Hawaii, 25 hr. and 36 min. later. In this non-stop flight, 2348 miles were covered.

STINSON

IN the National Air Tour, June 27 to July 12, 1927, Edward A. Stinson, in a Stinson monoplane with a Whirlwind engine, won first place with a score of 97 per cent of the possible maximum. This plane attained a high speed of 124.3 miles per hour with 1500 lb. pay load and a total of 2275 lb. useful load. This tour of over 4000 miles, covered 18 States and one Province of Canada. Twelve of the 14 planes competing were equipped with the Wright engines.

Operating Costs of Industrial Trucks

Evaluation of Elements Affecting Costs—Influence of Size of Load, Distance Covered and Surface of Floor or Ramp

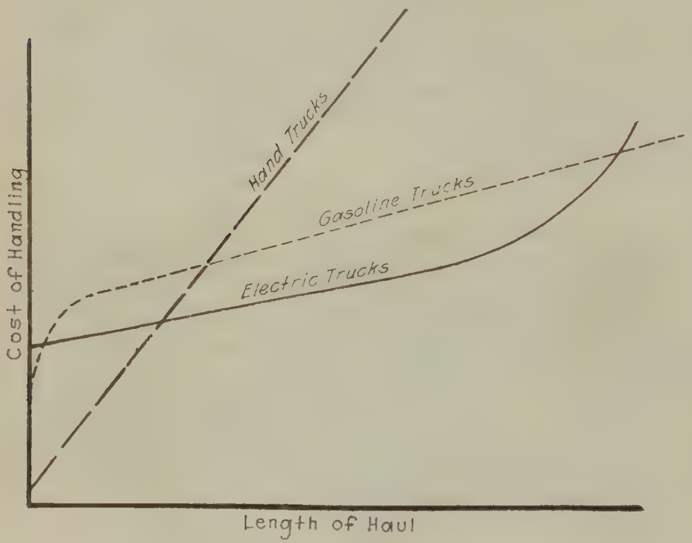
BY C. B. CROCKETT AND H. J. PAYNE*

ALL direct costs of handling materials by industrial trucks are influenced by operating conditions. Theoretical curves are presented showing the effect on the operating costs of different types of trucks resulting from variations in:

1—Length of haul,
2—Amount of material to be handled,
3—Condition of runways,
4—Number and severity of ramps.

In addition to the above, other conditions having a decided effect on the cost of operation defy analytical treatment. Experience will have to be used in determining their influence in the choice of any type of equipment. These include

5—Width of runways and available space,
6—Fragility of material handled,
7—Special requirements in handling,
8—Labor market conditions,
9—Range of uses for which equipment is employed.



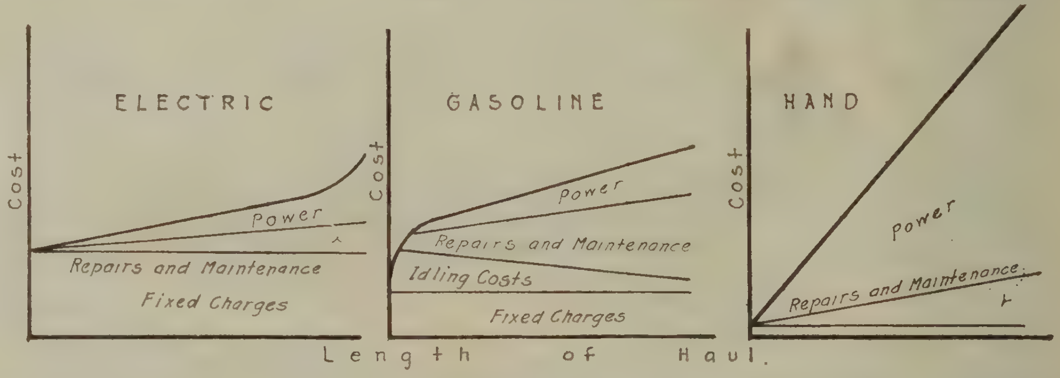


Fig. 1 (Right)—Analysis of Costs of Operation, with Relation to the Distance to Be Covered

Fig. 3 (Above)—Total Costs, with Relation to Distance to Be Covered, Arranged for Direct Comparison

Indirect savings effected by the introduction of a new system of handling or the purchase of new equipment are most readily taken care of by considering them as an indirect cost of the old system. If interest charges on the system under consideration be included in the cost, and all savings are charged as costs of the system where they are *not* realized, the difference between total costs will then be the net yearly profit accruing from the change. If interest charges are omitted, the difference in costs represents the annual savings available to meet the interest charges on the new system.

The amount of time a piece of equipment is in service has a distinct influence on the cost of operation, but not so great as many imagine. Many plant managers say that the high initial cost of electric trucks or tractors prohibits their use, because the equipment would not be in service more than a few hours a day. Suppose a gasoline or electric truck will replace four men at $3.50 a day. Assume (which is seldom true) that the men can be employed productively when not handling material. We then can draw curves to show the relation of cost to days per year or hours per day employed.

[Examination of the sets of diagrams, which are grouped in pairs (showing the building up of costs for each of the three types of operation and then comparing the total costs of the three with each other), indicates that (1) hand trucks are cheapest to operate for very short hauls, electric trucks being cheapest over an intermediate range and gasoline trucks on the longest hauls; (2) hand trucks are cheapest when the smallest amount of material is to be handled, with electric trucks cheapest for larger amounts; (3) gasoline trucks are cheapest (other things being equal) with bad runways, but electric trucks when the surface is better; (4) severity and number of ramps are of least effect on costs of operating electric trucks and greatest effect on those run by hand.]

Effect of Various Factors on Operating Costs

CURVES are presented here not as accurate results of tests made, nor are they true graphical representations of the formulas on which they are based. They are merely a suggested method of approach to the problem of selecting the most economical equipment operating under given conditions.

Cost vs. Length of Haul

The first condition to be considered is the length of haul. Letting Y = operating cost and X = length of haul, and assuming that the cost is influenced by this one condition only, the following formula is suggested:

$$Y = A + \frac{B}{X} + C\frac{X}{r}$$

There are three terms in this cost formula:

1—Fixed charges, represented by A.

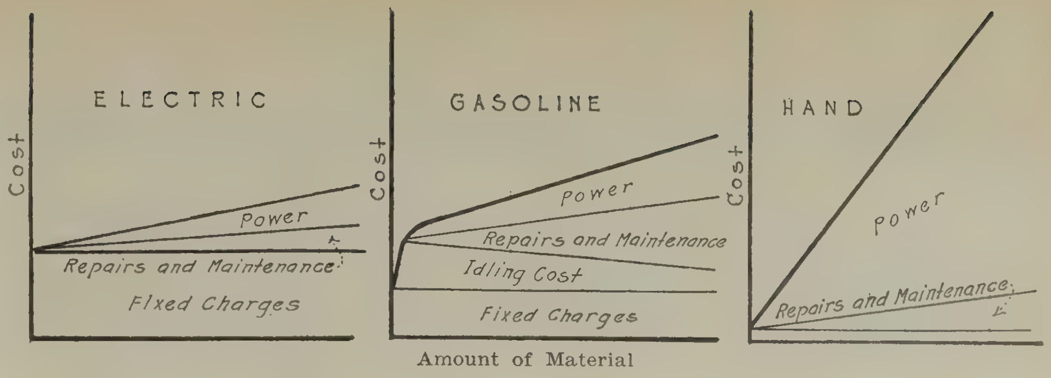
2—Cost of the equipment when idling, being a constant B, which represents the hourly cost of the truck when stopping for short periods, times the time idle, which is inversely proportional to the length of haul. The second term may then be represented as B/X. For hand or electric trucks $B = 0$.

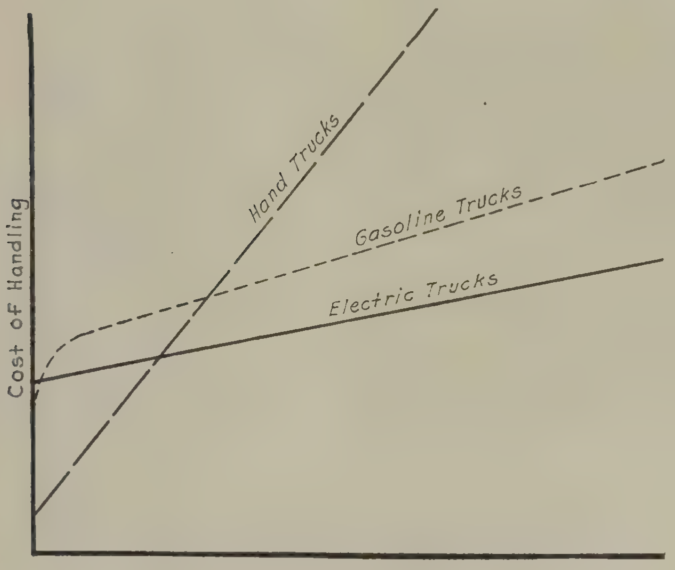
---

*Society for Electrical Development, Inc., New York. This is a portion of a paper read Dec. 7, at New York, before the Materials Handling Division of the American Society of Mechanical Engineers.

Fig. 2 (Right)—Analysis of Costs of Operation, as Affected by the Amount of Material to Be Handled

Fig. 4 (Below)—Total Costs, as Affected by Quantity of Material, Arranged for Comparison





Amount of Material

3—The third term is the cost of the machine when moving. This term is a constant C, representing the cost per hour when running, corrected so that the variables remaining are only the length of haul X and the speed of the truck r. The influence of speed is not seen in the cost until the hauls are of considerable cost.

Analysis of the different costs is shown in the curves of Figs. 1 and 3.

Cost vs. Amount of Material

The second condition is the amount of material handled. The formula and curves are both similar to those for the length of haul. The fixed charges are the same as before, the idling cost is proportional to the capacity of the truck and inversely proportional to the amount of material. The cost while running is proportional to the amount of material divided by the capacity of the truck. The formula is:

$$Y = A + B\frac{M}{X} + C\frac{X}{M}$$

where B = idling constant

M = capacity of truck

X = amount of material.

The curves are shown in Figs. 2 and 4.

Cost vs. Condition of Runways

The third variable influencing cost is the condition of runways. The cost here is influenced by the amount of torque necessary at the hub and varies inversely with the size of the wheel. The electric truck has to retain the small wheel for the sake of ease in handling, as the benefits therefrom generally exceed any trouble experienced on bad runways. The curves are given in Figs. 5 and 7; the formula is as follows:

$$Y = A + B + C\frac{X}{DT}$$

where D = diameter of wheel

T = torque available

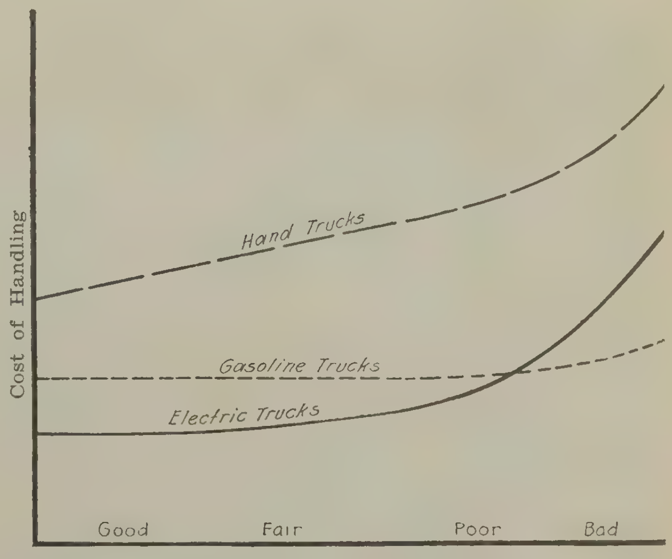
B = constant for handling on smooth runways

X = coefficient for runway.

Cost vs. Number and Severity of Ramps

The last external condition whose influence on cost is possible to analyze is the number and severity of ramps. Considering as a base the fixed charges plus operating expenses on a level floor, we may add a variable cost which is added by the ramps. This cost is principally one of power, or more exactly one of overload capacity.

As the storage battery has an overload capacity of 300 per cent or more, the operating cost of electric trucks is little influenced by this item, being merely the extra power cost. In the case of gasoline or hand trucks, however, with a definite overload limit, either units of larger capacity (or smaller loads) must be adopted, or a sharp increase in maintenance and re-



Condition of Runways

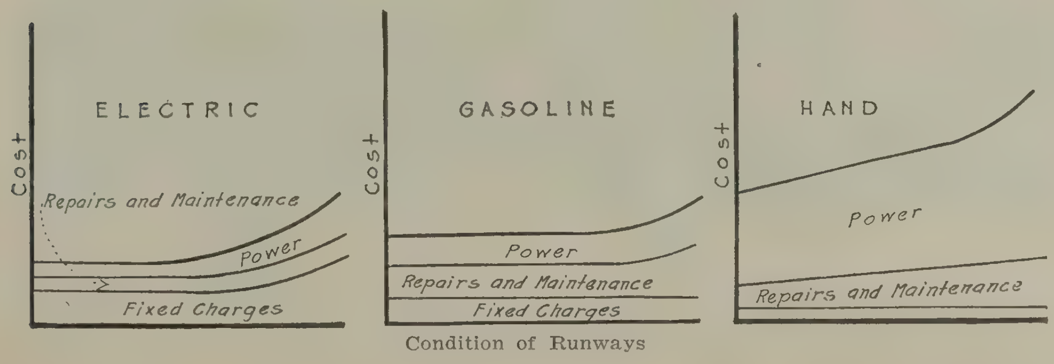


Fig. 5 (Left)—Analysis of Costs of Operation, as Affected by Condition of the Surface Covered

Fig. 7 (Above)—Total Costs, as Affected by Runway Conditions, Arranged for Comparison

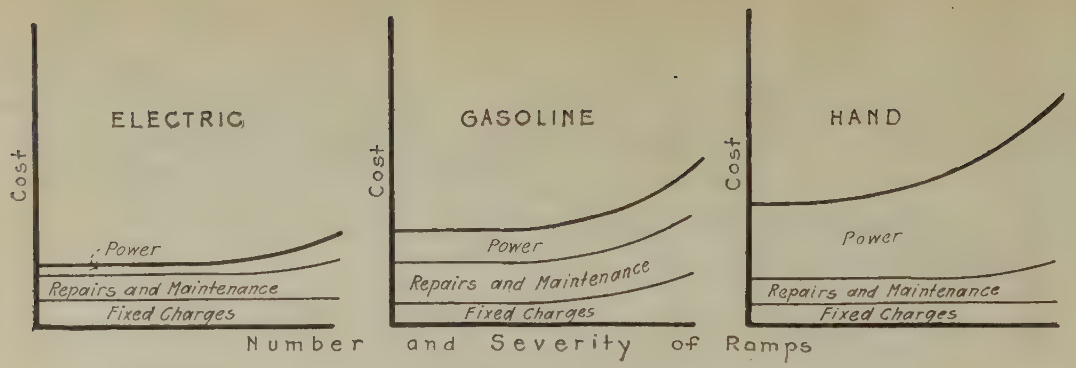

Fig. 6 (Left)—Analysis of Costs of Operation, as Affected by the Ramps to Be Negotiated

pairs and power will occur. The curves are given in Figs. 6 and 8, and the formula is as follows:

$$Y = A + B\frac{X}{M}$$

where A = fixed charges
B = cost of operation on level runways
M = capacity of truck for overload
X = coefficient for number and severity of ramps.

[In the discussion following presentation of this paper the authors disclaimed any intention of setting these figures up as final values for the costs sought. They stated that the curves were, rather, of an indicative character, and that circumstances in a particular plant might alter the relationships somewhat. They believed, however, that the curves, and the data on which they are based, are representative of what is commonly found in practice, and that, as such, they would serve as a general guide in connection with considerations of probable costs for a contemplated installation.]

Bridge Wire Tested After 75 Years

Developed Strength Exceeding Figure Used in Designing the Suspension Cable—Aging Thought to Improve Physical Properties of Drawn Wire

BY H. C. BOYNTON*

AT times we meet the engineer or architect who is doubtful about the permanence of our modern materials of construction. Steel and iron corrode readily, but even if a steel structure could be preserved against rust, he questions whether the high strength given to members by cold work or by heat treatment are truly permanent.

While it is impossible to cite historical data on steel treatment methods which have been in vogue only during this generation, some information is available on bridge wire which has been removed after nearly 75 years' service.

There is in the possession of the John A. Roebling's Sons Co. some wrought iron wire taken from the High Falls Bridge in New York State, which according to our records was erected in 1848 and was in service until removed, which was in August, 1921.

Inasmuch as the records of the tests of wire made in those early days are somewhat fragmentary, we do not have the original tests of the individual wires which went into the cables of this bridge, but from the late John A. Roebling's personal records is secured the fact that the wire was designed to have a tensile strength of 90,000 lb. per sq. in. That the wire is still amply strong for the intended duty is shown from tensile tests of one of these wires, made in August, 1921, which gave the following results:

Diameter	0.153 in.
Breaking strength	1,735 lb.
Ultimate strength	94,166 lb. per sq. in.
Reduction of area	25.4 per cent

This material was not galvanized or coated with any metal, yet the corrosion of this wire, while marked, was not excessive. There was relatively little pitting of the surface.

Moreover, residents living in the vicinity stated that the cables on the High Falls Bridge had not been painted for at least 10 years. This proves quite conclusively (if further proof be needed) that old wrought iron made 75 years ago is much more resistant to corrosion from ordinary weathering than our present high carbon steel made in acid open-hearth furnaces under strictest supervision.

As far as we can gather from our records the material used in this bridge was imported Swedish or Norway iron. For comparison some No. 9 Norway iron wire was recently drawn in about the same way as the old sample mentioned above, and an average of three tests from three separate bundles is as follows:

Diameter	0.147 in.
Elongation in 12 in.	3.0 per cent
Breaking strength	1,360 lb.
Ultimate strength	80,130 lb. per sq. in.
Reduction of area	28.6 per cent

This Norway iron wire tests true to form and was given three holes or passes. It is probable that the old wire mentioned above, which had a higher breaking strength in pounds per square inch, was drawn four passes, which wire-drawing, if given to the modern Norway iron wire, would bring its strength to about 90,000 or 95,000 lb. per sq. in.

From the facts above it certainly seems apparent that the cold-worked iron installed 75 years ago has not lost its valuable physical properties since the bridge was erected. In fact, the general opinion among my associates here is that cold-drawn wire gradually grows a little stronger with age. This despite the fact that the process of hardening by cold work involves the fragmentation of the metallic crystals, a large increase in what is called the amorphous phase, the introduction of great internal strains—all of which would be regarded by theoretical metallurgists as elements of structural instability. Yet such steel and iron wire has the most honorable service record of absolute dependability.

---

Modernizing Forging Practice

Plant Laid Out for Ease in Materials Handling and Straight-Line Production—Auxiliary Service Important

BY F. W. MANKER*

MODERN forging plants offer an interesting study in efficient synchronization in straight-line production of a multiplicity of power, heating and handling units, together with fuel, oil, air, water and steam distribution and utilization. In this scheme mass production and quality of product are the two paramount factors. Neither can in the least be sacrificed to the other. The mechanical problems of forging were solved long ago with power hammers, presses, dies, etc., but efficient and rapid heating of the raw steel is a goal more recently attained.

One of the largest and most modern forging shops has been put into full operation at the plant of Willys-Overland, Inc., Toledo, Ohio. It was built on the site of an old one, which was progressively dismantled without interfering with production.

This shop is so designed that the work progresses from one operation to another with the least amount of "float" trucking and handling. All hammers are served with individual forging furnaces and both are so arranged as to allow the greatest volume of output with the minimum of labor, fuel, power, etc.

Two main buildings, parallel, are built with steel sash sides with rolling steel shutters forming 9 x 20-ft. doors in the lower section of the side walls. This contributes to ease in handling material and parts in and out of all sections and also provides an excellent means of ventilation in the summer.

One of these buildings is 80 x 700 ft., while the second is 80 x 540 ft. All material is handled in containers by motor-driven lift trucks, according to a carefully worked out system of routing. Each building is equipped with overhead electric traveling cranes for moving and rearranging equipment, handling dies, etc.

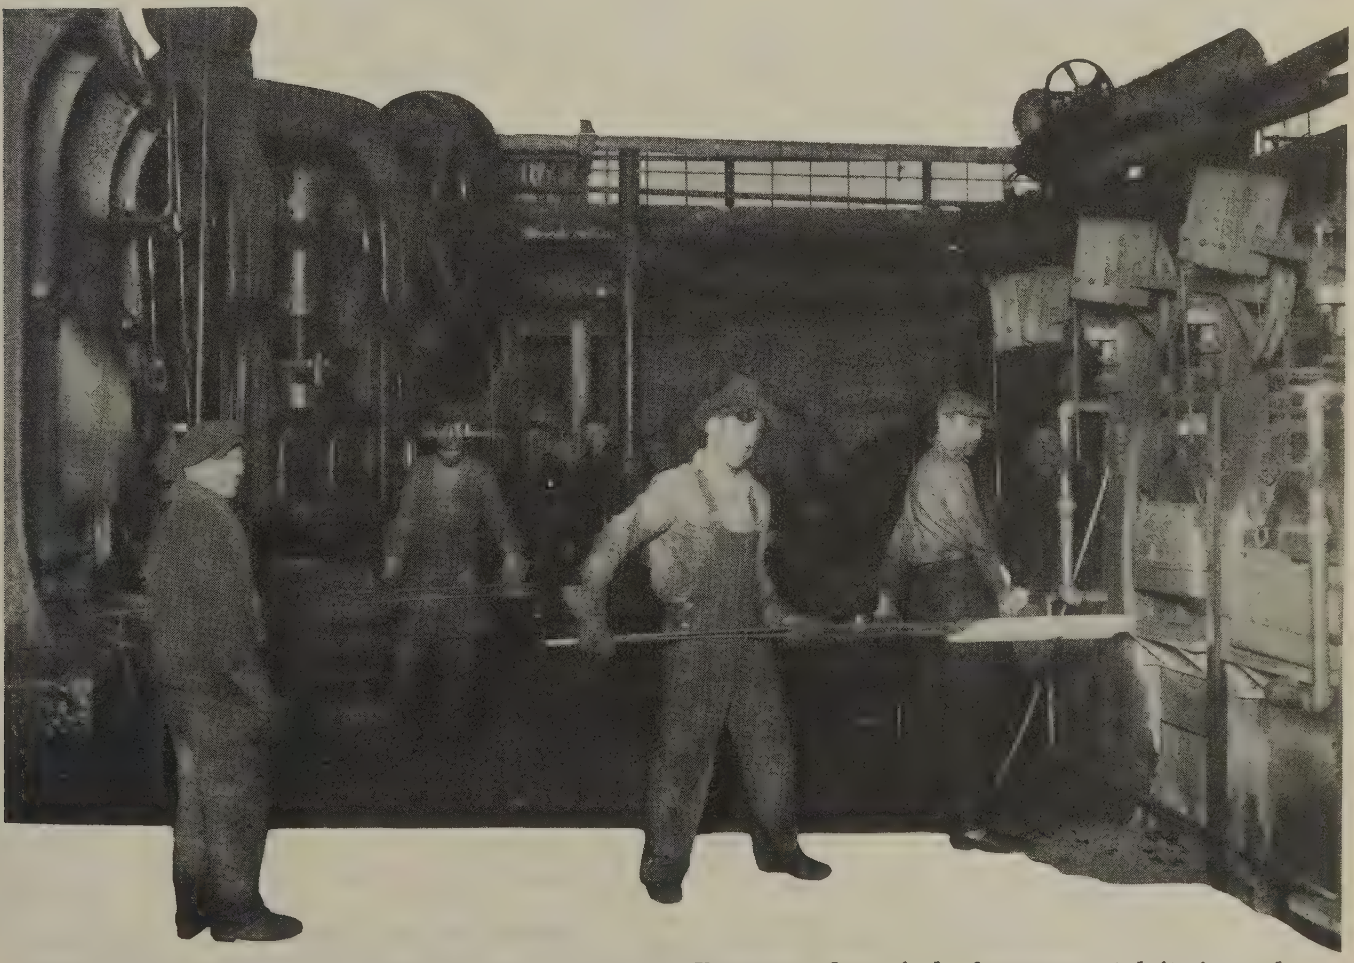
Raw material is brought in on spur tracks direct from the railroad to the steel yards, which are immediately adjacent to the forge shop buildings. These yards are commanded by overhead electric cranes of 45-ft. and 78-ft. span with lifting magnets. They serve the double purpose of unloading material from the cars and of handling the stock into the shear sheds, where it is cut to the proper length preparatory to forging.

Under a portion of the forge shop a reinforced concrete basement 12 ft. deep covers an area approximately 130 x 160 ft. This is used for compressors, oil tanks and the storage of dies, repair parts, furnace material, etc.

Separation of Heavy from Light Work

Rear axle shafts, connecting rods, cam shafts, steering worm gears and all miscellaneous parts are forged in No. 1 shop, while the heavy parts, such as crankshafts, front axles, steering knuckles, etc., are hammered out in shop No. 2. To eliminate long hauls on heavy stock, the shear sheds were placed adjacent to No. 2 shop.

In general arrangement each shop is as follows:



Removing Hot Blank from Discharge End of Forging Furnace. One of the hammers, at left, is ready to receive it

along each outside wall is an 8-ft. aisle running the length of the building. Along the inner side of these aisles are placed the forge furnaces. The hammer lines are parallel to the furnace lines and so placed as to leave 16-ft. aisles between and a center aisle of 28 ft., all running the entire length of each building.

Services such as high-pressure and exhaust steam, gas, oil, water and high and low-pressure air are provided through piping located on brackets on the side and end walls directly above the outside aisles, and completely looping the shops. Ordinary city gas, supplied to the plant through a 16-in. main, is distributed to the forge furnaces and heat-treating units in a loop varying in diameter from 8 to 12 in., with branch lines at intervals.

High-pressure steam at 175 lb. gage and 100 deg. Fahr. superheat is brought to the shops by a 14-in. high-pressure main from the power house on an overhead steel bridge. It is distributed through a loop as is the gas. Exhaust steam from the hammers is returned to the power house by a 20-in. line paralleling the steam supply line. At various points in the exhaust line branch lines are taken off to different parts of the plant, where the exhaust steam is utilized in various low-pressure steam heating operations.

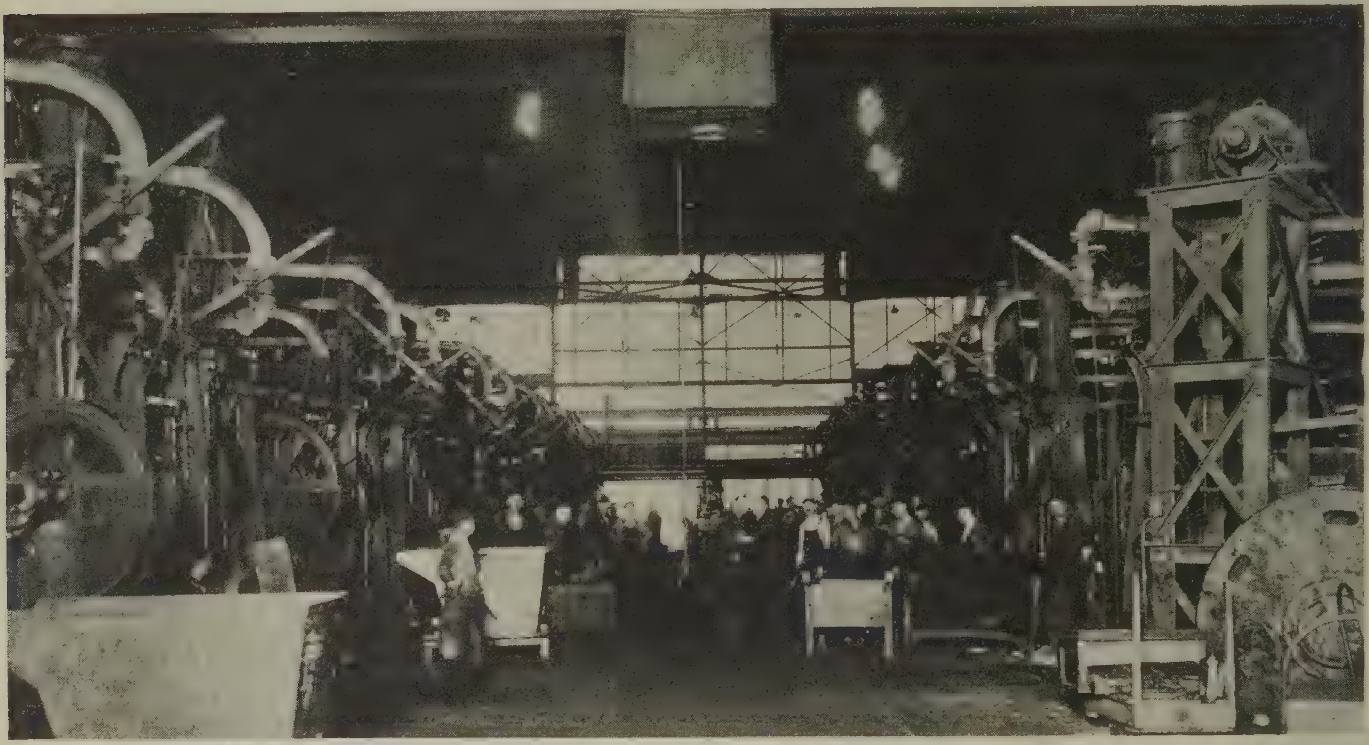
The high-pressure and exhaust steam headers are made up of Van Stone joints placed, usually, at expansion bends. These expansion bends are spaced at intervals of about 200 ft. and all the pipe joints between are welded. A steam plant of 8000 hp. capacity serves the forge shops. Overhead leads from the high-pressure steam loop supply the hammers, while the exhaust steam is returned to the exhaust header through a parallel loop.

Oil is delivered in tank cars and unloaded through gravity lines into five 10,000-gal. steel storage tanks in the basement of the forge shops. Thence motor-driven rotary pumps force it through strainers, meters and heaters into a distribution loop of 2-in. pipe. The oil is circulated continuously through this loop, which is divided into two main parts, each section having a relief valve on one end which maintains a pressure on the loop of 20 lb. at all times. Surplus oil, over and above that immediately used, passes the relief valve, is introduced into the suction manifold of the pumps and again recirculated. The six pumps have a capacity of 30 gal. per minute each.

Leads run from the oil supply line to the oil furnaces, where the oil is manifolded to the burners. From the manifold another line connects with a 2-in. oil return line which forms a loop around the shop, parallel with the others. In this way continuous circulation can be maintained right up to the burners. The oil in the return line drains by gravity into the storage tanks.

Compressors in the main power house, augmented by others in the forge shop basement, furnish high-pressure air through an 8-in. line to a loop around the shops, of from 2 to 6 in. diameter. This air at 100 lb. pressure is used on the upsetters for blowing off scale, and is employed also in pumping water. Low-pressure air for gas and oil burners is provided by eight motor-driven pressure blowers, which deliver the air at 24 oz. pressure into a 20-in. loop. Leads are taken off this air loop to each furnace burner manifold. Low-pressure air is used also for cooling dies on all the hammers, and is supplied through underground mains with an outlet to each hammer base.

The water supply consists of city, well and river water systems, forced by centrifugal pumps into lines which serve the forge shop from underground. This water is used for cooling and for some quenching operations.



Small Parts Forge Shop. Connecting rod blanks pass through some of these machines

Heating and Forging Equipment

Sixty-nine steam hammers of Chambersburg and Massillon make range in size from 1000 to 12,000 lb. Upsetters, trimming presses, bulldozers and hot saws comprise the remainder of the equipment. Each of these is served by a furnace, of which there are approximately 130. Most of these are of the box, in-and-out type and range in size from 18½ in. wide and 19 in. deep for the 1000-lb. hammers up to 57 in. wide and 33 in. deep for the 5000-lb. hammers.

While some of these furnaces are fired by oil, others, designed and installed by the Surface Combustion Co., New York, use gas as a fuel. One type, which is 6 ft. wide, 3 ft. deep and 4 ft. high, gives even heat to the material by firing along the arches with two burners on each side.

The large hammers are served with continuous, automatic temperature-controlled, gas-fired, billet heating furnaces, about 22 ft. in length, designed and installed by the Surface company. Each continuous furnace took the place of four slot-type oil-fired furnaces in the older plant.

Foreign Trade Meeting at Houston

James A. Farrell, chairman National Foreign Trade Council, has issued a call for the fifteenth meeting of the organization to be held at Houston, Tex., April 25, 26 and 27, and has invited the cooperation of chambers of commerce, boards of trade and other commercial and industrial organizations interested in the development of American commerce abroad. O. K. Davis, 1 Hanover Square, New York, is secretary of the council.

Rails Made from Bottom-Cast Ingots

Unusually Free From Segregation and Piping—Roller Straightener Used at Krupp Works an Improvement on Gag Press

BY C. W. GENNET, JR.*

IN the spring of 1926 the Boston & Maine Railroad Co. contracted with Friedrich Krupp, A.G., Essen, Germany, for 11,000 tons of 100-lb. rails of the New York, New Haven & Hartford section, and 4000 tons of 85-lb. rails of the American Society of Civil Engineers section. Basic open-hearth steel rails were to be furnished conforming to the specifications of the American Railway Engineering Association, slightly modified in the requirements for drop testing.

The rails were rolled at the Rheinhausen Works from steel made in 120-ton tilting basic-lined open-hearth furnaces. The charges, mostly all cold, consisted of about 75 per cent mill scrap and 25 per cent pig iron made from Swedish and Moroccô ore. Furnace operations were stopped when the bath showed the proper carbon content, and as ferromanganese was added to the furnace the only necessary addition to the ladle was ferrosilicon, and no additions were made to the metal in the ingot molds. It required approximately 10 hr. to make a complete heat.

The ingots were bottom-cast in groups of four. The molds, slurried with tar, stood on a cast iron base plate grooved for runner bricks connected to a central riser. The molten steel from a 1.56-in. ladle nozzle entered the central riser through a hole 3 in. in diameter and flowed thence through 1½-in. holes in the runner bricks to each of the four molds. The ingots cast were 25 in. square at the bottom and 21 in. square at the top, with 4-in. radii at the corners. The ingots were poured 88 in. high for the 100-lb. rail and 100 in. high for the 85-lb., and weighed respectively about 12,500 lb. and 13,500 lb. It required about 15 min. to bottom-pour a group of four ingots, and after approximately 50 min. the molds were taken off and the ingots charged to the pits.

Pits consisted of three groups, each of 16 holes, fired with coke oven gas. Each hole held but one ingot. After about 2 hr. in the pits, the ingots were bloomed and rolled directly into rails.

The blooming was in a two-high 43-in. mill, rolling the top end of the ingot first and reducing it in 21 passes, after six turns, to a bloom approximately 8⅜ by 7⅞ in. After a top discard of about 12 per cent and a bottom discard of 5 per cent, the blooms went without reheating into a three-high, 33½-in. roughing stand and a three-high 33½-in. finishing stand. The blooms received nine passes in the rail mill for the 100-lb. section and 11 for the 85-lb. The rails were sawed to length by a single hot saw, cutting each rail slightly long to allow for milling to 39 ft. Hot rails went to one of the four hot beds directly from the mill and hot saws, being neither spaced nor turned while cooling on the hot beds.

Table I gives the results of the rolling, inspection and testing of the rails. It wàs conducted by American inspectors and the surface inspection of the Krupp rails was in every way comparable with the practice that would be followed at American mills.

Table I—Rolling and Testing Results

		Number	Per Cent

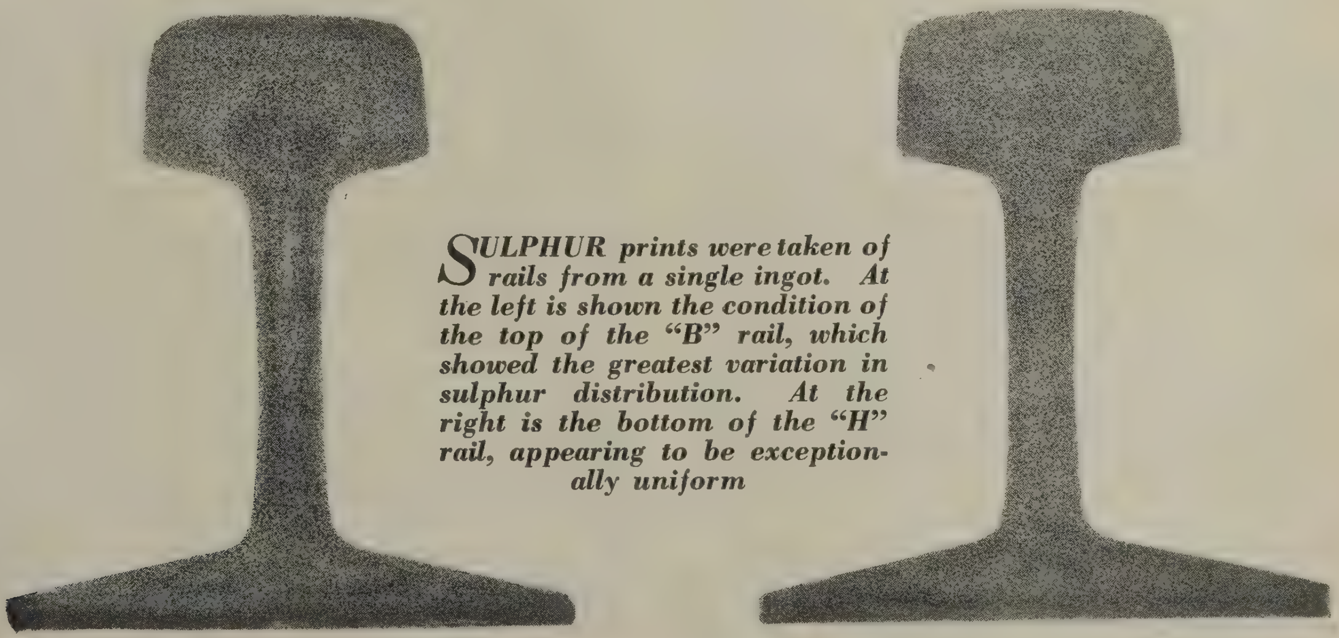
The chemical composition of the Krupp rails is in line with American practice, except perhaps that the sulphur content is low (average 0.028). The mill was able to keep the carbon content well on the high side of the specified range (0.62 to 0.77).

Table II shows the amount of each classification of rail that was shipped compared with results of Ameri-

---

*Recently manager rail department Robert W. Hunt Co., Chicago. This article is a contracted form of a paper entitled "The Manufacture of Some Foreign Rails," to be read before the February meeting of the American Institute of Mining and Metallurgical Engineers, to be held in New York.



SULPHUR prints were taken of rails from a single ingot. At the left is shown the condition of the top of the "B" rail, which showed the greatest variation in sulphur distribution. At the right is the bottom of the "H" rail, appearing to be exceptionally uniform

can practice from carefully kept figures covering approximately 450,000 tons of rails rolled to this specification at different mills in the United States:

Table II—Comparison of Percentages of Acceptable Rails

Classification of Rail Shipped	Percentage of Total Shipments	
	Krupp	Average American Practice
No. 2 rails	6.6	5.8
"X-Rayls"	None	2.2
"A" rails	10.4	12.9
Short-length rails	4.8	4.1
High-carbon rails	39.8	30.3
All other rails	38.4	44.6

Outstanding Features of Krupp Practice

One notable departure from American practice was the bottom-casting of the ingots, and the other was straightening all the rails by passing through a roller straightening machine.

Probably the most important requisite of rails for many years has been freedom from pipe and segregation. Various ingot practices and tests have been tried whereby the presence of piping and its accompaniment could be either eliminated or restricted. An extra price is sometimes paid for an abnormal top discard, frequently as much as 25 per cent on each ingot.

The specification under which these Krupp rails were rolled requires that a classification known as "X-Rayls" be made of those whose fractured test pieces show interior defects; meaning, chiefly, piping and segregation. A large tonnage of American rails tested in the past year showed that on the average 2.2 per cent of the total shipments was "X-Rayls," but there was none among the Krupp rails. The Krupp ingots were large, (in fact heavier because taller than most American rail ingots) and the steel was poured very hot, yet there was apparently complete freedom from piping. In view of the fact that a great many observations were made of the fractures of "A" rail test pieces, this is indeed a remarkable result, for which bottom-casting must have been largely responsible.

American steel makers frequently resort to bottom-casting for special purposes, but, so far as known, ingots cast in this manner have not been rolled into rails. To ascertain the actual effect of bottom-casting, small sections were cut from the top end of the top four rails (lettered "A," "B," "C" and "D") and the bottom end of the last two rails (lettered "G" and "H"), all from the same eight-rail ingot, selected at random in the mill at the time of rolling. Sulphur prints and chemical analyses were obtained. Typical results are shown in Fig. 1 and Table III. While considerable segregation is indicated by the sulphur print in the "B" rail, the other rails appear almost free from it and also fairly sound physically.

Table III—Carbon Analyses of Rails from a Single Ingot

Rail	Location of Sample, Per Cent Top to Bottom of Ingot	Carbon at Corner of Head	Carbon at Junction of Head and Web
A	11.5	0.76	0.77
B	21.9	0.71	0.84
C	32.3	0.75	0.80
D	42.7	0.74	0.76
G	84.9	0.74	0.71
H	95.3	0.73	0.72

Other rails were analyzed. These indicate that segregation is present in the large bottom-cast ingots, possibly to about the same extent as in the shorter and stubbier top-cast American ingots. However, the number of chemical tests made is altogether too few. So far as actual piping is concerned, the Krupp practice evidently has much to commend it, and it would not be surprising to find that, with the restricted tendency to pipe, the steel would be freer from segregation.

Straightening Rails

The standard practice of straightening rails in American mills is to use a gag press having fixed supports about 60 in. apart on which the cold, or hand-warm, rail rests. Prior to this straightening process, the rails are passed through a hot cambering machine located between the hot saws and the hot beds. Its function is to put a curve in the hot rails so that they will be as near straight as practicable when cold, in spite of their unsymmetrical cross-section.

It seems quite unnecessary to comment on the probable abuse that a cold rail of high-carbon steel receives when straightening. Each blow is one well beyond the elastic limit of the metal and the gag frequently leaves an impression on the surface of the rail.

The roller straightening machine in use at the Krupp works consists of three 24-in. top rolls spaced 43 in. centers, and two bottom rolls midway between, all power driven, and somewhat grooved to take a little of the rail head and base when in the machine. Power-driven pinch rolls bearing on both sides of the web feed the rails through. All of the rolls are movable, and their position is largely dependent on the operator and his idea of the condition of the incoming rail.

There was no hot cambering machine. Consequently these rails cooled on the hot beds with a head-low sweep amounting to as much as 12 in. The feed mechanism on the entering side of the roller straightener was nevertheless adequate, and rails were fed through one after the other, requiring approximately 15 sec. for a 39-ft. rail to go through. The temperature varied about as in this country, from stone cold to slightly warm.

From the arrangement of the rolls, about 2 ft. of each end of the rail is largely unaffected. Hence, if a short bend or kink occurred near the end of the rails, it had to be eliminated after roller straightening by going to the customary gag press. From 10 to 20 per cent of the rails had to be gagged, but if a hot cambering machine had been in use, it is altogether likely that this number would have been much smaller.

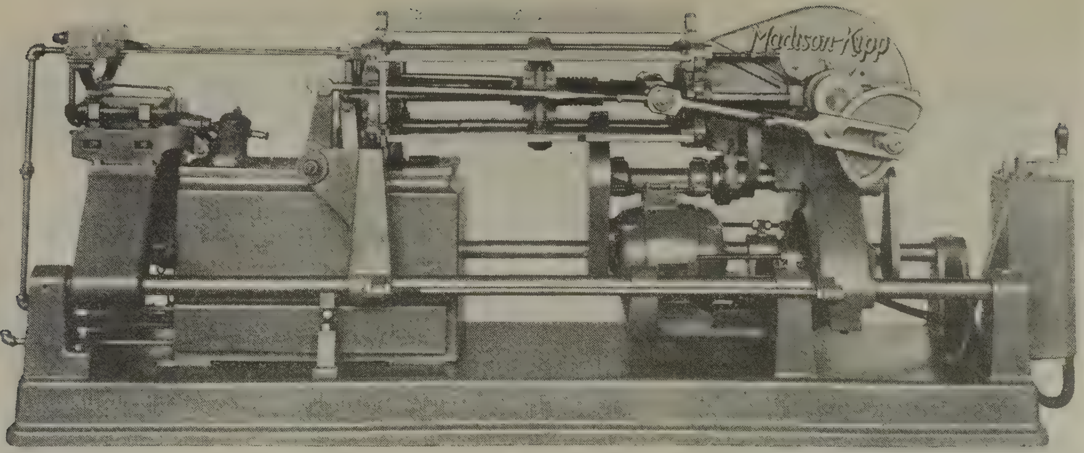
Rails straightened in this roller machine suffered considerable punishment. Of course, they had been strained well beyond the elastic limit, as was proved by the fact that they were quite free from the usual mill scale on the head and base excepting at the ends. The author, however, feels that this method of straightening is likely to be much less detrimental to rails than is the series of from 5 to 15 blows that the average rail receives in a gag press, and also is likely to result in a more accurate line and surface for the finished rail. In short, the roller straightening machine appears to be a desirable advance in the finishing of rails.

Proper Conditions for Use of Cobalt Steels for Permanent Magnets

Cobalt steels possess some important advantages for making permanent magnets, but their cost is high and in many cases may be prohibitive, says the United States Bureau of Standards in a new Scientific Paper, No. 567. However, the bureau points out that some applications of permanent magnets are possible only with the new cobalt steels, and in these cases the cost is a secondary consideration. Decrease in size and weight of the magnet are among the important advantages, but if cobalt steels are used, the magnet must be specially designed to make the best use of the peculiar properties of the alloy. The mere substitution of the more expensive material without due attention to the design is almost sure to lead to disappointing results.

Remarkable improvements have been made in magnetic materials and apparatus during recent years, and one of the greatest of these developments has taken place in steels from which permanent magnets are made. The superior qualities are brought about by adding to the steel a certain amount of cobalt. Unfortunately cobalt is, relatively, very expensive, and the new steels may cost from four to 10 times as much per pound as the ordinary kind. It was to determine the actual conditions under which the new steels should be used that the bureau took up this investigation.

The Dayton Power & Light Co., Dayton, Ohio, has bought from the Westinghouse Electric & Mfg. Co. a 33,000-sq. ft. radial flow type surface condenser, together with the necessary auxiliary equipment, to serve a 25,000-kw. turbine-generator unit. The condenser will be designed to condense 300,000 lb. of steam per hour and maintain a vacuum of 29 in. of mercury. The auxiliaries include dual-driven circulating pump, two priming ejectors, two steam jet air pumps and one turbine-driven condensate pump.



Die Castings of a Wide Range of Sizes and Forms May Be Produced

Die-Casting Equipment with Automatic Features

Operation of Dies and Die Mechanism Also Automatic In Air-Operated Gooseneck Type Machine—Die Service Offered

THE Madison-Kipp Corporation, Madison, Wis., has placed on the market the die-casting machine illustrated, one of which has been in use in the company's plant since 1920 for the production of die castings used in its own products. Toolroom facilities for designing and making dies have been developed, and complete die service is also offered by the company.

Operation is entirely automatic. A feature stressed is that in no case is more than one operator necessary, the duties of the operator being confined to manipulating the lever which engages the driving clutch, supplying new metal, and cleaning the die with an air hose. Safety features are provided and the machine can be stopped and reversed with the die in any position. Standard zinc-base and aluminum-base metals are used in the machine. The design is such that the cores can be pulled only in the proper order, and metal cannot be "shot" unless the die is closed and the gooseneck is in casting position.

The initial drive is by a 2-hp. variable-speed motor which permits the machine to be operated at 4, 6, 8 or 12 "shots" per minute. From the motor the drive is through back gears to a worm and worm-wheel which drives to a shaft upon which special dwell crank cams are attached.

The stationary half of the die is attached to the hot plate of the machine and the movable half of the die is mounted on the reciprocating carriage. The latter derives its motion from rods connected to the slotted connecting rods, eccentrically mounted on the crank cams. With the machine in the position shown, with the die open, the cam roller rides over the cam and advances the carriage by a gradually accelerated movement until the die is closed. This occurs shortly before the cam roller reaches the two-lobed section of the cam. The only object of these two lobes is to hold the die closed by exerting pressure against the heavy coiled springs behind the carriage. During this part of the cycle the crankpin moves forward and back in the slot in the connecting rod.

A charge of metal having been "shot" into the die and given sufficient time to solidify, the die is opened. In opening the die, the cam roller leaves contact with the cam and the crankpin, pulling against the rear end of the slot in the connecting rod, draws the carriage and the movable half of the die back to open position.

Molten Metal Delivered to Die by Air Pressure

It is to be noted that the accelerated movement causes the two halves of the die to come together at a speed sufficient to assure proper engagement, and conversely, it is important to have the highest speed in the cycle for breaking the die open and to start the pulling of cores. The cams provide the accelerated action in the forward movement and the decelerated action on reverse. This allows sufficient time for cleaning of the dies, putting inserts in place, etc.

The gooseneck dips into the metal pot automatically, is filled with metal, and then raised to casting position under the die. At the same time connection is made with the air chamber so that pressure may be applied to the metal for forcing the "shot" into the die. These actions are accomplished by means of push rods, connected to the slotted connecting-rod, which actuate bell cranks that raise and lower the gooseneck. When the gooseneck is raised into casting position, it makes contact with the air chamber and the die at the same time. As soon as the metal has been "shot" the gooseneck is lowered into the metal pot, thus breaking contact both at the die and the air chamber, after the air has been exhausted from the air chamber. Instead of having the gooseneck enter directly into the gate a nozzle-plate is inserted between it and the die. This is intended to prevent any tendency to spread the two halves of the die, thus eliminating production of a fin on the casting.

When the two halves of the die come together, and the gooseneck is in place, air pressure is applied behind the metal in the gooseneck, forcing a "shot" into the die. This is accomplished automatically by means of a cam on the main worm-wheel shaft, which cam makes contact with a roller on a small bell crank or trip and pushes forward the rod connected with the air valve at the rear of the machine. At the side of the machine opposite to the air pressure valve there is a similar mechanism which opens the exhaust valve, so that before the gooseneck is dropped out of engagement with the nozzle plate and die, the air in the air chamber is exhausted.

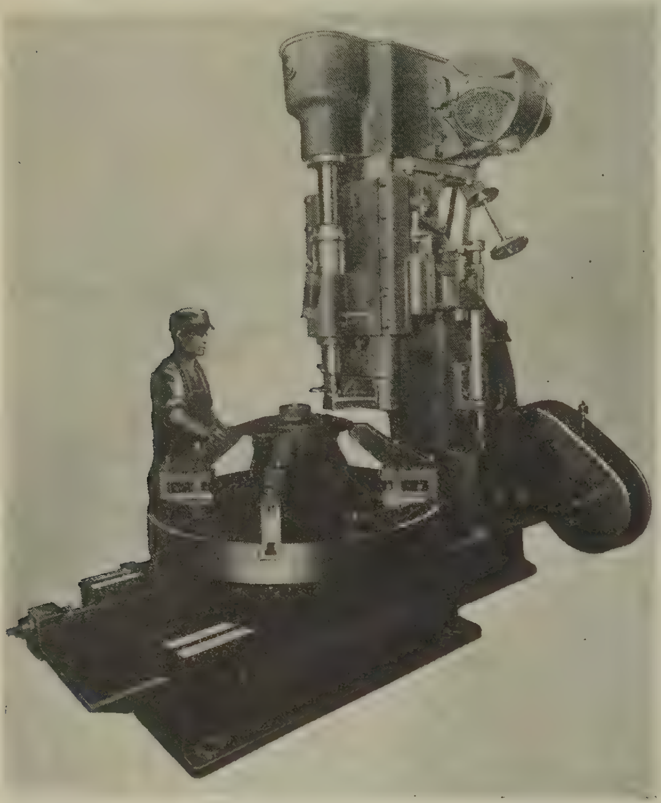
The machine is equipped with a fire brick lined cast iron furnace and a cast iron pot which can be removed from the furnace compartment. The furnace is also removable if occasion demands.

Operation of the dies and die mechanism is automatic with the operation of the machine. Advancing and withdrawing of all cores and the operation of ejector mechanisms are controlled by cams carried on members known as combination bars. Provision is made for mounting six of these bars, two on each side and two above the carriage on which the movable half of the die is mounted. It is stated that by means of these combination bars and the cams mounted on them, cores can be pulled in any direction and at any angle. Provision is also made for air and water cooling of the dies, for the mounting of splash guards and chutes for carrying away the finished castings. The machine is 10 ft. long, 34½ in. wide and 4 ft. 3 in. high. It weighs 6800 lb.

Rochester, N. Y., has been selected for the twelfth annual meeting of the American Gear Manufacturers' Association. Sessions will be held April 19, 20 and 21 at Hotel Seneca. T. W. Owen, 3608 Euclid Avenue, Cleveland, is secretary of the association.

Automatic Machine for Accurate Spacing and Drilling of Circular Pieces

For closely accurate spacing and drilling of a series of holes around circumferences of circular pieces of various diameters, the Southwark Foundry & Machine Co., Philadelphia, is offering the machine here shown, which is fully automatic excepting for mounting and removing the work. The drilled holes may be of different sizes, and the spacing or indexing mechanism may be set for eight to 36 holes. Two or three machines may be served by one operator, and a marked saving in labor is claimed for the machine in the work for which it is designed.



Automatic Spacing-Drilling Machine. The spacing or indexing mechanism may be set for eight to 36 holes, inclusive

The unit illustrated will drill holes ranging from 1 to 2 in. in diameter in steel, and is adapted for work from 1 to 3 in. in thickness. The table and chuck on this machine are special. The table is 54 in. in diameter and has a large central hole to accommodate work having long downward extensions. It is equipped with four self-centering chuck jaws which may be adjusted for gripping work ranging from 12 to 48 in. in diameter. By moving the table on the bed of the machine to a scale provided for the purpose, different diameters of drilling circles may be selected conveniently. Tables and chucks of other sizes, to suit particular requirements, may be applied to the machine.

A 10-hp. motor having speed variation of 3 to 1 is used to drive the machine, the motor being direct connected by gears and controlled by push button and magnetic contactors. The spindle, 4 in. in diameter, has three automatic drilling feeds and fast return. Downward and upward travel of the spindle is continuous while the machine is in operation, and reversal of direction of travel is automatic. Spacing of the table starts as soon as the point of the drill leaves the work on its upward stroke. The table is spaced from hole to hole, without manual setting of the work for each hole, by means of an indexing mechanism similar to that of a gear-cutting machine. This is operated by a small, independent motor and is said to afford very close accuracy of spacing. Coolant reservoir, pump and piping are regularly provided. The drilling chips drop to the open top bed, beneath the work table, and are raked out at the front end of the bed.

The Pacific Coast Steel Co.'s San Francisco office has been moved from the Rialto Building to the Hunter-Dulin Building, Sutter and Montgomery Streets.

Vertical Miller and Die Sinker for Large Castings and Dies

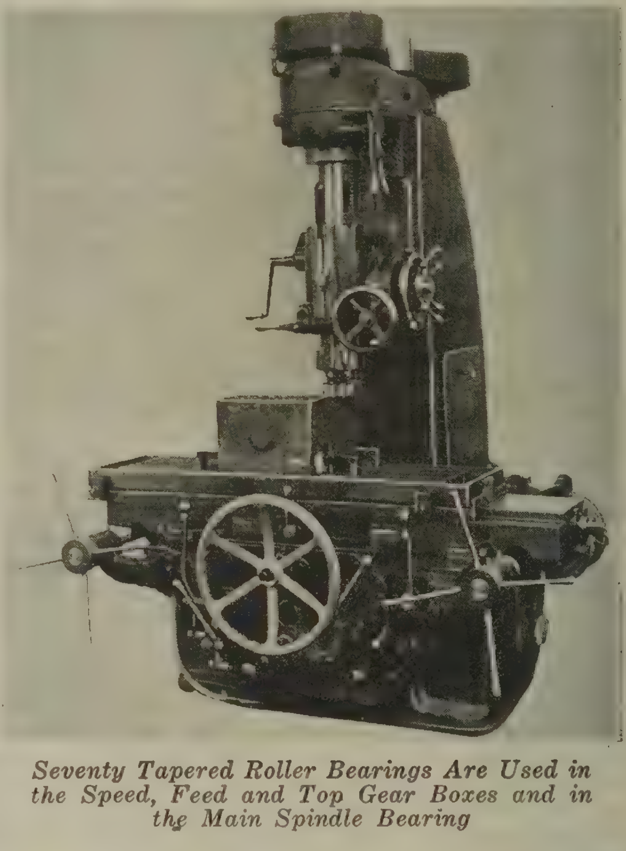
The Reed-Prentice Corporation, Worcester, Mass., is adding to its line a new No. 5 vertical milling and die sinking machine for the vertical milling of large and heavy castings and for the machining of drop forge, body and other dies.

High spindle speeds, necessary for end mills and die sinker cutters, are secured through belt drive to the spindle. Eighteen spindle speeds, ranging from 16.9 to 600 r.p.m., are obtainable and the range of feeds, which number eight for each spindle speed, is from 0.002 to 0.297 in. Power rapid traverse to the longitudinal and cross feeds in either direction is at the rate of 100 in. per min. The spindle is provided with a micrometer stop gage for accurate control of the depth of cut. It is provided with a clutch-type nose and has the taper hole adopted as standard by the National Machine Tool Builders Association.

Timken roller bearings are employed throughout, 70 such bearings being used in the speed, feed and top gear boxes, and in the main spindle bearing. The base is solid and the head and spindle quill adjustable, which construction is intended to provide maximum rigidity. The saddle extends the full length of the table and has four bearing surfaces accurately scraped to the base. Speed and feed gears are of alloy steel, heat treated, and operate in oil.

The spindle is a nickel-chromium steel forging, heat treated, and is mounted in tapered roller bearings.

Longitudinal and cross-feed screws are of heat-treated chrome-molybdenum steel of 50 Shore hardness, and the threads are finished by lapping. Nuts are of special phosphor bronze. The screws are mounted in tapered roller bearings to facilitate operation of the table and saddle.



Seventy Tapered Roller Bearings Are Used in the Speed, Feed and Top Gear Boxes and in the Main Spindle Bearing

Centralized control is a feature, speed and feed levers being located at the front of the machine for convenient operation. The main drive pulley is equipped with clutch and brake for starting and stopping the machine through one lever at the front of the machine. Large diameter handwheels can be supplied in place of the pilot wheels for longitudinal feed of the table by hand. Pilot wheels are disconnected automatically and do not rotate when power feed is engaged. Either single-pulley belt or belt-connected motor drive arrangements may be supplied. For motor drive, a 7½-hp., 1200-r.p.m. motor is recommended.

Some of the important specifications of the machines are: Working surface of the table, 62 x 16 in.; table travel, longitudinal and cross, respectively, 48 in. and 16 in.; height of table above floor, 33 in. The distance from spindle nose to table, minimum and maximum, respectively, 0 in. and 24 in.; vertical feed of spindle, 9 in.; travel of head on column, 15 in.; throat depth, 20 in.; and distance between center line of spindle to face of column, 11¼ in. The floor space occupied by the machine is 95 x 110 in. and the height is 98 in.

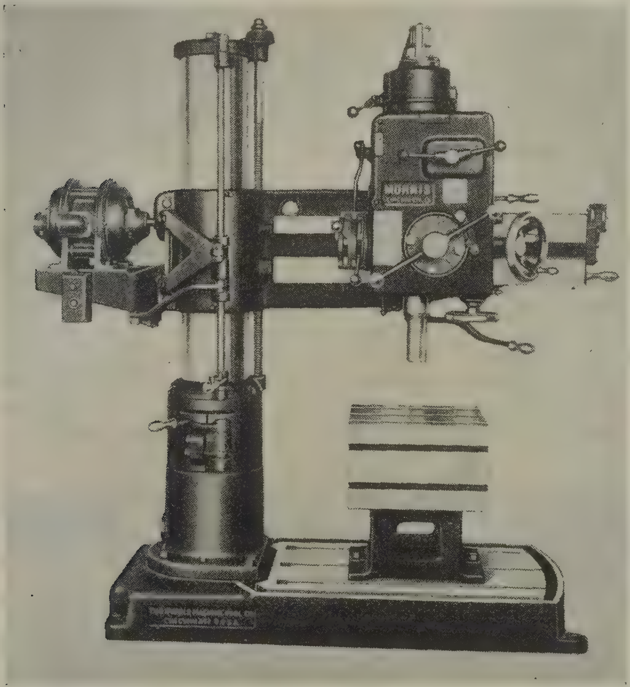
High-Speed Radial Drills with Taper Roller Bearings

The use of Timken roller bearings throughout, except for the tapping-attachment bevel gears, is a feature of a new high-speed, all-geared radial drill added recently to the line of the Morris Machine Tool Co., Cincinnati. Other features include hardened and broached gears; heat-treated multiple-splined shafts and spindle; multiple-disk clutch, and positive lubrication. The machine is available in 3- and 4-ft. sizes.

Speed and feed changes are located in the head and changes are made through sliding gears by means of convenient levers. Twelve speed changes, ranging from 125 to 1600 r.p.m., and six feeds, from 0.004 to 0.025 in. per revolution, are available. The tapping attachment reverse clutch is of multiple-disk type with the disks running in oil. The tapping-attachment bevel gears are mounted in double-row ball bearings.

The entire head and back bracket also operate in oil, which is supplied by a constant speed pump. The oil is pumped through a sight-feed oiler on top of the head, feeding by gravity through the head to the other parts.

The spindle is mounted on roller bearings in a heat-treated steel sleeve of large diameter with the rack teeth cut integral with the sleeve. Dial depth gage, automatic feed trip and safety friction feed are incorporated in the head.



Tapered Roller Bearings and Alloy Steel Gears Are Used. Twelve speeds, from 125 to 1600 r.p.m., are available

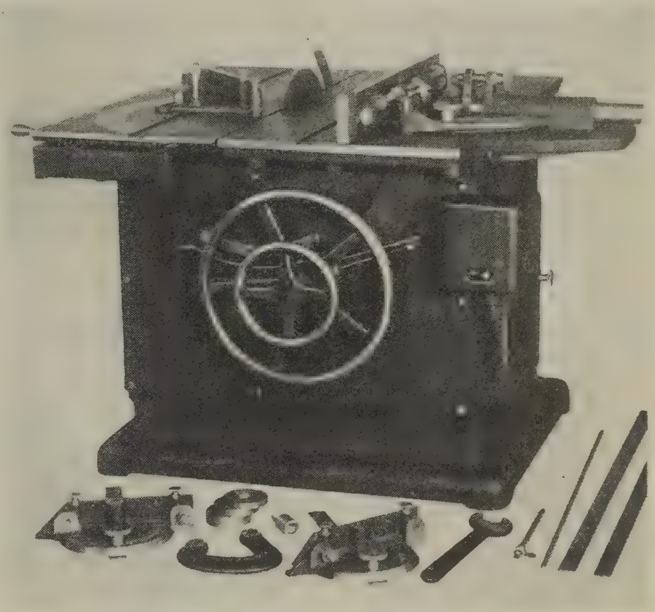
The elevating, lowering and clamping of the arm are controlled by a single lever located conveniently at the front of the machine. It is impossible to elevate or lower the arm while it is clamped, as the single lever unclamps the arm automatically before throwing in the elevating device. The elevating speed is constant and can be thrown in at any time. There is a safety friction on the elevating screw and an automatic knockout on the top and bottom of the column. All control levers are centralized. Speed and feed change, elevating and clamping levers can be reached by the operator without changing his position.

One constant-speed motor mounted on the arm and geared direct to the drive shaft is used to drive the machine, including the elevating device. The drills of 3/16-in. size may be run at 80 ft. per min., and the machine has capacity for driving 1½-in. drills.

Tilting-Arbor Saw Bench for Pattern Shop Use

A tilting-arbor miter saw adapted for use in pattern shops has been brought out by the Oliver Machinery Co., Grand Rapids, Mich. The machine is a built-in motor-driven circular sawing unit, the working top of which remains horizontal and the saw arbor tilts to any angle up to 45 deg. Saws up to 18 in. in diameter may be used, the 18-in. saw projecting through the table 4¾ in. The standard machine is designed to rip work up to 30 in. wide and do miter or dado work, either in the square or in the angular position up to 45 deg.

The base is a one-piece casting, measuring 33 x 39 in. at the floor line, and has built-in dust chute which terminates in a 6-in. round hole for connection to the blower system. A hinged door at the rear of the base provides access to all working parts of the machine, without the necessity of removing the table.



Tilting Arbor Saw Equipped with Universal Table with Rolling Section. There is also a universal tilting micrometer ripping fence and universal gages

Either a plain table, or a universal table having rolling section, can be furnished. The plain table is 44 in. long, 40 in. wide in the main portion, with 18-in. extension arranged so that it can be mounted either on the right-hand or the left-hand side of the table, giving a total of 58 in. of table width. A graduated scale on the top indicates the width of ripping up to 30 in. wide. Slots are provided on either side of the saw for the universal miter gages. The universal table has 15-in. rolling section to the left of the saw, and rolls on ball bearing ways. The rolling table may be moved 4 in. from the saw to permit use of dado saws and special heads. Cross cutting, mitering and grooving up to 36 in. wide may be done.

The motor-on-arbor consists of a 5-hp., 2 or 3-phase, 60-cycle, 220 or 440-volt, ball-bearing shaftless motor mounted directly on the saw arbor. Tilting of the saw arbor and motor unit is by means of a large handwheel directly in front of the operator through suitable gearing. The angle at which the saw is tilted is indicated by a segment and pointer. Means are provided for locking the saw at any tilted position. Push-button motor control is mounted on front of the machine.

The saw arbor is of high-carbon steel ground and is fitted with ball bearings. A dado sleeve with filling collars enables the saw arbor to carry dados up to 4 in. if desired. Safety features are provided, and convenience of operation has been given thorough attention. Ripping fences, miter cut-off gages and other equipment are furnished. The weight of the machine, designated as the No. 88, is 2200 lb., crated.

Immersion Heater for Plating Solutions

An electric immersion heater for electroplating solutions and other liquids which will not attack lead, and intended primarily for low-temperature heating, has been made available by the General Electric Co., Schenectady.

There is a steel-sheathed helicoil unit covered with a lead jacket which is swaged tight to the steel unit. The terminals are brought into a terminal box suitable for conduit connections. It is made in two sizes, both for a maximum demand of 5 kw., one for 110-volt and the other for 220-volt circuits.

Only the lower portion of the heaters dissipates heat. The upper portion, being inactive, allows the unit to be used in tanks in which the level of the solution may be as low as 10 in. from the top of the tank. The heater can be supplied in different formations.

Portability, ease of installation and non-interference with work in the tank are among advantages claimed.

Six-Foot Extension Added to Plate Rolls

The lengthening of a set of 34-ft. plate rolls to 40 ft. was successfully accomplished recently at the East Chicago, Ind., plant of the General American Tank Car Corporation. The original machine, a Ryerson-Kling bending roll installed in 1919, had capacity of 34 ft. 2 in. by ¾ in., and was equipped with an upper roll 29 in. in diameter and two lower rolls 20 in. in diameter.

In making the addition it was necessary to dismount the rolls, extend the base, and move out the rear housing. The 6-ft. extensions, made of Mayari iron, were slipped over the journals and welded along the circumference of the joints. Additional center support was furnished and placed at the joints of the lower rollers. The completed machine is shown below.

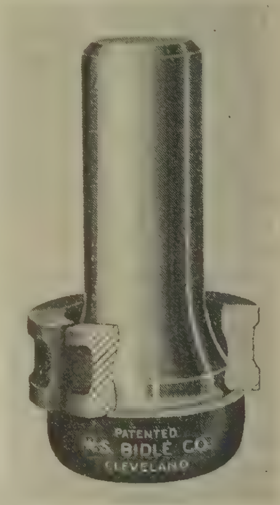
The North mill of the Alan Wood Iron & Steel Co., Conshohocken, Pa., has resumed operation. The mill, which produces blue annealed sheets, has been closed since December, when the mill drives were electrified.

Rivet Set with Tapered Shank for Standard Hammer Barrels

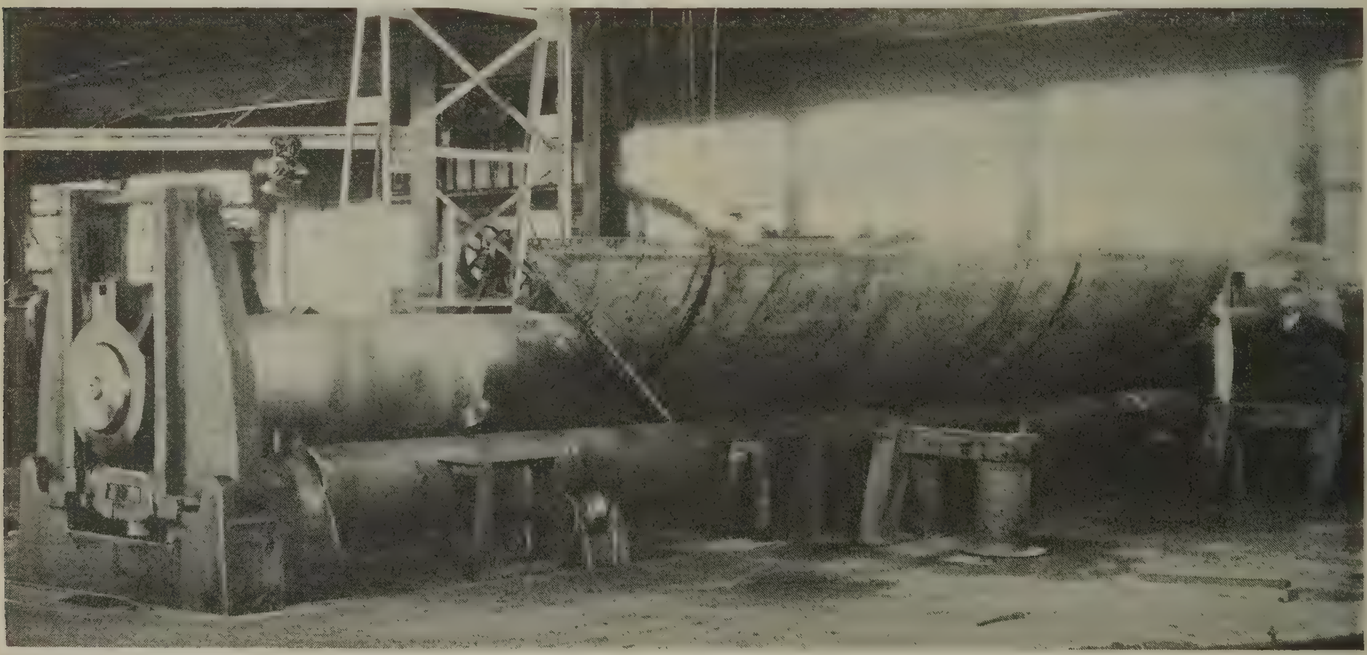
A new design of rivet set having a tapered shank and a split ring that is pressed on the shank, and permits the use of the set with any pneumatic hammer having a standard barrel, has been brought out by the W. S. Bidle Co., Cleveland. It is claimed that the design of the tool, which is designated as an anti-fatigue rivet set, eliminates breakage of the shanks under hard usage. The new set is intended to provide the advantages of a large radius between the shank and the head in a set that can be used with a standard hammer barrel.

The split ring floats, forms a separator between the barrel of the hammer of the set, and also acts as a buffer. Its weight thus becomes a part of the hammer, not of the set, so that it is stated that, size for size, the anti-fatigue sets are lighter than those of conventional design. The split ring has a spring temper, can be readily pressed on the set in a vise, and will not come off in use. When the set is worn out, the ring can be removed and applied on another set. The sets, including the split rings, are made of heat-treated chrome-vanadium steel.

Rivet Set Designed to Provide Large Radius Between Shank and Head, and Still Be Usable in Standard Pneumatic Hammers Without Any Changes



Average weekly earnings of factory workers in New York State in December are reported by the Industrial Commissioner to have been $29.57, compared with $28.75 in November. Except for last March, when an average of $29.78 was recorded, the December figure is the highest ever reported. It was equalled by that for September. Average for the year at $29.30 makes a new high record, exceeding by 1 per cent the average of $29.02 in 1926, which was the previous record.



The 6-Ft. Extensions, of Mayari Iron, Were Slipped Over the Journals and Welded Along the Circumference of the Joint. Additional center support was placed at the joints of the lower rollers

BOOK REVIEWS

Foremanship Training. By Hugo Diemer. Pages 230, 5 x 7 in. Published by McGraw-Hill Book Co., New York. 1927. Price, $2.50.

Naturally, this book is intended for the particular executive who is charged with and responsible for developing better foremanship—something that is rarely done, despite the importance of training, to say nothing of selecting the liaison officer between employer and nonclerical workers. The need for foremanship training is stressed, although that stress should really be a matter of supererogation.

The foreman's activities are defined along Taylor's machine-shop lines, which really apply to all kinds of production work. The foreman's personality is sketched from various widely different angles—works managers', trainers' and experienced foremen's. The production conference gets a chapter showing how it tends to develop foremen, but weight is laid upon the fact that participation in such conferences does not necessarily make a good foreman.

Foremen's clubs and associations are given attention; for instance, hints are thrown out as to how they should be organized, and a model constitution is reproduced. The statement is made that the international industrial committee of the Young Men's Christian Association will suggest programs and speakers; but, from personal knowledge of the way in which its foremanship course and books for side reading were turned down flat in Philadelphia, Baltimore and elsewhere, I do not concur in the author's recommendation. I am inclined to prefer that assistance be sought from the National Association of Foremen, Dayton, Ohio.

The activities of the conference as regards teaching, training, discussion, etc., are outlined. I may say that if care be not taken with such conferences the result will be, as it has been several times, that no two foremen will speak to each other. The recommendations of the Chamber of Commerce of the United States for foremanship courses are reproduced. The safety movement received, as it should, considerable attention; and there is a chapter recommending giving the foreman information about cost calculation. Industrial engineering in its relation to foremanship is considered somewhat in detail. This matter, however, is put in a manner properly addressed to and intended for the foreman, whereas the book is nominally not for him, but for the superintendent of personnel. R. G.

Organizing the Drafting Department. By H. F. Church. Pages 133, 5½ x 8½ in. Published by Ronald Press Co., New York. Price, $3.50.

There are so many kinds of drafting departments, the requirements varying so with the industry in question, the capital invested and the production methods, as well as the amount and kind of inventive genius involved in production, that set rules for organizing the drafting department cannot be formulated to cover the entire ground, or to cover any large part thereof other than thinly and unevenly. The human element, also, comes into play. A drafting department may be organized with almost Taylor-like thoroughness, but if there is not good team-work, no disposition on the part of the head draftsman to impart his knowledge and on that of the old hands to aid the newer ones, the department will fail in spots at least, and perhaps as a whole.

The author apparently has had personal experience with a head draftsman chosen on account of "firm loyalty," but I have never heard of such a case. I do know, however, of one head draftsman whose lack of that quality led him to run a private drafting department at home and eventually to set up in business for himself in competition with the employers whose ideas, and those of his own for which his employers had paid, he stole.

One asset for a head draftsman the author omits to mention: a well-filled notebook and a set of pocket books and reference books in the line of the work in question; further, good eyesight and steady nerves, also necessary qualifications for his assistants.

Addresses of publications useful in advertising for draftsmen are given—most unnecessarily, as such lists imply that the head draftsman is not familiar with the trade periodicals in his own line; and the lists are incomplete, as they omit, for instance, the employment bulletins issued by the associated American engineering societies.

One qualification for draftsmen in machinery lines is omitted—the ability to take "mental photographs" of machines and appliances, and make detail sketches thereof afterward; also to evolve kinematical equivalents for patented mechanical movements, as for instance, a "sword-arm" for a slotted link on a locomotive, a filling cam for a cam and spring, or a petcock for an adjustable head on a printing-press buffer.

Isometric perspective, one of the most valuable means of representing three-dimensional objects in one drawing with the same scale in all three axial directions, is not even hinted at, although it is a godsend for pattern-makers and blacksmiths.

Apparently "the" drawing department to be organized is to use high-grade white paper for the master drawing; whereas modern practice is more likely to make the original on Manila paper (in lead pencil, often) and rely on tracing for the master drawing, from which any number of blueprints may be made. This permits changes to be made for successive models with but little difficulty, a new set of blueprints, properly dated, answering for repeat jobs until the new model is in the shops, and for repairs.

—

Metallographic Atlas. By Prof. H. Hanemann and Miss A. Schrader. Sections 1 and 2, consisting of 16 plates with text (125 illustrations). Published by Gebrüder Borntraeger in Berlin, Germany. Price, 14 marks.

This will eventually be a complete collection of photomicrographs, covering all metals and alloys. It bids fair to be an excellent reference collection of the structures encountered, and has accompanying explanations. These two sections (the first of the series) have to do with steel. Photographs are on photographic paper (not printed through a screen), thus preserving all the detail, and they are of fine quality.

—

Metallography. (Die praktische Nutzanwendung der Prüfung des Eisens durch Atzverfahren und mit Hilfe des Mikroskopes.) By G. Berndt and M. V. Schwarz, professors in the technical high schools of Dresden and Munich respectively. Third enlarged and improved edition of E. Preuss's original work. Pages 198, 204 illustrations. Julius Springer, Berlin W.9, Germany. Price, 7.80 reichsmarks in paper; 9.20 in cloth.

A note on the title page says the book is for engineers as well as for superintendents. It might be added that it could be used to advantage by students, laboratory investigators and inspectors who have a smattering of German. Its scope is entirely confined to iron and steel, and much attention is given to those portions of the field which have not yet found their way commonly into text books. About a quarter of the space is given to macroscopy, the examination of large areas of polished and etched specimens by naked eye or under low magnifications. Included is a fine collection of 50 pictures showing segregations, flow lines, strain lines and other abnormalities discoverable by this method. Another excellent section is on the structure of welds made by all the commercial processes.

The selection and reproduction of the photographs are especially commendable. Without using a paper so highly finished that it glares, the printers have been able to reproduce fine details of structure with unusual fidelity.

Care and Operation of Machine Tools. By J. W. Barritt. Pages XIII + 290, 6 x 9 in., 160 figures. Published by John Wiley & Sons, Inc., 440 Fourth Avenue, New York. Price, $2.75, net.

Written by a former supervisor of apprentices, Westinghouse Electric & Mfg. Co., Philadelphia, and used for a number of years in his own work, the volume is intended as a text and reference book for high schools, universites and trade schools, and as a part of apprentice training programs. The arrangement adapts it also for home study purposes.

Machine tools dealt with are the drill press, shaper, vertical boring mill, engine lathe, planer, horizontal boring machine and the milling machine—in the order named. More than 70 pages are devoted to the engine lathe, more than 50 to the milling machine, and more than 35 to the planer. The opening chapters deal with lubrication and the emery wheel, respectively.

The text describes the construction of the various units of the standard machine tools listed above, and explains why and how to make the necessary adjustments, which enable the beginner to operate the different mechanisms without injuring himself or the machine. Specific job operations are not considered except for the purpose of illustrating some point in the care and operation of the machine. The subject of tool grinding is treated pictorially. Tools used on each machine are grouped by classes and the shape of each tool and correct grinding are shown. The chapter devoted to milling machines includes data and illustrations of the recently adopted standardized spindle end.

The author writes clearly and gives evidence of practical contact with and appreciation of the needs of the apprentice and other students. The questions and problems listed at the end of each chapter (to the number of 139 and 30, respectively, in the chapter on lathes), add to the worth of the volume.

Plating and Coloring. (Metallniederschlage und Metallfarbungen.) By F. Michel, director of public testing laboratories, Pforzheim, Germany. Pages 179, 13 illustrations. Julius Springer, Berlin W.9, Germany. Price, 6.90 reichsmarks in paper binding.

This book contains a wealth of information on the subject matter. It is evidently written by a man well informed about the science underlying his art, but who is able to state the essential information in a manner understandable to an artisan not so well favored. Thus, while it describes the operation of a plating vat, it does so without introducing a heavy mathematical consideration of the electrical phenomena. It is unusually complete, discussing the operation of ordinary plating baths and those for the rarer metals as well. Notes on solutions which can be used for plating without the use of electricity are also included. Coloring of the various commercial metals by dipping into suitable solutions is very briefly considered in 20 pages of text. Heat tinting is not mentioned.

Mechanics of Machinery. By C. W. Ham and E. J. Crane. Pages XIII + 504, 6 x 9 in.; 385 figures. Published by the McGraw-Hill Book Co., 370 Seventh Avenue, New York. Price, $4.00.

The purpose of the authors has been to bring together in a condensed textbook just sufficient material to give the student a working knowledge both of "mechanism" and of "dynamics of machinery" in the time ordinarily available for this work in an engineering curriculum.

The book is divided into two parts, Part I, of 204 pages, being devoted to "Mechanism," and Part II, of 280 pages, to the "Kinematics and Dynamics of Machinery." The chapters on mechanism outline the fundamental mechanisms and the theory of the operation, while the second part of the book aims to enable the student to analyze the forces as well as the motions in the mechanisms or machines dealt with in the first part of the volume. A knowledge of analytical mechanics is presupposed in connection with study of Part II.

The authors did not set out to write a complete treatise. The statement of each topic is necessarily brief, only sufficient material having been included to bring out fundamental principles and methods. Sources of additional information are listed at the end of each chapter. Problems, also given at the end of each chapter, are intended to serve as a guide in presenting the drafting room work.

Handbook of Iron and Steel Foundry Work. (Handbuch der Eisen und Stahlgiesserei.) Vol. II.: Molding and Pouring. By C. Irresberger. Pages 584, 7½ x 10½ in.; 1702 illustrations in the text. Published by Julius Springer, Berlin, Germany. Second edition, 1927.

While we have not much to learn from Germany in the matter of iron founding, particularly core-making and setting, and perhaps in brand mixing, we can well learn from her analysis and teaching; and this work is an excellent example of infinite detail, carefully arranged and thoroughly explained. We probably excel German practice in molding machines and their use, and in core machines; and the Germans have only comparatively recently learned the use of stripping plates and drawing machines. These facts, however, and the German's infinite capacity for taking pains, go to furnish the reason why the average German foundryman is better than the average American.

Especially to be commended is the clearness of the line engravings, and the abandonment of German Schrift letters in favor of the italic line lettering of the character originated, I believe, in the Westinghouse drafting rooms.

Strangely enough, the "carrousel" machine, of which there are two in the Bavarian State foundries at Amberg, are not mentioned; neither are iron cores, so successfully used in American stove foundries and in making very wide so-called link belts. One-piece iron soil-pipe molds, for straights and elbows, find no place; although the Custer heavy two-part iron molds are given a couple of paragraphs. The Schwarz double-walled, oil-cooled molds (an American invention, which one can see in the Allyne-Ryan foundry in Cleveland) get considerable attention in connection with the mechanical appliances for their use on a large scale. This is a most important process, as castings from the same ladle show much greater tensile strength and bending capacity than those made in sand molds. Centrifugal force, as applied to driving the metal into the finest crevices of the mold, is taken up rather fully, which is necessary; as for each pipe or piston ring diameter, there is a best rotation speed of the machine, also a most practical metal temperature. The "monocast" process, used in the American Cast Iron Pipe Co. foundry in Birmingham, Ala., and another somewhat similar one, in use in Florence, N. J., have attracted the author's attention.

This book is a valuable addition to the first volume, and a worthwhile contribution to foundry literature. It is unfortunate, however, that from the very thoroughness with which it has been written and published, it is not, and cannot be, quite up to date.

R. G.

"Steel Roofing—Its Use and Application" is the title of a booklet issued recently by the Sheet Steel Trade Extension Committee, Oliver Building, Pittsburgh, which is designed to sell the idea of sheet steel roofing to the rural dweller. Of particular interest are photographs showing the effect of sheet steel roofs in preventing the spread of fire.

The International Nickel Co., 67 Wall Street, New York, has issued Nos. 203 and 204 of its series of booklets on nickel cast iron. The first, entitled the "Economic Value of Nickel in Cast Iron," outlines the various uses of nickel in foundry mixtures and deals in some detail with the results obtained. The other booklet deals briefly with the "Effect of Nickel on Machinability of Cast Iron," and presents an analysis of the difficulties in machining gray cast iron.

Electric Industrial Trucks and Tractors in Industry

A book of 96 pages and 136 illustrations has been issued by the Society for Electrical Development, 420 Lexington Avenue, New York. Cooperation with 20 manufacturers of electric industrial trucks and tractors, storage batteries and accessories was had in preparing the book, which is devoted to the profitable application of these units in industry. There is a special chapter for each of 16 major industries, of which the steel industry, foundries, machine shops and automobile plants are the four first considered. Others include railroad, marine and warehousing operations, and plants devoted to textiles, leather, rubber, paper, lumber, food products, chemicals and ceramics.

For each of the industries covered, the operating processes and the particular type of truck suited to individual jobs are described. An outline of operating costs is given, together with a tabulation of direct savings effected by employing this type of equipment. Illustrations show equipment in use in various types of service, handling various materials.

Steel Construction

A valuable addition to the engineering handbooks dealing with construction matters is a volume on steel construction, just issued by the American Institute of Steel Construction, 285 Madison Avenue, New York. Bound in limp leather, there are 384 pages full of engineering data, relating particularly to structural materials and their use. New beam and girder sections announced during the past two years by the Carnegie Steel Co. and the Jones & Laughlin Steel Corporation are included, alongside the Bethlehem special H-beams, and the standard beams furnished by all companies making structural material. Hence, the present volume contains a compendium of data regarding all of the principal structural members obtainable.

Part I covers standard specifications, the code of standard practice of the American Institute of Steel Construction and several pages devoted to the historical development of steel and iron as a construction material. Part II takes up the properties of sections, formulas for beam loading and general mathematical tables. Part III is devoted to the strength of building materials and general information related thereto. Part IV takes up the structural shapes and details—both the rolled structural shapes and the built-up sections. It explains the institute's specifications and formulas and gives dimensions, functions and allowable load tables for the various sections described, and data regarding rivets and other connecting media. Copies of the book may be obtained from the institute at $1.50 each.

Ventilation of the Holland Tunnel

Under the title "The Eighth Wonder," a well illustrated book has been put out by the B. F. Sturtevant Co., Hyde Park, Mass., describing the construction of the Holland vehicular tunnel between New York and Jersey City, and in particular featuring the elaborate ventilation arrangement. The fans, in heavy traffic, will handle 84,000 tons of air an hour, or 1400 tons a minute. The book describes the elaborate experiments which had to be undertaken before this system could be worked out and shows by illustration, both half-tone and line-cut, how the job was done.

Most of the book is taken up, however, with a graphic description of the operation of constructing the tunnel. There are 64 pages filled with information and with photographic reproductions showing many of the features of construction work, as well as line drawings giving particulars of size, relations of one part to another and many other pertinent facts.

"Getting Results with Ludlow-Saylor Screens" is the title of a catalog issued by the Ludlow-Saylor Wire Co., St. Louis. Sections of the book are devoted to the control of crusher wastes with woven screens, points to consider in choice of sizing screens, reducing costs of crushing and grinding with woven screens, special wire cloths for unusual services, and other subjects. Complete reference data on double crimped wire cloth and woven screens are furnished. Illustrations are ample. The book is handsomely printed and bound.

Recovery of waste heat from industrial processes is dealt with by J. B. Crane, engineer, boiler department of the Heine Boiler Co., New York, in the December issue of *Safety Valve*, published by that company. Particular attention is given to the recovery of waste heat in the open-hearth furnace.

Production of bituminous coal in January is estimated by the United States Bureau of Mines at 44,200,000 net tons in 25.3 working days. This is a reduction of 23 per cent from the output of January, 1927, with the same number of days; but exceeds the production of December, which was 41,277,000 tons in 26 days.

New Books Received

Standards and Specifications in the Wood-Using Industries. 1927. Pages 349, 8 x 11 in., illustrated. Published by Bureau of Standards, United States Department of Commerce, Washington. Price, $1.50.

The Economics of Installment Selling. By Edwin R. A. Seligman. Two volumes, pages 357 and 623 respectively, 6½ x 9½ in., illustrated. Published by Harper & Brothers, 49 East Thirty-third Street, New York. Price, $8.

The Road to Plenty. By William T. Foster and Waddill Catchings. Pages 231, 5½ x 8½ in. Issued by Pollak Foundation for Economic Research, Newton 58, Mass. Price, $2.

Postponing Strikes. By Ben M. Selekman. Pages 405, 5½ x 8 in. Published by Russell Sage Foundation, 130 East Twenty-second Street, New York. Price, $2.50.

Industrial Progress and Regulatory Legislation in New York State. Pages 147, 6¼ x 9¼ in. Published by National Industrial Conference Board, Inc., 247 Park Avenue, New York. Price, $2.50.

Manual of Industrial Safety. By Sidney J. Williams. Pages 197, 5¾ x 8½ in. Published by A. W. Shaw Co., Cass, Huron and Erie Streets, Chicago. Price, $2.

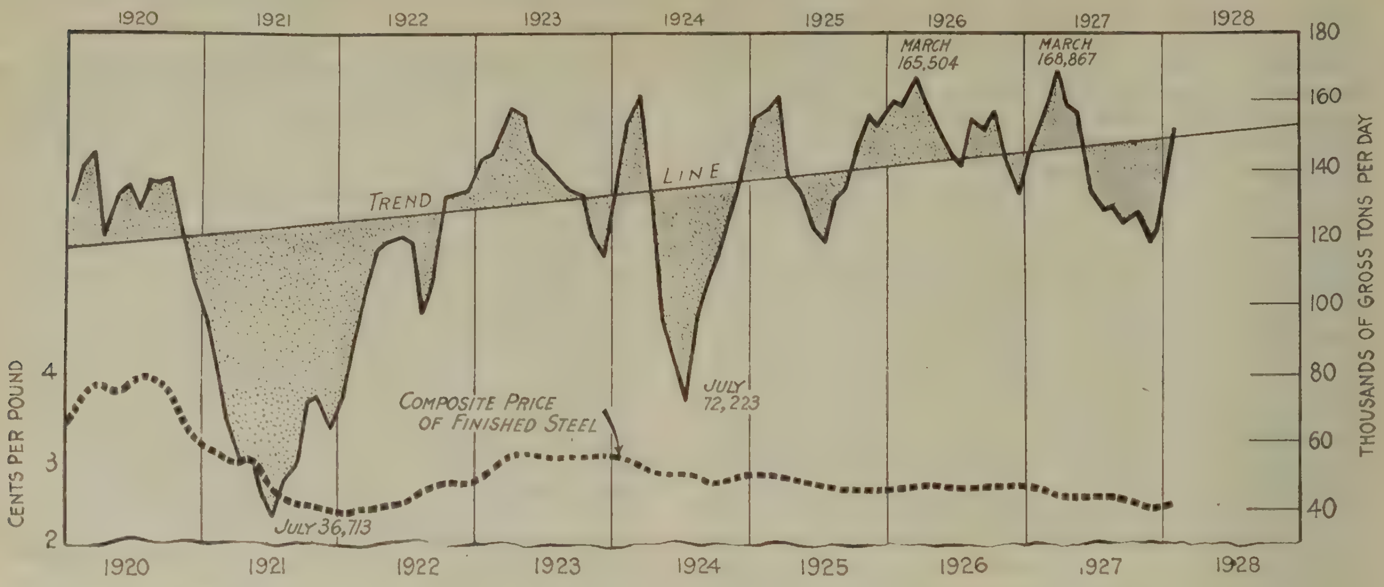
Production of Steel Ingots in January Showed an Exceptional Gain, Over 25 Per Cent, and Now Has Gone Above the Line Representing the Calculated Trend of Consumption for the First Time Since Last May



Great Increase in Ingot Production

Daily Rate of 152,304 Tons Was 25.7 Per Cent Above December and the Largest in Eight Months

PRODUCTION of steel ingots in the United States in January is calculated by the American Iron and Steel Institute at 3,959,904 gross tons. This is based on returns from companies which in 1926 produced 95.40 per cent of the total tonnage. With 26 working days, the January production was 152,304 tons a day. This compares with 121,167 tons in December and 119,299 tons in November, and with 144,611 tons a year ago.

Except for March, April and May, the January total tonnage was greater than that recorded in any month last year. With two exceptions (1926 and 1925) it was the largest January output ever made. It exceeded last year's opening month by 5.3 per cent. Most of the gain of 25.7 per cent over December was made in open-hearth steel, which advanced 28.2 per cent. Bessemer tonnage went up 11.3 per cent. Only once before was the present gain of 809,000 tons in one month matched. March, 1918, 26 working days against February's 24, advanced 1,003,000 tons. The famous "heatless days" were then over.

Estimating production in January of electric and crucible steel ingots (no longer covered in the institute's monthly figures) at 700 tons a day, the January total ingot output would appear to be about 153,000 tons a day. Details of the past two years are shown in the table.

*Excluding crucible and electric steel ingots.

Foundrymen Appoint Members of Bureau of Standards Committee

Representatives of the American Foundrymen's Association on the ferrous metal committee advisory to the United States Bureau of Standards have been appointed for 1928 and are as follows:

John Howe Hall, metallurgical engineer Taylor-Wharton Iron & Steel Co., High Bridge, N. J., chairman of the A. F. A. group and representing the steel castings section of the A. F. A.

H. Bornstein, chief chemist Deere & Co., Moline, Ill., representing the cast iron section of the A. F. A.

J. B. Deisher, consulting engineer, 24 Roslyn Street, Rochester, N. Y., representing the malleable section of the A. F. A.

The advisory committee to the Bureau of Standards meets once a year and with its staff goes over the activities of the bureau, advising as to the projects which seem to be of greatest need to the industries, and discussing projects which should be given future consideration.

The next meeting of the committee is to take place in Washington May 11 and 12.

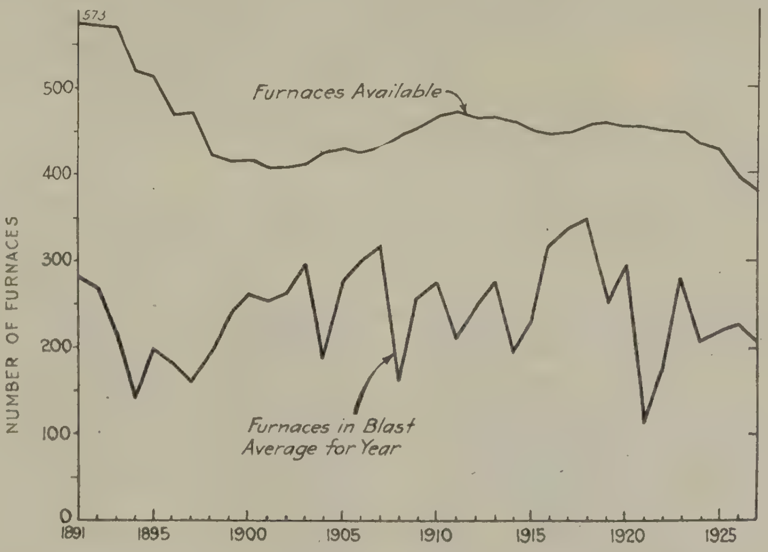
Fewer Locomotives Shipped

Railroad locomotives to the number of 47 were shipped in January, as against 72 in December, according to the Department of Commerce, Washington. Of the December shipments, 22 locomotives were steam and 23 electric for domestic use and two were steam engines for foreign use. Unfilled orders numbered 222 on Jan. 31, against 232 a month earlier. January shipments made the lowest month's total in several years.

Increasing Blast Furnace Capacity

Study of Output of Past 37 Years Covers Total Capacity of Furnaces Available, Number of Furnaces and Average Number in Blast and Tonnage Produced

AVERAGE annual production of pig iron per furnace in blast in the United States has advanced from 29,570 tons in 1891 to 176,700 tons in 1927, according to figures published in a Business Barometer of the Iron and Steel Industry, prepared by the School of Business Administration, University of Pittsburgh. Our table is based on one from an unpublished master's thesis by F. C. Smith, of the Department of Business Statistics of that university. With a few irregularities, the advance was continuous over the period. The average output first reached 100,000 tons per furnace in 1909. It has not dropped below that figure since then. It first reached 150,000 tons per furnace in 1921, and dropped below only in 1923, when, with a new high record output of pig iron for the country, many of the smaller, high-cost furnaces were brought into play by the demand for iron.



FURNACES in Blast in the United States, as an Average for the Year, for Each Year from 1891 to 1927, Both Inclusive, Together With the Total Number of Furnaces in the Country. Heavy elimination of worn-out and high-cost furnaces features the recent years

Figures for capacity were derived from annual reports of the American Iron and Steel Institute. In 1896, and again in 1924, 1926 and 1927, a slight decline in total capacity was registered. But no retrograde movement appears in the average capacity per furnace, which shows a consistent and steady rise from 62.5 tons a day in 1891 to 364.3 tons in 1926. It first passed 100 tons in 1896, then 200 tons in 1907 and 300 tons in 1920. While this change came about in large measure from the erection of large and ever larger stacks. it was accelerated by the gradual disappearance of most of the charcoal furnaces, which are small, individually, and of low output.

One diagram shows the total number of furnaces available (including those undergoing repair) on Jan. 1 of each year from 1891 to 1927. Furnaces in blast furnish a companion curve which gives a clear indication of the extent to which existing furnaces were being used. The active furnaces represent the average, during the year, of the monthly figures.

In a second diagram the steady upsweep of the average

Number and Capacity of Furnaces Available and of Furnaces in Blast in the United States: 1891-1927

Year	Total Capacity (Thousands of Gross Tons)	Number of Furnaces Available Jan. 1	Average Capacity per Furnace (Gross Tons) Year	Average Capacity per Furnace (Gross Tons) Day	Annual Production (Thousands of Gross Tons)	Average Number of Furnaces in Blast	Average Production per Furnace in Blast (Gross Tons) Year	Average Production per Furnace in Blast (Gross Tons) Day
1891	13,064	573	22,800	62.5	8,280	280	29,570	81.0
1892	14,551	571	25,480	69.8	9,157	266	34,430	94.1

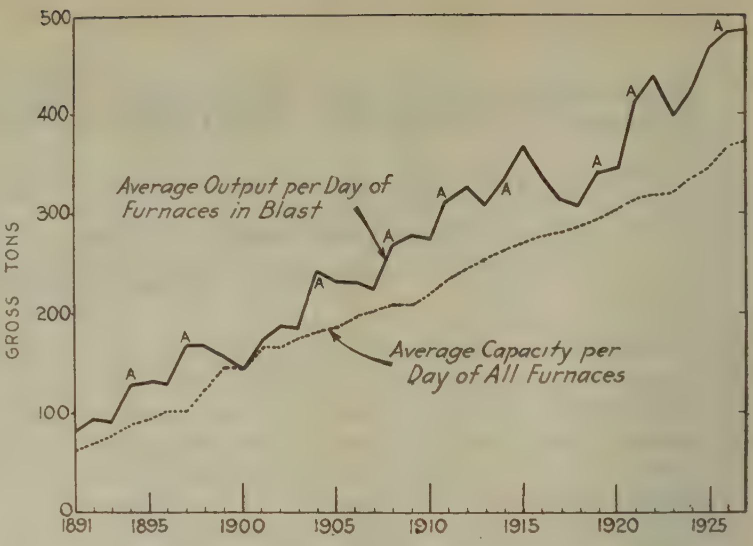
1900	21,991	414	53,120	145.5	13,789	260	53,030	145.3
1901	24,812	406	61,110	167.4	15,878	251	63,260	173.3
1902	24,812	406	61,110	167.4	17,821	261	68,280	187.1
1903	26,216	412	63,630	174.3	18,009	266	67,700	185.5
1904	28,114	425	66,150	181.2	16.497	186	88,690	242.4
1905	29,154	429	67,960	186.2	22,992	271	84,840	232.4
1906	30,446	424	71,810	196.8	25,307	300	84,360	231.1
1907	31,581	429	73,620	201.7	25,781	315	81,840	224.2
1908	33,646	443	75,950	208.1	15,936	162	98,370	268.8
1909	34,834	453	76,060	208.4	25,795	255	101,160	277.2
1910	37,552	468	80,240	219.8	27,304	273	100,010	274.0
1911	40,128	473	84,840	232.4	23,650	208	113,700	311.5
1912	41,475	465	89,190	244.4	29,727	249	119,390	326.2
1913	43,257	466	92,830	254.3	30,966	275	112,600	308.5
1914	44,395	462	96,090	263.3	23,332	192	121,520	332.9
1915	44,405	451	98,460	269.8	29,916	223	134,150	367.5
1916	45,034	445	101,200	277.3	39,435	317	124,400	339.9
1917	45,865	448	102,380	280.5	38,621	337	114,610	314.0
1918	47,948	455	105,380	288.7	39,055	349	111,910	306.6
1919	49,270	459	107,340	294.1	31,015	249	124,560	341.3
1920	50,222	453	110,860	303.7	36,926	292	126,460	345.5
1921	51,741	452	114,470	313.6	16,688	111	150,340	411.9
1922	52,488	450	116,640	319.6	27,220	170	160,120	439.0
1923	52,687	449	117,340	321.5	40,361	278	145,180	397.8
1924	52,684	432	121,950	334.1	31,406	204	153,950	420.6
1925	53,435	425	125,730	344.5	36,701	216	169,910	465.5
1926	52,521	395	132,960	364.3	39,373	224	175,770	481.6
1927	51,681	379	136,362	373.6	36,400	206	176,699	484.1

capacity of all furnaces stands out prominently. At only one point (1900) does the curve showing average output per day go as low as the average capacity. Mainly it is about 25 per cent higher, due to the more intensive use of the latest, largest and lowest-cost units.

Notable in this diagram is the recurrence of nine "humps" at A, A ——— A, each appearing at a year when total production slumped, and each successive one higher than any of its predecessors. This bears out the observed fact that, when demand falls off, it is the small, high-cost furnace which first is shut down, leaving the large units to carry the load at the lowest possible total cost.

As a matter of fact, the 206 furnaces (average) in blast in 1927 produced one-sixth more iron than the 275 furnaces of 1913; more than twice as much iron as the 266 furnaces of 1903; nearly three times as much as the 236 furnaces of 1899 and four times as much as the 266 furnaces of 1892. The average furnace of 1927 made six times as much iron as the average furnace of 1891.



Average Capacity per Day of All Furnaces Available Runs Well Below the Average Output of Those in Blast, Because the Furnaces in Most Constant Use Are the Latest, Largest and Most Economical We Have. Humps in the upper curve, at A A A, show years of low total output, in which only the very best of the furnaces could be run. Each such year made a new record in average output per furnace

Weirton Steel Co.'s Ingot Capacity Now Exceeds 1,000,000 Tons

The Weirton Steel Co., Wierton, W. Va., informs THE IRON AGE that with the completion of a new open-hearth furnace, which was lighted this week, it will have a total ingot capacity of not less than 1,050,000 tons annually. The new open-hearth furnace will give the Weirton company a total of 11, the latest one having a rated capacity of 250 tons per heat. The company's finishing capacity is estimated at 960,000 tons a year, made up as follows: Tin plate, 255,000 tons; galvanized and black sheets, 85,000 tons; hot and cold rolled strip steel, 260,000 tons; wide strip sheets, full finished, hot rolled blue annealed and single pickled sheets, 360,000 tons. Its pig iron capacity is 540,000 tons. Much of the new steel capacity of the Weirton company has been added since the publication of the 1926 edition of the Iron and Steel Works Directory of the American Iron and Steel Institute, which gave its ingot rating as 570,000 tons, and this was the figure used in a table of steel company capacities published in the Feb. 2 issue of THE IRON AGE.

New High Record in Electric Power Output

Production of electric power in December, by public utility power plants in the United States, is reported by the Geological Survey at 7184 million kwhr. This is a gain of nearly 5 per cent over the November total of 6864 and about 4 per cent over the October figure of 6929. The December total was the largest ever recorded. On the daily basis, the sendouts for September, October, November and December were successively new high records. Previous to September, the record was held by December, 1926. The last December total stands at more than double the level of the average month in 1921, and nearly double the figures for 1920. Water-power provided about 38 per cent of the December sendout, against 36½ per cent in November and 34½ per cent in October.

Steel boilers ordered in December are reported by the Department of Commerce at 1054, with a total of 905,680 sq. ft. of heating surface. This is the smallest rating for any month of the year and shows a drop of approximately 20 per cent from the November total of 1,125,261 sq. ft. For the 12 months of 1927 there were 15,946 boilers ordered, aggregating 15,732,639 sq. ft.

Fewer Steel Barrels Made in December but Year Shows Small Gain

December production of steel barrels reported by 27 companies to the Department of Commerce amounted to 444,227 units. This was the smallest total for any month in more than two years. It compared with 500,909 in the preceding month and with 539,805 in December of last year. Total for the year amounted to 6,630,569 barrels, compared with 6,588,535 barrels in 1926. This represents a gain for the year of less than 1 per cent.

Shipments, at 454,638 units in December, made the smallest total for any month in more than two years. Shipments month by month have held close to the production figures. Stocks at the end of December were 52,606 units. This was a reduction of more than 10,000 during the month, but is not far from the average figure of the past 18 months. Unfilled orders at the end of the year called for 1,308,365 barrels, of which 221,897 were for delivery within 30 days. This makes the largest total of unfilled orders since the end of July.

Shipments of members of the Steel Barrel Manufacturers' Association in December are reported at 277,542. The number of barrels on unfilled orders at the end of the month was 289,392. Capacity was engaged during the month to the extent of 38 per cent.

Steel Corporation Pension Fund Paid $3,003,209 in 1927

The seventeenth annual report of United States Steel and Carnegie Pension Fund shows that last year $3,003,209.02 was distributed as pensions among retired employees of the United States Steel Corporation and its subsidiary companies. The Carnegie Steel Co. was first among the subsidiaries in the amount paid to retired employees, the amount being $783,896.90. Some of the pension disbursements of subsidiary companies were: American Steel & Wire Co., $610,068.94; American Sheet & Tin Plate Co., $401,675.22; National Tube Co., $283,019.10; H. C. Frick Coke Co., $241,216.24; Illinois Steel Co., $158,052,47; American Bridge Co., $134,753.15; Oliver Iron Mining Co., $113,330.25; Elgin, Joliet & Eastern Railway Co., $41,100.10; Tennesse Coal, Iron & Railroad Co., $40,780.05; Bessemer & Lake Erie Railroad Co., $37,656.10, and Duluth & Iron Range Railroad Co., $35,073.30. There were 1175 employees added to the pension roll during 1927 and 524 were removed from the list. At the close of the year there were 6388 on the pension roll.

Continental Steel Prices Higher

General Advances Accompany Swedish Strike—British Ore and Coke Dearer and Steel Demand Better

(*By Cable*)

LONDON, ENGLAND, Feb. 6.

CLEVELAND pig iron is active with consumers placing prompt and forward contracts and inquiring for third quarter. Export demand is still light but inquiries are increasing. Hematite iron is firmer as stocks are diminishing and export sales are increasing. Foreign ore prices are firmer as a result of the strike in the Swedish ore mines, but buyers are not desirous of committing themselves.

Finished iron and steel demand is improving, but plate orders of a substantial nature are still scarce. In general the trade is showing definite signs of improvement.

Tin plate is quiet, but there is a moderate volume of inquiry. Galvanized sheets are inactive, but the outlook is hopeful. Japan has been a moderate purchaser of light-gage black sheets.

Continental iron and steel prices are strong on increased costs and a good demand from overseas markets. Most French works and some Belgian producers have withdrawn quotations. Continental pig iron is firmer, but practically no sales have been effected with British users.

The total French production last year was 9,300,000 metric tons of pig iron and 8,275,000 tons of steel ingots. There were 142 blast furnaces operating on Jan. 1. German output last year was 13,100,000 metric tons of pig iron and 16,305,000 tons of steel ingots. Rolled steel output was 12,840,000 tons.

Luxemburg Market Quiet but Prices Are Unchanged

LUXEMBURG, Jan. 24.—The early part of January was quiet and prices were slightly irregular, but, with the inventory period over, the price situation is improved. Competition for business in South America and the Far East continues keen, but in China the political situation still hampers buying. Rail mills are well filled, some sizable tonnages having been booked in December. Buying by American consumers is small, but a revival of demand from that market is expected as the year progresses.

The entente of French, Belgian and Luxemburg producers of phosphoric foundry iron is maintaining domestic and export prices without change. It is pointed out by the association that prices of pig iron in Switzerland and Italy have reached such a low level that further reduction is impossible, but in other export markets prices will continue to fluctuate.

Semi-finished material is inactive and purchasers are seeking concessions. Beams are unchanged at £4 7s. to £4 9s. per ton (0.96c. to 0.98c. per lb.) and bars are fairly firm at £4 17s. to £4 18s. per ton (1.07c. to 1.08c. per lb.). The wire rod market is active, but prices are unchanged. Sheet purchasing has been small and concessions are beginning to develop on the lighter gages.

With 37 out of 47 furnaces in blast at the end of December, total pig iron output for the month was 228,139 metric tons. Steel ingot production reached 213,864 metric tons.

Higher Ocean Freights from Europe Aid United States

HAMBURG, GERMANY, Jan. 26.—Continental mills are viewing with dissatisfaction a further increase of ocean freight rates to Brazil, Uruguay and Argentina. Effective Feb. 1, the freight rates have been increased by 2s. 6d. to 4s. (61c. to 98c.) per ton on pipes, tubes and fittings, structural shapes, bars, plates, sheets, wire, nails, bolts and rivets, parts of railroad cars and locomotives.

These increases in freight rates are on shipments from Hamburg, Bremen, Rotterdam and Antwerp, so that German and Belgian mills are being forced to make a corresponding advance in their c.i.f. quotations. The new rate is effective until the end of March, when a further advance is in prospect. Producers point out that the rates will mean a loss of business to them and will probably react to the advantage of their American

competitors, especially in tubular products, sheets, barbed wire and railroad cars. In other products price differences are sufficiently great to prevent American sellers approaching the European quotations.

FAR EAST BUYS TIN PLATE

Business Confined to Small Merchant Buying—Wire Rod Orders Go to Canadian Mill

NEW YORK, Feb. 7.—Business with Far Eastern markets has been small in recent weeks. Chinese merchants are offering to purchase second hand material and plate cuttings for $24 to $26 per ton, c.i.f. Shanghai, but such prices are too low to interest American sellers. Inquiries for tin plate are confined to small lots of 500 base boxes or less. Occasional sales of tin plate waste are being made to both Chinese and Japanese merchants. With Japan entering into a political campaign, at which a larger proportion of the population will vote than ever before, not much business activity is expected until after the election in March.

Recently there were some inquiries from Japan for high-carbon wire rods, but most of this business is understood to have gone to a Canadian mill at $43.50 per ton, c.i.f. Japan, although the Canadian quotation today is about $45. Tin plate quotations are substantially unchanged at about $5.20 per base box, c.i.f. Japanese or Chinese port. There are no inquiries of consequence for light-gage black sheets, the price of which for export continues at about $77 per ton, c.i.f. Japan.

New York importers of European steel report higher Continental quotations, particularly from German mills. Current quotations range from 1.70c. to 1.75c. per lb., delivered Atlantic port, on ordinary Thomas steel bars, with shapes at about 1.60c. to 1.65c. per lb., delivered. On French and Belgian material these prices can be shaded occasionally by a few cents per 100 lb.

A decision is reported to have been rendered by the Customs Court on the classification of imports of reinforcing bars. A suit brought by Henry L. Exstein & Co., New York, importers, has been in progress for several months, the importers claiming that reinforcing bars should be classified as construction material, which takes a duty of 20c. per 100 lb., instead of the plain steel bar duty of 30c. per 100 lb.

German Furnaces Affected by Swedish Mine Strike

HAMBURG, GERMANY, Jan. 26.—Industry is beginning to feel the effect of the strike in the Swedish iron mines. Shipments of Swedish ore having ceased, German consumers have turned to the use of North African and Spanish iron ores, which, however, are of different quality. Stocks of iron ore on hand are small, and prices have already registered a slight advance.

German steel mills and blast furnaces are showing interest in iron ore and coal deposits at Kaissarie, Turkey, now being developed. Turkish Government plans to establish a blast furnace and steel mill at Kaissarie have brought out offers from German companies to construct and operate the plant. The Turkish Minister of the Interior, however, has not yet announced whether the plant will be built.

Agricultural Implement Exports Made New Record in 1927

Exports of agricultural implements from the United States established a record in 1927 amounting to $90,097,949, or $4,500,000 in excess of the previous record, made in 1926, according to George Bell, chief of the agricultural implements division, Department of Commerce, Washington. Field tractors to the number of 56,563 with a value of $33,891,332 represented the largest item. The increase in this item accounted for the gain in value of 1927 shipments over those of 1926, inasmuch as there was a decrease in most lines last year when compared with the preceding year. December exports totaled $6,246,092 as against $4,954,359 a year earlier. The principal increase was in tractor shipments, with gains made also in shipments of planters, sprayers, dusters, threshers, and windmills and parts.

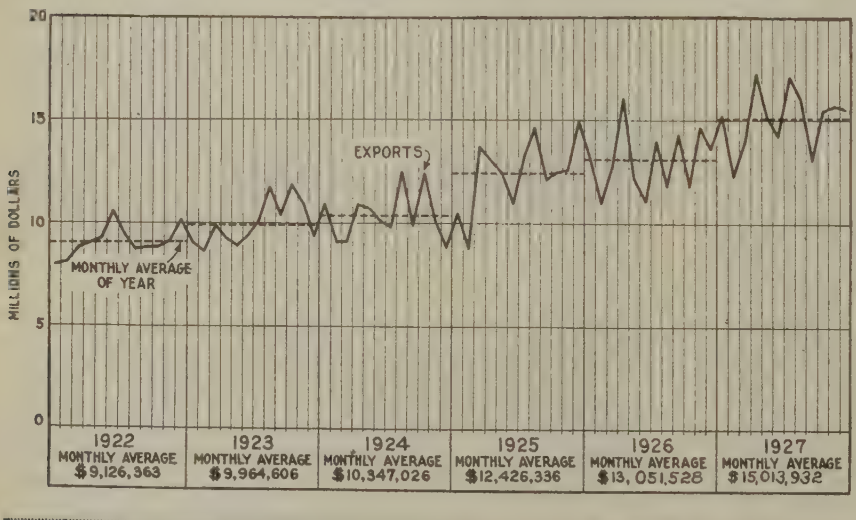
Accidents in Small Plants

More than two-thirds of the number of industrial establishments in the United States employ not more than 20 wage earners each. The total number of wage earners in such plants was given in an address by Ethelbert Stewart, commissioner of labor statistics, at 824,000. He made the significant statement that in these small establishments accidents are on the increase. Because of this fact, some insurance companies refuse to provide accident insurance in such plants, while the units are too widely scattered and too unorganized to form mutual insurance organizations.

While an enormous sum is being spent annually on safety work, it goes almost wholly into large plants. The small units lack the safety equipment which large corporations provide almost automatically. Safety organization practically does not exist in them, while the tendency to push production to the highest possible point is largely responsible for the trouble which occurs.

In a table detailing the results of a study along this line, and which is published in extenso in the January issue of *Monthly Labor Review*, the loss ratio for the smallest plants is shown to be almost double that for the largest plants. While the change in the loss ratio, as the plants become larger and larger, is not uniformly downward, it has that general tendency, and a curve would be almost uniform in its downward grade. The ratio for the smallest plants is more than 50 per cent higher than that for the average of all plants.

Exports of Industrial Machinery



EACH of the past five years has shown a consistent increase over the preceding years in United States exports of industrial machinery. The diagram shows the month-by-month movement and, in horizontal dotted lines, the average movement for each year beginning with 1922. The monthly average for 1927 was 65 per cent higher than that for 1922 and was more than 15 per cent above that of 1926. Shipments in 1927 aggregated more than $180,000,000. This steady increase was not participated in by all lines of machinery, but those which showed declines were more than offset by those which showed advances.

British Empire Steel Corporation Acquired by Bankers

Canadian Company Probably Will Be Reorganized, Though No Definite Announcement Has Been Made—President Roy M. Wolvin Resigns

TORONTO, ONT., Feb. 7.—Following a meeting of the British Empire Steel Corporation and subsidiary companies in Montreal, Que., official announcement was made of the acquisition of control of the British Empire Steel Corporation by Holt, Gundy & Co., prominent in Canadian banking. President Roy M. Wolvin announced his resignation and was succeeded as head of the corporation by C. B. McNaught of Toronto. Sir Herbert S. Holt, J. H. Gundy, George H. Montgomery, G. H. Duggan and W. E. Wilder became members of the board of directors. The new controlling interests have nothing to say as yet regarding their plans for reorganization. In fact, indications are that it will be some time before such a plan is finally drafted. The official statement was as follows:

> At the meeting of board of directors of the British Empire Steel Corporation, Ltd., Dominion Steel Corporation, Ltd., Nova Scotia Steel & Coal Co., Ltd., and their subsidiary companies, President Wolvin resigned, having succeeded in bringing into the affairs of the steel and coal industry of the Maritime Provinces new and influential financial and industrial interests. Mr. Wolvin expressed a belief that the complete severance of his connection with the affairs of these corporations might assist in ending litigation and facilitating reorganization of the finances and property of the company. He further stated that his entire holdings of securities of Dominion Steel Corporation, Ltd., and its subsidiaries had been purchased by interests associated with Holt, Gundy & Co., who had also secured 94 per cent of the currency series of consolidated mortgage bonds of Dominion Iron & Steel Co., Ltd., the guarantee of these bonds being practically the only indebtedness of Dominion Steel Corporation, Ltd. C. B. McNaught was elected president of British Empire Steel Corporation, Nova Scotia Steel & Coal Co., Ltd., and their subsidiary companies, and Sir Herbert Holt, J. H. Gundy, G. H. Duggan, W. E. Wilder and G. H. Montgomery, K. C., were added to the board of directors of the companies. To insure stability and continuity of management for Dominion Steel Corporation, Ltd., and its chief operating subsidiaries, British Empire Steel Corporation has created a voting trust for five years, the present five voting trustees being: Sir Herbert Holt, J. H. Gundy, G. H. Montgomery, K. C., C. B. McNaught and G. H. Duggan.

The British Empire Steel Corporation has two main interests, steel and coal. These are handled through an organization of 13 companies. The corporation consists in the first place of three chief companies, the Dominion Steel Corporation, the Nova Scotia Steel & Coal Co., and the Halifax Shipyards. The first two of these groups have, in turn, separate groups of lesser subsidiary companies. The Dominion Steel Corporation, for example, has 11 subsidiaries, including the Dominion Iron & Steel Co.; the Dominion Coal Co., with 16 collieries in Cape Breton, and the Sydney and Louisbourg Railway Co.; the Nova Scotia Steel & Coal Co., operating four collieries at Sydney, iron mines at Wabana, Newfoundland, limestone and dolomite properties in Cape Breton and blast furnaces and steel works at Sydney Mines; the Acadia Coal Co., Ltd., with four collieries in Pictou County, N. S.; the Halifax Shipyards, owning and operating a drydock and extensive shipbuilding and repair plants at Halifax; the Dominion Shipping Co., Ltd., with 12 cargo carrying vessels of a total tonnage of 68,000 tons; Wasis Steamship Co., Ltd., with two steel carrying ships; Cumberland Railway & Coal Co., with three collieries in Nova Scotia; Eastern Car Co., manufacturers of standard railroad cars and other rolling stock at Trenton, N. S.; the Sydney Lumber Co., at Dalhousie, and James Pender & Co., Ltd., manufacturers of wire nails and fencing.

COMMENDS BUSINESS PAPERS

J. C. McQuiston of Westinghouse Electric & Mfg. Co. Addresses Publishers at Advertising Club

FOR comprehensive knowledge of our industries, manufacturers owe a great deal to the technical publishing companies, said J. C. McQuiston, advertising manager Westinghouse Electric & Mfg. Co., East Pittsburgh, in an address to a group of business publishers at the Advertising Club, New York, on Jan. 31. His subject was "The Place of the Business Paper in the General Advertising Program."

Progressive and highly specialized publishing organizations have made exhaustive surveys of the many industries of the United States, he said, and have pointed the way for the manufacturer to talk to the specialists in all these fields.

"Stop to think how Mr. Westinghouse discovered the air brake! It was after reading something in a little publication," said Mr. McQuiston. "He picked it up one day on a train—bought it from a little girl that he thought really needed the 15c. or a quarter that she asked for it. He bought it out of kindness. He looked through it and read about using air in the switch cylinder, and the idea came to him: 'That's it, the application of air to the braking of trains.'

"Now, that is what our technical publications do. We don't know how much they do for business in spreading these new ideas of inventions and applications and all that. If a man invented something and kept it to himself it would mean nothing. But as it gets into print and goes out to other engineers who think along the same general lines, the idea is enlarged and developed, and out of it all come the big things we have today such as the automobile and the airplane.

"Along with that we have got to give credit to the business publishers for finding the way for the advertiser to use these publications. The publishers know those who subscribe, they know the character of the people who read their publications, and when they come to know the thing that the advertiser has to sell, when they come to know the problems of the advertiser, they can advise him on how to use properly the specialized media they publish.

"They now go further than that. I know because I am one of the beneficiaries of the advice of the leading technical publishers, and I want to emphasize leading technical publishers because in the technical and business publishing field, like in almost every other field of publishing, there are unfortunately a lot of very questionable publications and they weigh the thing down; papers that have no right, after all, to carry advertising. The leading and worthwhile technical publications render a real service. They study the markets, and they bring to the advertiser the service that they render—advice, counsel, plans and guidance which make the advertising effectual.

"As our plan has developed it has been largely through the research work of the leading technical papers. The research work done two years ago crystallized the plan that we have today."

Navy Asks for Bids on Plates

WASHINGTON, Feb. 7.—Bids will be opened on Feb. 14 by the Bureau of Supplies and Accounts, Navy Department, for 505 tons of medium steel plates for modernization of the battleship Oklahoma and for 250 tons of special treatment plates for construction of light cruisers Nos. 24, 28 and 29. The material for the Oklahoma is to be delivered at the Philadelphia navy yard, while the steel for the light cruisers is to be delivered at the Brooklyn yard.

This Issue in Brief

When does it pay to replace hand trucks with power trucks? Formulas have been worked out, enabling the user to calculate accurately whether he should use hand, gasoline or electric trucks.—Page 399.

Three-quarters of a century's service fails to weaken bridge wire. Strands from bridge erected in 1848 show remarkable resistance to corrosion, testing 94,166 lb. per sq. in., and evidencing the durability of old wrought iron.—Page 400.

Heavy gain in steel ingot output. January's daily average was 152,304 gross tons, which was 25.7 per cent above the 121,167 tons per day made in December.—Page 414.

Favors Krupp methods of rail making. Bottom-cast ingots produce superior rails, engineer believes. He also recommends the Krupp method of straightening rails through rollers rather than using the American gag press method.—Page 405.

New die-casting machine requires only one operator. Machine is almost fully automatic. All the operator does is to manipulate the driving clutch lever, supply new metal, and clean the die with an air hose.—Page 407.

Should we build a fearsome navy to secure a steady flow of essential imports in emergency, or build up a reserve of the necessary materials? As far as the strategic raw materials used in steel-making are concerned, storing reserves would be the wiser policy. Executing the contemplated cruiser-building program would very likely result in competitive building by other nations.—Page 423.

Low operating costs secured in new forging plant by straight-line production layout. All hammers in the Willys-Overland forge shop have their own individual furnaces. Work progresses from one operation to another with the least amount of "float" trucking.—Page 401.

Scrap market now reacts differently to a price advance than it did in former years. Consumers are convinced that they can secure a large supply on any occasion simply by bidding a slight advance. But in the days when the steel industry had sharp peaks and deep troughs a slight rise in scrap prices tightened the supply.—Page 423.

Prevents distortion by **quenching pressed parts** in dies. Automobile bumper parts are placed in a hydraulic press as soon as they leave the hardening furnace, and after the dies are closed, the platens are lowered into a vat of oil.—Page 393.

Lower steel prices have not resulted in lower wages for steel mill workers. Wages appear to be stabilized, even though economies made possible by improved equipment have not kept pace with price reductions. —Page 422.

Swing grinders yield higher production when used in conjunction with oscillating table to hold work. The table is power driven and moves backward and forward at right angles to the axis of the grinding wheel. At the end of each travel the table is raised slightly so grinding wheel will not retrace its path. —Page 393.

"Whirlwind" airplane engine is remarkable for accessibility of its parts and the convenience with which changes can be made. It may be dismantled and inspected or overhauled without being taken out of its airplane mounting. Direct operating cost is less than 4c. per mile.—Page 394.

Number of blast furnaces has **decreased** 34 per cent in past 37 years, but capacity has quadrupled. In 1891 there were 573 furnaces available, with a capacity of 13 million gross tons. Today there are 379 furnaces, with a capacity of more than 51 million tons.—Page 415.

Hardening furnace temperature is controlled within 10 deg. Fahr. by means of overhead combustion chamber. The work chamber is separated from the combustion chamber by a perforated arch, which acts as an accumulator and distributer for the heating gases.—Page 392.

Accident rate is increasing in small plants, says commissioner of labor statistics. Small establishments, employing not more than 20 wage earners, have a loss ratio almost twice that of the large plants, and the ratio is getting larger, as practically no accident prevention work is done in small plants.—Page 418.

American steel exporters may profit by increase in ocean freight rates from continental ports to Brazil, Uruguay and Argentina. Rates were advanced from 61 to 98c. per ton on Feb. 1.—Page 417.

Structural steel fabricators will find useful data in new handbook. New beam and girder sections are included in engineering volume issued by the American Institute of Steel Construction.—Page 417.

Steel Selling Prices and Wages

A SIDELIGHT on the present determination of steel manufacturers to obtain more profitable prices for their products was contained in the annual report of the Bethlehem Steel Corporation and apparently has escaped the attention it deserves.

Since Jan. 1, 1923, President Grace reported, the corporation has expended $150,000,000 for additions and improvements to properties and this program has been "largely responsible for a reduction of $7.27 per ton in the average cost of producing the finished steel products shipped by the corporation in 1927 as compared with the corresponding average (based upon equivalent tonnages of the same products) in 1923."

This is a cost reduction that would be gratifying to any manufacturer, but here is the rub:

"Unfortunately," continued Mr. Grace, "the economies in production have not resulted in a corresponding increase in the net income of the corporation because, during the same period, the prices of steel products have steadily declined, the average billing price per ton of all rolled steel and other finished products shipped by the corporation during 1927 having been $8.60 less than the corresponding average for 1923. The effect upon earnings of this decline in prices is apparent from the fact that Bethlehem shipped 3,971,811 tons of finished products during 1927."

It is significant that during the past four years when prices of finished steel products have steadily declined, wages not only of iron and steel workers but of all wage earners have varied but little. The National Industrial Conference Board in a recent review of wages, hours and employment in manufacturing industries points out that "for four years average hourly earnings of all wage earners covered by the Conference Board's study have varied only between 56 and 57 cents, and such uniformity must be accepted as convincing evidence of the stability of present wage scales."

Reports of wage reductions in certain industries have appeared in the press within recent months, but it can be stated on the highest authority that there is no intention on the part of the steel industry to make up for the declines in prices of its commodities by any reduction of wage scales among iron and steel workers. On the contrary, the belief that such prosperity as we now have is based largely on a high average level of wage earnings is well accepted. With labor costs undisturbed and with other operating costs brought as low as at present seems feasible, the steel industry now turns to the consumer. Price advances have been announced in almost all branches of the industry since Jan. 1, yet the protection given at former prices is so widespread that not much, if any, gain in the average shipping prices will be realized in this quarter, and the effect of the advances on second quarter business and billing prices is still to be determined. Buyers have generally accepted as an economic law that an advance in prices cannot be maintained except when supported by a demand which taxes capacity, but the profitless selling of the past year or more undoubtedly has created a new state of mind among steel selling organizations which may bring a better adherence to prices that will pay dividends.

Recent Scrap Market Phases

OF all sections of the iron and steel trade the scrap market is always one of the most interesting, because it is a market of open trading, subject to changes in the actual practices of buyers and sellers and to changes in mental attitudes. There is always the alluring chance of "beating the game," and there are more participants than there used to be. Time was when the well posted dealer could safely pursue the course of accumulating scrap in yard over periods of months, liquidating over other periods, with a large enough margin in market fluctuations to cover the extra freight, the cost of carriage, and a comfortable profit. Of late this has been impossible, for originators of scrap have endeavored to play the market by holding back scrap when prices are low and consumers have played corresponding tactics by accumulating cheap scrap and endeavoring to get through a spell of maximum consumption with a minimum of stock.

Still more recently another turn has come, as mills have adopted a policy of carrying smaller stocks, in any condition, than formerly. They have found sales competition so keen as to relieve them of their former danger, that of dealers creating further rises when they found one advance had occurred. Mills are convinced that on any occasion they can promptly get a larger supply by bidding a slight advance. Such an advance loosens the supply instead of tightening it as in the old days.

Yet some speculative tendency remains, as is indicated by the fact that both in January of this year and January of last year the scrap market weakened, whereas in each case mill operations were expanding and scrap consumption increased. Plainly the preceding rises in the market had been in anticipation, the weakening showing that the situation had been overplayed.

Dealers' yard stocks are now made up almost wholly of scrap that must pass through yard, for assorting or for manufacture. With this scrap there is naturally some speculation. The flow into yard is fairly uniform, while in determining the time to sell the dealer has opportunity to use his judgment.

A special influence helping to lessen the swings in scrap prices in recent years is that the steel industry is not called upon at times to operate at capacity or to swell its output beyond ordinary ability to produce. There used to be such occasions, and then the mills used larger percentages of scrap, relative to pig iron, than their averages. Now their practice varies but little, for they have been having neither sharp peaks nor deep troughs.

Adequate vs. Competitive Navy Building

COMMENTS both favorable and unfavorable have come to us on editorials appearing in THE IRON AGE since the abortive Geneva Conference to limit auxiliary naval craft. These editorials have opposed competitive and hence excessive navy building.

Some of the adverse criticism points out that the facts and data presented give but a partial picture of the situation. Space limitations, however, demand that the editor select those facts which bear upon the point he is making. A consideration of all the phases of the matter, while properly a preliminary to the writing, cannot be compressed within a few hundred words.

Nor is it exactly in the field of THE IRON AGE to discuss the relative parity of Great Britain's *York*, Japan's *Aoba*, and our own *Omaha* as cruisers; that is for the naval experts. Parity also is a word which means different things to different experts. But the broad question of expansion of naval armament and its repercussions on the international situation is within the field of a journal serving the steel and machinery industries—the industries essential to the maintenance of our country's defenses.

We agree with President Coolidge's words spoken last Memorial Day: "Our forces are dedicated solely to the preservation of peace."

Again: We subscribe to President Coolidge's sentiments expressed at Trenton, Dec. 29, 1926, "I do not believe that we can advance the policy of peace by returning to the policy of competitive armaments."

We believe that if the United States lays down twenty-five 10,000-ton cruisers in five years, there will be as a result much competitive building by other powers, and consequently are opposed to H. R. 7359, "A bill to provide for the increase of the naval establishment," in its present form.

We believe that the energy required to build arms and armaments on the scale contemplated by some proposals could more profitably be used for articles of peaceful commerce, more profitable both in dollars and in spiritual values.

We heartily indorse a steady and deliberate replacement program for keeping our present navy at the top of efficiency.

There is no reason for speedy building in any category of ships, because (with President Coolidge) we can see no threatening international situation, and (again agreeing with the commander-in-chief of the Navy) our present fleet is among the greatest afloat.

As to the argument often advanced that we need a fearsome navy to assure a continuous flow of essential imports, especially for the iron and steel industry, we hold that it would be wiser and better business (as far as the steel industry is concerned) to import and store a generous reserve of the strategic raw materials, manganese, chromium, tungsten, vanadium, nickel and tin, than to foment international misunderstanding, and to imperil the peace of the world, by excessive building of naval armament.

Per Ton Profits in Steel

A STUDY of the United States Steel Corporation's monthly earnings over a period of years relative to the tonnage of current shipments does not disclose, as might be fancied, a tendency of profits per ton to decrease with light operations and increase with heavy operations. The much used argument that the Steel Corporation has "other sources" of earnings is not adequate, for these outside earnings are small relative to the total.

One is prompted to question the sufficiency of the common doctrine that high operation makes for reduction in unit cost, particularly when carried to the length of claiming so large a reduction as to justify seeking a higher operating rate at the expense of prices. That there have been such practices is generally charged.

Depreciation allowances make the subject an intricate one. Does depreciation increase or decrease according to the rate at which a plant operates? If the depreciation is a fixed amount for a given time, then the per ton charge increases as output diminishes, and per ton profits decrease. Depreciation and obsolescence may be considered together, and there is an important point not always considered, that these decreases in the value of a given property are not controlled entirely by what goes on within the property. They are affected also by what occurs outside. If competitors adopt improved methods and appliances the value of the plant which does not do so is diminished.

From such considerations this becomes obvious, that a partial idleness of a plant due to trade conditions causing light general demand does not produce obsolescence as does similar idleness occasioned by owners who are not progressive or sufficiently assiduous in selling their products. A light operation shared by the whole producing trade results in less depreciation and obsolescence than occurs when trade is active. The measure is in large part what occurs in the trade as a whole, rather than what occurs in the individual plant, as to its own operating rate. The impropriety of any general policy of seeking a high operation of a steel plant for the sake of reducing depreciation is thus made apparent.

With the increasing mechanization of the steel industry these points become of greater importance year by year. The steel industry pays high wage rates, but its wage cost relative to other costs has been diminishing and the handling of charges upon investment is of increasing moment. There are times when it is as commendable that sales effort be restrained as that, under ordinary conditions, it should be aggressive. It is nearly three years now since Judge Gary said, at the Steel Corporation annual meeting, April 20, 1925: "Ever since the war the competition in the United States has been increasing—I will not say has been desperate, but I will say has been exceedingly strenuous," and since then a great deal more has occurred along the same line.

Census of Consumption

PRELIMINARY work done by the Department of Commerce in its study of a census of consumption in the United States gives rise to disturbing thoughts regarding the full utility of that census. The matter is to be prosecuted with vigor at the time of the regular decennial census of population in 1930. It is designed to supplement our vast storehouse of knowledge on conditions of production in the United States. Such a study has been in contemplation for a long time; industry wants it as a further guide and frequent requests for it have been made.

One of the chief criticisms which might be directed against the consumption census, as it has so far developed, lies in its almost complete ignoring of the distribution of producer goods. This does not connote raw materials or goods in process of manufacture; but certainly the absorption by industry of such items as machine tools is worthy of a place in any consumption census which goes beyond foods and clothing. Hand tools going into the possession of carpenters and machinists are given their place in the census, because they are sold from retail stores. Machine tools should have the same consideration, regardless of the fact that the retailer does not know them.

Doubtless many other factors might prove to be missing on a careful study of the census returns for the small area already covered. Such a glaring example as the one cited, however, would make it appear desirable to survey the entire field of the proposed endeavor, so that when it does come to fruition it may represent something that shall have been worth while.

READERS of THE IRON AGE who desire to receive a copy of the index for the last six months of 1927 may have it, with our compliments, upon request. The index, of 24 pages, has just been completed.

CORRESPONDENCE

A Naval Officer on the Pending Program

To the Editor: I wish to bring to your attention certain features connected with the position of representative naval officers on the subject of the proposed naval building program now under consideration in Congress and by the country, with particular reference to the editorial on this subject in your issue of Jan. 19, entitled "A Too Costly Navy."

The position of representative opinion in the Navy may be, I believe, summarized in the following factors:

1. We need to balance our fleet by the addition of various auxiliary units to make it an effective instrument of national defense.
2. Concerned in any question of naval power is consideration of naval bases near our outlying possessions and strategically located harbors along the approaches and near the Panama Canal and along our lines of essential communication.
3. The fighting strength of fleets lies in their modern vessels, obsolete vessels being a liability rather than asset when opposed by modern vessels of their own type.

The above are believed to concern naval strength in the abstract. Any consideration of comparison or the subject of naval competition as raised in your editorial must, it is believed, include:

4. The building programs of other Powers since the Washington Conference.
5. The total fleets of other Powers, including modern vessels built, laid down and already authorized.

On the broad subject of naval power the Navy is believed to have two general functions, indeed responsibilities:

1. To recommend to the country the types of vessels and numbers in each type necessary to make our standardized capital ship strength an efficient and effective instrument of national defense.
2. To apprise the country of the relative strength from a technical standpoint of our Navy compared with other principal powers.

This latter appears very necessary, since naval strength is known by technical people to depend greatly on naval bases and strategically located harbors along the lines of essential communication or within the probable areas of war.

As an analysis of the lessons of history (an essential part of the training of responsible naval officers) so clearly reveals that an effective defensive force is the surest insurance of a rich nation against war, we conceive it therefore the duty of the Navy to advise the country on these two points. The weight given this advice is a matter to be decided by the higher authority responsible to the nation for public policy.

Referring specifically to your editorial, it would seem that the Navy would not attempt to enter into the controversial features of what the policy of the country should be regarding this building program, but we do feel concerned with some of the statements in your article. We feel, for example, that your table is somewhat misleading, as it does not mention completed large cruisers, and that any discussion of the cruiser question should include all modern cruisers of this type, not alone the 10,000-ton class, and should not include obsolete cruiser tonnage.

By "modern" is meant the classification used during and since the Washington Conference: namely, that "light cruisers" consist of combatant vessels less than 20 years old, from 3000 to 10,000 tons, with speed of 27 knots or greater. While obviously all classes of this type will not be equal in effectiveness, mere size or total tonnage are not conclusive determining factors either, for strength in this type depends also on numbers and on base and harbor facilities that may be available to these ships for fueling, shelter and repair.

Since other Powers have been building cruisers, along with other vessels, following the Washington Conference, and since the total proposed cruiser strength for this country would not in fact exceed in tonnage or equal in numbers that already constructed or authorized by Great Britain, it is not believed fair to accuse the Navy of starting any competition in this type.

As stated before, it is considered to be the function of the Navy to recommend the numbers or tonnage of any type, not standardized by treaty, it considers necessary from a technical viewpoint. The tonnage proposals of this country at the late Geneva Conference were therefore obviously a matter for those responsible to the country for public policy to decide, after such consultation with naval advisers as they saw fit.

The British proposals at this conference that have been published do not, it is believed, contain simply an offer of cruiser parity at 400,000 tons, but, in fact, include in this a stipulation that would have limited the number of 10,000-ton cruisers to 12 for each of the two countries, and would have permitted the British to retain the most, at least, of their existing modern cruiser strength, to a total of considerably in excess of 600,000 tons. While it is believed doubtful that the British would actually prefer to limit their battle fleet cruiser strength to 12 vessels, they doubtless did, in fact, in arriving at their conclusion as to their needs, consider the number of bases and well located harbors that they possess throughout the world. It is considered equally necessary that the American Navy, in recommending to this country what it considers our needs in this type, consider also all factors involved in naval strength.

It may indeed be assumed that the Navy does consider some vessels necessary for commerce protection and for maintaining sea communication, since this country too is a maritime power and is dependent on sea communications, not only for trade but for various imports essential in war, as well as our communications with the Panama Canal and our insular possessions.

It is therefore believed to be not only the right but the duty of the Navy to state to the country the naval needs for national defense. This it considers it is doing in recommending the naval building program submitted to Congress by the Navy Department, with the authorized statement that it is not in opposition to the financial policy of the President.

In conclusion, I desire to express the appreciation I am sure the Navy must feel of the interest such a representative journal as THE IRON AGE, representative as it is of such a large factor in our country as the steel and allied industries, takes in this subject.

N. H. GOSS,
Captain, United States Navy.

New York, Feb. 3.

The Cruiser Feature of Our Naval Program

To the Editor: In the Jan. 19, 1928, issue of THE IRON AGE there appeared an editorial headed "A Too Costly Navy."

You are undoubtedly well aware of the fact that Great Britain has numerous possessions throughout the world where naval bases and supply stations are maintained. These bases are so located that it is entirely feasible for a 7500-ton British cruiser to cope with any situation that might arise and at the same time be close enough to a supply base to refuel. You also, of course, are aware that the United States does not have such bases distributed throughout the world. In so far as the Hawaiian and Philippine islands are concerned, the distance from the United States is such that a 7500-ton cruiser would be of no value at all on account of the relatively small fuel capacity of a 7500-ton cruiser as compared with a 10,000-ton cruiser.

If you would carefully read the various arguments presented by Admiral Jones and other American members to the Geneva Conference it should be quite clear to you why a 10,000-ton cruiser is essential to the United States and why it is not essential to the British. It should be quite easy to understand from the last information available why the United States would be at a very serious disadvantage if we do not have sufficient cruisers of 10,000 tons.

The Disarmament Conference of 1921 established the principle that ships were obsolete after 20 years. It is also quite well known that a cruiser having a speed of less than 25 or 27 knots is of no value as a cruiser.

In regard to your reference to the cheers that greeted the British proposal to lay down but one of the three cruisers projected in 1928, we are rather surprised that you should take such cognizance of such action, inasmuch as it is so generally known that this action was pure propaganda and was intended to influence the United States' action in regard to a new navy program that the President of the United States even referred to it in his last message to Congress. It seems axiomatic that the best way to prevent war is to be in a position to protect one's rights and commerce just as the best way to preserve law and order is to have a sufficient and well equipped police force in our modern cities.

Inasmuch as you have chosen to quote from "Brassey's Naval Annual," we believe that you would be interested in the table noted below giving a list of cruisers having effective age of 20 years or less and having a speed greater than 27 knots. (See table at bottom of page.)

From the table you will note that the effective cruiser tonnage totals:

	British Empire	Japan	United States
Building	138,000 tons	60,000 tons	80,000 tons
Built	190,810 tons	116,205 tons	75,000 tons
Total	328,810 tons	176,205 tons	155,000 tons

This table does not take any cognizance of the cruisers projected by any of the above countries. However, even with the 250,000 additional tons of cruisers now projected by Congress the United States would not be on a parity with the British Empire when the cruisers projected by the British are also considered.

We trust that you will be able to give as much publicity to the above facts as you did to the statements quoted from "Brassey's Naval Annual."

R. T. S.

New York, Jan. 31.

Makers of Sheets and Strip Steel May Combine Their Associations

A single association to embrace the activities of the National Association of Sheet and Tin Plate Manufacturers, the Cold-Rolled Strip Steel Institute and the Hot-Rolled Strip Steel Institute, is the object of a movement that has been started and has been the subject of discussion of interested manufacturers.

With the success that has attended continuous rolling of strips in sheet mill widths and the fact that a number of manufacturers of sheets have either installed or plan to install the new type of mill for mechanically producing sheets, a closer relationship of the two products has developed and with it has come a belief that trade association and sales promotion activities could be as effectively handled by one as by three separate agencies.

No information of a formal character yet has been provided, but there is admission that the plan has been discussed and the idea that there will be a merging of the three associations into one is strengthened by the fact that the presidency of the National Association of Sheet and Tin Plate Manufacturers has been vacant since the resignation of Walter C. Carroll became effective on Jan. 15, last, and no effort yet has been made to fill it.

CRUISERS BUILT AND BUILDING BY THREE POWERS

	British Empire	Japan	United States
Building	14 ships of 138,000 tons	6 ships of 60,000 tons	8 ships of 80,000 tons
Built, 5 years age or less......	7 ships of 48,340 tons	14 ships of 81,705 tons	10 ships of 75,000 tons
Built, 6 to 10 years..........	20 ships of 97,470 tons	7 ships of 34,500 tons	None
Built, 11 to 15 years..........	12 ships of 45,000 tons	None	None

January Iron Output Up Sharply

Net Gain of 16 Furnaces the Feature—Actual Data Show Daily Rate Increased 5613 Tons or 6.4 Per Cent

COMPILATION of the actual data for the pig iron production in January shows that the estimates made by wire on Jan. 31, as published in THE IRON AGE Feb. 2, were about 100 tons per day less than the real figures.

Total pig iron production in January was 2,869,761 gross tons or 92,573 tons per day for the 31 days, against 2,695,755 tons or 86,960 tons per day for the 31 days in December. The increase last month over December was 5613 tons per day or about 6.4 per cent. This is the first increase in output since April, last year, and is the largest production since August, when the daily rate was 95,073 tons. A year ago the output was 100,123 tons per day.

Net Gain of 16 Furnaces

A large gain in active furnaces was the feature. Twenty-one furnaces were blown in and five were shut down—a net gain of 16 for the month. This follows nine months of successive net losses. The nearest approach to so large a net increase was 14 in December, 1925, when 15 furnaces blew in and one was shut down.

Of the 21 furnaces blown in last month 13 belonged to the United States Steel Corporation, six to independent steel companies and two to merchant producers. The Steel Corporation shut down two furnaces, as did also merchant producers with only one independent steel company stack blown out. Thus the net gain of 16 furnaces was confined to steel companies with 11 credited to the Steel Corporation and five to independent steel companies.

Capacity Active on Feb. 1

On Feb. 1 there were 185 furnaces blowing as compared with 169 on Jan. 1. The estimated daily rate of the 185 furnaces was 96,640 tons; the 169 furnaces on Jan. 1 had an estimated operating rate of 86,835 tons per day.

Manganese Alloy Output

Production of ferromanganese in January was 22,298 tons or the largest since last July, when it was 26,394 tons. A substantial amount of spiegeleisen was made by two companies, but publication of the actual data is not now possible.

Possibly Active Furnaces Reduced

The number of possibly active furnaces in the United States has been reduced by the dismantling of

Round Table Discussions on Blast Furnace and Coke Ovens

A program of wide interest to blast furnace and coke oven operators has been arranged for the mid-winter meeting of the Eastern States Blast Furnace and Coke Oven Association to be held at the William Penn Hotel, Pittsburgh, Friday, Feb. 17. Separate round table discussions on coke plant and blast furnace matters are to be held during the morning and in the afternoon there will be a general meeting at which both coke oven and blast furnace operating subjects will be considered. In the evening, following the dinner, F. H. Willcox, vice-president Freyn Engineering Co., Chicago, will be the principal speaker and his subject will be "Blast Furnace Practice in Europe."

Complaint has been filed with the Interstate Commerce Commission by the Continental Steel Co., Kokomo, Ind., charging that rates on the transportation of scrap iron and steel from points in Ohio, Michigan, Illinois, Wisconsin, Iowa, Nebraska, Oklahoma, Texas, Missouri, Arkansas and Kentucky to Kokomo are relatively higher than the rates on old material to Chicago, St. Louis and a number of other consuming points.

Iron and Steel Markets

Sharp Increase in Ingot Output

Production Rises 26 Per Cent in January—Another Large Gain in Unfilled Orders—Further Price Advances —Heavy Pig Iron Sales

A TWENTY-SIX per cent increase in steel ingot production and another sharp gain in unfilled business in January have further emphasized the extent of market recovery. Steel output last month made the second largest gain on record, and the Steel Corporation's unfilled orders statement is expected to show an increase of more than 300,000 tons—the largest, excepting that of 518,430 tons in the previous month, since December, 1925.

Steel output has continued to gain in February. Current operations of Steel Corporation plants are placed at 88 per cent of capacity, as compared with 84 per cent last week and 60 per cent in late December. Recent increases in production have been sharpest at Chicago, where ingot output averages 92 per cent, as compared with 88 per cent last week. At Pittsburgh, operations are reported as unchanged at 75 to 80 per cent.

The trend of prices is still upward, in contrast with the situation a year ago when prices were declining. Moreover, the present rate of production is a more accurate measure of consumption than was true at that time, when there was some stocking of steel in advance of actual specifications. A marked difference also is seen in the fact that the current period was not preceded by an autumn expansion in business. Present recovery is a logical consequence of underbuying in the closing months of 1927.

Comparisons with recent years are chiefly of interest because of the recurrence of heavy production in the first quarter. Doubtless this has been due to roughly coinciding upswings in demand, but buying because of peculiarities of given seasons of the year is of diminishing importance. Such seasonal fluctuations are disappearing even in structural steel, tin plate and automobile steel, and remain a factor mainly in wire products and rails.

Price advances during the week include increases of $3 a ton on fender stock strips and $2 a ton on cold-finished bars and rail steel bars. Sheet prices are also stronger and on new business in black sheets 2.90c., Pittsburgh, has become the minimum of most makers. Higher prices on these products, as well as those recently announced on wire products, cannot become fully effective until next quarter, since most buyers are covered until April 1 at lower quotations.

These forward obligations were doubtless driven in by recent evidences of market strength, but rising prices normally result in heavier commitments. The fact that the advance in plates, shapes and bars to 1.85c., Pittsburgh, caused hesitant buyers to place pending business at 1.80c., a price at least $1 a ton above that ruling on fourth quarter specifications, indicates that one upward step in prices has become established.

Railroads are taking more steel both in the form of shipments against recent rail contracts and in material for cars. The Southern Railway and a Western road have added a total of about 30,000 tons to rail bookings, and at Chicago 50,000 tons remains to be closed. Sales of track accessories at Chicago totaled 12,000 tons. The St. Louis-San Francisco has ordered 4000 freight cars requiring more than 45,000 tons of steel.

Structural steel business in prospect has been enlarged by inquiries for nearly 54,000 tons, including 18,000 tons for a new civic opera house in Chicago and four projects in New York totaling 21,000 tons. Awards in the week of 44,500 tons included 9000 tons for a viaduct in Cleveland, 5000 tons for a bridge in Pittsburgh and 5000 tons for a New York office building. At St. Louis 3000 tons of reinforcing steel is on inquiry for a warehouse.

Pig iron sales increased sharply in the week in the East and at Chicago and Cleveland. In the territory in which New York and Philadelphia are centers, the total business was fully 75,000 tons and possibly more. This included 20,000 to 25,000 tons of basic bought by an eastern Pennsylvania steel company and about 20,000 tons for a Delaware River cast iron pipe company. At Cleveland 34,000 tons was sold, representing largely the needs of foundries which have been using up supplies ordered in the last quarter. Except in eastern Pennsylvania, where producers have advanced foundry iron to a basis of $20, furnace, prices remain unchanged, and the eastern Pennsylvania rise has not been tested.

Steel ingot production in January was 3,959,904 tons, or 152,304 tons a day, according to data compiled by the American Iron and Steel Institute. The increase over December output was 809,559 tons, or 25.7 per cent. This gain is exceeded only by that of March, 1918.

At 53.25c. per lb., spot Straits tin has sold at the lowest level since April 21, 1925, when the price was 52.62½c.

Stronger sheet prices have caused THE IRON AGE composite for finished steel to advance to 2.350c. from 2.336c. last week. It is now higher than at any time since last September and is only about 1 per cent below its level a year ago. The pig iron composite remains at $17.67 for the fourth week.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Price Advances Extend to Fender Stock Strips and Cold-Finished Steel Bars

PITTSBURGH, Feb. 7.—Events of the week have to do with prices rather than with changes in the character of buying or in the rate of iron and steel plant operations. Since a week ago, the $3 a ton advance to 4.15c., base Pittsburgh, on automobile body sheets has become general, and because full finished sheets and cold-rolled strips are competitive for automobile fenders, makers of fender stock strips have announced an advance of $3 a ton. An advance of $2 a ton has been announced on cold-finished steel bars and shafting. Meanwhile, sheet manufacturers are getting stronger price ideas on the common finishes and efforts continue to put strips, both hot and cold-rolled, at definitely higher levels. New quantity extras, the same as those now demanded on bars and small shapes, have been applied to hoops and bands, which means higher prices for lots of less than 2 tons of a size.

Manufacturers are well obligated for this quarter on most of the products on which advances have been announced and the higher prices therefore represent largely the ideas of the steel trade on second quarter business. While the latest advance on cold-finished steel bars is announced as applying only on business written for shipment over the remainder of this quarter, this stipulation is generally regarded as an assurance that they will not have to absorb a further advance in prices of hot-rolled bars, which it is hinted will be made before books are formally opened for second quarter.

There is a steady flow of specifications on existing commitments, and here and there is some evidence that consumers underestimated their requirements and have had to make fresh purchases, which in some cases carry the full quotations of producers. As a general rule, the requirements of consumers are not exceeding the tonnages they have on order or on which they are protected. Consumption of steel is increasing, as it usually does at this time of the year. The automobile industry made a substantial increase in output in January as compared with December, and all indications are that it will go still higher in production this month, but it is also a fact that this industry is not doing as well as it did at this time last year, nor is it taking steel as freely as many expected it would by this time.

No appreciable increase is observed in the demand for oil country pipe, as the oil industry has not yet succeeded in overcoming the evils of overproduction. Railroad demands are fair and the inquiry from that source is promising. Not much structural steel business is developing in this district, and the national picture is one of a few projects of size rather than one of many small jobs. The agricultural implement industry is busier now than it was during the last few months of last year. Railroads are now taking large deliveries of rails, which helps to explain the present volume of production. The market, however, derives some of its life from the fact that buyers take more seriously than usual the price advances that have been made and are taking out steel a little more freely than they might if there was not the possibility that delay may mean higher costs.

Steel ingot production in this and nearby districts still may be estimated at from 75 to 80 per cent of capacity. There is not the tendency of a year ago to produce in advance of actual specifications, and the present rate of production is a more accurate measure of consumption than was the slightly higher rate of a year ago, when not a few producers were operating on the basis of the probable requirements of their customers.

Pig Iron.—New business in pig iron has rarely been lighter than at present. Melters are depending very largely on contract purchases, but it is encouraging to producers that they are taking shipments with much more freedom than they did in the closing weeks of last year. There are hopes of higher prices, but they seem to rest largely on the belief that as the steel industry gets busier there will be less steel company iron on the market. There is, however, no evidence yet that the steel companies which ordinarily have iron for sale have withdrawn from the merchant market. Only small lots of the various grades are being sold and there is no occasion to change prices. Two small lots of Bessemer iron recently were sold at $18, Valley furnace, but the inquiries were not general and as a steel company was the seller it is supposed that reciprocal considerations enabled the seller to get a price above the ruling market. The Shenango Furnace Co. has put on its No. 1 furnace and for a short time will have both of its furnaces going, the starting up of the idle furnace being in preparation for blowing out its No. 3 stack.

W. P. Snyder & Co. make the average price of Bessemer iron shipped from Valley furnaces in January $17.50, and of basic iron $17, as compared with $17.57 and $17, respectively, in December.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	$17.25 to 17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—Consumers of ferromanganese are specifying guardedly because of fairly large carryover stocks from late last year, but the movement of other commonly used ferroalloys is steady and well up to monthly quotas. Prices are unchanged.

Semi-Finished Steel.—There is little or no open market trading in billets, slabs and sheet bars, non-integrated manufacturers merely meeting increased requirements by enlarging specifications to regular sources of supply. There are no suggestions of a change in prices. Pipe skelp orders likewise are largely on a requirement basis and the few pipe makers that now buy their steel no longer seek competitive bids. The open quotation is that of plates, or 1.85c. There has been little or no test of the new base price on wire rods, because important tonnage buyers were covered for this quarter at materially lower prices, most of the tonnage now moving on first quarter contracts carrying a price of $40, with a little at $42.

Rails and Track Supplies.—The local standard-section rail mill is producing and shipping actively against an order book that will engage capacity well toward the middle of the year, provided the roads take out all the tonnage ordered. Light-section rails continue to reflect the unfavorable coal situation. Makers of spikes and other track accessories have fair-sized order books, but specifications are moderate.

Wire Products.—Makers have taken some small-lot orders at the recently advanced prices, but most buyers are protected for this quarter at lower prices and new business does not amount to much. Specifications are reported to be steady and of good volume on regular contracts for this quarter, against which specifying can be done for the next six weeks. Nails at $2.65, base, per keg, Pittsburgh, and plain wire at $2.50, base, per 100 lb., are largely a second quarter proposition except for stray tonnages beyond regular contracts.

Tubular Goods.—Steady increase is noted in the demand for standard-weight pipe, and if all the tonnage that is embraced in projected gas and oil pipe lines should be placed in the near future, a number of manufacturers would not have to worry about mill operations. Except for the demands from California in connection with deep well drilling, the call for oil country pipe is moderate. The pipe lines mentioned as being nearest a formal inquiry are one to run from Monroe, La., to St. Louis, with a spur into Memphis, Tenn., and an extension to Kansas City of the line from Amarillo, Tex., to Wichita, Kan. The former is said to have been approved by the bankers, but the actual inquiry is yet to reach any of the mills, and in view of the necessity of securing the right of way and the franchise necessary to get into the city of St. Louis, it is probably good opinion that the order will not come out in the next few months. Fairly good demand is noted for boiler tubes for locomotive construction and repair and mechanical tubing is being taken steadily by motor car builders. Tubular mill operations range from 60 to 70 per cent of capacity.

Sheets.—Heavy operations of independent sheet mills in January seem to have affected February operations, and a few mills appear to need business to keep going. Last month's operations by independent mills are estimated at 85 per cent of capacity, but shipments fell considerably below that rate and there are now supplies to meet tonnage releases yet to come in. Operations this month are more in keeping with specifications and they form most of the business, since so large a percentage of consumers secured coverage for this quarter long before it began. In spite of these conditions, however, the general tendency of prices is higher and some fair-sized lots of black sheets have been placed at the full price of 2.90c., base Pittsburgh, representing purchases by buyers who underestimated their requirements. Most mills want 2.90c., base, for black; 3.75c., base, for galvanized, and 4.15c., base, on automobile body sheets, the latter quotation having been generally adopted since a week ago, presumably for the reason that tonnage now entered would be an obligation against second quarter tonnage and the common desire is to bring up the price average for that period. Demands from the motor car and body builders still are below what it was expected they would be by this time. Car builders have somewhat modified the inspections they recently set up on sheets and again are accepting shipments on the basis of former specifications.

Alloy Steel Bars

(F.o.b. Pittsburgh, Chicago or Ohio Mill)

S. A. E. Series Numbers		*Base Per* 100 *Lb.*
2100*	(½% Nickel, 0.10% to 0.20% Carbon)	$2.90 to $3.00
2300	(3½% Nickel)	4.00 to 4.10
2500	(5% Nickel)	5.00 to 5.25
3100	(Nickel Chromium)	3.00 to 3.10
3200	(Nickel Chromium)	4.75 to 5.00
3300	(Nickel Chromium)	6.75 to 7.00
3400	(Nickel Chromium)	6.00 to 6.25
5100	(Chromium Steel)	3.00 to 3.10
5200*	(Chromium Steel)	7.00 to 7.50
6100	(Chrom. Vanadium bars)	4.00 to 4.15
6100	(Chrom. Vanad. spring steel)	3.50 to 3.75
9250	(Silicon Manganese spring steel)	3.00 to 3.15
Carbon Vanadium (0.45% to 0.55% Carbon, 0.15% Vanad.)		4.10 to 4.20
Nickel Chrome Vanadium (0.60 Nickel, 0.50 Chrom., 0.15 Vanad.)		4.05 to 4.20
Chromium Molybdenum bars (0.80—1.10 Chrom., 0.25—0.40 Molyb.)		4.00 to 4.25
Chromium Molybdenum bars (0.50—0.70 Chrom., 0.15—0.25 Molyb.)		3.05 to 3.10
Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)		4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in. the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

---

*Not S. A. E. specification, but numbered by manufacturers to conform to S. A. E. system.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 *Lb.*
Spikes, 9/16 in. and larger	$2.70 to $2.80
Spikes, ½ in. and smaller	2.70 to 2.80
Spikes, boat and barge	2.90 to 3.00
Tie plates, steel	2.25
Angle, bars	2.75
Track bolts, to steam railroads	3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count,	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel			*Iron*		
Inches	Black	Galv.	Inches	Black	Galv.

2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	2	23	9
2½ to 4	57	46½	2½ to 4	29	15
4½ to 6	56	45½	4½ to 6	28	14
7 to 8	52	39½	7 to 8	21	15
9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5 and 2½%, and on galvanized by 1½ points, with supplementary discount of 5 and 2½%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel		*Charcoal Iron*	
2 to 2¼ in.	27	1½ in.	+18
2½ to 2¾ in.	37	1¾ to 1⅞ in.	+ 8
3 in.	40	2 to 2¼ in.	— 2
3¼ to 3¾ in.	42½	2½ to 3 in.	— 7
4 to 13 in.	46	3¼ to 4½ in.	— 9

Beyond the above discounts, 7 fives extra are given on lap welded steel tubes and 2 tens to 2 tens and 1 five on charcoal iron tubes.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	60	3 in.	45
1¼ to 1½ in.	52	3¼ to 3½ in.	47
1¾ in.	36	4 in.	50
2 to 2¼ in.	31	4½, 5 and 6 in.	45

2 and 2¼ in.	37	3¼ and 3½ in.	53
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Tin Plate.—Specifications for tin plate are sufficient to engage productive capacity to fully 80 per cent, a gain of 3 or 4 points from the average of a week ago. This is somewhat under the rate of a year ago, but can makers are not making up containers nearly as heavily in advance of orders as a year ago, and tin plate specifications are in keeping with that fact. Plans have been made for increased acreage in almost all packing crops regardless of this year's carryover, and efforts are to be made to increase consumption of canned foods through emphasis on the quality. The common expectation of tin plate manufacturers is that this year will see a production between that of 1926 and 1927, or, roughly, 37,500,000 base boxes.

Cold-Finished Steel Bars and Shafting.—Most manufacturers since a week ago have announced an advance of $2 a ton to 2.30c., base Pittsburgh or Chicago, to apply on new business for shipment between now and the end of this quarter. General coverage of buyers for this quarter at 2.20c. minimizes the possibility of much new business between now and March 31. Restriction of the new price to orders for shipment by that date is probably a safeguard against a further advance in hot-rolled bars. Specifying on first quarter contracts is steady and in good volume despite the fact that parts makers generally are not making up stocks of finished products in anticipation of orders.

Hot-Rolled Flats.—Specifications and shipments still show an expanding tendency and from that standpoint the situation is satisfactory. But the movement is against low-priced orders and consumers generally are so well covered that there is little new business. On new business mills generally want 1.90c. for wide stock and 2.10c., base, fcr material less than 6 in. wide. The Jones & Laughlin Steel Corporation has put out a new card on hoops and bands, the only change being the adoption of the quantity extras for lots of less than two tons, already in effect on bars and small shapes. For lots of less than 4000 lb., but not less than 2000 lb., there is a lump sum extra of $3; less than 2000 lb., but not less than 1000 lb., $6, and for lots of less than 1000 lb., $10.

Bars, Plates and Shapes.—Makers in this district are well satisfied with what buyers are specifying on first quarter bar contracts, which generally carried a price of 1.80c., base Pittsburgh. Business in bars, plates and shapes taken late last year at 1.75c., base, appears to be well cleaned up. On new business there is no evidence that less than 1.85c. is being done. Structural lettings are light in this area and neither in the shops nor the estimating departments are local fabricators as busy as they could be.

Cold Rolled Strips.—All makers now are quoting 3.15c., base Pittsburgh or Cleveland, subject to a deduction of 25c. per 100 lb. for lots of 3 tons or more of a size and temper for one shipment. Specifications on old and lower-priced contracts are still coming along well.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.60c.
Hoops	4.00c. to 4.50c.
Black sheets (No. 24 gage), 25 or more bundles	3.65c.
Galvanized sheets (No. 24 gage), 25 or more bundles	4.50c.
Blue annealed sheets (No. 10 gage), 25 or more sheets	3.10c.
Galvanized corrugated sheets (No. 28 gage), per square	$4.39
Spikes, large	3.30c. to 3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.
Track bolts, all sizes, per 100 count,	62½ per cent off list
Machine bolts, per 100 count	62½ per cent off list
Carriage bolts, per 100 count	62½ per cent off list
Nuts, all styles, per 100 count,	62½ per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft annealed, base per 100 lb.	$3.00 to 3.10
Wire, galvanized soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Bolts, Nuts and Rivets.—Demand for bolts and nuts is considerably better, notably from jobbers, than it was a few weeks ago, but still is no strain upon the ability of manufacturers to supply. Rivets are not yet showing much life. Prices of these products are firm.

Fluorspar.—Small lots of gravel spar for spot shipment are bringing $15 per net ton at mines, but all contracts of any consequence carry a price of $14.50 for domestic material. Foreign spar does not appear to be finding much use in this and nearby districts.

Coke and Coal.—It is impossible to report improvement in either prices or business. Furnace coke is plentiful in relation to demand and prices are largely dictated by buyers. Usable coke can be bought as low as $2.50 but pig iron producers who are exacting as to sulphur content of the coke cannot do much better than $2.60, while a little more is asked when only one or two cars are wanted. Foundry coke ranges from $3.75 to $5.10, but most of the business is nearer the lower limit. The coal market is very slow.

Old Material.—Not much change is noted in the market. A steel maker putting in a new open-hearth furnace for the first time was a buyer of a small lot of selected heavy melting steel and is reported to have paid $15.75 and $16. But dealers are seeking orders for railroad steel from other melters at $15.25, while on some short orders dealers continue to pick up fair-sized lots at $14.75 for delivery at one point. No sales of this grade into consumption are noted at under $15 and that is a fair appraisal of the consumer market. Blast furnace scrap still is easy. There is little life to the demand for any grade, but sales develop without much advance notice, since there is not the tendency of former years for consumers to buy well ahead of needs.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$14.75 to $15.25
Scrap rails	14.25 to 14.75
Compressed sheet steel	14.00 to 14.25
Bundled sheets, sides and ends	13.00 to 13.25
Cast iron carwheels	14.00 to 14.50
Sheet bar crops, ordinary	15.00 to 15.50
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	14.75 to 15.25
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	10.50 to 11.00
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	16.75 to 17.00
Railroad coil and leaf springs	16.75 to 17.00
Rolled steel wheels	16.75 to 17.00
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.00
Short mixed borings and turnings	11.00
Cast iron borings	11.00
No. 2 busheling	10.00 to 10.25
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.00 to 15.25
Malleable Grades:	
Railroad	14.75 to 15.25
Industrial	14.25 to 14.75
Agricultural	13.75 to 14.25

Baldwin Steel Plant in Canada Taken Over By New Interest

TORONTO, ONT., Feb. 7.—Gordon F. Perry, president National Iron Corporation, Ltd., Toronto, on behalf of himself and a syndicate of British, Canadian and United States interests, has taken up the option he held on the plant and property of the Baldwin Canadian Steel Corporation, Toronto. Mr. Perry stated that he is not yet in a position to announce plans for the development which the syndicate has in mind, but he said in a short time a thriving industry will arise on the site of the now idle plant.

Milled headless set screws, cut thread	80
Upset hex. head cap screws, U.S.S. thread	85 and 5
Upset hex. cap screws, S.A.E. thread	85 and 5
Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Ingot Output at 92 Per Cent—Sales Volume is Undiminished

CHICAGO, Feb. 7.—Ingot output in the Chicago district is conservatively estimated at 92 per cent of capacity. The Illinois Steel Co. has blown in a stack at Gary and one at South Chicago, making 20 active out of 27. For the district as a whole, eight furnaces have been lighted since the first of the year.

Sales volume is undiminished since a week ago, when purchases compared favorably with any seven-day period in the last two years. Deliveries on most products have been extended.

Not less than 45,000 tons of steel will be required by Western shops for cars purchased in the week. A Mid-Western railroad is asking for prices on 36 passenger and baggage cars and it may soon enter the market for freight equipment.

Bids have been taken on the Chicago Civic Opera Building and it is probable that the 18,000 tons of steel required will be purchased at an early date. The position of fabricators is strengthening because of recent contracting and the prospect that spring construction will be heavy. Building permits in Chicago in January were 15 per cent heavier than in the first month a year ago.

Active inquiry for oil storage tanks now totals 5000 tons of steel and several new projects are rapidly taking form. Small consumers of steel are feeling the pinch of extended deliveries and the quantity extras recently placed on bars and small shapes by local mills. The effect has been a noticeable increase in the average size of purchases.

Pig Iron.—Excluding the long term contracts placed at the beginning of the year, sales for first and second quarter delivery in the first seven days of the current month are only a shade less than the total for January. As an indication that foundrymen are looking to the future, it is estimated that two-fifths of recent purchases are for delivery up to March 31 and that three-fifths of the tonnage sold is for shipment in the second quarter. Furnace operations are steady but release orders are in excess of production, thus affording sellers an opportunity to reduce furnace stocks. Higher prices at St. Louis are broadening the Chicago territory and are adding stability to local quotations. Less is heard of options at $18, delivered, against possible shipments by boat in the spring. The melt in malleable foundries continues to grow.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Ferromanganese is quoted at $100, seaboard, or $107.56, delivered Chicago. The spiegeleisen market is quiet and prices are steady.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Plates.—Financial arrangements appear to be holding in check a pipe line project requiring 130,000 tons of steel, which will extend from the Southwest as far north as Omaha. Orders for tankage materials are lacking this week but inquiry is enlarged to the extent of 3000 tons. The railroad equipment market is active. The St. Louis-San Francisco has placed 4000 freight cars requiring 45,000 tons of plates, shapes and bars, and the Rock Island is asking for prices on 36 passenger and baggage cars. The Chicago & Eastern Illinois inquiry for 500 cars is promising. The St. Paul will come into the market for rolling stock, but it is understood that formal inquiry will not be issued before April. The local plate market is active as indicated by deliveries of four to five weeks on the universal mill product and two to four weeks on sheared products. Less is heard of low competitive prices on business that emanates from the Southwest, and in the local market prices are firm at 1.95c. for large lots and at 2.05c. for small lots.

Mill prices on plates per lb.: 1.95c. to 2.05c., base, Chicago.

Structural Material.—Projects that are in the making and actual inquiry before the trade total close to 100,000 tons in the immediate Chicago territory, while at Milwaukee it is estimated by the trade that an additional 40,000 tons is in prospect. Bids have been submitted on 30,000 tons of building work in Chicago. The Civic Opera building will require 18,000 tons and the Sheridan Towers 4000 tons. Railroad needs in structural shapes are heavy but the pending list is growing more rapidly than awards are being made. More activity is noted among fabricators. It is doubtful if prices named by shops are much above the level of December, but with heavier backlogs it seems probable that an advance in prices, much talked of by fabricators, may go into effect. Building promoters are being hurried into the market by the advances in mill prices. Structural mills are heavily engaged and deliveries have been extended, the best available now being four weeks, while on some sizes six weeks is the best promise. Prices are firm at 1.95c. on large tonnages and at 2.05c. for small orders.

Mill prices on plain material per lb.: 1.95c. to 2.05c., base, Chicago.

Rails and Track Supplies.—A Western railroad has purchased 15,000 tons of standard-section rails. Counting new inquiry, there remains not less than 50,000 tons of rails still to be purchased in this district. Track accessory sales total 12,000 tons, and 15,000 tons is on inquiry. Railroads are ready to take heavier shipments of track supplies and mills have been speeded. Although rail purchases have dragged as compared to a year ago, the railroads have been more prompt in completing shipping schedules and mills today have better arranged rolling schedules than in any previous late winter delivery period. The light rail market is dull.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Bars.—Soft steel bar sales are on a par with last week, making the second consecutive seven-day period which compares favorably in volume of business with any like period in two years. Agricultural machinery manufacturers are fully engaged and local producers report no check in output is apparent in the automobile trade. In fact, such March schedules as now have been made up by that industry indicate that shipments in the coming month may be heavier than in January or in February. Cold drawn bar producers are forwarding heavy specifications. Prices are firm at 1.95c. to 2.05c. The iron bar market is moderatley active and prices remain at 1.90c., Chicago. Quotations on alloy steel bars are showing greater strength as sellers find their order books well filled. Rail steel bar producers have light backlogs and they hesitate to disturb the market by keeping pace with advances in the prices of mild steel bars. Quotations remain at 1.80c., Chicago Heights mills. Hard steel bar requirements for concrete reinforcement are heavy and the movement of fence posts is fully up to seasonal expectations. Deliveries of these products are prompt.

Mill prices per lb.: Soft steel bars, 1.95c. to 2.05c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Cast Iron Pipe.—Reports are that a more strenuous effort will be made to advance prices, but in the light of recent sales market quotations can be based only on $26 to $28, Birmingham, on attractive tonnages and on $28.50 to $30 for the average run of small business. The delivery situation is clearing in that makers are now able to make prompt shipment of some small sizes and shipment in 20 days is being promised on the larger diameters. Detroit will open bids Feb. 10 on 2000 tons of 24-in. class C pipe. A number of old quotations such as the year's requirements for Conneaut, Ohio, and 100 tons for Portsmouth, Ohio, are still open. Springfield, Ill., has ordered 300 tons from the National Cast Iron Pipe Co. The Santa Fe placed two sizable orders but interest among the railroads has been lagging. Public utilities give indication that they will soon be shopping for early spring requirements.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $34.20 to $36.20; 4-in., $38.20 to $40.20; Class A and gas pipe, $4 extra.

Sheets.—Specifications are more liberal and mill schedules are made up for two weeks. In the last few days the flow of releases has been growing steadily. The Milwaukee mills have resumed operations. Although the improved demand for shipments is relatively widespread it is noticeable that the roofing trade and general manufacturing are more active now than other buyers. Business in the Northwest is spotty but improved. Fresh sales are in small volume at steady prices.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Reinforcing Steel.—Orders for billet steel reinforcing bars out of Chicago warehouses are small in the aggregate. The bulk of recent reinforcing bar awards has been taken by the hard steel bar mills. Fresh inquiry is light, but old projects are active as weather conditions become more favorable to outdoor construction. Shop operations average about 40 per cent. Asking prices for billet steel reinforcing bars range from 2.35c. to 2.75c. and rail steel is going at 1.80c. to 1.85c., Chicago Heights mills.

Cold Rolled Drawn Bars.—Chicago prices have been advanced to 2.30c. New sales have not been in large volume and a real test of the market is yet to come, but sellers say they have withdrawn old quotations and are naming only the new prices. Producers in this district are well engaged.

Wire Products.—Orders for these commodities are in good volume and mill operations are being held at 65 per cent of capacity. Specifications from the manufacturing trade are expanding. Jobbers, who in January undertook to expand stocks, are finding the rate of turnover high and are reordering to keep pace with demands. Mill stocks are growing smaller but the assortment is still good. Nail shipments are steady and woven wire fencing is moving in good volume, especially to the Southwest. Little business is coming from the railroads. All local producers have put in effect the advance in prices announced last week. Order books are of fair size. Current sales can hardly be said to be in sufficient volume to afford a test of the market. Prices for wire and wire products are shown on page 431.

Coke.—All by-product coke ovens in this district are lighted. Shipments are steady and prices are well maintained at $9, local ovens, and at $9.50, delivered in the Chicago switching district.

Bolts, Nuts and Rivets.—Demand for small rivets is sharply upward and prices are stronger. Specifications for these commodities in January were fully 30 per cent heavier than in December and this increase is well sustained in the first days of February. Production averages a shade under 70 per cent of capacity.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.35c. to 2.75c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.

	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	3.00
Cement coated nails, base per keg	2.90

Old Material.—The local scrap situation is rather mixed in its tendencies. Large sales of heavy melting steel made two weeks ago stiffened the market and it was then generally believed that after a short period of inactivity prices would advance. Insofar as bids for railroad lists and trading prices among dealers are concerned this is true, but it is now disclosed that two local mills have taken upward of 18,000 tons of heavy melting steel at $12.75 to $13 a gross ton, delivered. This is a shade under the prices paid by other consumers in the near past. Rejections are high by users, who insist on having strictly No. 1 material, and dealers fear that margins of profits may be wiped out. The position of sellers is made worse by the inactivity of local yards and the fact that consumers are entering more spiritedly into bidding on railroad lists. Railroad shipments are finding placement as soon as they appear on tracks. One steel mill that does not often enter the market is picking up odd lots of 1000 to 2000 tons of heavy melting steel.

Prices delivered consumers' yards, Chicago:

Per Gross Ton		
Basic Open-Hearth Grades:		
Heavy melting steel	$12.50 to	$13.00
Shoveling steel	12.50 to	13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	14.25 to	14.75
Hydraulic compressed sheets	11.00 to	11.50
Drop forge flashings	9.75 to	10.25
Forged, cast and rolled steel carwheels	15.50 to	16.00
Railroad tires, charging box size	16.25 to	16.75
Railroad leaf springs, cut apart	16.25 to	16.75
Acid Open-Hearth Grades:		
Steel couplers and knuckles	14.50 to	15.00
Coil springs	16.50 to	17.00
Electric Furnace Grades:		
Axle turnings	13.00 to	13.50
Low phosphorus punchings	14.25 to	14.75
Low phosphorus plate, 12 in. and under	13.50 to	14.00
Blast Furnace Grades:		
Axle turnings	10.75 to	11.25
Cast iron borings	10.25 to	10.75
Short shoveling turnings	10.25 to	10.75
Machine shop turnings	7.50 to	8.00
Rolling Mill Grades:		
Iron rails	13.50 to	14.00
Rerolling rails	15.00 to	15.50
Cupola Grades:		
Steel rails less than 3 ft.	15.25 to	15.75
Angle bars, steel	14.00 to	14.50
Cast iron carwheels	14.00 to	14.50
Malleable Grades:		
Railroad	13.75 to	14.25
Agricultural	12.50 to	13.00
Miscellaneous:		
*Relaying rails, 56 to 60 lb.	23.00 to	25.00
*Relaying rails, 65 lb. and heavier	26.00 to	31.00
Per Net Ton		
Rolling Mill Grades:		
Iron angle and splice bars	14.00 to	14.50
Iron arch bars and transoms	18.75 to	19.25
Iron car axles	21.50 to	22.00
Steel car axles	16.00 to	16.50
No. 1 railroad wrought	11.00 to	11.50
No. 2 railroad wrought	11.00 to	11.50
No. 1 busheling	9.25 to	9.75
No. 2 busheling	4.25 to	4.75
Locomotive tires, smooth	12.50 to	13.00
Pipes and flues	8.00 to	8.50
Cupola Grades:		
No. 1 machinery cast	14.50 to	15.00
No. 1 railroad cast	13.50 to	14.00
No. 1 agricultural cast	13.50 to	14.00
Stove plate	11.75 to	12.25
Grate bars	11.50 to	12.00
Brake shoes	11.75 to	12.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Inland Steel Earnings Decline Slightly—Donner Profits Off Sharply

The Inland Steel Co., Chicago, had net profits in 1927 of $6,806,894, equivalent after all charges to $5.16 per share of common stock. This compares with $7,147,704 in 1926, equal to $5.45 a share earned on common. Decline in earnings was most pronounced in the last quarter of the past year, when the company earned $1,216,853, as compared with $2,113,185 in the corresponding quarter of 1926.

Earnings for 1927 of the Donner Steel Co., Inc., Buffalo, amounted to $372,194, compared with $736,608 in the previous year. This company's profits in the quarter just passed were slightly better than in the December quarter of the previous year, having amounted to $86,595 in 1927 and to $86,092 in 1926.

New York

Pig Iron Sales 20,000 Tons—Structural Inquiries 21,000 Tons

New York, Feb. 7.—Sales of pig iron in this territory in the past week exceeded 20,000 tons. With a few exceptions, buying is for specific needs rather than for speculative purposes. Melters have largely disposed of stocks carried over from last quarter, and in some cases are expanding operations. Moderate-sized purchases still predominate, although several large buyers have placed orders recently. The Central Foundry Co., New York, has closed for 5000 tons, of which 3000 tons is for delivery at its Dundalk, Md., plant and 2000 tons is for shipment to the Essex foundry at Newark, N. J. The Thatcher Co. has placed 2000 tons for its Garwood, N. J., plant and 1500 tons for its Newark, N. J., works. The Eastern Malleable Iron Co., Naugatuck, Conn., has placed 3000 tons of malleable, and W. P. Laytham, Passaic, N. J., has closed against his inquiry for 3000 to 5000 tons of high silicon iron. An inquiry from the Washburn Wire Co., Phillipsdale, R. I., for 5000 tons of basic is the largest pending tonnage. A considerable proportion of the iron recently bought is for delivery this quarter. Two inquiries in this territory for 2000 tons and 500 tons of foundry iron respectively call for second quarter shipment. Except for low prices made by an idle furnace in disposing of its remaining stocks, the trend is toward a firmer market. Most eastern Pennsylvania producers have advanced their quotations on foundry iron to $20, base furnace. Recent sales have been at $19.50 and less. Buffalo foundry iron is increasingly steady at $17, base furnace.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.89 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Reinforcing Bars.—Effective today, distributers have advanced prices $1 a ton, to 1.95c., Pittsburgh mill. Youngstown and New York warehouse prices have remained unchanged, although two $1 advances have been made in the mill price. Sizable bookings have not been numerous in the last week, but some distributers have taken a fair tonnage in small jobs. Another section of the subway on which the general contract is soon to be awarded will require 300 tons of bars.

Finished Steel.—Structural steel inquiry is the most important development of the week locally, the total in four projects being 21,000 tons, of which 11,000 tons is for subway work, 4000 tons for a New York State office building to be erected in Manhattan, 3500 tons for bridge in Queens and 2500 tons for a loft building in Manhattan. The Structural Steel Board of Trade of New York reported for its members a total of about 10,000 tons in structural steel awards for the week, of which the largest was 5000 tons for the Lefcourt Building at Fifth Avenue and Forty-third Street. Builders are apparently recognizing that recent price advances are a determined step by the mills to improve their recent unsatisfactory earnings, and as a consequence tonnage involved in important undertakings is being placed or is about to be placed against options at previous prices soon to expire. Eastern shape mills report a gain in tonnage booked. In the last week of January there were fairly good specifications against the quotas for that month, and with this tonnage coming in consumers have not been specifying as freely during the past week. Mills making plates, shapes and bars are now getting fairly well into the prices which became effective on first quarter contracts, as consumers have almost reached the end of the steel due them on specifications at former prices given to the mills on or before Dec. 31. The recent advance of $1 a ton for the remainder of this quarter has so far applied only to small lots from consumers who had no contract protection. The interest of consumers in the future course of prices is evidenced by a few inquiries for second quarter plate contracts, on which mills have preferred not to quote at this time. Makers of sheets are now uniformly quoting 2.90c. on black, 2.10c. on blue annealed and 3.75c. on galvanized, Pittsburgh base, but consumers are well covered and new buying is light. The same situation applies to hot and cold-rolled strip steel and wire products, on which price advances have recently been announced.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c.; plates, 2.17½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Warehouse Business.—Effective Feb. 6, jobbers have advanced prices on cold-finished shafting and screw stock $2 per ton to 3.40c. per lb., base, for rounds and hexagons and to 3.90c. per lb., base, for flats and squares. Business is beginning to show some improvement, particularly in the movement from stock of

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

structural material. Black and galvanized sheets continue in moderate demand and prices are unchanged.

Cast Iron Pipe.—There is a fair volume of small tonnage purchasing by private companies, but municipal buying is small. The New Haven Water Co., New Haven, Conn., has closed on 2000 tons of pipe and Brockton, Mass., is reported to have closed for 225 tons of 6 and 8-in. water pipe with the United States Cast Iron Pipe & Foundry Co. The basis of $28 per ton, f.o.b. Birmingham, is being fairly well maintained by both Southern and Northern makers.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Coke.—Purchasing of both foundry and furnace grades is light, but curtailment of operations has enabled producers to maintain prices. Standard foundry is quoted for prompt shipment at $4 to $4.50 per ton, Connellsville, and standard furnace at from $2.75 to $3 per ton, Connellsville. Delivered prices are: To northern New Jersey, $8.03 to $8.53; to New York or Brooklyn, $8.79 to $9.29; to Newark or Jersey City, $7.91 to $8.41. By-product coke continues at $9 to $9.40 per net ton, delivered Newark or Jersey City.

Old Material.—Prices are unchanged in an inactive market. Purchasing by consumers is confined to small tonnages. Although prices show no tendency to advance, there are apparently no large supplies of most grades. No. 1 heavy melting steel is unchanged at $13.50 per ton, delivered eastern Pennsylvania. Yard grade is being purchased by brokers at $10.75 and $11 per ton, delivered Harrisburg, Phoenixville or Pottsville, Pa., and as high at $11.25 has been paid in some instances. The list of about 45,000 tons of scrap offered by the Pennsylvania Railroad is reported to have brought out slightly lower prices than were offered on the Pennsylvania list last month.

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	6.75 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	8.75 to 9.00
Machine shop turnings	6.75 to 7.50
Short shoveling turnings	7.00 to 7.50
Cast borings (blast furnace or steel works)	6.75 to 7.50
Mixed borings and turnings	7.00 to 7.50
Steel car axles	16.00 to 16.50
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)	8.75
Forge fire	6.75 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought, long	9.00 to 9.50
Rails for rolling	10.50 to 11.00
Cast iron carwheels	11.25 to 11.75
Stove plate (foundry)	8.75 to 9.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.00 to 11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.75 to $14.25
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.75 to 12.25
No. 2 cast (radiators, cast boilers, etc.)	11.25 to 11.75

Cleveland

Heavier Steel Tonnages Coming from Automotive Industry

CLEVELAND, Feb. 7.—Specifications against contracts for practically all forms of finished steel are holding up in good volume. Heavy tonnages are coming from the automotive industry and other consuming industries are ordering material somewhat more freely than recently. While the output of the Ford Motor Co. is still rather limited, falling considerably short of 1000 cars per day, some of the other makers of low-priced automobiles are operating at maximum capacity.

New steel business is moderate owing to the fact that most consumers are under contract. However, quite a little new business is being placed in steel bars, plates and structural material at 1.85c., Pittsburgh, which is being firmly adhered to except by local bar mills that are using a 1.85c. Cleveland base for steel bars. Following the $3 a ton advance on cold rolled strip and auto body sheets, makers of cold rolled strip have made a similar advance on fender stock. Cold finished bars have been advanced $2 a ton to 2.35c., Cleveland. Not much change is looked for in the volume of sales before next month, when consumers will come into the market for the second quarter, and on this business mills may get the full benefit of the higher prices.

Inquiry in the building field is light. The Timken Roller Bearing Co., Canton, Ohio, has placed a contract for a factory extension, requiring 3000 tons of structural steel. The Strobel Steel Construction Co., Chicago, has taken a contract for the erection of 9000 tons of structural steel bridge work for the Cleveland Union Terminals Co. The fabricating contract for this placed recently did not include erection. Lake shipyards have an inquiry out for a small building requiring 1000 tons.

Pig Iron.—Sales increased in the past week, during which Cleveland interests took orders for 34,000 tons, a gain of 10,000 tons over the previous week. The business was well scattered and for the most part was in small lots. Sales were rather evenly divided between early shipment orders, contracts for the second quarter and contracts to carry buyers through the remainder of this and the second quarter. The latter list is made up mostly of foundries that had carried over fourth quarter iron and had not previously made any purchases for this year's delivery. Buying interest developed in the northern Ohio territory, which has been quiet for some time. February shipments are starting out well and promise to equal in volume those of January. Although heavy shipments, particularly to the automotive industry, enabled some furnaces to reduce their stocks considerably last month, others are shipping only about as much iron as they are making and still have fairly large stocks that were accumulated in the late months of last year. Jobbing foundries report a slight gain in business. Pig iron prices show no change. Lake furnaces are able to sell foundry and malleable iron at $17 in the northern Ohio territory, but local furnaces must go to $16.50 to overcome the freight disadvantage for shipment to some competitive points. For Michigan delivery there is still a range of from $17.50 to $18. Low phosphorus iron is inactive. While a Valley producer has taken considerable business at $27, furnace, this price has to be shaded 50c. a ton when competition with Eastern furnaces must be met.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Sheets.—The market has a firmer tone and prices below 2.90c., Pittsburgh, on black and 2.10c. on blue annealed sheets seem to have disappeared. While new business is only moderate, as most buyers are under contract, mills are taking some fair-sized lots of finished black sheets at the full price. Galvanized sheets are still irregular, some mills going to 3.75c., Valley, or 3.65c., Pittsburgh. Mills generally have joined in the advance to 4.15c. on auto body sheets. Specifications are heavy from the automotive industry and fair from most other consumers. The steel barrel industry is slack and little business is coming from that source.

Strip Steel.—Makers of cold rolled strip have advanced fender stock $3 a ton to 4.30c., Cleveland and Pittsburgh, for the remainder of this quarter for No. 20 gage and heavier. Cold-rolled strip is being quite

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.60c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb	$2.90
No. 9 galvanized wire, per 100 lb	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

generally quoted at a 3.15c. Cleveland base or 2.90c. for 3 tons and over. Hot-rolled strip is firm at 1.85c., Pittsburgh, for wide and at 2.05c. for narrow material. Specifications against contracts are good, but new business is light.

Reinforcing Bars.—The Cleveland Union Terminals Co. has a new inquiry out for 1000 tons for foundation work, which with 2000 tons reported last week and tunnel work still pending, makes a total of 4600 tons to be placed. Makers of rail steel bars have marked up their price $2 a ton to 1.75c., mill. Billet steel reinforcing bars are generally quoted at 1.85c., Cleveland. Good lots from warehouses are going at around 2.25c.

Warehouse Business.—Jobbers have advanced galvanized sheets $2 a ton to 4.60c. but have not changed other grades. Warehouse orders are fair, showing a gain over January and the average size of orders is larger. Prices are firm.

Iron Ore.—Consumers are as yet showing no interest in Lake Superior ore for 1928 delivery, and there has been no discussion of prices. Prices may not be named before April and it is doubted whether the ore buying movement will start before that time. There is nothing to indicate that there will be a change from the prices that have prevailed the past two years.

Semi-Finished Steel.—Specifications for sheet bars are not holding up to recent volume, as some of the sheet mills report that they do not have orders to keep them operating at the rate at which they were running last month. The leading local producer has shut down one open-hearth furnace, now operating nine out of 14. Prices are unchanged at $33, Cleveland, for sheet bars, billets and slabs.

Coke.—Foundry coke is in better demand than recently, reflecting some improvement in foundry operations. By-product foundry coke is quoted at $8, Painesville, for February shipment, or $9.01, delivered Cleveland. Connellsville quotations are $3.75 to $5.10, ovens, for foundry grades and $2.75 for heating coke. By-product coke for domestic use is moving slowly and unchanged at $4.50, Valley ovens, for egg size.

Bolts, Nuts and Rivets.—The demand for bolts and nuts is slowly expanding. Specifications during January showed a gain over December, but were not as heavy as during January last year. The industry has increased operations and is now running at from 60 to 65 per cent of capacity. Rivet orders are rather light. Prices on these products are firm.

Old Material.—Mills are not taking as much scrap as recently, several finding it necessary to restrict shipments which were coming in faster than needed. A Warren, Ohio, mill has stopped shipments entirely. There is no new demand from consumers and dealers are buying very little scrap. The holding up of shipments is having a depressing effect on the market, although prices are no lower. Dealers are making small-lot purchases, paying $14 for No. 1 heavy melting steel and $10.50 for blast furnace scrap.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.00 to 11.25
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.50 to 10.75
Mixed borings and short turnings	10.50 to 10.75
No. 2 busheling	10.50 to 10.75
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Philadelphia

Foundry Iron Advanced to $20 Per Ton; Sales in Week of 60,000 Tons

PHILADELPHIA, Feb. 7.—Purchases of several sizable tonnages of pig iron brought the total closed in this district in the week to 60,000 tons or more. Eastern Pennsylvania pig iron producers have advanced prices of foundry grades to $20 per ton, base furnace, and in some cases quotations at $19.50 were withdrawn. Included in pig iron sales were 20,000 to 25,000 tons of basic and a large tonnage of foundry iron for a cast iron pipe interest.

Sales of plates, shapes and bars are in most cases small as consumers are well covered by contracts, but the recent advances are being firmly maintained on new business. Among plate mills there is some discussion of the advisability of adopting quantity differentials. Sizable plate tonnage has been booked by eastern Pennsylvania mills from fabricators who were awarded contracts for oil tanks and stills for the Sinclair Oil Co.

Pig Iron.—Effective last week, eastern Pennsylvania furnaces advanced prices 50c. a ton on foundry grades to a basis of $20 per ton, base furnace. Prior to the advance, a large tonnage of outstanding business was closed at the former quotations. It is estimated that more than 60,000 tons of foundry and basic iron was purchased in this district during the week. Included in this total was more than 20,000 tons of foundry grades purchased by the leading cast iron pipe interest, 5000 tons of foundry iron by the Central Foundry Co. and 20,000 to 25,000 tons of basic iron by an Eastern plate manufacturer. A Delaware River pipe maker is in the market for a medium-sized tonnage of foundry iron and another eastern Pennsylvania consumer of basic iron is reported to be considering purchase of a tonnage soon. The past week's basic business is understood to have figured back to about $19, furnace. There has been some small business in low phosphorus iron, steel foundries working on orders from the railroads being particularly active. There have been some carload lots of foundry iron closed on the new basis of $20 per ton, furnace, but no substantial tonnage has been placed at this price.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	$20.26 to $20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76 to 21.26
East. Pa. No. 1X	21.26 to 21.76
Basic (delivered eastern Pa.)	$19.50 to 20.00
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to 24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to 24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to 25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to 25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Quotations on steel billets continue unchanged at $33 per ton, Pittsburgh, for rerolling quality and $38 per ton, Pittsburgh, for forging billets.

Bars.—Current purchasing is small, but specifications against contracts are coming out freely and mills are beginning to consider the possibility of a further advance for second quarter business. The present basis of 1.85c. per lb., base, Pittsburgh, or 2.17c. per lb., delivered Philadelphia, is evidently being well maintained.

Shapes.—Prices are showing slightly less irregularity, so that 2c. per lb., Bethlehem, and 1.97½c. per lb., Pottsville, or 2.12c. to 2.13c. per lb., delivered Philadelphia, are representative of the present market. Award of contracts for barges and car floats by the Pennsylvania and New York Central railroads has been postponed. In a few instances recently, local fabricated projects have been revised to reinforced concrete. An outstanding revision is the Blum Store addition, originally 1200 tons of structural steel and now only 150 tons of column cores and girders.

Plates.—Eastern Pennsylvania mills have booked some substantial tonnage from fabricators of oil tanks and stills for the Sinclair Oil Co. A Chattanooga, Tenn., fabricator awarded about 2500 tons of plates to a Claymont, Del., mill and a Louisville, Ky., contractor has placed 1000 to 1200 tons with another eastern Pennsylvania producer. Quotations continue unchanged at 2c. per lb., Coatesville, or 2.10c. per lb., delivered Philadelphia.

Sheets.—Blue annealed sheet prices are fairly well maintained at 2.10c. per lb., base, with a 10c. per 100 lb. extra for widths greater than 40 in. Black and galvanized sheet prices, however, still show a tendency to softness with black sheets ranging from 2.70c. to 2.90c. per lb., Pittsburgh, and galvanized from 3.65c. to 3.75c. per lb., Pittsburgh.

Warehouse Business.—Purchasing from stock continues small, but prices are being fairly well maintained with only occasional concessions. Effective Feb. 6, prices on cold finished steel were advanced $2 per ton to 3.35c. per lb., base, for rounds and hexagons and 3.85c. per lb., base, for flats and squares.

Imports.—In the week ended Feb. 4, the only iron or steel shipment received at this port was 23 tons of steel billets from Sweden.

Old Material.—Prices are unchanged and the market is quiet. Dealers report all grades moving in fair volume, although there is no great surplus of scrap available. Consumers are reported to be showing less inclination to suspend shipments.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	15.25 to	15.75
Bundled sheets (for steel works)	10.50 to	11.00
Machine shop turnings (for steel works)		11.00
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast boring (for steel works and rolling mill)		11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars		13.00
Stove plate (for steel works)		13.00
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to	18.50
Couplers and knuckles	16.00 to	16.50
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.00 to	10.50
Machine shop turnings (for rolling mill)	11.00 to	11.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to	13.50
Shafting	17.50 to	18.00

No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	15.00 to	15.50

Milwaukee Company Saves 784 Hours by Use of Air Mail

The Kearney & Trecker Corporation, Milwaukee, machine tool manufacturer, has been making a practical test of the advantages of air mail, with the result that in one week's time, a net gain of 784 hours over the regular mail was made. The test was made between Milwaukee and Detroit, Cleveland, Syracuse, N. Y., Philadelphia, New York, San Francisco and Los Angeles representatives of the company. A regular letter and an air mail letter were dispatched to each city daily and a tally was kept on the time of arrival. In only one instance, that to Cleveland, did a letter sent through regular channels beat the air mail letter. One letter to Syracuse and another to Philadelphia arrived at the same time. The investment of $3.50 in air mail postage is balanced by the 784 hr. saved, according to George L. Erwin, Jr., sales manager, who conducted the test.

Production of machinery in Canada in 1926, excluding household and office equipment, was valued at $29,563,000, an increase of 31 per cent over the output value of 1925, and close to the production record established in 1920, according to industrial census statistics recently issued by the Canadian Government, says a report of the Industrial Machinery Division, Department of Commerce. Returns were received from 156 machinery manufacturers.

Wyckoff Drawn Steel Co. Acquires Chicago Plant

The Wyckoff Drawn Steel Co., Pittsburgh, with plant at Ambridge, Pa., has substantially added to its productive capacity in the manufacture of cold-finished steel bars and shafting and also has entered the Chicago district through its acquisition of the Fitzsimons Steel & Iron Co., Chicago. The Fitzsimons company started business 25 years ago at Milwaukee, moving to Chicago about three years ago and building the plant which now becomes the Chicago works of the Wyckoff company. The latter was organized in 1919 and produced its first steel early in 1920.

E. C. Rock, recently Cleveland district manager of the Wyckoff company, has been appointed Chicago district manager in charge of both sales and the operation of the plant, while Joseph Mahan, assistant superintendent at Ambridge, goes to Chicago in a similar capacity. George A. Neesham has been appointed assistant treasurer and transferred from Pittsburgh to Chicago and Herman J. Laurent, who has been in the Pittsburgh office, has been appointed office manager of the Chicago branch.

A. A. Bialis, who has been special representative of the Wyckoff company in Pittsburgh, has been named general manager of sales. A. W. Wyckoff is president of the company; William McConway and Joseph T. Somers are vice-presidents, the latter in charge of sales; D. G. Dodds is secretary-treasurer, and they with William Metcalf, Jr., comprise the board of directors.

Bethlehem Offers Preferred Stock to Employees at $120 a Share

The Bethlehem Steel Corporation has announced its 1928 offering of preferred stock to employees under the terms of the company's employees' saving and stock ownership plan. In commenting upon the offering Eugene G. Grace, president, stated that since the plan was inaugurated four years ago 30,000 employees have invested more than $11,000,000 in the corporation's stock and $2,000,000 in dividends has been paid or credited to them. Special benefit payments amounting to $530,000 have also been made or credited to the workers.

Employees who subscribe for shares may pay for them either in cash or in monthly, semi-monthly or weekly installments extending over 27 months. During this period they will be credited with all dividends declared. In addition, special benefit payments amounting to $15 per share will be made to employee stockholders who hold their stock for a period of five years and remain in the employ of the corporation. The price this year will be $120 per share, compared with $107 in 1927.

American Sales Agents for British Ferromanganese Appointed

Sales representation in the United States for British producers of ferromanganese is now in the hands of two companies: Rogers Brown & Crocker Brothers, Inc., New York, and Frank Samuel & Co., Philadelphia.

Rogers Brown & Crocker Brothers, Inc., has become the agent of an organization recently created in England, known as the United Kingdom Ferromanganese Co. This is made up of the following companies: Darwen & Mostyn Iron Co., Ltd., Wigan Coal & Iron Co., Ltd., Dorman, Long & Co., Ltd., and the United Steel Companies, Ltd.

Frank Samuel & Co. have been made the agents of the two other principal British ferromanganese producers: The Linthorpe Dinsdale Smelting Co., Ltd., and Bolckow Vaughan & Co., Ltd.

Production of beehive coke in the United States in January is estimated by the Bureau of Mines at 373,000 net tons in 26 working days. This is about 1 per cent under December, and is less than half the output of January, 1927, which was 787,000 tons. All three months had the same number of working days.

Canada

Business Making Progress—Pig Iron Gaining Strength

TORONTO, ONT., Feb. 7.—Business as a whole is making progress. Following an order placed by the Canadian Pacific for $2,000,000 to $3,000,000 worth of rolling stock, it is now reported that the Canadian National Railways will be in the market shortly for 200 cars. Business placed by Canadian railroads for rolling stock, etc., this year is several million dollars less than orders of a year ago.

Pig Iron.—Current demand is confined almost entirely to orders for 50 to 500 tons for early delivery. Forward buying is not a feature of the market, but shipping orders against contracts have resulted in a big movement of iron to consumers. Prices are gaining strength in Toronto and Montreal districts, but no revision has been made.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	25.00
No. 2 foundry, sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—Dealers have failed to make further revision in prices, although the market continues weak. Sales are largely confined to a few special grades.

Dealers' buying prices:

Per Gross Ton	Toronto	Montreal
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	6.00
Boiler plate	7.00	7.00
Heavy axle turnings	7.50	7.50
Cast borings	7.50	6.00
Steel turnings	7.00	6.50
Wrought pipe	5.00	6.00
Steel axles	14.00	19.00
Axles, wrought iron	16.00	21.00
No. 1 machinery cast	....	16.00
Stove plate	....	12.00
Standard carwheels	....	14.50
Malleable	....	13.00
Per Net Ton		
No. 1 machinery cast	15.00	....
Stove plate	9.00	....
Standard carwheels	13.00	....
Malleable scrap	13.00	....

Birmingham

Steel Demand Satisfactory—Southern Places 15,750 Tons of Rails

BIRMINGHAM, Feb. 7.—New pig iron tonnage is not large and the market is moving along quietly, except for daily small-lot sales. Quotations for foundry iron remain on a $16 base. Most melters have covered their requirements for February, while some have bought through March. The Sloss-Sheffield Steel & Iron Co. has blown out its city furnace No. 1 preparatory to rebuilding and enlarging. This work will duplicate city furnace No. 2, which included all of the Dovel improvements and increased production to 400 tons. Shipments of foundry iron have been growing larger since the middle of January and now are close to production. There was a considerable increase in yard stocks during January because of the small shipments in the first two weeks.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil.	$16.00
No. 1 foundry, 2.25 to 2.75 sil.	16.50
Basic	15.00

Finished Steel.—Demand continues satisfactory and new business is developing at an even rate. No further changes have been made in prices. The Tennessee Coal, Iron & Railroad Co. is adding two new stands of finishing rolls to the Fairfield sheet mill, a continuous reheating furnace is to be built at the Fairfield structural mill and an additional row of soaking pits will be installed at the Fairfield blooming mill. The Tennessee company has received an additional order from the Southern Railway for 15,750 tons of rails. The Central of Georgia Railroad placed an order for 500 steel gondola cars and 50 flat cars. Several orders for 100 tons or more of structural steel and reinforcing bars were reported last week. The Ingalls Iron Works Co. will furnish the structural steel for the new 14-story office building of the Protective Life Insurance Co. in Birmingham, which will require about 350 tons. Open-hearth operations continue the same as for the past two weeks, the Gulf States Steel Co. operating four and the Tennessee company 12 to 13.

Cast Iron Pipe.—Small orders are coming in at a fair rate but nearly all of the larger business expected this quarter remains in abeyance. Bids were opened in Atlanta on Feb. 3 for about 700 tons but award was not made at the time. Several small awards from Mississippi towns are pending. Plant operations remain unchanged.

Coke.—Shipments are increasing and the market outlook is improving. Coke business is now between 30 and 40 per cent better than late November and December. No change has been made in the price, $5.

Old Material.—Shipments are about the same as for some time. Inquiries have increased but very little additional business is being obtained.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to	$10.00
Scrap steel rails	11.00 to	11.50
Short shoveling turnings	8.00 to	8.50
Cast iron borings	8.00 to	8.50
Stove plate	13.00 to	14.00
Steel axles	19.00 to	20.00
Iron axles	20.00 to	21.00
No. 1 railroad wrought	10.00 to	10.50
Rails for rolling		13.00
No. 1 cast		15.00
Tramcar wheels	12.50 to	13.50
Cast iron carwheels	12.00 to	13.00
Cast iron borings, chemical	13.50 to	14.00

St. Louis

Pig Iron Sales Exceed 5,000 Tons—3,000 Tons of Bars in New Project

ST. LOUIS, Feb. 7.—Sales of pig iron by the Granite City maker during the week amounted to between 5000 and 6000 tons of foundry grades and 150 tons of malleable, mostly for shipment during first quarter. A leading Southern interest sold 500 tons. The iron was sold in scattered lots to Illinois, Iowa and Missouri melters. Shipping specifications are satisfactory. An increased melt is reported by the steel mills, jobbing foundries and stove plants. The market is firm.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.

Tank rivets, $\frac{7}{16}$-in. and smaller, 100 lb. or more	70
Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

Coke.—Domestic grades are moving in fairly large volume because of favorable weather conditions. Industrial grades are being taken more freely as a result of heavier melt in the district.

Finished Iron and Steel.—Increased activity is shown in construction work. About 1000 tons was placed with structural fabricators during the week in projects of 100 tons or more, while smaller jobs are increasing in number. The largest reinforcing bar project in some time is the J. C. Penney Co. warehouse, requiring 3000 tons, the general contract for which has been let to Starrett Brothers, Inc., New York. The Granite City steel mill reports that its bookings for January were the heaviest for any month since March, 1927, and sufficient to operate the plant until the end of March. Prices in sheets are said to be firmer. Warehouse business in the St. Louis industrial district is very good, but the slump in orders from the oil fields offsets gains from other sources.

Old Material.—The market for old material continues weak, and prices are lower as the result of heavy offerings and congestion at the mills, which have bought heavily. Between 10,000 and 12,000 tons rolling mill and foundry grades were bought by mills during the week at 50c. a ton less than they paid for similar material in January. Railroad lists include: Baltimore & Ohio, 14,170 tons; Atchison, Topeka & Santa Fe, 7215 tons; Kansas City Southern, 250 tons; St. Louis-San Francisco, 29 carloads, and Standard Oil Co. (Woodriver), 3 carloads.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$12.00 to $12.50
No. 1 locomotive tires	13.00 to 13.50
Heavy shoveling steel	12.00 to 12.50
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.00 to 14.50
Railroad springs	14.50 to 15.00
Bundled sheets	8.75 to 9.25
No. 2 railroad wrought	12.00 to 12.50
No. 1 busheling	10.25 to 10.75
Cast iron borings	9.25 to 9.75
Iron rails	13.50 to 14.00
Rails for rolling	14.50 to 15.00
Machine shop turnings	7.75 to 8.25
Steel car axles	20.00 to 20.50
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	10.25 to 10.75
Steel rails, less than 3 ft.	15.75 to 16.25
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	15.00 to 15.50
Railroad malleable	12.50 to 13.00
No. 1 railroad cast	14.00 to 14.50
Stove plate	13.75 to 14.25
Agricultural malleable	12.50 to 13.00
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Buffalo

Pig Iron Prices Slightly Firmer—Finished Steel in Good Demand

BUFFALO, Feb. 7.—Stiffer prices are reported on New England pig iron business and the local market is firmer. The International Harvester Co. closed for 1000 tons of malleable and 1000 tons of foundry for Auburn, N. Y., and the Eastern Iron Malleable Co. is said to have placed part of the 2500 to 3000 tons of malleable it required. A Troy melter wants 500 tons of foundry. The Washburn Wire Co. and the American Tube & Stamping Co. are in the market for basic iron, the former asking for 5000 tons and the latter for 3000 to 5000 tons. The Kensington-Davis foundry of Buffalo is seeking 2000 tons of foundry iron.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	$17.00 to 17.50
Basic	16.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—The market for all lines shows an improvement in specifications and new business. The sheet market is firm, with demand better, particularly for black and automobile body sheets. Bars, shapes and plates are firm and demand is improved. Bolt and nut business is very good. A Rochester school will require 200 to 300 tons of reinforcing bars and a Buffalo school, No. 47, 130 tons. Bethlehem's Lackawanna plant, the Donner Steel Co. and the Seneca Iron & Steel Co. are maintaining good operation.

Old Material.—Conditions are slightly better, though prices are not strong. An additional tonnage of heavy melting steel, No. 1 grade, has been sold. This included No. 1 busheling and hydraulic compressed sheets. A tonnage of knuckles and couplers was sold at $16.50 to $17, with coil and leaf springs and rolled steel wheels at the same price. There has been some inquiry for low phosphorus billet and bloom ends, but this material is scarce. Railroad malleable purchases were at $15 and $15.50 for immediate delivery.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.75 to $15.25
No. 2 heavy melting steel	13.25 to 13.75
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.25 to 13.75
Hand bundled sheets	9.00 to 9.50
Drop forge flashings	11.50 to 12.00
No. 1 busheling	13.25 to 13.75
Heavy steel axle turnings	12.75 to 13.25
Machine shop turnings	9.00 to 9.25
Acid Open-Hearth Grades	
Railroad knuckles and couplers	16.50 to 17.00
Railroad coil and leaf springs	16.50 to 17.00
Rolled steel wheels	16.50 to 17.00
Low phosphorus billet and bloom ends	16.50 to 17.00
Electric Furnace Grades	
Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	11.00 to 11.50
Blast Furnace Grades	
Short shoveling steel turnings	10.75 to 11.00
Short mixed borings and turnings	10.50 to 11.00
Cast iron borings	10.50 to 11.00
No. 2 busheling	9.00 to 9.50
Rolling Mill Grades	
Steel car axles	16.75 to 17.25
No. 1 railroad wrought	12.50 to 13.00
Cupola Grades	
No. 1 machinery cast	14.50 to 15.00
Stove plate	13.00 to 13.25
Locomotive grate bars	10.50 to 11.00
Steel rails, 3 ft. and under	17.00 to 17.25
Cast iron carwheels	13.00 to 13.50
Malleable Grades	
Railroad	15.00 to 15.50
Agricultural	15.00 to 15.50
Industrial	15.00 to 15.50

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.
Structural shapes—	
Angles and beams	3.365c.
Tees	3.365c.
Zees	3.465c.
Soft steel bars and small shapes	3.265c.
Flats, hot-rolled	4.15c.
Reinforcing bars	3.265c. to 3.54c.
Iron bars—	
Refined	3.265c.
Best refined	4.60c.
Norway, rounds	6.60c.
Norway, squares and flats	7.10c.
Spring steel—	
Open-hearth	5.00c. to 10.00c.
Crucible	12.00c.
Tire steel	4.50c. to 4.75c.
Bands	4.015c. to 5.00c.
Hoop steel	5.50c. to 6.00c.
Cold rolled steel—	
Rounds and hexagons	*3.35c. to 5.35c.
Squares and flats	*3.85c. to 5.85c.
Toe calk steel	6.00c.
Rivets, structural or boiler	4.50c.
	Per Cent Off List
Machine bolts	50 and 5
Carriage bolts	50 and 5
Lag screws	50 and 5
Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

---

*Including quantity differentials.

Boston

Pig Iron and Some Grades of Scrap Are Firmer in Price

BOSTON, Feb. 7.—Buffalo and eastern Pennsylvania steel mills, having increased their bookings of finished products, are practically out of the pig iron market. Buffalo iron at $16.50 a ton, base, has disappeared from New England, and $17 is the prevailing quotation, while eastern Pennsylvania iron is generally $20 a ton, base furnace. With the price situation clearer, more Buffalo iron is being sold, one furnace having booked approximately 3500 tons within 10 days. During the past week furnaces east of Buffalo took orders ranging from car lots to 300 tons, sales aggregating about 2000 tons, at delivered prices mostly equivalent to $17, Buffalo. Sales of Indian iron at $21.75 to $22 a ton, on dock here, duty paid, for No. 2 grade, are reported. An open inquiry for 1000 tons of No. 2 plain and No. 2X is still uncovered, and another melter is privately negotiating for 2000 tons. Otherwise prospective tonnages are small because most foundries are well covered into the second quarter.

Prices of foundry iron per gross ton; delivered to most New England points:

Buffalo, sil. 1.75 to 2.25		$21.91
Buffalo, sil. 2.25 to 2.75		22.41
East. Penn., sil. 1.75 to 2.25	$23.15 to	23.65
East. Penn., sil. 2.25 to 2.75	23.65 to	24.15
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Coke.—Activity centers in domestic fuel on a basis of $8.50 a ton, Everett, Mass. No further gain in specifications against first half by-product foundry contracts has developed beyond that noted a week ago. By-product foundry coke is still $11.50 a ton, delivered within a $3.10 freight rate zone.

Shapes and Plates.—Representatives of mills continue to report encouragingly on shape, plate and bar business. Fabricators, however, have few jobs of size to bid on, and competition for work is keen. Several sizable jobs are hanging over the market and should close shortly. Local fabricators expect sizable business will develop in Fall River, Mass., as a result of the recent fire there.

Warehouse Business.—Most warehouses have advanced wire nails 10c. per keg to conform with new mill quotations. The general price from stock is $3.50 a keg. Car lot shipments from mills are $2.70 a keg, base, and less than car lot, $2.95. The movement of iron and steel out of warehouses is increasing, although individual purchases are small. Prices are firmer in view of the fact that most warehouses are holding to scheduled lists. Foreign material, however, is still obtainable at concessions.

Importations.—Receipts of foreign iron at this port in January consisted of 750 tons of English, 333 tons of Dutch and 295 tons of Indian, a total of 1378 tons, which compares with 643 tons of December, 1927, none in January, last year, 4061 tons in January, 1926, and 8212 tons in January, 1925. No foreign ores were imported in January, whereas in December, last year, 8850 tons was received and in January, last year, 16,052 tons.

Cold Rolled Strip Steel.—The recent adjustment in cold rolled strip steel prices has further stimulated mill sales. Much of the current buying, however, is for immediate consumption. The Worcester mill is quoting 3.30c. per lb. for 1 to 3-ton lots in one shipment, and 3.05c. for larger lots.

Old Material.—No perceptible increase in the movement of old material has occurred. Business the past week was largely confined to heavy melting steel, railroad and yard wrought, long bundled skeleton, forge scrap and flashings. These materials, with the exception of heavy melting steel, are firmer. Current sales of skeleton are generally at $7 to $7.25 a ton on cars at shipping point, whereas a week ago sales at $6 to $6.50 were reported. Forge scrap ranges from $6 to $7 a ton, with a majority of sales at $6.50 to $7. Railroad wrought is up 50c. a ton at $10.50 to $11. Heavy melting steel is $9 to $9.10 a ton, with an occasional sale at $9.25. Textile cast continues in large supply and sells at a discount from strictly No. 1 machinery cast, when usually it brings a premium.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to	$9.25
Scrap rails	8.50 to	8.75
No. 1 railroad wrought	10.50 to	11.00
No. 1 yard wrought	9.50 to	10.00
Machine shop turnings	6.00 to	6.25
Cast iron borings (steel works and rolling mill)	6.00 to	6.25
Bundled skeleton, long	6.50 to	7.00
Forge flashings	7.00 to	7.25
Blast furnace borings and turnings	6.00 to	6.25
Forge scrap	6.00 to	7.00
Shafting	13.00 to	13.50
Steel car axles	15.50 to	16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	8.00 to	8.50
Rails for rolling	10.00 to	10.50
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$14.00 to	$14.50
No. 1 machinery cast	14.50 to	15.00
No. 2 machinery cast	12.50 to	13.00
Stove plate		11.00
Railroad malleable	13.00 to	13.50

Cincinnati

Foundry Melt Increases 20 Per Cent in 10 Days—Scrap Weak

CINCINNATI, Feb. 7.—Foundry melt in this district has increased about 20 per cent in the past 10 days, but the improvement is not reflected in pig iron. Shipments on contract are only fair and consumers are not manifesting interest in second quarter needs. Most melters have covered their requirements for the remainder of the first quarter, so that fresh orders booked by local dealers have been meager. The largest sale was 2000 tons of foundry iron for a southern Ohio company. The Buick Motor Co. is reported to have bought approximately 600 tons of 14 to 16 per cent ferrosilicon from a Buffalo furnace, shipment to be made by water. Southern Ohio producers are adhering to $19, base furnace, though this price is noncompetitive except for delivery by barge. Lake Erie makers are understood to be asking from $16.50 to $17, base furnace, and Southern interests are holding to $16, base Birmingham. One of the Columbus furnaces of the American Rolling Mill Co. will be blown out in March.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25		$20.89
So. Ohio malleable	$20.14 to	20.89
Alabama fdy., sil. 1.75 to 2.25		19.69
Alabama fdy., sil. 2.25 to 2.75		20.19
Tennessee fdy., sil. 1.75 to 2.25		19.69
Southern Ohio silvery, 8 per cent		26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Specifications against first quarter contracts are indicative of a steady acceleration in industrial operations in this district. The number of fresh orders at the new prices has been surpris-

Warehouse Prices, f.o.b. Cincinnati

		Base per Lb.
Plates and structural shapes		3.40c.
Bars, soft steel or iron		3.30c.
Reinforcing bars		3.30c.
Hoops	4.00c. to	4.25c.
Bands		3.95c.
Cold-finished rounds and hexagons		3.85c.
Squares		4.35c.
Open-hearth spring steel	4.75c. to	5.00c.
Black sheets (No. 24)		4.05c.
Galvanized sheets (No. 24)		4.90c.
Blue annealed sheets (No. 10)		3.60c.
Structural rivets		3.85c.
Small rivets		65 per cent off list
No. 9 annealed wire, per 100 lb.		$3.00
Common wire nails, base per keg		2.95
Cement coated nails, base 100 lb. keg		2.95
Chain, per 100 lb.		7.55
		Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.		$18.00
4-in.		38.00
Seamless steel boiler tubes, 2-in.		19.00
4-in.		39.00

ingly large. One of the bright spots is the favorable attitude which buyers in general have shown toward the effort of mills to get more money for their products. The advance of $2 a ton on common wire nails and on plain wire has served as a stimulus for the better movement of material on contracts calling for delivery prior to April 1, but the actual test of the market will not come for some time. The producer at Ironton is understood to have followed the lead of Eastern makers in establishing prices on a higher basis, so that the prevailing quotation on common wire nails is now $2.65 per keg, Ironton or Pittsburgh, and on plain wire $2.50 per 100 lb., Ironton or Pittsburgh. Bookings of sheets continue at a high rate, the early days of February having kept pace with January. Mills in this district have enough orders in hand to schedule rollings about two weeks ahead. Prices are fairly steady at 2.10c., base Pittsburgh, for blue annealed, 3.75c. for galvanized and 2.90c. for black. Only in structural steel are activities lagging. The Ohio State Highway Commission is taking bids for the general contract for a highway bridge in the northeastern part of the State for which about 700 tons will be required. Bars, structural shapes and plates are firm at 1.85c., base Pittsburgh.

Reinforcing Bars.—A gradual increase in the strength of prices is noted. New billet bars are bringing from 1.85c. to 1.90c., base Pittsburgh, while rail steel is firm at 1.75c., base mill. In at least one instance the latter has been sold at 1.80c. for delivery in 60 days.

Warehouse Business.—Jobbers report a slight increase in sales, but total bookings from a tonnage standpoint are still below normal. The slackness in building activities in this district has been partially responsible for the rather unsatisfactory condition. Prices are firm and unchanged.

Coke.—A sudden influx of specifications for by-product foundry coke is reported by local dealers, who say that orders on hand are sufficient to take practically the entire month's output. As a result of this betterment, February shipments for at least two companies will be the best in five months. There also has been a buying spurt of more limited proportions in by-product domestic coke. Prices are unchanged.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates: $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—Melting steel is off 25c. a ton and weakness has cropped out in other items. A steel company in this district bought a small tonnage of heavy melting steel the past week and is reported to have paid a delivered price of $14.75. Mills are taking a fair amount of material on current contracts, but are hesitant about placing orders for future delivery. The Chesapeake & Ohio has put out a list of 8000 tons, half of which is rails, and the Louisville & Nashville 7800 tons.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.50 to $12.00
Scrap rails for melting	12.25 to 12.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	9.50 to 10.00
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.50 to 9.00
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.50 to 8.00
Rails for rolling	13.00 to 13.50
No. 1 locomotive tires	13.50 to 14.00
No. 1 railroad wrought	11.50 to 12.00
Short rails	17.00 to 17.50
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	16.00 to 17.00
No. 1 railroad cast	13.50 to 14.00
Burnt cast	8.00 to 8.50
Stove plate	9.00 to 9.50
Brake shoes	10.00 to 10.75
Railroad malleable	12.75 to 13.25
Agricultural malleable	12.25 to 12.75

By-product coke plants associated with blast furnaces made a smaller proportion of the by-product coke output in 1927 than for some years past. The United States Bureau of Mines places this ratio at 81.3 per cent, leaving 18.7 per cent for the independent ovens. The furnace figure compares with 82.6 per cent in 1926 and with ratios varying from 82.3 to 83.6 per cent in the four preceding years.

San Francisco

Southern Pacific Orders 4400 Tons of Tie Plates—Plates $1 Higher

SAN FRANCISCO, Feb. 7 (*By Telegraph*).—Demand in most lines is well sustained, with shapes and cast iron pipe the most active. Important developments include the award of 4400 tons of tie plates by the Southern Pacific Co. to Eastern makers and 1200 tons of structural shapes for a paper bag plant at Tacoma, Wash., to the Hofius Steel & Equipment Co., and 800 tons for the Alexander & Baldwin Building in Honolulu to the Honolulu Iron Works.

Pig Iron.—About 800 tons of Indian pig iron arrived and was divided between San Francisco and Los Angeles melters. The next shipment of 1400 tons is due the latter part of the month.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Plates and Shapes.—Structural shape awards for the week exceeded 2800 tons and pending business involves 24,000 tons. No plate awards of size have been made, but bids have been opened on a tanker for the Standard Oil Co., San Francisco, involving 3500 tons of plates and 1500 tons of shapes. The Newport News Shipbuilding & Dry Dock Co. was low bidder. Bids will be opened Feb. 17 on 1500 tons for a penstock at Seattle, Wash. Plate prices have been advanced $1 a ton from 2.25c. to 2.30c., c.i.f. Pacific Coast ports.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, $\frac{3}{16}$-in. and over	3.15c.
Small angles, under $\frac{3}{16}$-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.75c.
Galvanized sheets (No. 24)	5.35c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.35
Cement coated nails, 100-lb. keg	3.35

Reinforcing Steel.—The only reinforcing steel award of the week was 500 tons taken by the Pacific Coast Steel Co. for a paper bag plant at Tacoma.

Cast Iron Pipe.—Bert Noble, San Francisco, has been awarded the order for 263 tons of 2 to 6-in. pipe for improvement of Voltaire Street, San Diego. Pending business involves 4000 tons.

Coke.—About 4000 tons of British coke has arrived, most of it going to foundries in the San Francisco and Los Angeles districts. The next shipment is due about the middle of March.

Detroit Scrap Market Weak

DETROIT, Feb. 7.—Further signs of weakness were noted in the market on old material in this district during the past week because some mills have held up deliveries in the face of increasing output by the larger scrap producers.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$12.00 to $12.50
Borings and short turnings	8.75 to 9.25
Long turnings	7.75 to 8.25
No. 1 machinery cast	14.50 to 15.50
Automobile cast	18.00 to 19.00
Hydraulic compressed sheets	10.75 to 11.25
Stove plate	11.50 to 12.50
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	10.00 to 10.50

Loading of revenue freight for the week ended Jan. 21 totaled 884,095 cars, according to reports of the Car Service Division, American Railway Association. This was a decrease of 22,639 cars from the preceding week.

FABRICATED STRUCTURAL STEEL

Awards of 54,000 Tons—Chicago Civic Opera House Will Take 18,000 Tons

Awards totaling close to 44,500 tons made the past week's business one of the best so far this year and new projects calling for a total of nearly 54,000 tons were larger than any week since Jan. 1. The largest single awards were 9000 tons for a viaduct in Cleveland, 5000 tons for a bridge in Pittsburgh, and 5000 tons for an office building in New York. Included in pending business is 18,000 tons for the Chicago Civic Opera House, 11,000 tons for a New York subway and 4000 tons for a State office building in New York. Awards follow:

Lynn, Mass., 580 tons, Lynn Gas & Electric Co. power house addition, to New England Structural Co.

Somerville, Mass., 100 tons, garage, to New England Structural Co.

State of New Hampshire, 1500 tons, bridges, 14 to American Bridge Co., two to Boston Bridge Works, Inc., and one to Standard Engineering Co.

New York, 11,300 tons reported to Structural Steel Board of Trade, Inc.; 9800 tons in following jobs not previously reported: Savings Bank at Sixth Avenue and Ninth Street and warehouse at 167th Street and Sedgwick Avenue, to George A. Just Co.; 15-story apartment building at 15 East Ninety-sixth Street, 37-story Lefcourt office building at 521 Fifth Avenue, 15-story apartment building at Ninety-first Street and Riverside Drive and pavilion for Clarence Mackay at Roslyn, L. I., to Paterson Bridge Co.; supports for power station installation for Brooklyn Edison Co., to McClintic-Marshall Co.; chapel and faculty building for Fordham University, to Lehigh Structural Steel Co.; alteration to Cohan Theater at Broadway and Forty-third Street, Proctor's Theater at Third Avenue and Fifty-eighth Street, 14-story office building at Madison Avenue and Seventy-sixth Street and one-story club at 115 West Seventieth Street, to Harris Structural Steel Co.

New York, 1600 tons, loft building at Eighth Avenue and Forty-sixth Street, to Harris Structural Steel Co.

New York, 1500 tons, apartment building on West Ninety-sixth Street, to Easton Structural Steel Co.

New York, 1200 tons, apartment building on Eighty-eighth Street, to Harris Structural Steel Co.

New York, 650 tons, apartment building at 105 East Twenty-first Street, to Easton Structural Steel Co.

Nyack, N. Y., 400 tons, high school, to Bethlehem Steel Co.

Perth Amboy, N. J., 500 tons, building for American Smelting & Refining Co., to Pittsburgh Bridge Co.

Greensand, N. J., 1725 tons, coal distillation plant for Combustion Engineering Corporation, to Jones & Laughlin Steel Corporation.

Waldwick, N. J., 100 tons, plate girder bridge for Erie Railroad, to Phoenix Bridge Co.

Philadelphia, 200 tons, plant building for Olney Foundry Co., to Belmont Iron Works.

Pittsburgh, 5000 tons, Thirty-first Street bridge, to Fort Pitt Bridge Works.

Ambridge, Pa., 150 tons, municipal water tanks, to Pittsburgh-Des Moines Steel Co.

Detroit, 320 tons, branch for Bank of Detroit, to local fabricator.

Corpus Christi, Tex., 370 tons, dock sheds, to local fabricator.

Schiller Park, Ill., 1300 tons, viaduct for Soo line, to Bethlehem Steel Bridge Corporation.

Cleveland, 9000 tons, Prospect Avenue viaduct, to Mount Vernon Bridge Co.

Buffalo, 250 tons, Public School No. 23, to Henesey-Mann Structural Co., local.

Canton, Ohio, 3000 tons, plant additions for Timken Roller Bearing Co., to McClintic-Marshall Co.

Downers Grove, Ill., 100 tons, theater, to Midland Structural Steel Co., Chicago.

Powerton, Ill., 156 tons, miscellaneous steel for Super-Power Co., to Vierling Steel Works, Chicago.

Cary, Ill., 300 tons, building for Cary Brick Co., to Hansell-Elcock Co., Chicago.

Burlington, Iowa, 300 tons, barge for Burlington Barge Terminals, to St. Louis Structural Steel Co.

Burlington, 130 tons, municipal dock house, to Lakeside Bridge & Steel Co.

Milwaukee, 100 tons, factory, for Federal Asbestos & Insulating Co., to Lakeside Bridge & Steel Co.

Birmingham, 350 tons, Protective Life Insurance building, to Ingalls Iron Works Co.

Lake Charles, La., 600 tons, municipal wharf sheds, to Orange Car & Steel Co., Orange, Tex.

State of Texas, 1100 tons, tanks for Pan-American Co., to Chicago Bridge & Iron Works.

Lincoln, Neb., 1500 tons, third wing of State House, to unnamed bidder.

St. Louis, 130 tons, girders in addition to Jefferson Hotel, to Mississippi Valley Structural Steel Co.

St. Louis, 450 tons, girders in Arsenal Street viaduct, to Stupp Brothers Bridge & Iron Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

Middletown, Conn., 575 tons, office building.

New York, 11,000 tons, section 1, route 8, of subway in Borough of Queens; bids close March 2.

New York, 4000 tons, State office building.

New York, 3500 tons, highway bridge in Borough of Queens.

New York, 2500 tons, loft building at 228 East Forty-fifth Street.

New York, 350 tons, apartment building at 69 East Seventy-seventh Street.

New York, 125 tons, gymnasium at Amsterdam Avenue and 138th Street.

Bayonne, N. J., 300 tons, tanks for Standard Oil Co. of New Jersey.

East Orange, N. J., 600 tons, Municipal Building.

Philadelphia, 300 tons, public school.

Philadelphia, 600 tons, Uptown Theater; may be changed to reinforced concrete.

Philadelphia, 150 tons, column cores and girders for Blum Store, previously reported as 1200 tons but revised to reinforced concrete; general contract to Wark Construction Co.

Philadelphia, 2500 tons, Integrity bank and office building, Sixteenth and Walnut Streets.

Philadelphia, 2000 tons of sheet steel piling, Tacony-Palmyra bridge; general contract to Dravo Construction Co.

Philadelphia, 358 tons, Radcliffe central office building for Bell Telephone Co.; general contract to John N. Gill Construction Co.

Pontiac, Mich., 900 tons, building for J. W. Cook Corporation.

Washington, 1000 tons, power house for Stone & Webster, Inc.

Coles County, Ill., 200 tons, bridge for Illinois Highway Commission; St. Louis Structural Steel Co., low bidder.

Chicago, 18,000 tons, Civic Opera House.

Chicago, 2800 tons, approach to Robey Street bridge.

Chicago, tonnage being estimated, approach to La Salle Street bridge.

Chicago, 300 tons, building for Strauss & Schram.

West Pullman, Ill., 400 tons, building for Columbia Mills, Inc.

Milwaukee, 1500 tons, County section of Milwaukee Public Safety Building; bids close March 16; separate bids on fabrication and delivery, and on erection.

San Diego, Cal., 700 tons, power house for Byllesby Engineering & Management Corporation, Chicago.

RAILROAD EQUIPMENT

St. Louis-San Francisco Places Orders for 4000 Freight Cars

St. Louis-San Francisco has placed orders for 4000 freight cars, distributed as follows: 1000 box and 500 hopper cars with American Car & Foundry Co., 500 hopper and 500 automobile cars with Pullman Car & Mfg. Corporation, and 500 box, 500 flat and 500 hopper cars with General American Car Co.

Swift & Co. have ordered 500 underframes from Bettendorf Co.

Seaboard Air Line has made inquiry for 25 Mikado type locomotives.

Chicago, Rock Island & Pacific is inquiring for 10 baggage and six baggage-mail cars, 10 coaches and 10 suburban coaches.

Southern Pacific has withdrawn its inquiry for 300 box car underframes and 300 superstructures.

Mud Valley Logging Co., Olympia, Wash., has purchased a Mallet type locomotive from Baldwin Locomotive Works.

Mexican Railways have ordered two Pacific type locomotives from American Locomotive Co.

American Smelting & Refining Co. is inquiring for 60 gondola cars.

Bangor & Aroostook will build 100 single-sheathed box cars at its Derby, Me., shops.

Carnegie Steel Co. has ordered 15 tank cars from Petroleum Iron Works and 35 from Standard Steel Car Co.

Woodward Iron Co. has ordered 50 mine cars from American Car & Foundry Co.

Long Island Railroad has ordered two baggage-mail cars from American Car & Foundry Co.

Monon will buy one gas-electric car.

NON-FERROUS METAL MARKETS

The Week's Prices

Cents per Pound for Early Delivery

	Feb. 7	Feb. 6	Feb. 4	Feb. 3	Feb. 2	Feb. 1
Lake copper, New York	14.25	14.25	14.25	14.25	14.25	14.25
Electrolytic copper, N. Y.*	13.87½	13.87½	13.87½	13.87½	13.87½	13.87½
Straits tin, spot, N. Y.	53.25	53.62½	....	54.00	54.37½	54.25
Lead, New York	6.50	6.50	6.50	6.50	6.50	6.50
Lead, St. Louis	6.22½	6.22½	6.25	6.25	6.25	6.25
Zinc, New York	6.00	6.00	6.00	6.00	5.97½	6.00
Zinc, St. Louis	5.65	5.65	5.65	5.65	5.62½	5.65

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, Feb. 7.—None of the markets is particularly active, excepting possibly tin. Demand for copper has been moderate with prices exceedingly firm. Tin sales have been quite large at new low levels for several years. Very little change in lead has developed and both demand and prices for zinc remain about the same.

Copper.—A moderate spurt in demand from domestic producers developed last week, but the market in the last few days has been exceedingly quiet. Firmness in prices is a feature despite light demand both from domestic and foreign consumers. Practically all producers are adhering rigidly to 14.12½c., delivered in the Connecticut Valley, at which level most of the metal changed hands. Some metal has been available from custom smelters now and then at a concession, but the quantity has been small. The official quotation of Copper Exporters, Inc., is unchanged at 14.50c., c.i.f., usual European ports. Lake copper is reported quiet but firm at 14.25c., delivered.

Tin.—Total sales for the week ended Saturday, Feb. 4, were about 1300 tons, of which 800 tons was sold up to Thursday night. Most of the latter was taken by dealers. Consumers did not enter the market until Friday, when sales were made as low as 53.75c. On that day consumers took most of the offerings and were evidently buying on the scale down. Yesterday, Monday, the market was dull with 75 tons changing hands, but today consumers bought quite liberally again with futures selling at 53c. to 53.12½c. Spot Straits tin today was quoted at 53.25c., New York, which is the lowest price since April 21, 1925, when it was 52.62½c. Two causes mentioned for the low prices are the increase in world production last year and the fact that consumers are fairly well covered for February and March, at least. London prices today fell sharply from those of yesterday and are considerably below those of a week ago, with spot standard quoted at £238 15s., future standard at £240 5s. and spot Straits at £240 10s. The Singapore price today was £245 5s. Arrivals thus far this month have been 630 tons, with 6240 tons reported afloat.

Lead.—Offerings of resale metal in the West have somewhat weakened the market there and quotations range from 6.22½c. to 6.25c., depending on the producer. The quotation of the leading interest is unchanged at 6.50c., New York, as its contract price. While no large quantities have changed hands, there is a fair demand for smaller lots.

Zinc.—Another advance in ore prices took place last week bringing the quotation to $38, Joplin. For the first time in several weeks sales exceeded production. A corresponding increase in the price of prime Western zinc has not developed and quotations during the week have ranged from 5.62½c. to 5.67½c., St. Louis, with the quotation today largely nominal at 5.65c., St. Louis, and 6c., New York. It appears possible that this price would be slightly shaded under favorable conditions. Sellers report a fair demand from day to day, but they are not anxious to force the issue, particularly for future delivery.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—Demand is very light and Chinese metal for spot and early future delivery is a little easier at 11c., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in ingots, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Feb. 7.—Prices, with the exception of tin, are firm. Sales are numerous for prompt delivery, while future business is only moderately active. The old metal market is quiet.

Prices, per lb., in carload lots: Lake copper, 14.25c.;

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	56.00c. to 57.00c.
Tin, bar	58.00c. to 59.00c.
Copper, Lake	15.25c.
Copper, electrolytic	15.00c.
Copper, casting	14.25c.
Zinc, slab	7.25c. to 7.75c.
Lead, American pig	7.65c. to 8.65c.
Lead, bar	9.90c. to 10.90c.
Antimony, Asiatic	13.00c. to 13.50c.
Aluminum No. 1 ingot for remelting (guaranteed over 99 per cent pure)	27.00c. to 28.00c.
Aluminum ingots, No. 12 alloy	26.00c. to 27.00c.
Babbitt metal, commercial grade	30.00c. to 40.00c.
Solder, ½ and ½	36.00c. to 37.00c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	59.50c.
Tin, bar	61.50c.
Copper, Lake	15.25c.
Copper, electrolytic	15.25c.
Copper, casting	14.50c.
Zinc, slab	7.75c.
Lead, American pig	7.25c.
Antimony, Asiatic	16.00c.
Lead, bar	9.50c.
Babbitt metal, medium grade	19.75c.
Babbitt metal, high grade	64.50c.
Solder, ½ and ½	35.50c.

Rolled Metals from New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—	
High brass	18.50c. to 19.25c.
Copper, hot rolled	22.75c. to 23.75c.
Copper, cold rolled, 14 oz. and heavier,	25.25c. to 26.25c.
Seamless Tubes—	
Brass	23.37½c. to 24.37½c.
Copper	24.50c. to 25.50c.
Brazed Brass Tubes	26.50c. to 27.50c.
Brass Rods	16.25c. to 17.25c.

From New York Warehouse

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9), casks	10.00c. to 10.50c.
Zinc sheets, open	10.50c. to 11.00c.

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products have not been changed for more than two months. Lead full sheets are still being quoted at the advance of Dec. 1, and zinc sheets have held at 10c., base, for six months.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Zinc	10.00c.
Lead (full sheets)	10.00c. to 10.25c.
Seamless Tubes—	
High brass	23.62½c.
Copper	24.50c.
Rods—	
High brass	16.50c.
Naval brass	19.25c.
Wire—	
Copper	15.75c.
High brass	19.25c.
Copper in Rolls	21.75c.
Brazed Brass Tubing	26.75c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also allowed to St. Louis on shipments to destinations west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Rolled Metals, f.o.b. Chicago Warehouse

(Prices Cover Trucking to Consumers' Doors in City Limits)

	Base per Lb.
Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Copper, cold rolled, 14 oz. and heavier	25.00c.
Zinc	11.00c.
Lead, wide	9.75c.
Seamless Tubes—	
Brass	25.12½c.
Copper	26.00c.
Brazed Brass Tubes	26.75c.
Brass Rods	16.50c.

tin, 55c.; lead, 6.35c.; zinc, 5.75c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.25c.; pewter, No. 1, 34c.; tin foil, 40c.; block tin, 50c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

REINFORCING STEEL

New Projects Include 3000 Tons for St. Louis Warehouse—Awards Small

The tonnage of reinforcing bars awarded and specified in new projects registered a decline this week, with less than 3000 tons placed and about 3800 tons of new business. The largest award was 1600 tons for a building in Fort Worth, Tex., for Montgomery Ward & Co. An outstanding inquiry is 3000 tons for the J. C. Penney Co. warehouse in St. Louis. Awards follow:

CAMBRIDGE, MASS., 360 tons, Lever Brothers warehouse, to Barker Steel Co.

LYNN, MASS., 100 tons, Lynn Gas & Electric Co. power house addition, to Morrison Stevens Co.

LONG ISLAND CITY, N. Y., 200 tons, warehouse for R. H. Macy & Co., Inc., to Concrete Steel Co.

GRIFFIN, GA., 100 tons, Graham Mfg. Co. plant addition, to Connors Steel Co., Birmingham.

TAYLOR, S. C., 300 tons, plant building, to Connors Steel Co.

FORT WORTH, TEX., 1600 tons, Montgomery Ward & Co. building, to Concrete Engineering Co.

CHICAGO, 100 tons of rail steel bars, building in Humboldt Park, to Calumet Steel Co.

CHICAGO, 200 tons of rail and billet steel bars, Cornell apartment building, to Barton Spider-Web System.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 300 tons, Harlem River subway tunnel; George H. Flinn Corporation, low bidder on general contract.

ROCHESTER, N. Y., 200 to 300 tons, Benjamin Franklin school; bids taken, Feb. 20.

BUFFALO, 130 tons, school No. 47; bids taken, M. B. Parker, Cleveland, contractor.

CHICAGO, tonnage being estimated, Civic Opera House; Graham, Anderson, Probst & White, architects.

CHICAGO, 700 tons, Passavant Hospital; George A. Fuller Co., general contractor.

MILWAUKEE, 225 tons, County highway trestle; bids close Feb. 21.

ST. LOUIS, 3000 tons, warehouse for J. C. Penney Co.; Starrett Brothers, Inc., New York, general contractor.

Youngstown-Inland Merger Details Are Being Worked Out

YOUNGSTOWN, Feb. 7.—Details are being worked out for the merger of the Youngstown Sheet & Tube Co. and the Inland Steel Co., which will operate under the name of the Youngstown-Inland Steel Corporation as an Ohio corporation. A new company will not be formed, but the charter under which the Sheet & Tube company operates will be amended to provide for the changes. Special stockholders' meetings of both companies will be held March 15, when the merger plan, already approved by directors, will be ratified. President James A. Campbell of Sheet & Tube has gone to Florida for a month's vacation.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	10.00c.	11.25c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.75c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	4.25c.	4.75c.
Zinc	3.75c.	4.25c.
Sheet aluminum	12.75c.	14.50c.
Cast aluminum	12.75c.	14.50c.

Obituary

CAPT. JAMES MOWATT, retired head of the Chicago Ship Building Co., Chicago, died Jan. 24. He was born near Duncan's Bay in Scotland and came to America in 1863. He was manager of the Chicago Dry Dock Co. from 1880 to 1892.

—

GEORGE BERGMAN, assistant secretary and export sales manager of the Cincinnati Milling Machine Co., Cincinnati, died suddenly Feb. 1. He was 44 years of age and had been associated with the company for 26 years. During a part of that time he was head of the commercial sales department and also was identified with the export department. He was recently appointed export sales manager.

—

CHARLES KROESCHELL, until five years ago president of the Kroeschell Brothers Co., Chicago, manufacturer of steam boilers, died Jan. 31.

—

BERTON B. BRATT, active for many years in blast furnace construction, died at his Pittsburgh home Jan. 31. For the past 14 years he had been connected with the engineering department of the Eliza furnaces, Jones & Laughlin Steel Corporation, Pittsburgh. Previously while identified with Julian Kennedy, Pittsburgh, he had supervised the reconstruction of the Isabella furnaces, Carnegie Steel Co., and the building of the furnaces of the Rogers-Brown Iron Co., Buffalo, and the American Steel & Wire Co., Cleveland. He was born at Glenfield, Pa., in 1873 and was graduated from the University of Pittsburgh in 1893.

—

FRANK F. VANDERVORT, for many years Eastern sales representative for the Wheeling Mold & Foundry Co., Wheeling, W. Va., died on Feb. 3 at his home in Chestnut Hill, Philadelphia. He was 62 years of age. Mr. Vandervort was born at Pittsburgh and attended Cornell University.

—

W. F. HOPKINS, metals sales manager of the Republic Metalware Co., Buffalo, died suddenly on Jan. 19 at his home in that city, aged 47 years. He had been associated with the Republic company since 1918 and was previously identified for 17 years with the Buffalo Wire Works, Buffalo.

—

CHARLES F. W. FELT, chief engineer for the Atchison, Topeka & Santa Fe, died Feb. 5 at Colorado Springs, Colo., after an illness of several months. He was president of the Railway Engineers' Association in 1926.

Hickman, Williams & Co., pig iron brokers, who for years have had Eastern selling offices in New York and Boston, as well as in Philadelphia, have decided to consolidate the New York and New England territories with one office at 120 Broadway, New York. Rufus W. Page will continue to represent the firm in New England, making his headquarters at Auburndale, Mass.

PERSONAL

William Lawrence Saunders, chairman Ingersoll-Rand Co., New York; J. Vipond Davies, of Jacobs & Davies, consulting engineers, 30 Church Street, New York, and Bancroft Gherardi, vice-president American Telephone & Telegraph Co., New York, simultaneously completed notably long periods of continuous service in the United Engineering Society at the annual meeting of its board of trustees held on Jan. 26. Mr. Saunders has been a trustee for 12 years, Mr. Davies for 11½ years, and Mr. Gherardi for nearly eight years. Each has served as vice-president, as chairman of the finance committee and as president. The latter office they filled, respectively, for three, four and one years. For two terms Mr. Saunders represented the American Institute of Mining and Metallurgical Engineers, of which he is a past-president, and for two terms the American Society of Mechanical Engineers. Mr. Davies represented for two terms the American Society of Civil Engineers, of which he is a past vice-president, and for two terms the American Institute of Mining and Metallurgical Engineers. Mr. Gherardi represented continuously the American Institute of Electrical Engineers, of which he is now president.

P. J. McCarty, who for a number of years has served as sales representative in Connecticut of the Ludlum Steel Co., Watervliet, N. Y., has been appointed district sales manager of the company in New York. The New York office, which has been at 33 West Forty-second Street, will be removed to 40 Rector Street.

A. E. Starbuck, for many years identified with the Haynes interests, Kokomo, Ind., manufacturers of stellite and other alloys, has been elected president of the American Stainless Steel Co., 801 Commonwealth Building, Pittsburgh, succeeding John C. Neale, who recently resigned.

W. A. Whaley has been appointed district manager in Virginia and North Carolina for the Fitzsimons Co., Youngstown, with headquarters at Norfolk, Va. Walter F. Bray has been added to the company's sales organization at Detroit.

R. H. Minton, general superintendent General Ceramics Co., Metuchen, N. J., has resigned, following a connection of 14 years with that company. He has had supervision over all plants of the organization in the Raritan River district, devoted to the production of sanitary ware, refractories, chemical stoneware and kindred products. Mr. Minton has been specializing in refractory and high-refractory research and investigations for blast furnace and steel mill service and will engage as a consulting engineer in this line. He is a past-president of the American Ceramic Society.

H. W. Caldwell, who was recently elected president of the Cleveland Stone Co., Cleveland, has been president of the Sterling Grinding Wheel Co. since its acquisition by the Stone company in 1922. Previously he was for many years vice-president of the latter company and in direct charge of its grindstone department. The Sterling company is operated as the abrasive division of the Cleveland Stone Co.

J. W. McLeod, formerly with Hall-Will, Inc., Erie, Pa., has been appointed Erie district sales representative for the Arch Machinery Co., 1005 Park Building, Pittsburgh, and will handle sales in northern Pennsylvania, with headquarters in Erie.

John C. Neale has been elected a director of the Pittsburgh Valve Foundry & Construction Co., Pittsburgh, succeeding J. N. Anderson, Jr., resigned, and also is serving as assistant to the president. Mr. Neale for almost five years was president and general manager of the American Stainless Steel Co., Pittsburgh, and previously had been identified in executive capacities with the Midvale Steel & Ordnance Co., the Central Steel Co., Massillon, Ohio, construction of the plant of which he supervised, and the Carnegie Steel Co.

Frank A. Demms and H. S. Bradley have been elected directors of the Shenango Furnace Co., Pittsburgh, and Mr. Bradley has been made assistant to the president. Mr. Demms is treasurer of the company and has been associated with the W. P. Snyder interests for 25 years. Mr. Bradley is president of Shenango-Penn Mold Co., an affiliated Shenango Furnace Co. interest.

Herbert C. Poole, for the past three years works manager Colonial Steel Co., Pittsburgh, has been appointed assistant general sales manager in charge of the eastern district, including the Philadelphia, New York and Boston offices of the company. He will make his headquarters in New York. Mr. Poole has been identified with the company for 20 years and was New York district sales manager prior to his appointment as works manager.

W. F. Piper, of the Beardsley & Piper Co., Chicago, manufacturer of foundry equipment, is in a serious condition at Buhl Hospital, Sharon, Pa., because of injuries sustained Feb. 2, when an airplane in which he was flying from Sharpsville, Pa., to Chicago, crashed in a forced landing. Elmer L. Beardsley, also a member of the firm, pilot of the plane, was cut about the face but escaped serious injury. Mr. Beardsley and Mr. Piper flew from Chicago to Sharpsville, 410 miles, in 3 hr. 15 min. The accident occurred as they were taking off for the return trip to Chicago.

Herbert Mertz, formerly secretary and sales manager for the Orton Crane & Shovel Co., Chicago, has resigned and will establish an office in New York to sell the products of that company in New York and New England. P. A. Orton, Jr., becomes secretary and sales manager of the Orton company.

Dr. Michael Pupin, professor of electrical engineering at Columbia University, is the recipient of the 1928 Washington Award. Presentation was made Feb. 2 at a dinner given at the Palmer House, Chicago. The American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the Western Society of Engineers were hosts. The Washington Award, which has been established by the latter society, "is to be presented annually to the engineer whose work in some instance or whose services in general have been noteworthy for their merit in promoting public good."

Guy M. Peterson has been made vice-president of the Cheney-Bigelow Wire Works, Springfield, Mass. He has been engaged in the realty business.

Emil Nelson has resigned as president of the Moulders Foundry Co., North Chelmsford, Mass., and has been succeeded by John H. Davis.

H. B. Swan, superintendent of foundries for the Cadillac Motor Car Co., Detroit, addressed the foundry study group in the College of Engineering and Commerce of the University of Cincinnati on Feb. 3. His subject was "Modern Developments of Foundry Practice."

R. S. Cochrane, metallurgist of the Surface Combustion Co., Toledo, Ohio, spoke on the "General Application of Gas Heat in Industry" at the monthly meeting of the Cincinnati Chapter of the American Society for Steel Treating on Feb. 8.

Charles E. Stone, since 1924 vice-president of the Interstate Drop Forge Co., Milwaukee, has been elected president, succeeding C. R. Messinger, who is a member of the board of directors and also president of the Chain-Belt Co. Lamar S. Peregoy has been elected vice-president. C. C. Bremer, treasurer, and J. C. Merker, secretary, were re-elected. Directors are C. R. Messinger, W. C. Frye, J. W. Millspaugh, L. S. Peregoy, E. L. Wood and W. J. Nugent. Mr. Stone was purchasing agent and later assistant to the president of the Chain-Belt Co. prior to his association with the Interstate company, which is a member of a group of affiliated concerns, including the Sivyer Steel Casting Co., the Federal Malleable Co., and the Chain-Belt Co., Milwaukee, and the Nugent Steel Castings Co., Chicago.

—

H. E. Sheldon, president Allegheny Steel Co., Pittsburgh, is on a Pacific Coast tour. He is accompanied by W. F. Detweiler, general manager of the company.

—

V. W. Peterson is president and C. B. Mitchell is vice-president and treasurer of a new company that has purchased the plant and business of the Hannifin Mfg. Co., 621 South Kolmar Avenue, Chicago, manufacturer of air chucks, air-operated arbor presses, boring bars and other air-operated devices. The business will be continued under the old name. Mr. Peterson and Mr. Mitchell also control and operate the Sherman-Manson Mfg. Co., Chicago, manufacturer of tubular steel products.

—

George W. Page, associated for 30 years with the W. A. Jones Foundry & Machine Co., Chicago, and now director of purchases for that company, has been elected vice-president to succeed the late Thomas A. Jones. William F. Coleman has been appointed treasurer. He has been identified with the company for a number of years and will continue to serve also as general superintendent. Warren G. Jones continues as president and general manager and J. A. Sizer remains as secretary.

—

Donald M. Ryerson has been elected chairman of the board of directors of Joseph T. Ryerson & Son, Inc., Chicago, succeeding his father, the late Edward L. Ryerson. The new chairman has been active in the management of the company, formerly having been vice-president and general manager. Joseph T. Ryerson continues as president and treasurer and Edward L. Ryerson, also a son of the late chairman, has been made general manager and will continue also in his position as vice-president. Everett D. Graff is a newly elected vice-president and G. G. Moody and E. L. Hartig remain as vice-presidents.

—

A. P. Afanassieff has been appointed assistant to the president of the Shaw-Crane-Putnam Machine Co., Inc., 100 East Forty-second Street, New York, according to an announcement by F. J. Baumis, president. Henry Huss has been appointed sales manager of the Putnam division of the same company.

—

P. J. Flaherty, president and general manager of the Johnson Bronze Co., New Castle, Pa., has purchased the Johnson interests in that company, and will continue with the company in his same capacity. No changes in operation or personnel are planned.

—

A. B. Moyer, formerly assistant engineer for the Struthers-Wells Co., Warren, Pa., has been placed in charge of a new branch office which has been opened by the company at 332 South Michigan Avenue, Chicago.

—

H. B. Miller has been appointed Pittsburgh district manager for the Truscon Steel Co., Youngstown, succeeding Charles D. Loveland, recently appointed district manager in charge of the company's office at Newark, N. J. Mr. Miller has been assistant sales manager with headquarters in Youngstown.

—

H. H. Morgan, since 1904 connected with Robert W. Hunt Co., Chicago, engineer, has been appointed metallurgical engineer in charge of the rail and track fastening department, succeeding C. W. Gennet, Jr. Mr. Gennet has resigned to become associated with the Sperry Development Co. in connection with the Sperry transverse fissure detector. Mr. Morgan is a graduate mechanical engineer, and during the first 13 years of his employment with Hunt company he was directly connected with inspecting and testing work, being particularly active in the inspection and testing of rails, investigation of rail failures, and various tests of track fastenings. During the World War he was transferred to Washington to engage in inspection and testing of engineering materials and equipment for the American Expeditionary Forces. At the close of the war he was appointed district manager of the Pittsburgh district of Hunt company.

—

F. A. Lawler, formerly manager of the Chicago branch of the Crucible Steel Co. of America, has been appointed executive vice-president of the Ziv Steel & Wire Co., Chicago.

—

Bennett Chapple, director of publicity for the American Rolling Mill Co., Middletown, Ohio, has been elected a vice-president of the company in general charge of advertising and publicity programs and as a special representative. Other officials of the Armco organization who have been given this title during the last year include Weber Sebald, in general charge of commercial development; John B. Tytus, in charge of special construction engineering and special assistant to the general management; J. C. Miller, general representative of the company at Ashland, Ky.; D. Eppelsheimer, in charge of general engineering and construction problems and special assistant to the general management, and A. K. Lewis, who is vice-president of the Columbia Steel Co., and special representative of the company at Butler, Pa.

—

George T. Johnson has been elected third vice-president of the Buckeye Steel Castings Co., Columbus, Ohio, and will be in charge of sales and engineering. He was graduated from Cornell University in 1906 and has been identified with the manufacturing, engineering and sales departments of the Buckeye company since that time.

—

Frank A. Peck, vice-president of the Universal Crane Co. and the Thew Shovel Co., Cleveland, has been elected a director of the Manufacturers' Division of the American Road Builders' Association, in recognition of his work in contributing to the success of the 1926 Cleveland Road Show.

—

L. J. Jones has resigned as vice-president, secretary and a director of the Eastern Rolling Mill Co., Baltimore, and will leave shortly for a Mediterranean cruise.

—

J. King Hoyt, Jr., a member of A. Milne & Co., 741 Washington Street, New York, iron and steel merchants, sailed for Sweden on Feb. 4. He will visit iron and steel plants in Sweden and other countries on the Continent and at Sheffield, England.

—

B. H. Hale, Albany, N. Y., and J. A. Rumer, Chicago, have been appointed Eastern and Western sales managers, respectively, for the Ferro Enamel Supply Co., Cleveland.

—

E. M. Adams, first vice-president and general sales manager for the Inland Steel Co., Chicago, left Feb. 4 for a five weeks' vacation in Honolulu.

—

C. R. Lewis has been made executive vice-president, in addition to his duties as general manager of sales for the Standard Forgings Co., Chicago. A. C. Stockton, formerly vice-president and comptroller, has been elected vice-president, treasurer and secretary of the company.

—

E. C. Wells, president Roane Iron Co., Chattanooga, Tenn., has resigned on account of ill health, his retirement being effective immediately. He has been succeeded by Morrow Chamberlain, who has been secretary and treasurer. Charles T. Culbert, auditor of the company during the past two years, will take up the duties relinquished by Mr. Chamberlain.

Machinery Markets and News of the Works

UPTURN IN SALES VOLUME

Machine Tool Business and Inquiries Show Decided Gain

Santa Fe Railroad Issues Inquiry for 34 Items of Equipment—Large Buying by Mergenthaler Linotype Co.

MACHINE tool sales and inquiries have turned upward in the first week of February. Buying has been well apportioned among all consuming lines, although automobile companies probably have been the most active purchasers. However, the orders of the Mergenthaler Linotype Co., Brooklyn, totaling upward of $1,000,000 in the past two or three weeks, comprise one of the largest amounts placed by any one company outside the automobile field since the war. The Santa Fe Railroad has issued an inquiry for 34 items of shop equipment.

Orders booked during the past week or two have placed some machine tool manufacturers in the best position in several months. Inquiries are in good volume and lend encouragement to the prediction of some in the trade that a mounting scale of purchasing will be in evidence throughout February and March. Some machine tool companies report a heavy increase in the demand for repair parts, indicating that manufacturers generally are expanding their activities.

The automotive industry promises to yield much more business in the first half of this year than in the latter six months of 1927. Tools for which automobile companies are now inquiring total about $500,000.

Woodworking machinery is fairly active. The St. Marys Wheel & Spoke Co., St. Marys, Ohio, has bought 25 new and six rebuilt machines, and the Perfection Stove Co., Cleveland, is taking bids on 25 machines.

New York

NEW YORK, Feb. 7.

THERE is a fair volume of inquiry for machine tools, but with the exception of some further purchasing by the Mergenthaler Linotype Co., Brooklyn, only a small number of purchases is reported. The Merganthaler list of purchases has been one of the largest since the war, totaling $1,000,000 to $1,200,000. In addition to the six turret lathes reported early in the year and about 20 engine lathes, of which 17 went to the Monarch Machine Tool Co. and three or more to the Hendey Machine Co., the Merganthaler company is understood to have closed on about 230 spindles of drills with Leland-Gifford Co. and 50 to 60 more with another maker. Its orders for milling machines total about $400,000, of which $250,000 worth was bought from one maker and $125,000 worth was distributed to four others. The Intertype Corporation, Brooklyn, is preparing additional production factilities and may be in the market for a few tools soon.

Machine tool builders have comfortably filled order books and in some instances are quoting slightly extended deliveries. One maker, quoting from seven to 15 weeks' has advanced prices about 10 per cent.

Recent purchases have included a 16 x 60-in. and a 20 x 72-in. lathe and a No. 2 Brown & Sharpe surface grinder by a California machine tool builder; an 8-in. rotary surface grinder by a Philadelphia company; an automatic grinder for thread milling machines by a New York City manufacturer, and a 42-in. boring and turning mill by a machine tool manufacturer in Cincinnati.

Plans are being arranged by Decorated Metal Mfg. Co., Sackett and Henry Streets, Brooklyn, for extensions and improvements in its six-story plant to cost close to $45,000. Slee & Bryson, 160 Montgomery Street, are architects.

A. C. and A. K. Roemermann, First National Bank Building, Mount Vernon, N. Y., architect, have plans for a two-story automobile service, repair and garage building, to cost approximately $100,000 with equipment.

General Motors Truck Co. and Yellow Coach Co., both operated as divisions of General Motors Corporation, Broadway and Fifty-seventh Street, New York, have leased seven-story building being erected at 211-25 West Sixty-first Street, totaling 140,000 sq. ft. floor space, and will centralize service and repair departments, as well as sales division, at that location.

Fairchild Aviation Corporation, 270 West Thirty-eighth Street, New York, is said to have plans for additions in its aircraft manufacturing plant at Farmingdale, L. I., to cost more than $50,000.

Westcott & Mapes, Inc., 233 Broadway, New York, architect and engineer, has plans for a 12-story terminal warehouse, with ice, cold storage and refrigerating departments, on block bounded by Eleventh and Thirteenth Avenues, Twenty-sixth and Twenty-seventh Streets, to cost about $7,500,000 with equipment.

General Bronze Corporation, recently formed to take over and consolidate John Polachek Bronze & Iron Co., Long Island City, and Renaissance Bronze & Iron Works, both at Long Island City, has concluded negotiations for purchase of the bronze and iron works of Tiffany Studios, Inc., Corona, L. I., with plant totaling about 2½ acres, specializing in architectural bronze and iron products, lighting fixtures, etc. New owner will maintain operations at Corona works.

Benjamin Stevens, Flatbush Avenue and Stevens Street, Brooklyn, has filed plans for a two-story automobile service, repair and garage building on Nostrand Avenue, to cost about $175,000 with equipment.

Columbia Air Liners, Inc., recently formed by Charles A. Levine, 233 Broadway, New York, is completing installation of plant at Long Island City, 100 x 100 ft., for manufacture of commercial and military airplanes, and parts.

Ossining Ice Co., South Highland Avenue, Ossining, N. Y., has work under way on a new plant to cost about $150,000 with machinery. Waldemar Mortensen, 405 Lexington Avenue, New York, is architect.

Universal Pipe & Radiator Co., 420 Lexington Avenue, New York, is arranging an expansion program, to include acquisition of other properties and manufacture of additional steel and iron products. It is purposed to increase capital from 400,000 to 3,000,000 shares of stock, no par value, at a special meeting Feb. 15, and to begin program immediately thereafter. Louis B. Ladoux is president.

Western Electric Co., 195 Broadway, New York, has awarded a general contract to Turner Construction Co., Graybar Building, for a one-story unit at its telephone apparatus and cable shops, Kearny, N. J., 97 x 348 ft., for by-products production, to cost in excess of $200,000 with equipment.

In connection with an expansion program to cost $22,000,000, Public Service Electric & Gas Co., Public Ser-

The Crane Market

INQUIRIES for both electric overhead and locomotive cranes are numerous, but purchasing is still limited. The Public Service Production Co., Newark, N. J., which has been in the market for three large capacity overhead cranes is understood to have closed. The Franklin Lumber Co., Newark, has not yet closed on its two lumber handling cranes. There are a number of inquiries current for locomotive cranes, but users are slow to place orders.

In the Pittsburgh district the Westinghouse Electric & Mfg. Co. is inquiring for a 5-ton, 25-ft. 6-in. span, 1-motor overhead crane.

Among recent purchases are:

Dixie Construction Co., High Level, Ala., 125-ton, 60-ft. 3-in. span, overhead crane with 15-ton auxiliary from Niles Crane Corporation.

Koppers Construction Co., Pittsburgh, a 5-ton, 50-ft. span electric crane for New Haven, Conn., from Niles Crane Corporation.

Otis Elevator Co., Yonkers, N. Y., 1-ton, 2-motor, single I-beam crane reported purchased from Shepard Electric Crane & Hoist Co.

Commonwealth of Massachusetts, a 6-ton, single I-beam hand power crane through a local dealer.

State Line Generating Co., Hammond, Ind., 20-ton, 33-ft. 4½-in. span; 20-ton, 28-ft. 5½-in. span and 20-ton, 26-ft. 1¾-in. span, electric overhead cranes and a 4-motor, 27-ft. 7-in. span bucket crane from Whiting Corporation.

Chicago Garbage Disposal Plant, three 2-cu. yd. bucket cranes from an unnamed builder.

New Haven Gas Co., New Haven, Conn., 5-ton, 50-ft. span crane to handle a ¾-cu. yd. bucket from Niles Crane Corporation.

Penn Metal Co., Parkersburg, W. Va., two 3-ton underhung transfer cranes and one 3-ton, 2-motor electric hoist from Northern Engineering Works.

vice Terminal, Newark, plans construction of a steel tower transmission line from a power substation and switching plant at Roseland, on which work has been started, to Bushkill, Pa., about 45 miles, where connection will be made with system of Pennsylvania Power & Light Co., Allentown, Pa.; Roseland station will occupy a 40-acre tract, and will cost close to $5,000,000 with equipment. About $3,000,000 will be expended for other transmission lines in different parts of State. Power substation at Kearny will be increased and additional equipment provided, to cost more than $400,000.

British-American Metals Co., South Second Street and Clinton Avenue, Plainfield, N. J., manufacturer of brass and copper tubing, etc., has authorized rebuilding portion of plant destroyed by fire Jan. 29, with loss in excess of $400,000 including machinery. Casting and machine shops were not damaged; tube mill was one story, 200 x 300 ft., and will be replaced in same size.

Triplex Safety Glass Co. of North America, Hoboken Terminal Building, Hoboken, N. J., has leased property at Passaic, N. J., formerly used by Passaic Cotton Mills, and will remodel for production of non-shatterable windshields.

Scandinavia Belting Co., Charlotte, N. C., manufacturer of brake bands, belting, etc., has leased one-story building to be erected at 248-50 Central Avenue, Newark, for an Eastern factory branch and distributing plant. Local office now at 226 High Street.

Bigelow & Shanley, 24 Walnut Street, Newark, architects, have plans for a new multi-story automobile service, repair and garage building, to cost $200,000 with equipment.

Guardian Fence Co., 1125 Broad Street, Newark, manufacturer of wire fencing, etc., subsidiary of Igoe Brothers, 234 Poinier Street, has leased three-story building at 32-34 Austin Street and 19 Tichenor Lane, for a new plant.

Board of Education, Union, N. J., contemplates installation of manual training department in addition to high school on Morris Avenue to cost $300,000, for which plans will be drawn by Fred Elsasser, 845 Broad Street, Newark, architect.

Ochrome Valve Co., 17-23 West Sixtieth Street, New York, has been formed to manufacture poppet valves for automobiles and Diesel engines, still plugs of special material and other items. Plant is at Bayonne, N. J.

Buffalo

BUFFALO, Feb. 6.

OFFICIALS of Savage Arms Corporation, Utica, N. Y., are organizing a company to take over electric refrigerator and affiliated branches and to carry out increased production in this line, including electric washing and ironing machines. A present subsidiary, known as J. Stevens Arms Co., with main plant at Chicopee Falls, Mass., will succeed to firearms division of parent company, with change in name to Savage-Stevens Arms Co. Production in latter line will be concentrated largely, it is said, at Chicopee Falls. Savage corporation will operate as a holding company for both interests.

Board of Education, Gowanda, N. Y., is considering installation of manual training equipment in a new high school, to cost $250,000, for which plans will be drawn by Edward Green & Sons, and Albert H. Hopkins, 1 Niagara Square, Buffalo, architects.

Lockport Light, Heat & Power Co., Lockport, N. Y., has secured permission to operate in Niagara and Olean Counties, and plans construction of new pipe lines for distribution of coke-oven gas secured from plant of Semet-Solvay Co., Tonawanda, N. Y., including line to Wrights Corner and Medina, to cost $334,000 with station equipment; and line to Olcott and vicinity to cost $136,400.

V. R. Decrow, 91 Walnut Street, Lockport, N. Y., and associates have formed Decrow Automotive Specialties, Inc., capitalized at $100,000, and contemplate establishment of local plant for manufacture of automobile equipment and devices. Earl E. Hoyt, 57 Locust Street, is also interested in organization.

Board of Education, Municipal Building, Rochester, N. Y., is asking bids on general contract until Feb. 23 for two-story Benjamin Franklin High School, to include manual training department, to cost $2,750,000. Gordon & Kaebler, Hiram Sibley Building, are architects.

Clinton Metallic Paint Co., Clinton, N. Y., has purchased mining plant and ore rights in this section formerly operated by late C. A. Borst. Negotiations have also been concluded for acquisition of deposit of hematite ores in this same district, heretofore held by Franklin Iron Mfg. Co. New owner is planning development and operation of properties for raw material supply, and will increase output of metallic paints.

Plans are now under way for rebuilding foundry of Otis-Sawyer Co., Oswego, N. Y., recently destroyed by fire, with a loss estimated at $40,000.

Fabrication of steel has been started in new plant of Leach Steel Corporation, Adele Street, Rochester. Main building is 60 x 200 ft., with shop 30 x 100 ft.

Philadelphia

PHILADELPHIA, Feb. 6.

BIDS have been asked on general contract by Norton Co., Worcester, Mass., manufacturer of grinding wheels, etc., for a two-story and basement factory branch and distributing plant, 57 x 100 ft., at Stenton and Louden Streets, Philadelphia, to cost more than $50,000 with equipment. Local headquarters are at 3208 Market Street. Ballinger Co., 105 South Twelfth Street, is architect and engineer.

Philadelphia Rapid Transit Co., 810 Dauphin Street, Philadelphia, is planning construction of an automobile service, repair and garage building, with bus terminal facilities in vicinity of Broad Street and Olney Avenue, to cost $1,500,000 with equipment. A similar multi-story structure will be erected also on Locust Street. Company is arranging for sale of $5,000,000 preferred stock, fund to be used for cost of structures.

Bids will be received by Bureau of Supplies and Accounts, Navy Department, Washington, until Feb. 14, for 320 pneumatic hose clamps and 1350 pneumatic hose couplings for Philadelphia Navy Yard, schedule 8416.

Harry L. Hussman Refrigerator Co., North Broadway, St. Louis, manufacturer of domestic refrigerators, freezers, etc., has acquired plant of Keystone Screw Co., Yardley, Pa., for new Eastern works. Existing plant consists of 35,000 sq. ft. of floor space on 17 acres and will be improved for immediate occupancy of new owner.

Philadelphia Rubber Works Co., Land Title Building, Philadelphia, has awarded general contract to Robert E. Lamb Co., 849 North Nineteenth Street, for a one-story addition to its mill at Oaks, Pa., 50 x 100 ft., to cost $40,000 with equipment.

Borough Council, Clayton, N. J., plans installation of electrically-operated pumping machinery and auxiliary power equipment at municipal waterworks. Fund of $100,000, is being arranged for expansion.

Giant Mfg. Co., Council Bluffs, Iowa, manufacturer of playground equipment, has leased portion of former pottery of John Maddocks' Sons Co., Trenton, N. J., and will remodel for Eastern branch factory, to specialize in merry-go-rounds and kindred apparatus.

Board of Public Works, Camden, N. J., William D. Sayrs, Jr., director, will soon ask bids for four pumping plants for municipal waterworks, with capacity of about 5,000,000 gal. per day, to cost close to $100,000.

Bartol Research Foundation, care of Dr. Howard McClenahan, Franklin Institute, 15 South Seventeenth Street, Philadelphia, has plans for a two-story engineering and laboratory building on Swarthmore College campus, Swarthmore, Pa., to cost about $150,000. John T. Windrim, Commonwealth Building, is architect.

Harry Burgin, 4608 Salmon Street, Philadelphia, and associates have organized Bridesburg Foundry Co., with capital of $50,000, and plan operation of works in Bridesburg district for production of iron castings, dies and kindred products. George Elliott, 4817 Leiper Street, is also interested in new enterprise.

American Assembling Machine Co., Easton, Pa., is arranging for establishment of local plant for mechanical parts production and assembling.

Pennsylvania Water & Power Co., Holtwood, Pa., is disposing of bond issue of $6,000,000, portion of proceeds to be used for expansion. Company is affiliated with Consolidated Gas, Electric Light & Power Co., Baltimore, and has plans for a hydroelectric power development on Susquehanna River, south of its present station at Holtwood.

Harry A. Whartenby, Inc., Philadelphia, has been chartered under State laws, with capital of $50,000, to take over and expand structural steel and iron business of Harry A. Whartenby, Fulton Building. New company will manufacture line of ornamental iron and steel products and other metal goods.

School District of Upper Darby Township, Upper Darby, Pa., is considering installation of manual training equipment in new junior high school to cost $700,000, for which plans will be drawn by Heacock & Hokanson, 1211 Chestnut Street, Philadelphia, architects.

Gannett, Seelye & Fleming, Inc., Harrisburg, Pa., engineer, operating public utility properties, has acquired plant and system of Elizabethtown & Marietta Gas Co., Elizabethtown, Pa. Plans are under advisement for expansion, including pipe line construction.

Moltrup Steel Products Co., Beaver Falls, Pa., maker of cold drawn, milled and ground specialties, has discontinued connection with Henry Stewart & Co., Drexel Building, Philadelphia, and opened a branch office at 617 Widener Building. Russell E. Crank is district sales manager.

Briscoe Mfg. Co., 725 Walnut Street, Lebanon, Pa., has been organized to manufacture patented flexible coupling and do a general machine and jobbing business. Factory is completed and company expects to be in operation soon.

Chicago

CHICAGO, Feb. 6.

AN additional inquiry for 34 tools to the list of the Santa Fe Railroad is the feature of this market. There is some doubt in regard to the report that the Studebaker Corporation, South Bend, Ind., will revive a list of experimental department tools. The Nash Motors Co., Kenosha, Wis., is purchasing tools for installation where production methods can be improved. The upward swing in sales late in January has been carried into February. Orders received, however, are scattered. New inquiry, which comes from widely diversified sources, is growing. Sales reported include a 25-in. x 20-ft. lathe, a 3½-ft. radial drill and a 14-in. tool room lathe.

Additions to Santa Fe List:

One portable crane.
One flanging clamp.
One 84-in. guide bar grinder.
Two 90-in. wheel lathes.
One 1500-lb. steam hammer.
One 8-in. cold saw.
One 24-in. upright drill.
One 14-in. x 6-ft. portable lathe.
One 30-in. x 16-ft. heavy-duty engine lathe.
One Niles, or equivalent, 90-in. locomotive truing machine.
One Hendey, or equivalent, 20-in. x 12-ft. heavy-duty engine lathe.
One Whitney, or equivalent, 20-in. x 2½-in. single wet tool grinder.
One 20-in. x 8-ft. heavy-duty engine lathe.
One 24-in. heavy-duty shaper.
Two Lucas No. 33, or equivalent, horizontal boring machines.
One Cincinnati No. 4, or equivalent, milling machine.
One 20-in. x 6-ft. brass turret lathe.
One 54-in. guard-wheel, tire-turning lathe.
One 90-in. driving wheel lathe.
Two 18-in. x 10-ft. engine lathes.
One 36-in. x 10-ft. engine lathe.
One 3½-ft. and one 4½-ft. radial drills.
One 20-in. drill press.
One Micro grinder.
One 2-in. double-head bolt cutter.
One 75-ton hydraulic press.
One 1¼-in. bolt cutter.
One 50-ton hydraulic press.
One 10-in. x 36-in. grinder.
One 39-in. crank planer.

Plans for merger of Jefferson Electric Mfg. Co., Chicago, with Chicago Fuse Mfg. Co. have been announced by John A. Bennan, president of both companies. Consolidated company will be known as Chicago-Jefferson Fuse & Electric Co. and will have an authorized capitalization of 120,000 shares of no par capital stock. Exchange of stock will be made on a share for share basis.

Hannifin Mfg. Co., 621 Kolmar Avenue, Chicago, manufacturer of machine tools, will build a two-story addition to provide 25,000 sq. ft. of floor space.

The Dominion Electric Co., Minneapolis, Minn., will build a shop addition to cost $25,000.

Mattoon Engine Works, 120 North Fourteenth Street, Mattoon, Ill., has been organized to succeed Chuse Engine & Mfg. Co. It will continue manufacture of steam engines in plant of former company and is prepared to carry out old contracts.

West Side Metal & Roofing Co., 2917 South La Salle Street, Chicago, has asked bids on general contract for a three-story addition, including improvements in present plant, to cost $150,000 with equipment. Lowenberg & Lowenberg, 111 West Monroe Street, are architects.

Rapid Roller Co., 800 Austin Avenue, Chicago, manufacturer of printers' rollers, etc., will proceed with erection of new three-story plant, 100 x 200 ft., to cost more than $250,000, instead of smaller sum. Present plant will be removed to new location. Schmid & Ryan, 77 West Washington Street, are architects.

Samuel Olsen & Co., 2418 Bloomingdale Avenue, Chicago, manufacturer of conveying machinery, etc., has asked bids on general contract for a one and two-story addition, 135 x 250 ft., to cost approximately $150,000 with equipment. Waller Co., 510 North Dearborn Street, is architect and engineer.

Great Northern Railway Co., Railroad Building, St. Paul, Minn., is considering extensions and improvements in its terminal and locomotive shops at Grand Forks, N. D., including addition to engine house, additional machine repair shops, two 100,000-gal. capacity water tanks, and other facilities, to cost in excess of $500,000. R. W. Davis is chief engineer.

City Council, Centralia, Ill., is considering installation of a municipal electric light and power plant, to cost more than $50,000 with equipment.

Davenport Cement Co., Davenport, Iowa, J. R. Lane, president, is said to be planning early construction of initial units of a cement mill at Buffalo, Iowa, to cost upward of $1,000,000 with machinery.

City Council, Great Falls, Mont., plans the installation of high duty pumping machinery to cost about $36,000, and other pumping and power equipment in connection with extensions and improvements in municipal waterworks, entire project to cost about $100,000. M. L. Morris is city engineer.

Great Northern Tool & Supply Co., Billings, Mont., J. C. O'Donell, manager, is considering plans for new factory branch for oil well equipment at Cody, Wyo., including machine shop and other structures.

William L. Hoffman, 718 West Sixty-third Street, Chicago, architect, has plans for a one-story automobile service and repair garage building, to cost $165,000 with equipment.

Chicago, Burlington & Quincy Railroad Co., 547 West Jackson Boulevard, Chicago, is reported planning extensions and improvements in its car and locomotive shops at Aurora, Ill., to cost $275,000 with equipment. A. W. Newton is chief engineer.

Key City Gas Co., Dubuque, Iowa, is considering construction of an addition to its artificial gas plant, to cost $200,000 with equipment; extensions will be made in pipe lines.

Beckwith Iron Works, 544 West Seventy-ninth Street, Chicago, has awarded general contract to Olson & Berg, 7957 Rhodes Avenue, for an addition, 40 x 180 ft., to cost $15,000 with equipment.

New England

BOSTON, Feb. 6.

MACHINE tool sales, which showed signs of activity the past 10 days, have slumped. With some dealers business is as quiet as at any time in December and November. While actual sales fell off inquiries increased and the trade feels confident that a good business will develop late this month or early in March. Recent sales included a new 53-in. boring mill, new 18-in. x 25-ft. engine lathe, two used milling machines, an arbor press, a 24-in. x 14-ft. lathe, 28-in. upright drill and a new band saw to Massachusetts shops; a two-spindle drill and an upright drill, used tools, to Maine users, and miscellaneous smaller equipment to plants in various sections of New England. Several pieces of equipment, each costing $5,000 to $7,000, also were sold, but because of the possibility of additional orders from these buyers, sellers are withholding details. The local trade expects that the General Electric Co., Pittsfield, Mass., will shortly close on several large machines.

Central Maine Power Co. contemplates a hydroelectric power development at Bingham, Me.

Pattern shop of Gibby Foundry Co., Condor Street, East Boston, valued at $25,000 and patterns valued at $75,000 were recently destroyed by fire. It is planned to rebuild.

Parker Wire Goods Co., Worcester, Mass., has acquired Stephen Richard Co., Inc., Southbridge, Mass., cutlery. It is planned to continue manufacture of cutlery, but to establish sales and shipping departments in Worcester.

Saco-Lowell Shops, Boston, textile machinery, will move its Lowell Machine Shop, Lowell, Mass., to its plant at Biddeford, Me. Lowell plant manufactures minor lines of cotton machinery, Bradford, worsted and spun silk machinery, while the Biddeford plant is devoted to spinning, roving and twister equipment. Kitson Machine Shop, Lowell, opening and picking machinery is not affected by this move. Company also operates a card and drawing machinery plant at Newton Upper Falls, Mass.

Mechanical Devices, Inc., with a capitalization of 700,000 shares of 7 per cent preferred stock, par $10, and 60,000 shares of common stock, par $5, has organized under Massachusetts laws to manufacture cotter pins, nuts, bolts, screws, etc., and to do engineering work. It will use part of Victory plant, Squantum, Quincy, Mass., which was operated during war by Bethlehem Shipbuilding Co., Ltd.

Contract has been let by Taunton-New Bedford Copper Co., New Bedford, Mass., to J. E. Cox Co., North Main Street, Fall River, Mass., for extensions and improvements in two-story plant, to cost more than $30,000.

Northern Rubber Co., Ballardvale, Mass., has acquired portion of local plant of Ballardvale Mills Co., consisting of two factory units on 2¾ acres, and will remodel for a new mill. It is purposed to begin production in March.

New England Public Service Co., Worcester, Mass., has purchased plant and properties of Utilities Power Co., Bristol, N. H., including a local power dam and hydroelectric power station and is planning to increase height of dam for expansion in generating capacity. Extensions will be made in transmission lines.

Public Building Department, City of Boston, City Hall Annex, has plans for a new power house at jail on Charles Street, to cost $100,000 with equipment. Bids will be asked by Desmond & Lord, 1 Beacon Street, architects. Department is also planning erection of a municipal automobile service, repair and garage building, to cost in excess of $200,000 with equipment.

Indiana Truck Corporation of Massachusetts, 54 Carleton Street, Cambridge, Mass., a subsidiary of Indiana Truck Corporation, Marion, Ind., has acquired building adjoining present factory branch, and will use for extensions.

Worcester Wire Works, Inc., 230 Ludlow Street, Worcester, Mass., has awarded a general contract to Bylund Brothers, Wallace Avenue, Auburn, Mass., for a two-story addition, 67 x 200 ft., to cost about $35,000.

Rhode Island Carboard Co., Pawtucket, R. I., has acquired through its subsidiary, Emerson Realty Corporation, plant of Home Bleach & Dye Works, Attleboro, Mass., and will remodel for new plant. Entire project, including purchase, is reported to cost more than $500,000. Lowell Emerson is president.

Coffin Valve Co., 20 Tolman Street, Boston, manufacturer of heavy gate valves, is said to be completing plans for rebuilding portion of plant recently destroyed by fire, with loss of more than $75,000 including equipment.

Kingsbury Machine Co., Keene, N. H., has changed its name to Kingsbury Machine Tool Corporation.

Pittsburgh

PITTSBURGH, Feb. 6.

MACHINE tool sales are dull, but inquiries are fairly active. A few dealers have succeeded in closing some old inquiries.

Locomotive Stoker Co., Pittsburgh, a subsidiary of Westinghouse Airbrake Co., has been sold to Standard Stoker Co., New York, which has plant at Erie, Pa., and will be known as Pittsburgh plant of Standard Stoker Co., Inc. Locomotive Stoker Co. will be dissolved after servicing of numerous stokers now in use on locomotives and coal pushers is completed.

Chromium Co. of Pittsburgh, has been incorporated under Pennsylvania laws and is engaged in chromium plating in a plant at 400 Lexington Avenue. Offices are at 1005 Park Building. Norman Allderdice is president and Dr. R. J. Piersol, vice-president and consultant.

Plans are under consideration by Baltimore & Ohio Railroad Co., Baltimore, for rebuilding engine house and adjoining machine shops at its repair works, Connellsville, Pa., destroyed by fire Feb. 2, with loss in excess of $400,000, including equipment.

United States Engineers, Huntington, W. Va., are asking bids until Feb. 15 for a quantity of iron rivets, circular 137; until Feb. 13 for riveted spiral pipe, circular 135; until Feb. 16 for 1540 lb. steel pipe lining, 1875 lb. steel swing chain, and two sprocket chains, circular 136.

W. T. Carson Battery Co., Huntington, W. Va., plans rebuilding its service, repair and garage building at 1331 Third Avenue, recently destroyed by fire, with loss close to $100,000 including equipment.

Hubbard & Co., Granite Building, Pittsburgh, manufacturers of heavy hardware products, plan rebuilding machine shop destroyed by fire Jan. 31, with loss estimated at $21,000 including equipment.

Board of Education, Fulton Building, Pittsburgh, is arranging an early call for bids on general contract for a two-story and basement trade and vocational school, to cost $150,000 with equipment. E. B. Lee, Chamber of Commerce Building, is architect.

Philip Palmgreen, McKeesport, Pa., and associates, have formed Palmgreen Mfg. Co., to operate local plant for manufacture of tools and machinery. Ben A. Dahlin, Versailles, Pa., will be an official of new company.

South Atlantic States

BALTIMORE, Feb. 6.

BIDS will be asked soon for a one-story addition to plant of Davison Chemical Co., Garrett Building, Baltimore, manufacturer of acids, fertilizers, etc., Curtis Bay district, to cost in excess of $400,000 with machinery. A. Benzon is company engineer.

Newman Machine Co., Jackson Street, Greensboro, N. C., manufacturer of wood-working machinery and tools, has plans for a one-story addition, 60 x 135 ft., to cost about $80,000 with equipment. Extension will provide total floor space of more than 42,000 sq. ft. Later it is purposed to build a one-story foundry addition. Company recently increased capital to $500,000 for expansion.

Board of Commissioners, District Building, Washington, is asking bids until Feb. 20 for foundry and forge shop equipment for McKinley Technical High School.

Maryland Clay Products Co., Frostburg, Md., recently formed by J. Glenn Beall, Frostburg, and associates, has plans for new plant for manufacture of vitrified sewer pipe, to cost in excess of $200,000 with machinery. Site has been selected along line of Western Maryland Railway. Ervin I. Prichard, Frostburg, is also interested in organization.

Capital Granite Co., Columbia, S. C., recently organized with capital of $300,000 by Robert G. Lassiter, Oxford, N. C., and associates, has plans for a new rock-crushing plant in vicinity of Blairs, S. C., to have capacity of 3000 tons per day. D. E. Saunders, Columbia, is secretary.

Crown Cork & Seal Co., 1611 Guilford Avenue, Baltimore, manufacturer of metal bottle caps, capping machinery, etc., will make extensions and improvements in three-story plant to cost $50,000. L. R. White, Hearst Tower Building, is architect.

J. A. Jones Construction Co., Realty Building, Charlotte, N. C., has filed plans for four-story automobile service, repair and garage building, to cost upward of $200,000 with equipment.

Bureau of Supplies and Accounts, Navy Department, Washington, is asking bids until Feb. 14 for six motor-generator sets and spare parts for navy yard at Anacostia, schedule 8451; for 6691 lb. rough machined forged shafts for Brooklyn Navy Yard, schedule 8463; for wire, brass, copper, bronze and steel for Eastern and Western yards, schedule 8420; for quantity of brass, copper and steel burrs, rivets and washers for Eastern and Western yards, schedule 8423; and for quantity of machine and wood screws and nuts for Philadelphia yard, schedule 8404.

Baker County Power Co., Moultrie, Ga., is reported planning installation of a local power house, using Diesel engine units. Company was recently acquired by W. B. Foshay Co., Foshay Building, Minneapolis, Minn.

Edisto Public Service Co., Denmark, S. C., will make extensions in power facilities and transmission lines in Allendale section, where electric light and water properties recently were acquired.

Bureau of Yards and Docks, Navy Department, Washington, is asking bids (closing date not stated) for refrigerating equipment for marine barracks, Mare Island, Cal., including motor-driven compressor, motor-driven brine pump, control equipment, switchboard apparatus, etc., specification 5523.

Dreamland-on-the-Bay, Inc., Love Point, Md., C. W. Elrod, general manager, is considering construction of steam-operated electric power plant, to cost more than $60,000 with equipment. Application has been made for permission to build transmission lines for service at Chester, Stevensville and vicinity.

M. H. Elder Culvert & Machinery Co., Atlanta, Ga., has been formed by merger of Southern Supply Co. and M. H. Elder Co., both of Atlanta, and will carry line of products of Galion Iron Works, Galion, Ohio, and other makers of road building and construction supplies. Warehouses have been opened at 653 Whitehall Street, Atlanta, and company will operate in Georgia, Florida, South Carolina and Alabama.

Milwaukee

MILWAUKEE, Feb. 6.

WHILE machine tool sales have not yet reached a substantial volume, conditions in the trade are becoming more satisfactory and give indications of a steady increase. Inquiry is active, with automotive industries showing greater interest than for the past six months. Due largely to the greater activity of these industries, Milwaukee employment has increased 1000 men in the past thirty days.

Allis-Chalmers Mfg. Co., Milwaukee, has placed orders amounting to $100,000 for new production machinery for its tractor division and is in market for additional miscellaneous items.

Modine Mfg. Co., Seventeenth and Racine Streets, Racine, Wis., manufacturer of radiators and cooling systems for internal combustion engines, contemplates construction of an addition costing about $100,000 complete. Bids will be taken about March 15.

MacWhyte Co., Kenosha, Wis., manufacturer of wire rope, cable, etc., has placed general contract with John Zoubek, 4042 Seventh Street, local, for erection of a mill addition to cost about $25,000.

Quality Aluminum Casting Co., Lincoln Avenue, Waukesha, Wis., has contracted with Paul Gierke, 816 Lincoln Avenue, local, for construction of a brick and steel foundry addition, 40 x 200 ft.

J. E. Fuller and associates, Rockford, Ill., have purchased former plant and property of Acme Brass & Metal Works, Waupaca, Wis., with patent rights to Jorgenson primer for gas engines, and will resume operation upon completion of alterations and replacements. A gray iron foundry unit will be established and a general line of automotive and power farm machinery specialties will be manufactured.

George S. Parker Co., 219 Court Street, Janesville, Wis., manufacturer of fountain pens and metal magazine pencils, is holding in abeyance plans by F. A. Carpenter, architect, Brown Building, Rockford, Ill., for an addition estimated to cost $150,000. Work may be undertaken later in year.

Gold Medal Camp Furniture Co., Racine, Wis., has acquired plant and equipment of R. B. Lang Mfg. Co., 1800 Holborn Avenue, Racine, at assignee's sale for $14,900, and will use it as an additional production unit for metal parts. Lang company manufactured hardware specialties and metal stampings and has been in liquidation following death of its founder and president, R. B. Lang. Some alterations will be made by Gold Metal company, with replacement of obsolete equipment.

Nekoosa Motor & Machine Co., Nekoosa, Wis., has plans by Frank J. Henry, architect, Wisconsin Rapids, Wis., for a new machine shop costing about $25,000 with equipment. Work will begin March 1.

Gedemer Tool & Machine Co., 1920 Taylor Avenue, Racine, Wis., is preparing to build a new unit at a cost of about $25,000.

Atlas Engineering Co., 3038 Galena Street, Milwaukee, which recently sold its mortar and plaster mixer department to Chain Belt Co., Milwaukee, has changed its name to Zimmermann Engineering Co. and will continue to manufacture other lines of mechanical specialties. H. W. Zimmermann is president.

Kurz-Root Co., Appleton, Wis., manufacturer of electrical appliances and specialties, sustained a loss of $15,000 by fire on Feb. 2. Plans are being made for erection and equipment of a new plant.

Armstrong Foundry Co., 1530 Junction Avenue, Racine, Wis., manufacturer of gray iron castings, has plans by J. Mandor Matson, local architect, for a brick and steel addition, 70 x 80 ft. Work will begin about March 1.

Cincinnati

CINCINNATI, Feb. 6.

SALES turned sharply upward the past week, with the result that machine tool builders are in the best position in several months, so far as orders on hand are concerned. Buying has been well apportioned among all consuming lines, although automobile companies probably have been the most active purchasers. Inquiries have been good, and manufacturers are of the opinion that bookings during February and March will be of liberal volume. The automotive industry affords promise of yielding substantial business through the first half of 1928, pending transactions indicating that expenditures in the Detroit district will approximate at least $500,000, and possibly considerably more.

Railroads are beginning to come into the market. The Santa Fe has issued a list covering its annual requirements, while the Southern has placed an order for three large shapers. The Norberg Mfg. Co., Milwaukee, has bought a 62-in. heavy boring mill and a 73-in. standard boring mill. Many machine tool companies report a heavy increase in demand for repair parts. Electrical tool manufacturers state that sales have been fairly good in the past 30 days, and prospects are favorable for active business in the first six months of the year. Purchases by companies in the automobile industry have contributed much to order books.

Plans are being considered by Armstrong-Johnston Mfg. Co., foot of West First Avenue, Columbus, Ohio, manufacturer of truck and cab bodies, for a two-story addition to cost about $40,000 with equipment.

Ohlen-Bishop Co., Columbus, Ohio, manufacturer of saws, saw frames, etc., contemplates rebuilding portion of plant destroyed by fire Jan. 29, with loss in excess of $100,000 with machinery.

I. F. Weber & Co., Commercial Building, Dayton, Ohio, engineers and contractors, have plans for a three-story automobile service, repair and garage building to cost $250,000.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until Feb. 20 for 65 spinner assemblies, split hub propellers, circular 215; until Feb. 13 for inverted Liberty engine spare parts, circular 199; until Feb. 13 for 30 sets bomb rack installation parts, circular 207.

W. M. Dean Marble Co., South Garden Street, Columbia, Tenn., will begin a one-story addition, 106 x 145 ft., with installation of additional machinery. Capital has recently been increased to $75,000 for expansion.

Diamond Ice Co., Knoxville, Tenn., operated by Standard Ice Co., is considering erection of a one-story plant to cost close to $200,000 with equipment.

Tennessee Electric Power Co., Chattanooga, Tenn., will make extensions and improvements at Maryville, Tenn., and vicinity, including construction of transmission lines, additional substation equipment, etc. O. T. Huddleston is local manager.

Steel Products Engineering Co., Springfield, Ohio, plans installation of additional machinery.

Advance Bag & Paper Co., Inc., Middletown, Ohio, has arranged for a bond issue of $3,750,000, a portion of proceeds to be used for expansion. Work is under way on a new mill at Hodge, La., for manufacture of kraft paper products, containers, etc., to cost upwards of $1,500,000 with machinery.

Ovens, power equipment, conveying and other machinery will be installed in one-story and basement plant, 70 x 200 ft., to be erected by Blue Bird Baking Co., Horton Street, Dayton, Ohio, to cost about $85,000 with equipment.

Cincinnati Gas & Electric Co., Cincinnati, is concluding negotiations for a merger with Columbia Power Co. and Union Gas & Electric Corporation, under first noted name. An expansion program will be carried out, including transmission line construction.

Monroe Brass & Wire Co., Traction Building, Cincinnati, has been appointed representative in this territory for Fitzsimons Co., Youngstown, Ohio, manufacturer of cold drawn steel.

Indiana

INDIANAPOLIS, Feb. 6.

CONTRACT has been let by Bendix Brake Co., Bendix Drive, South Bend, Ind., manufacturer of automobile brakes and kindred equipment, to H. G. Christman & Co., 306 South Notre Dame Avenue, for a one-story addition, 100 x 120 ft., to cost about $30,000 with equipment.

Indiana Service Corporation, Fort Wayne, Ind., is arranging bond issue of $5,000,000, portion of fund to be used for extensions and improvements in power plants and transmission lines.

Delco-Remy Corporation, Anderson, Ind., manufacturer of automobile electric lighting and starting equipment, is completing plans for an addition to be used largely for production of storage batteries, to cost in excess of $75,000.

Interstate Public Service Corporation, Indianapolis, has applied for permission to issue bonds in amount of $12,554,000, portion of proceeds to be used for expansion and improvements in electric light and power properties, including transmission lines.

United States Corrugated Fibre Box Co., 1315 Martindale Avenue, Indianapolis, plans early installation of machinery in new one-story plant, 125 x 300 ft., at Dayton, Ohio, on which work is under way. It is reported to cost upward of $100,000 with equipment. Charles E. Bacon, Odd Fellows Building, is architect.

City Council, Elkhart, Ind., plans early call for bids for an elevated steel water tank and tower with capacity of 500,000 gal., for municipal water department. Fred Anderson is city engineer.

Board of Education, Mishawaka, Ind., contemplates installation of manual training department in a two-story and basement junior high and grade school to cost $235,000, for which superstructure will soon begin. Hamilton, Fellows & Wilkinson, Tower Court, Chicago, are architects.

Baker Ice Machine Co., Omaha, Neb., manufacturer of ice and refrigerating machinery, has taken over building of Swartz Electric Co., West Sixteenth Street, recently acquired, and will establish new factory branch and distributing plant.

Cleveland

CLEVELAND, Feb. 6.

MACHINE tool sales and inquiries gained the past week following a slowing down during the previous week. A local manufacturer purchased eight small turret lathes from a Cleveland builder for use in making shock absorbers for automobiles. A local company purchased four 16-in. engine lathes and another two 10-ft. heavy-duty squaring shears. A Cleveland manufacturer sold five small turret lathes to an Eastern manufacturer of brass goods.

A fair volume of business is being done in the Detroit territory. Woodworking machinery is fairly active. The St. Marys Wheel & Spoke Co., St. Marys, Ohio, which is adding the manufacture of furniture to its other products, has purchased 45 new wood-working machines and six rebuilt machines. The Perfection Stove Co., Cleveland, is taking estimates on about 25 wood-working machines.

Butler Mfg. Co., 1812 East Twenty-fourth Street, Cleveland, manufacturer of street-cleaning machinery, sweepers, has leased new factory to be erected at Akron, Ohio, by Akron, Canton & Youngstown Railway Co.

National Sanitary Co., Salem, Ohio, manufacturer of sanitary ware, contemplates rebuilding portion of plant destroyed by fire Jan. 29, with loss reported in excess of $300,000 including equipment.

B. J. Long, 17712 Riverway Avenue, Cleveland, has filed plans for a one-story machine shop, 45 x 115 ft., to cost about $30,000 with equipment.

Northern Ohio Power & Light Co., Akron, Ohio, is arranging an expansion and improvement program to cost $1,600,000 for Akron district, including completion of power substation on Beach Street, cost $150,000; completion of new power substation at South Akron, $125,000; improvements in downtown heating plant and system, $248,000; extension in transmission lines, new power substations at Fairlawn, Kent, Lake Junction and vicinity and miscellaneous work.

Paterson-Leitch Co., 900 East Sixty-ninth Street, Cleveland, operating a structural steel fabricating plant, has filed plans for a one-story addition, 70 x 200 ft., to cost about $30,000. A 10-ton traveling crane and other handling equipment will be installed.

Canfield Oil Co., 3216 East Fifty-fifth Street, Cleveland, is considering extensions and improvements in its refinery, including installation of equipment for modernizing unit for handling crude oil.

Plant of Perkins Structural Steel Co., Wooster, Ohio, together with equipment, tools, machinery, etc., will be sold at public auction Feb. 14.

St. Louis

ST. LOUIS, Feb. 6.

PLANS are being considered by Central Hardware Co., 811 North Sixth Street, St. Louis, for a new multi-story storage and distributing plant, to cost $100,000 with equipment.

Alois Aufrichtag Copper & Sheet Iron Mfg. Co., 900 South Third Street, St. Louis, has begun superstructure for a new one-story plant, 80 x 240 ft., with extension, 30 x 100 ft., for tool room and boiler house, entire project to cost upward of $60,000 with equipment.

Common Council, Blackwell, Okla., is considering installation of additional equipment in municipal light and power plant to cost $30,000.

St. Joseph Lead Co., 60 Wall Street, New York, is reported planning installation of a new concentrating mill at Mine La Motte, vicinity of Bonne Terre, Mo., to cost in excess of $200,000 with equipment.

Swallow Airplane Co., Wichita, Kan., Victor Roos, manager, is planning erection of three one-story units, 50 x 100 ft, 40 x 50 ft., and 28 x 65 ft., to cost more than $40,000 with equipment.

Western Refrigeration Co., Twenty-first and Campbell Streets, Kansas City, Mo., has taken out permits for two new local ice-manufacturing plants, to cost $160,000 and $150,000, respectively, with machinery.

Harding Glass Co., Fort Smith, Ark., manufacturer of sheet glass products, has plans for extensions and improvements, with installation of additional equipment, to cost about $150,000.

Budig Machine Co., McCook, Neb., plans one-story machine shop addition, 40 x 100 ft.

Nebraska Power Co., Seventeenth and Harney Streets, Omaha, Neb., is planning an expansion and improvement program to cost about $1,500,000, including extensions in power plants and transmission lines. New 60,000-volt line will be built from Omaha to Louisville, Neb.

Hill, Hubbell & Co., Tulsa, Okla., manufacturer of paints, etc., has plans for a new four-story factory, to cost $75,000 with equipment. W. D. Blakley, Tulsa, is architect.

American Eagle Aircraft Co., Thirteenth and Chestnut Streets, Kansas City, Mo., is said to be planning immediate installation of equipment in a local building for parts production and assembling.

General Motors Corporation, Detroit, has begun erection of a new branch at 2501 McGee Road, Kansas City, Mo., 170 x 230 ft., to cost about $115,000 with equipment. It will be used for service, repairs and sales of General Motor Truck Division, Yellow Truck & Coach Division, and Hertz Drivurself Stations, Inc.

National Milling Co., 2221 Front Street, Toledo, Ohio, plans construction of a new flour mill at North Kansas City, Mo., with machinery for initial capacity of 3000 bbl. per day, to cost close to $800,000 including equipment.

Spartan Aircraft Co., 2240 St. Louis Street, Tulsa, Okla., recently formed with capital of $1,000,000 by Willis C. Brown, contemplates establishment of local plant for manufacture of airplane parts and accessories.

Detroit

DETROIT, Feb. 6.

CONTRACT has been let by Hupp Motor Car Co., 3641 East Milwaukee Street, Detroit, to Everitt-Winters, Inc., 1651 East Grand Boulevard, for a one-story addition to cost close to $30,000 with equipment.

Rich Steel Products Co., Battle Creek, Mich., has acquired 10 acres at Marshall, Mich., as site for new plant on which work will soon begin. It is reported to cost upward of $60,000 with equipment.

Oakland Motor Car Co., Oakland Avenue, Detroit, has awarded general contract to R. S. Knapp Co., Idaho and Fenkell Streets, Detroit, for a two-story addition for general engineering service, to cost $150,000 with equipment.

Consolidated Paper Co., Monroe, Mich., has awarded general contract to Owen-Ames-Kimball Co., Grand Rapids, Mich., for a four-story addition, primarily for manufacture of folding paper boxes and containers, to cost $300,000 with equipment.

Grand Rapids Gas Light Co., 47 Division Street, North, Grand Rapids, Mich., has plans for extensions and improvements in its artificial gas plant, to cost in excess of $250,000 with equipment. A booster gas pump and other machinery will be installed.

Department of Street Railways, Detroit, has taken out permit for a new automobile service, garage and repair building, to cost close to $100,000 with equipment.

Brunswick-Balke-Collender Co., 623 South Wabash Avenue, Chicago, manufacturer of talking machines, etc., has arranged for removal of its local plant to factory at Muskegon, Mich., where bulk of production will be concentrated. Muskegon plant will be extended.

Commercial Milling Co., 203 Randolph Street, Detroit, will soon take bids for an addition to its flour mill, to cost close to $85,000 with equipment. Fraser Co., 667 East Water Street, Milwaukee, is engineer.

Edwin Sterner Co., Flint, Mich., plumbing and heating equipment, has acquired former four-story plant unit of Hayes Wheel Co., totaling about 80,000 sq. ft. of floor space, and will remodel for expansion.

Hudson Motor Car Co., East Jefferson Avenue, Detroit, has filed plans for an addition, including improvements in portion of present plant, to cost $375,000 with equipment. Albert Kahn, Marquette Building, is architect and engineer.

Jaxon Steel Products Co., Jackson, Mich., division of General Motors Corporation, has begun production of stampings in portion of former plant of Kelsey-Hayes Wheel Corporation, and plans expansion in facilities and production to occupy entire works.

Detroit Boring Bar Co., 682 East Fort Street, Detroit, has been organized to manufacture boring bars, both of its own patented type and to customer specification. At present company is operating in plant of Waterman Corporation and is fully equipped.

Pontiac Sheet Metal & Roofing Co., Pontiac, Mich., has been organized to manufacture and install sheet metal building products and roofing. Plant is being erected and large part of equipment has been purchased.

Gulf States

BIRMINGHAM, Feb. 6.

PLANS have been completed by St. Petersburg Cold Storage Co., St. Petersburg, Fla., for a four-story cold storage and refrigerating plant to cost about $275,000 with machinery. C. C. Whitaker, Bona Allen Building, Atlanta, Ga., is architect and engineer.

North Alabama Utilities Co., Sheffield, Ala., recently formed with capital of $100,000 by R. T. Simpson, Sheffield, and associates, has acquired local site for artificial gas plant to cost $65,000.

Thompson Can Co., Dallas, care of Industrial Department, Chamber of Commerce, Dallas, recently chartered with capital of $70,000 by E. Rowse Thompson and associates, is planning early erection of a new plant for manufacture of tin cans, to cost $50,000 with machinery, which will be of automatic type.

Gulf, Colorado & Santa Fe Railway Co., Union Depot, Galveston, Tex., is considering establishment of a new engine house with machine shops and repair facilities at San Angelo, Tex., to cost in excess of $90,000 with equipment. F. Merritt is chief engineer.

Daniel Japhet, State National Bank Building, Houston, Tex., contractor, has filed plans for a three-story automobile service, repair and garage building, 125 x 125 ft., to cost about $150,000 with equipment.

Gulf States Utilities Co., Beaumont, Tex., is said to have plans for extensions and improvements in local power house, as well as power stations at Hull, Jasper and Port Arthur, Tex., with installation of additional equipment. Company will also improve ice-manufacturing plants at Orange and Port Arthur, with additional machinery installation. Work is in progress on extensions in electric generating plant at Lake Charles, La., with additional equipment, and permit has been secured for new power substation at Beaumont.

Consumers' Ice & Coal Co., 945 Houston Avenue, Port Arthur, Tex., is contemplating an extension to its plant, with installation of additional equipment, to cost $50,000.

Atchison, Topeka & Santa Fe Railway Co., 80 East Jackson Boulevard, Chicago, has plans for a one-story locomotive repair shop, 200 x 500 ft., at Cleburne, Tex., to cost upward of $150,000 with machinery. C. F. W. Felt is chief engineer.

Chevrolet Motor Co., Flint, Mich., has awarded general contract to Hewitt Construction Co., Houston, Tex., for a new two-story assembling plant at Houston, where site, 100 x 250 ft., has been acquired, to cost close to $200,000 with equipment.

Board of Education, West Point, Miss., contemplates installation of manual training equipment in a two-story and basement high school to cost $160,000, for which bids will soon be called. George Mahan, Jr., City Savings' Bank Building, Memphis, Tenn., is architect.

Presidio Light & Ice Co., Presidio, Tex., has plans for extensions and improvements in local power house, including installation of a new turbo-generator unit and accessories, to cost $70,000 with other machinery.

Aransas Compress Co., Corpus Christi, Tex., has plans for an addition to cost more than $300,000 with machinery. A high density compress, boilers, and other equipment will be installed. Hardy & Curran, Nixon Building, are architects.

J. E. Mitchell, 600 South Sixth Street, St. Louis, is at head of a project to construct and operate a plant at Dallas, Tex., for manufacture of cotton ginning machinery and parts. Property has been secured and work on two-story factory will soon begin, to cost about $35,000 with equipment.

Roxana Petroleum Corporation, Shell Building, St. Louis, has acquired about 13 acres at Midland, Tex., and plans construction of storage and distributing plant to cost upward of $75,000.

City Council, Amarillo, Tex., is planning installation of electrically operated pumping machinery and auxiliary power equipment in connection with extensions and improvements in municipal waterworks. Entire project will cost $125,000. H. B. Jones is city engineer.

Board of Trustees, Prairie View State College, Prairie View, Tex., is planning construction of a one-story unit for a boys' trade and vocational school, to cost $150,000.

Pacific Coast

SAN FRANCISCO, Feb. 1.

PLANS are being considered by Northwestern Pacific Railroad Co., San Francisco, for new power house at its car and locomotive shops. Work will be carried out in connection with an expansion program to cost more than $100,000.

California Rubber Products Co., Redwood City, Cal., manufacturer of hard rubber goods, has leased local plant and will remodel for a new factory. A department for refining gutta percha will be installed.

Fresno-Madera Ice Co., Seventh Street and Ventura Avenue, Fresno, Cal., is planning erection of a new plant, to cost about $100,000 with machinery.

Coast Counties Gas & Electric Co., Santa Cruz, Cal., has plans for a new equipment storage and distributing plant at Hollister, Cal., to cost about $35,000 with material-handling, repair and other equipment.

Metro-Goldwyn-Mayer Studios, Inc., Culver City, Cal., has plans for a one-story machine shop at its motion picture plant, 100 x 100 ft., to cost in excess of $40,000 with equipment. J. M. Haenke, Subway Terminal Building, Los Angeles, is architect.

Southern California Edison Co., Los Angeles, is disposing of preferred stock issue to cost close to $1,000,000, portion of proceeds to be used for extensions and improvements, including transmission line construction. Company has approved plans for expansion in Tulare district to cost about $325,000.

Lewis County Concrete Products Co., Chehalis, Wash., operated by Concrete Pipe Co., 134 Nickerson Street, Seattle, is arranging early erection of initial unit of a new local plant for production of concrete pipe and kindred specialties, to cost about $40,000 with equipment. Additional units will be built later. Thomas Stoy is local manager.

Puget Sound Power & Light Co., Seattle, is arranging an expansion and improvement program to cost $4,475,000. Work will include extensions in hydroelectric power plant on Baker River, to increase output by 27,000 hp., new power transmission line from Baker generating station to Seattle, substation equipment, etc. Company is operated by Stone & Webster, Inc., Boston.

San Joaquin Light & Power Corporation, Fresno, Cal., has approved plans for first unit of new power substation at Ashland and West Avenues, including additional transmission line, to cost about $90,000. Expansion will be carried out later, with ultimate cost of $250,000.

Apple Growers' Cold Storage Co., Watsonville, Cal., recently organized, has engaged Trine Service Corporation, Central National Bank Building, Oakland, Cal., architect and engineer, to prepare plans for a one-story cold storage and refrigerating plant, 300 x 500 ft., to cost approximately $250,000 with machinery.

Brown Instrument Co., Philadelphia, manufacturer of pyrometers, thermometers and other indicating and recording instruments, has opened new branch office at 537 Holbrook Street, San Francisco.

Foreign

CONTRACT has been let by Soviet Metal Trust, Moscow, Russia, to Frank D. Chase, Inc., 720 North Michigan Boulevard, Chicago, engineer, for plans and erection supervision for a new foundry at site of former plant of Singer Mfg. Co., Podolsky, about 25 miles from Moscow. It will have capacity of 150 tons per day, approximately trebling present output, and will cost in excess of $750,000. Work is scheduled to begin this summer.

Stuart & Partners, 12 Berkeley Street, London, W. 1, general contractors, have secured award for a new beet sugar refinery at Brigg, Lincolnshire, England, for which plans were prepared by German interests. Unit is estimated to cost close to $1,000,000 with machinery. Information at the American Consulate, London, William L. Cooper, commercial attaché.

Terni-Societa per l'Industria e l'Elettricita, Rome, Italy, known as Terni, is disposing of a bond issue of $12,000,000 in the United States, portion of proceeds to be used for hydroelectric power development, including completion of plant now in course of construction to have initial output of 105,000 kw., and similar type station of Societa Elettrica dell' Alto Nera, a subsidiary, designed for capacity of 9000 kw. Extensions will be made in transmission lines and substations.

Establissements Kuhlmann, Paris, France,. manufacturer of industrial chemicals, etc., has arranged for increase in capital from 200,000,000 to 250,000,000 fr., and will soon dispose of a block of stock in United States, proceeds to be used primarily for expansion in synthetic nitrate works, including buildings and equipment.

Colombian Government Bureau of Information, 1440 Broadway, New York, has detailed information regarding equipment and materials to be purchased by Republic of Colombia, South America, for 1928 railroad, waterway and highway construction, including data on bids to be received by Senor Ministro de Obras Publicas, Bogota, Colombia. Purchases will aggregate $10,000,000, and will include steel rails, steel for bridges, locomotives, stone-crushing plants, road rollers, concrete mixers, steel wire and cable, dynamite, pipe barges, construction machinery and miscellaneous equipment. Abram Martinez is director of information bureau at New York.

American-Russian Chamber of Commerce, 143 West Fifty-seventh Street, New York, has information regarding enlargement of bicycle manufacturing plant at Kharkov, Russia, for which it is proposed to secure a fund from net profits of industries of the Ukraine.

Canada

TORONTO, Feb. 6.

MACHINE tool sales are increasing, each week showing some improvement over the one preceding. Local builders and dealers are optimistic regarding the future and look for increased activity in early spring. In addition to the better domestic demand, there is general improvement in imports, especially in such lines as are not made in the Dominion, the United States benefiting considerably by this business. The automotive and mining industries are responsible for much of the current orders.

Bids are being received by F. A. Dallyn, 71 King Street West, Toronto, for following equipment required by water commissioners of Palmerston, Ont.: One direct-connected motor-driven centrifugal fire pump, capacity 850 gal. per min. with C. G. E. C. R. 7051-K1 automatic starting compensator with push button control, with no voltage and overload protection; gasoline-driven double-section centrifugal fire pump; and one deep water centrifugal multistorage pump, capacity 350-400 gal. per min., total discharge head 185 ft. Latter pump is to be installed in a setting 100 ft. below surface, price to include installation in well; all prices f.o.b. Palmerston, tax included.

Bids will be called at once by Municipal Council, Loretteville, Que., for construction of waterworks and sewage plants and systems on which work will start in spring. Estimated cost is $200,000.

Town Council, Pembroke, Ont., is in market for a 1400 gal. per min. pump for waterworks plant. E. G. R. Lewis is chairman of waterworks commission.

Bids will be called immediately by W. J. Walsh, architect, 304 Terminal Building, for a factory and office to cost $35,000, for F. T. Brooks, 28 Mary Street, Hamilton, Ont.

Dominion Truck Co., South Street, Kitchener, Ont., is having plans prepared by B. A. Jones, 14 Ontario Street South, for factory addition to cost $10,000.

Canadian Cartons, Ltd., 364 Richmond Street West, Toronto, will build a manufacturing plant at corner of Perth and Addison Avenues.

J. Robert Page, 18 Toronto Street, Toronto, has contract for erection of a two-story factory, 63 x 165 ft., to cost $50,000 for Art Craft Top & Trimming Co., 9 Bloor Street East. E. A. H. Menges, 40 Strathearn Boulevard, is architect.

Fire, Jan. 29, destroyed plant of Peterborough Lock Mfg. Co., Peterborough, Ont., with loss, including machinery, estimated at $75,000 to $100,000.

Western Canada

Baynes & Horie, 846 Howe Street, Vancouver, B. C., have contract for $6,000 addition to plant of the Tait Pipe & Foundry Co., 4100 Nanaimo Street, Vancouver.

Bids are being received by S. E. O'Brien, secretary Dominion Department of Public Works, Ottawa, Ont., until Feb. 15, for construction of drydock and plant buildings at Esquimalt, B. C.

Northern Construction Co., and J. W. Stewart, 736 Granville Street, Vancouver, B. C., have been awarded contract by Alberta Wheat Pool, Calgary Alta., for construction of superstructure of a grain elevator at foot of Rupert Street, Vancouver, to cost $2,500,000. C. D. Howe & Co., Port Arthur, Ont., are architects.

Growth of the Port of Montreal

A splendidly illustrated and printed book on the development of the only world port receiving ocean steamships located 1000 miles from the ocean, has been put out by the Harbor Commissioners of Montreal. It consists of 80 pages, mostly pictorial, but with a large amount of data covering operations of the port and, particularly, showing its rapid growth. In the seasons of 1924, 1925 and 1926 an average of more than 1000 transatlantic vessels each year arrived in the port. The annual tonnage of these ships averages a little less than 4,000,000.

VOL. 121, No. 7

Profits By Diversifying Products

Moderate Size Plant Anticipates Disadvantage of Single Line and Extends Activities by Developing New Devices—Production Carefully Planned

BY BURNHAM FINNEY*

EXCESS producing capacity has been put forward in the past few years as one of the chief ills affecting many industries. Some manufacturers have sought to meet this situation by diversifying their lines, and an increasing number have successfully adapted their plants for the manufacture of a multiplicity of products.

An example of a metal working plant of moderate size which has diversified its products and thereby attained volume of output without sacrificing profits is that of the Hobart Brothers Co., Troy, Ohio. To facilitate conception of the company's policy, it may be well to consider its history.

In the early days of the electrical industry, when the use of electricity for lighting was being introduced, C. C. Hobart, president of the company, saw the possibilities in electrically-driven equipment. In connection with his work in manufacturing and installing lighting plants, for instance, he saw the grocery clerk tiring himself grinding coffee by hand. An electric coffee mill was the result. After his business had grown substantially, Mr. Hobart sold his holdings and for a time left the electrical field.

Meanwhile his two sons became enthusiastic at the prospect offered by electrically-driven devices. Soon after his graduation from college, one

---

*Resident editor THE IRON AGE, Cincinnati.

of the sons, Edward A. Hobart, opened an electric motor repair shop. One of his possessions was an electric automobile, and in order to charge the battery of the car he built a motor generator set to convert to direct current the alternating current provided by the municipality. With the generator working successfully, other owners of electric automobiles began to bring their cars to Mr. Hobart to have the batteries charged.

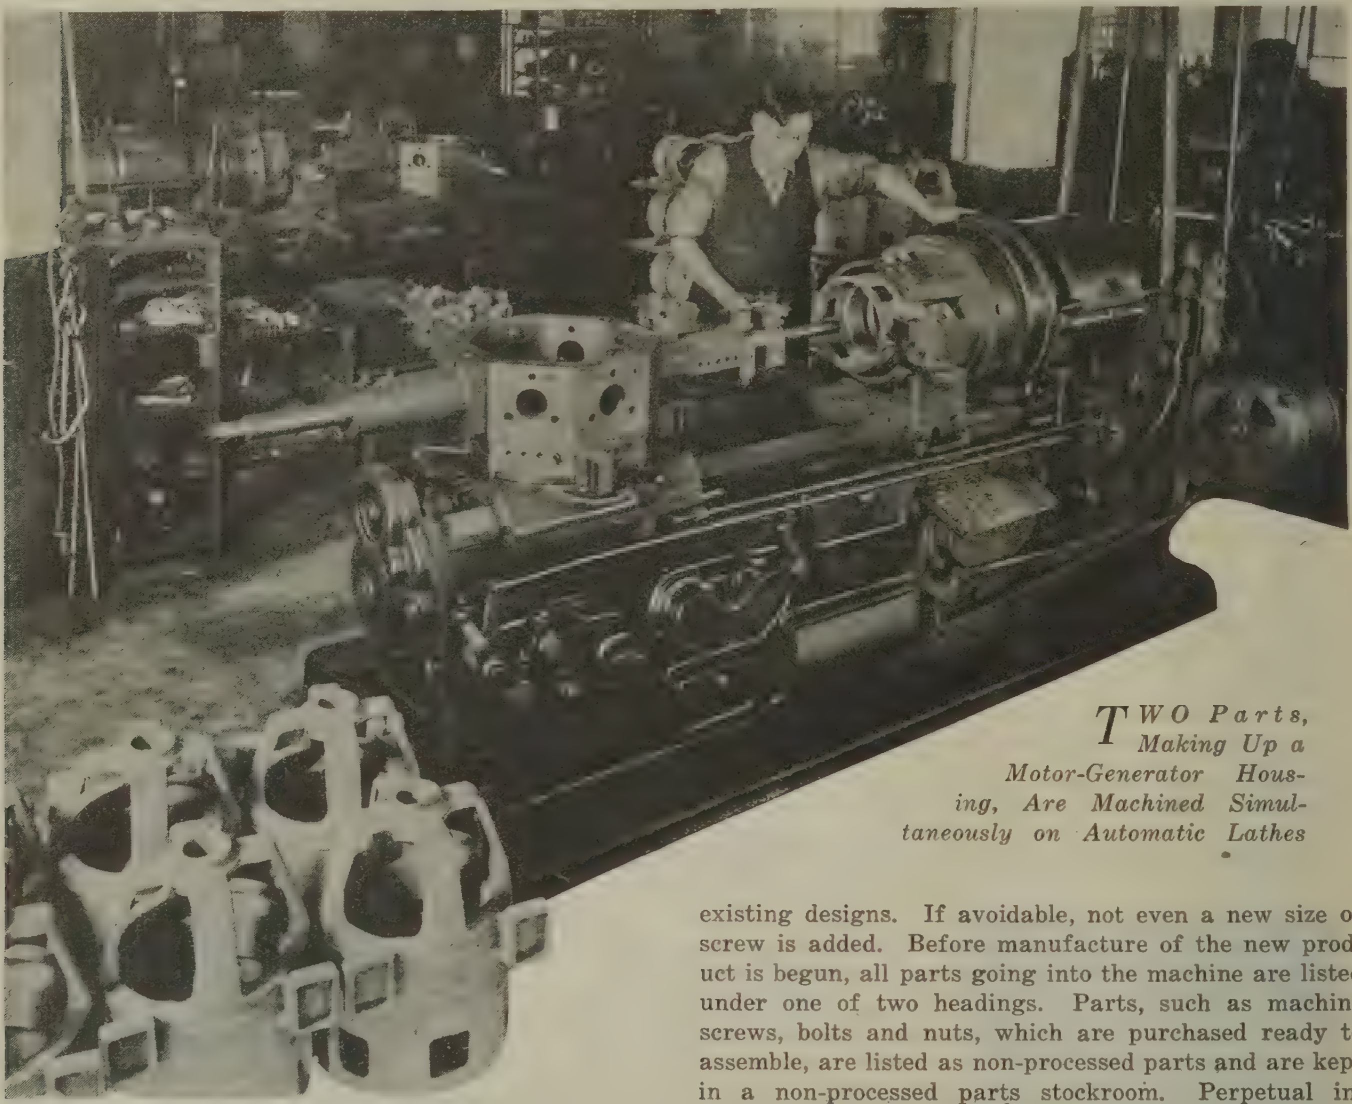
At that time the electric starter for gasoline automobiles was just coming on the market, and the owners of such cars with that device also wanted their starter batteries charged. Realizing the field that was opening up, Mr. Hobart, with his brother, William H. Hobart, began an advertising and sales campaign which caused their motor-generator manufacturing business to grow rapidly.

Foresees Danger in Dependence on Single Product

In 1916 E. A. Hobart saw danger ahead in being entirely dependent upon a single product, the use of which was limited and for which substitutes were appearing on the market. He was convinced that the automobile industry offered unusual possibilities and that the thing to do was to add another commodity which would be of service in the field in which the company had already become known. Accordingly, he began development of a small air compressor which, after four years of experimental work, was ready for the market. Being familiar with automobile construction, Mr. Hobart conceived the idea of utilizing the rear axle spiral bevel drive on an air compressor and put the idea into practice.

Having built up two different products, the company did not hesitate to add others as the needs of garages and automobile repair shops expanded. The result is that the Hobart Brothers Co. today manufactures 30 items and sizes of equipment. The principal products are: Motor generator sets for battery charging, for motion picture show arc lights and for arc welding; air compressors for tire inflating, paint spraying and for industrial applications; battery testing equipment; electrically-driven grinders; automobile starting motor and generator testing equipment; and car washers.

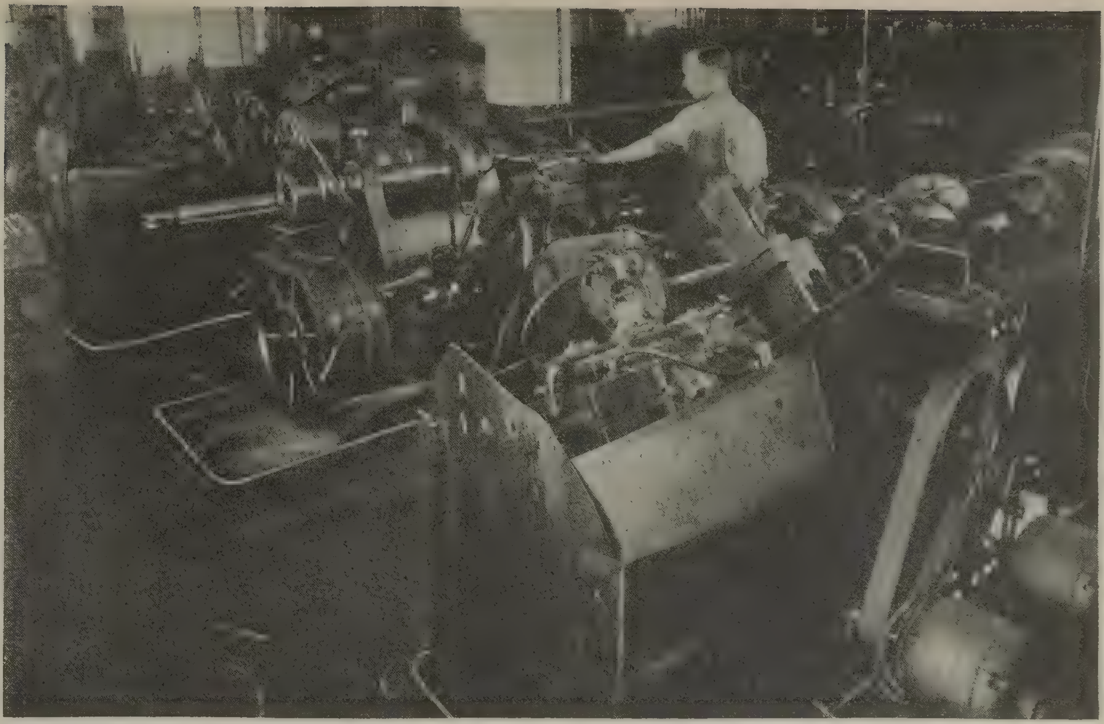
Control of the material and parts required to make such a variety of products has presented many problems, and close cooperation between different departments has been essential. In designing a new product, the engineering department takes into consideration the items already manufactured by the company and makes as many parts as possible interchangeable with existing designs. If avoidable, not even a new size of screw is added. Before manufacture of the new product is begun, all parts going into the machine are listed under one of two headings. Parts, such as machine screws, bolts and nuts, which are purchased ready to assemble, are listed as non-processed parts and are kept in a non-processed parts stockroom. Perpetual inventory is kept of this stock by means of a visual index filing system. Parts on which machining or any other work is required before they are ready for assembly are classed as processed parts. This material is started through the necessary operations by the production department, a production order card accompanying it. This card, reproduced herewith, specifies the routing and lists all operations. Space is provided on the lower part of the card for entering the daily production records. Upon completion of machining or other operations, the parts are sent to finished stock storage bins along the assembly line, each part being stored adjacent to the point where it will be assembled.



TWO Parts, Making Up a Motor-Generator Housing, Are Machined Simultaneously on Automatic Lathes

With approximately 2500 different items of material going into products on which about 7000 operations are performed, accurate records are essential. All records are headed with the number of the drawing, the number being so devised that an employee who has been in the factory only a short time gets a clear conception of what a particular drawing number covers. To make this clear: Suppose *A* indicates a certain bore and size of housing, in this case 8-in., and *P* is the

CARNEGIE LIBRARY OF ATLANTA



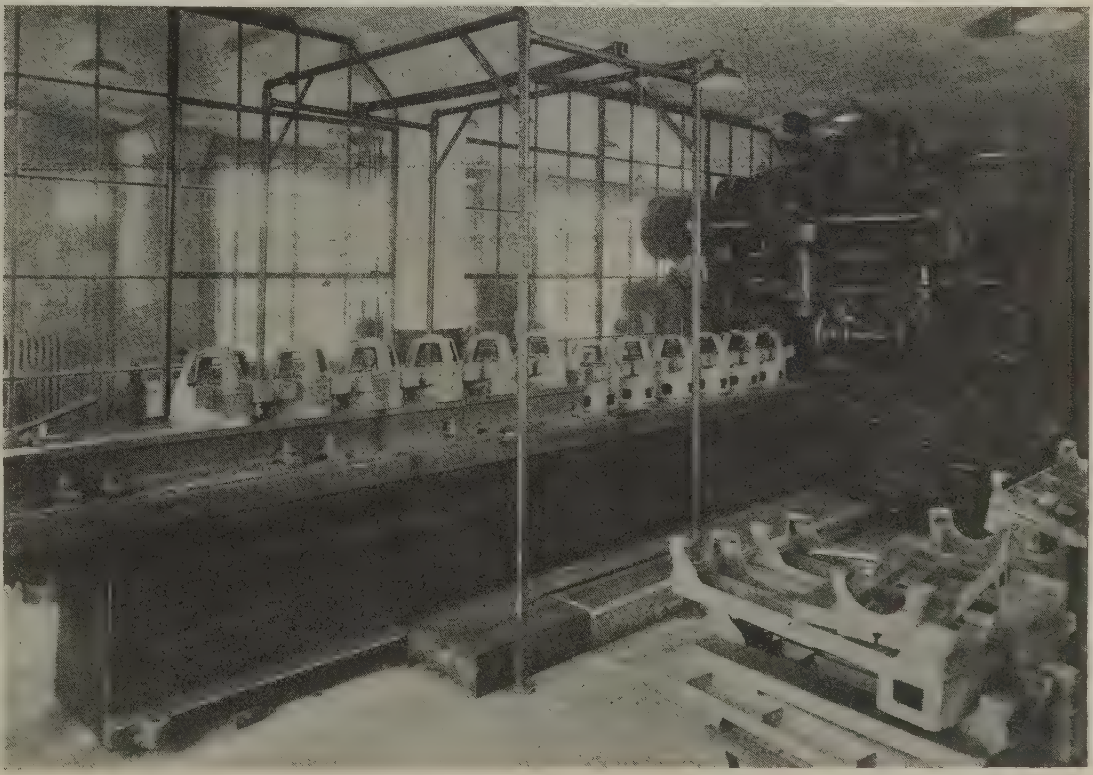
MOTOR - Generator Shafts Are Machined on Gridley Automatics. One end of the shaft is finished, ready for grinding, on the unit in the foreground, and the other end of the shaft is finished on the second machine

symbol for compressors. Therefore in seeing the symbol *AP*8, the workman knows that the subject is an 8-in. bore compressor part. The pattern number is the same as the drawing number, and all operations on the piece have the drawing number as a prefix. For example, *AP*8-1 would be the first operation on piece *AP*8. With this simple system, it is possible for many employees to know the drawing numbers of a great many parts, and consequently the numbers of patterns, jigs and operations.

With a diversity of products the problem of material handling is less easily solved than in a plant engaged in mass production of a single commodity. Mechanical conveying has been worked out successfully, despite the fact that in planning for it there arose difficulties which ordinarily do not occur. In order to bring about economies by the use of conveying equipment, it was necessary to arrange departments so that consecutive operations would fall in logical order and material move along a straight line from one operation to the next. Where roller or belt conveyors could not be utilized to advantage, lift trucks and platforms were substituted. The company has made a strict rule that nothing is to be piled on the floor, platforms or skids being used for the temporary storage of material in process. In this way material can be moved instantly.

Use of Modern Equipment an Established Policy

One of the major factors in maintaining a high standard of quality of product and in effecting manufacturing economies has been the installation of modern machine tools. Practically all machines are individually motor-driven and are specially equipped for certain work. The two parts that make up a motor-generator housing are machined simultaneously on automatic lathes, which, in addition to reducing the cost per piece, have permitted closer accuracy than previously. Air compressor crankcases are milled in one operation on an Ingersoll milling machine, equipped with three roughing cutters and two finishing cutters which work simultaneously. Similarly, five cutters are used in milling motor-generator housings in one operation. For making motor-generator shafts a number of Gridley automatics have been installed. One machine finishes one end of the shaft ready for grinding.



AIR Compressor Crankcases Are Milled in One Operation. The machine is equipped with three roughing and two finishing cutters. Similarly, five cutters are used in milling motor-generator housings

As soon as this operation is completed, the shaft is put in the second machine and the other end is finished.

Cooperation of Employees Fostered

While efficient control of production, installation of a simple system of keeping records, setting up of mechanical conveyance for transporting material and use of modern machine tools have contributed to the solution of the problems presented by the manufacture of a multiplicity of products, the most important factor has been the human element. To keep each employee interested in his work and to have him take pride in that portion of the product for which he is responsible has been the goal set by the company. To do this, different wage systems have been instituted in different departments. Varying conditions throughout the plant make undesirable a uniform wage system for all departments. Instead the management has tried to see that each man, judged by his natural ability, by his training and by his productive capacity, receives the highest pay to which he is entitled.

Foremen have been recognized as key men in maintaining contacts between management and employees. In every department hangs a sign giving the name of the department and the name of the foreman in charge. Beneath the sign is the slogan, "Quality—First and Always." The signs have a splendid psychological effect in creating in the foreman a fine sense of responsibility and in making him properly feel that he is important in the eyes of the management.

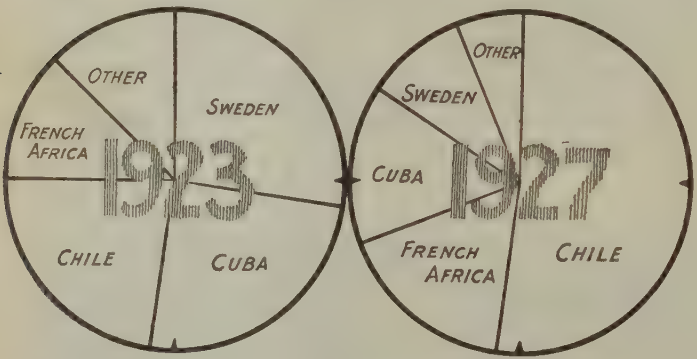
Foremen's meetings are held monthly. A few select employees other than foremen are invited to these meetings so that they may obtain first-hand knowledge of some of the problems confronting department heads. These conferences are conducted in the lunchroom of the plant and either a speaker is brought in or a round-table discussion is arranged. During the discussion each man has an opportunity of bringing before the group some of the difficulties he has encountered, and the discussions have been valuable not only in effecting cooperation but in bringing to each foreman the realization that his is not the only department, an idea which is likely to take root if such conferences are not held.

The experience of the Hobart company serves to show how a plant of moderate size, during a period of intense competition and of over-production in many industries, has been able not only to keep the position which it reached years ago, but also to extend its activities into new markets by intelligently planning its production program and by developing, within profitable bounds, new commodities the demand for which has been created by constantly changing conditions in industrial life.

IRON ORE IMPORTS GAIN

Changing Sources of Supply Notable in Last Few Years

IMPORTS of iron ore into the United States in 1927 are reported by the Department of Commerce at 2,620,717 gross tons. This represents an increase of about 2½ per cent over the 1926 total and is the largest incoming volume since 1923. With that exception, it is the largest total we have ever brought in. Imports in December, at 131,837 tons, were far below the figure of a year earlier, and far below the November total. If the December incoming movement had been in accordance with immediately preceding months, the aggregate for the year would have come close to the 1923 record.



Chile has furnished more than half of the total iron ore imports each year for the last four years. This is in contrast with Chile's position in 1923, with less than one-fourth the total, and with a smaller tonnage than came from either Sweden or Cuba. This point is brought out clearly in the diagram, which shows the proportion of the iron ore imports from the four principal supplying countries in 1927 and in 1923. Sweden, which was first in 1923, has dropped to fourth position. Cuba, which was second in 1923, is now third. Chile, which was third in 1923, has advanced to first, and French Africa, which was fourth in 1923, is now second.

It will be noted from the diagram that the supplies coming from countries other than the four mentioned have dropped off markedly. This total of all other shipments was under 169,000 tons in 1927, against 345,000 tons four years earlier. Spain in 1923 furnished about 215,000 tons, and in 1925 and 1926 sent in more than came from Sweden. Shipments from Spain have fallen to about one-eighth of the 1923 total, accounting for the major portion of the shrinkage of imports from the countries not individually shown in the diagram.

Prizes Given for Accident Prevention Work

Stanley & Patterson, Inc., 150 Varick Street, New York, manufacturer of electrical products, was the winner of the 1927 metal manufacturers' industrial accident prevention contest, conducted by the Merchants' Association of New York. At a meeting held on Feb. 7 the employees of the Stanley & Patterson organization were presented with $100 in gold as a reward. The company employs 250 persons and operated its plant for 214,416 man-hours without accident.

Of the 50 companies participating in the contest, 22 operated during the four months ended Dec. 31 without a lost-time accident and were given certificates attesting their records. The American Safety Razor Co., employing 750, operated 577,368 man-hours with but two lost-time accidents and the Sperry Gyroscope Co., with 500 employees, had only two lost-time accidents with 326,561 man-hours of operation. These companies received honorable mention.

The M. A. Hanna Co., Cleveland, has been appointed exclusive sales agent of the Bulger Block Coal Co., with coal mines at Bulger, Pa.

Cutting Costs and Avoiding Accidents

Mechanical Charging System for Cupola Saves 66 Per Cent in Operating Charges—Injury Hazard Reduced

BY G. F. TEGAN*

A MECHANICAL cupola charging system which has been in operation in the foundry of the Union Switch & Signal Co., Swissvale, Pa., since last October has reduced costs for charging from $23.50 per day to $8 per day. But it is not merely in this economy, one of several which have resulted from the change from manual to mechanical charging, that the management of the foundry finds satisfaction. The new system eliminated an accident hazard. Under the former method of charging the raw materials, the bins were located alongside a railroad spur track, directly under the loading platform. While no fatal accidents occurred, it happened fairly frequently that pig or scrap from a loaded charging box which had been improperly placed on the platform fell within a few feet of the men working in the bins. Introduction of the new system grew out of the desire of the management to wipe out that danger.

This system is unique in that the storage bins are built into instead of above the ground and, besides the mechanical charging, there is only one handling instead of two, as in most installations, of the raw materials. A spur track runs over a trestle, under which are the coke and limestone bins. Delivery of these materials in hopper cars obviates a handling and incidentally effects a very substantial saving. The coke and stone gravitate into the bins and it is no longer necessary to have the coke delivered in box cars for protection against the weather, for which there is an extra charge of 50c. a ton or $12.50 per car.

Another track on the other side of the storage house serves the pig iron and scrap bins. This track is served by an overhead electric traveling crane, used also by the forging shop of the company, lying parallel to the foundry building. It is equipped with a magnet hoist, and the pig iron and scrap are lifted from the cars and lowered into the bins. This is a much shorter lift and a simpler operation than would be the case with superposed bins.

Coke and Limestone Are Delivered in Hopper Cars, Which Go Over the Trestle Under Which Are Located the Bins. Scrap is delivered on the opposite side

Few would question the claim that it is actually a one-handling system. And it is a safe system, since by no conceivable way can any of the workmen be injured by falling loads. Proof of this is found in the fact that men who formerly either refused to work or worked unwillingly about the bins are really eager to work in the new bins, which are well removed from the radius of the charging bucket.

The system was the idea of the Union Switch & Signal Co. which made the drawings. The Webb Engineering Co., Oliver Building, Pittsburgh, was the contractor and made the detail drawings.

There are nine storage bins in all, five for pig iron

---

*THE IRON AGE, Pittsburgh.

To Permit Entry of the Large Charging Bucket, the Cupola Has Been Cut Away at the Charging Door. The hoist operator, by cable from the cage, releases the charge by opening the bottom of the bucket

and one for scrap on one side of the scale car pit, and two for coke and one for limestone on the other. The bins all have sloping bottoms, to give gravity movement of the materials to within easy reach of the loaders. The iron and scrap bins are open, while those in which the coke and stone are stored are gated to control the flow more easily, which is rapid on account of the use of heavy sheet steel as a covering for the bottoms. The floors of the iron and scrap bins get additional support, as well as resistance to the abrasion of the metals, from use of imbedded 20-lb. rails inverted. The structural steel and concrete bin house is of rugged construction. It is 90 ft. long and 45 ft. 3 in. wide, and is 21 ft. deep at the level of the scale car pit, which is approximately 6 ft. below the bottom of the bin floors. The iron and scrap bin doors, which serve also as a roof, are of heavy corrugated galvanized sheet steel.

The scale car, with automatic measuring devices, was furnished by the Atlas Mfg. Co., Cleveland. On it is placed a steel bucket capable of holding 4000 lb. of pig iron and scrap, 400 lb. of coke and 65 lb. of limestone. Nothing could be simpler than the making up of this charge, with scale bell to warn the operator when the correct amount of the several materials has been let down into the bucket. The charge made up, the scale car moves to an opening at the end of the bin building. Here the bucket is lifted by a 3-ton hoist, built by the Shepard Electric Crane & Hoist Co., Montour Falls, N. Y., and conveyed by monorail to the cupola, where the hoist operator, without leaving the cage, unloads the charge.

As is true in all foundries where mechanical charging has replaced manual effort, the cupola in this plant has been cut away at the charging platform to permit the entry of the larger charge. It is interesting to note that the charging platform in this foundry, formerly littered with charging boxes and reserve supplies of materials and equipment, now is as clear as the deck of a warship on inspection days. The change in the system has released considerable space for other uses. The new system is so thorough and dependable that it is not necessary to keep a supply of coke or metal at the charging opening of the cupola.

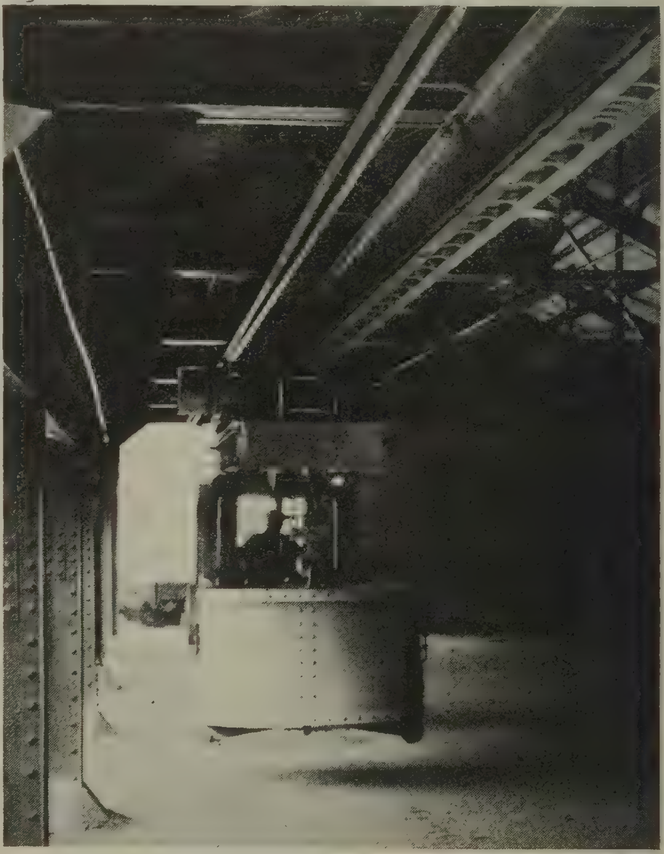
Definite Measure of the Savings

Based on 300 working days a year, the cost of handling materials to the cupola under the old system was $23.52 a day ($7,056 a year). Under the new method, it is $8 per day or $2,400 per year, which is an indicated annual saving, at 300 working days, of $4,656 a year.

The foundry consumes 65 cars of coke a year. The old cost of unloading cars on the platform was $35 a car or $2,275 a year. It now costs only $1.20 a car to perform the same operation, or $78 a year, a saving under the new system of $2,197 annually. There is in addition a saving of about 100 tons of coke a year, valued at approximately $700, which was lost in handling. And in taking coke shipments in hopper cars instead of box cars there is the saving of 50c. a ton, which on 65 cars of 25 tons each amounts to $812.50 a year.

Unloading three carloads of limestone, the usual yearly consumption of the company, formerly cost $35 a car or $105 a year. It is now being done for $1.20 a car through the use of the trestle, a saving of $102 a year. It was formerly necessary to maintain 48 boxes for handling metals, at $18 each a year, or a total charge of $864, while 25 boxes now suffice. At the same upkeep charge the annual cost is $450, a saving of $414. The foundry is charged for the use of the yard crane at $8 an hour. It was formerly used 2 hr. daily; its use has been cut to 1 hr. daily, or a saving of $2,400 a year.

A careful checkup of the results during the first three months of operation discloses that total costs for the year will run about $6,000, under the new system, against almost $16,000 under the old method. Besides this indicated saving there has been a more uniform cupola charge and consequently an improvement in the quality of the metal.



Charging Platform Now Serves as a Lane for Passage of the Hoist Conveying the Charge

Training and Paying Executives

Development of Administrators and Ways of Compensating Them Considered at American Management Association Meeting

WHILE scientific management has concerned itself exhaustively with the methods of training, supervising and compensating workmen, it has not often become introspective and stopped to consider the problem of maintaining and regulating the executive personnel. The development of executive talent, incentives for and compensation of executives, as well as methods for pensioning the men of administrative departments whose age has diminished their usefulness, were dealt with at the winter convention of the American Management Association, held at the Hotel Roosevelt, New York, Feb. 6 to 10. New points of view in the training of men on the job were also brought out, and emphasis was laid on telling how rather than what to do during the training periods.

Training Young Executives

Dependability, vigor, resourcefulness and personal leadership were suggested by Dr. W. W. Charters, professor of education, University of Chicago, as the qualities which should be developed in the training of young executives. During a well directed training period it is possible to determine whether any of these attributes are lacking in an individual. If the subject does not respond to special training along the line in which he is deficient, it is usually possible to shift him into another department of the company and into duties which are not essentially executive.

Dr. Charters' paper was based upon an investigation of the methods used for the development of executive talent by various members of the association. He found that a number of companies continue to place much stress on actual classroom instruction. In many cases this form of teaching is supplemented by considerable practical experience in various departments of the company. Other firms have derived splendid results without any formal classroom work, and develop their future administrators by a well planned building up of executive knowledge with consecutive training in the different departments. In such cases the young man is permitted to sit in on conferences devoted to policy problems and other administrative functions, and is allowed considerable personal contact with the manager in charge of the department in which he happens to be located. Special administrative problems are assigned, and careful study is made of solutions suggested by the junior. Criticism of such efforts is frequently warranted, but Dr. Charters pointed out that praise should be forthcoming when deserved, as the student has no other way of definitely knowing what progress he is making. This also leads to self confidence, which, if not developed to an extreme, is a very desirable quality in the young executive.

The speaker emphasized the fact that the advancement of an executive is always more likely if a properly trained assistant is available to step into the job. In spite of the fact that a number of men feel that training young executives is only training them out of their jobs, this seldom occurs in a progressive and expanding institution. Better positions nearly always await the man who is able to train others to attend to his own work properly.

Incentives for Executives

That incentive plans for executives may be used to advantage in industry was brought out by the experiences of a number of companies as outlined at two sessions of the meeting. Yet discussion indicated that the application of any sort of universal plan might easily nullify possible benefits.

Howard Coonley, president Walworth Co., Boston, in outlining the plan used by that organization, stated that the company had made a success of its system largely through recognition of the fact that different classes of executives respond to different kinds of incentives. The better type of executive, Mr. Coonley pointed out, cannot be handed bonuses in the way they are given to shop workers. This is true partly because the product of the executive is somewhat intangible and cannot be set down immediately in dollars and cents. Yet a well regulated incentive plan for executives will have its effects on the earnings of a company, and the speaker brought out the fact that bonus methods used by the Walworth organization are expected to result in a material increase in profits within the next few years.

In a discussion of Mr. Coonley's paper, J. P. Jordan, industrial engineer, New York, opposed limiting incentives by set rules.

Pensions Are a Business Proposition

By pointing out that the payment of pensions to superannuated employees is a direct aid to management in keeping up efficiency, reducing accident hazards and lowering manufacturing costs, E. S. Cowdrick, industrial relations counsellor, New York, was able to place his plea for adequate pension plans on a practical business basis. "For this reason," he said, "it is probable that industrial pensions will be a permanent and growing form of business administration. At the same time it is likely that, with clear thinking on the subject, better administration and more adequate financing, pensions will become increasingly valuable to employers by raising efficiency and morale and by preventing the retention of superannuated workers on active payrolls."

Pension plans, the speaker stated, have developed rather recently in American industry. In surveying 248 plants he found that only five had had pension systems prior to 1900 and that 87 per cent of these companies had began pension payments since 1910. This growth was due partly to the increase in life expectancy. The increase, however, has not been offset by a lengthening of the working period, which, on the contrary, has grown shorter. The spread of education and the decline in child labor are sending workers into industry at a much higher age than was true in the past, and there is less work for the laborer who has grown old or has even come to late middle life.

Mr. Cowdrick stated that there are several theories underlying pension payments, notably the deferred wage theory, the supposition that the pension is a charitable gratuity and the conception that it is a reward for long and faithful service. "According to the deferred wage theory," he said, "money expended for pensions comes out of funds available for the compensation of labor and is merely part of the wages which might have been paid to the worker during his productive years. If this theory were accepted there would arise at once a moral question as to the right of the employer to withhold any part of the wages due to employees and then to restore the money only to those who, by longevity and continuity of service, fulfill the pension requirements." He rejected this objection, however, because a company is not forced to pay the pensions in order to hold and secure a labor force.

The keen manager asks a stronger reason than charity for the payment of such pensions, and will not accept the theory that a reward must be paid for long service. If this were the only reason for pensions it would be cheaper to secure new employees at stated intervals. But upon realizing that paying pensions increases the morale of the worker and decreases labor turnover, thus

Large Pipe for High Head Made by Arc Welding

Penstock for Japanese Hydroelectric Plant Made of Bent Plates, Longitudinal Joints Welded by Hand

BY T. UJIIYE*

SINCE the end of the great war, striking progress has been made in Japan in the scientific study of electric arc welding as well as in practical applications. Its utilization is becoming more popular year by year.

Modern, highly scientific welding is exclusively employed in the construction of important strength members of pressure vessels at the three dockyards of Mitsubishi Shipbuilding Co., Ltd., located at Kobe, Nagasaki and Hikoshima.

One of the earliest applications of welding on a large scale was the construction of a 1942-ft. penstock at our Kobe works for the Azumi Electric Power Co., Ltd. This penstock was built in 1924 for their Nakafusa No. 4 power station in Nagano Prefecture; it was the first penstock built by means of electric arc welding in Japan, and its successful operation proves the soundness of the design and manufacturing methods.

The dimensions are as follows: Total length of the penstock, 1942 ft.; upper riveted portion, 796 ft. long; lower welded portion, 1146 ft. long; maximum statical head, 1031 ft. The welded portion is in two sizes with a reducer at the middle part of the line, the upper section being 625 ft. in length by 42 in. in diameter includes pipes numbers 1 to 31, and the lower highest pressure section 521 ft. in length by 39 in. in diameter.

Individual sections of pipe were made 20 ft. long; plate thicknesses ranged from ½ in. to ⅞ in., as shown in the accompanying table.

Manufacturing Procedure

Flat steel plates were cut to shape by guillotine shear, and the edges were milled to the correct bevel as shown in the figures. Then the plate was bent to the required semi-circle by means of a mast roller. Two plates formed the pipe; with a temporary band outside and an inner core at each end, it was then welded on specially designed roller saddles. Each piece has two longitudinal welds, diametrically opposite.

After having properly prepared the edges of the plate and assembled the joint, a light tack weld or initial layer weld was made at 8-in. intervals along the outside of both seams. The welder then made a complete weld between the first two tacks. He then omitted three spaces and welded between the fifth and sixth tacks, and so on, until the end of the seam was reached. This process was again repeated by starting between second and third tacks, skipping three, and so on, until the whole seam was welded. Finally, a finish or second layer weld was made on the initial light tack welds along the entire line to complete the work.

Cast steel flanges, approximately 4 in. x 3½ in. x 1¼ in. were then attached at each end by edge welds, as shown in Fig. 1. The routine of the work was about the same as just described for the longitudinal seams.

The anchor rings shown in Fig. 2 were bent from a straight bar, 0.66 in. x 4 in., and the ring was butt welded at the closure. Each was attached by a series of 3-in. corner welds alternating with 5-in. open spaces, the series on either side being staggered in position.

Pipe No. 53 has a T-branch welded on to lead to one turbine, while pipe No. 54, in addition to a similar turbine outlet, is closed by a domed end.

Each completed pipe was subjected to a hydrostatic pressure test ranging from 368 to 670 lb. per square inch depending on the thickness of the pipe wall, as shown in the table. The result was satisfactory; no welded places failed.

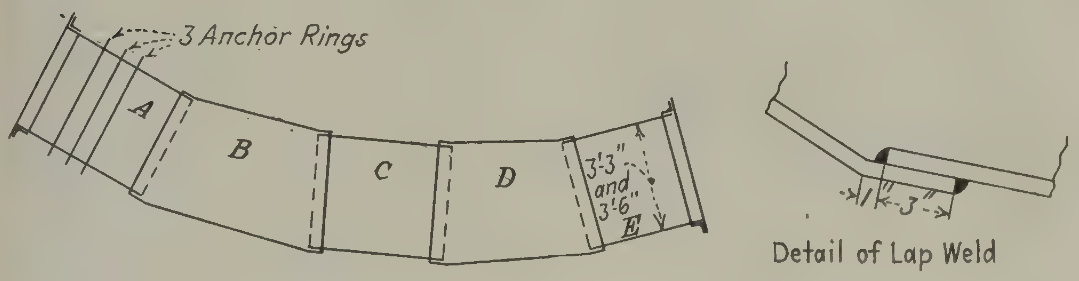

Fig. 2—Bends Are Made by Welding Straight Nipples Inside Flanged Connectors

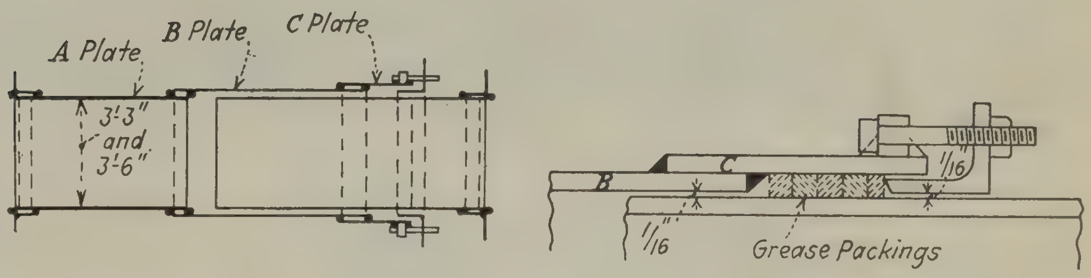
Fig. 3—General Assembly and Details of Expansion Joint



Field joints between pipe sections were made by a series of 24 to 32 bolts, in size up to 1⅛ in. in diameter, depending upon the stress to be carried. All tests, including proof test on the completed line, were completed to the entire satisfaction of the customer; the work also passed the severe survey of the Japanese Communications Department.

Advantages of Welded Construction Listed

Experiences with this penstock indicate the following advantages of this type of construction: First, tight joints, metal solid against metal, can be obtained without punching a single hole in the pipe wall; second, the weight of the pipe can be considerably reduced below a riveted design, and the expense of punching and caulking is also eliminated; third, the diameter of the entire line was reduced by about 1½ in., because the internal friction caused by rivet heads is eliminated; fourth, continual inspection and caulking of leaks has been dispensed with; fifth, the appearance of the welded line is much better than a riveted one and lagging can be applied in a more economical way; sixth, after installing the penstock on the site, and passing water into it, no trouble or no stoppage has occurred; and seventh, in operation, the water is passed in a more satisfactory manner than ever experienced with riveted pipes.

All those who have been connected with this power project, or who have inspected this penstock, are of the opinion that it offers a positive demonstration of the advantage of electric arc welding in securing rigidity of pipe, low frictional resistance, less weight for transportation and installation, greater capacity for the turbines, smoother interior and exterior surfaces and freedom from corrosive tendencies. The Mitsubishi Shipbuilding Co. is confident that the process applied under strict supervision of technical engineers will give great economies and satisfaction.

Fig. 4—Pipe Sections in Testing Yard

Welding of Gun Metal

Hitherto it has been impossible to weld gun metal bronzes (90 per cent copper, 10 per cent tin) because the microscopic crystals of delta constituent existing in such castings cooled at a moderate rate will melt and boil out before the alpha solid solution, which forms the bulk of the alloy, reaches its melting point. The result is a concentration of tin next to the weld line, inducing brittleness, and a spongy zone just below, through which cavities rupture occurs at relatively low loads.

S. W. Miller, welding engineer, Union Carbide & Carbon Research Laboratories, in a paper to be read before the Montreal meeting of the American Society for Steel Treating, notes that this trouble can be avoided by heating the casting before welding to 1000 deg. Fahr., when the delta constituent changes to a higher melting, tough beta solid solution. After welding the rate of cooling should be about that of the original casting.

Sintering a Variety of Materials

Magnetic Concentrates and Iron-Bearing Ores Handled by Continuous Dwight & Lloyd Process

BY EDWARD J. TOURNIER[*]

CONTINUOUS sintering of ferrous materials was discussed, in many of its general aspects, at page 191 of THE IRON AGE for Jan. 19. The present article carries the subject forward into consideration of the possibilities of the process for two particular types of raw materials—magnetic concentrates and iron-bearing ores. The series will be concluded with a third article, to be published at an early date. A previous series of three articles, by the same author, covered intermittent sintering. They were published in THE IRON AGE of March 17, April 21 and July 14, 1927.

Flow Sheet of Plant Sintering Magnetic Concentrates

Sintering Magnetic Concentrates

For a number of reasons the sintering plant of the Chateaugay Ore & Iron Co. is of considerable interest: First, it has in operation the largest continuous process machine ever built; second, it treats magnetic concentrates. The ore, which contains about 62½ per cent iron, is conveyed from a concentrator plant to a storage bin at the top of the sintering plant. Adjacent to the ore bin is a similar bin for anthracite culm, which is used for ignition. Both bins have American Ore Reclamation Co. revolving table feeders which discharge materials directly into a pug-mill, where they are mixed and moistened with water. The mixture then goes by belt conveyor to the swinging spout of the 72-in. x 64-ft. sintering machine. Sintering fuel is approximately 6½ per cent.

The sintering machine has a suction zone 6 ft. wide and 63 ft. 4 in. long, and has 84 pallets mounted on Timken roller bearing wheels. Each pallet is fitted with six grate bars. The driving mechanism consists of two sets of gears and an inclosed reducer. This arrangement brings the gears outside the machine frame, making them more accessible. It also takes them out of the path of sinter dust from the pallets. The machine has a capacity of 50 tons of sinter per hour.

Oil Is Used for Ignition

After the material has been spread on the grates by the swinging spout it passes under the ignition furnace, which is fired by oil. About 0.40 gal. of oil per ton of sinter is used. Air for combustion is furnished by a Spencer turbo-compressor. Air and oil, mixed in a Hagen burner at the side of the furnace, pass through a preheating coil directly into the combustion chamber of the furnace.

Combustion gases pass through cast iron tubes to a preliminary dust-settling chamber, where separation of the coarse particles is effected. The preliminary separator discharges into a hopper having double bell valves at the bottom. These valves are operated intermittently, the coarse dust being thus fed on to a belt conveyor, which takes it to a small belt and bucket elevator. The latter discharges the dust over a stationary bar screen on the discharge end of the sintering machine. The larger pieces are delivered to a railroad car and the fines drop into the return hopper.

The gases then pass into a centrifugal separator where the fine particles of dust are eliminated. The dust separator is connected to a center-plate fan, 100 in. in diameter, having a capacity of 60,000 cu. ft. of air a min. at 720 r.p.m. It is direct-connected to a 350-hp., 2300-volt General Electric synchronous motor.

Sintering Iron-Bearing Ores

At blast furnaces where sintering plants are operated, the depletion of the flue-dust stock piles creates a condition which necessitates the employment of other materials that can be treated profitably. Such a con-

Non-Deforming Steels Require Care

Heat Treatment to Prevent Cracking, Warping, Soft or Brittle Skin, and to Get Desired Hardness and Exact Size

BY W. PAUL EDDY, JR.*

THERE are two important classes of so-called non-shrinking oil-hardening tool steels. The first and older type contains usually 0.85 to 1 per cent carbon, and 1.50 to 1.75 per cent manganese; some brands also have 0.15 to 0.25 per cent vanadium. The second type is a later development of the simple manganese oil-hardening steel. It contains the same amount of carbon but about one-half per cent less of manganese than the older steel, and has approximately 0.5 per cent each of chromium and tungsten; some brands of this type also contain a small amount of vanadium. The phosphorus, sulphur and silicon in both types are kept as low as is practicable. Both steels are made in either electric or crucible furnaces, principally in the former.

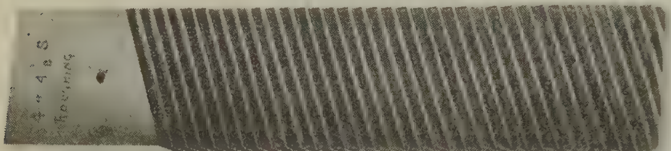

Fig. 1. Hand Broach Made of Straight Manganese Steel, with Vanadium. Hardened in salt bath at 1500 deg. Fahr. Ground on cutting edges only

It appears that the chrome-tungsten type is very slowly displacing the straight manganese. The newer alloy seems to have as small a volume change in hardening as has the older, and in addition to have somewhat better cutting qualities. It is true, nevertheless, that in a great many applications the two steels may be used interchangeably.

They are much used for gages—in plug gages they are generally conceded best among the tool steels so far as wear resistance is concerned. They are widely used for stamping and blanking dies, thread-rolling dies, hobs, taps and broaches. It perhaps goes without saying that many of the applications are for master tools or dies which, owing to complicated design or to lack of special equipment, are inconvenient or impossible to grind after hardening. Yet a successful product cannot be produced consistently without very careful handling and knowledge of the peculiarities of such steels.

Procedure to Avoid Cracking

Both these steels, and especially the early manganese type, are far from immune to cracking. To overcome this hazard, we apply the same principles used for other steels: (a) re-annealing, before hardening, any tools of very complicated design or on which much work has been done; (b) careful design, to eliminate so far as possible immediately adjoining thick and thin sections and sharp corners and angles; (c) careful inspection of the steel for defects; (d) slow, even heating of the tools, using preheats whenever possible; (e) careful quenching; (f) tempering soon after quenching; (g) annealing, whenever rehardening is necessary.

Of course, there is no steel which is absolutely non-deforming in heat treatment. The difference in volume change between these steels and most other tool steels is one of degree only. Non-deforming steels have very low volume changes after correct heat treatment.

Although these steels scale somewhat less than plain carbon steels, they show a marked tendency toward forming a soft skin during hardening. With ordinary methods it will often be found that a file easily digs into the surfaces to depths which may vary from 0.001 in. to 0.005 in., depending upon the size of the tool, the method used and the care exercised. It must be remembered that the slightest skin softness may be fatal to precision tools which probably are not to be ground.

Non-deforming steels transform with comparative sluggishness when passing through the critical range during heating. They require considerably longer times of heating than do plain carbon steels. This means that the opportunity to decarburize or to scale is increased. It is sometimes found advisable to raise the hardening temperature in order to reduce the time of heating.

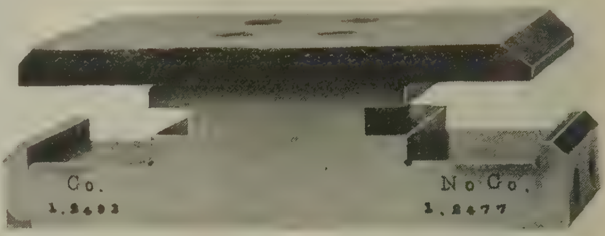

Fig. 2. Gage, Ground on All Working Surfaces. Made of same steel and hardened in same way as broach shown in Fig. 1

The real problem is to produce hard surfaces with as little distortion as possible. Since it is not to be expected that many heat-treating departments will have facilities for all methods of hardening, the results to be expected in the use of several methods will be discussed.

Open Fire and Muffle Liable to Produce Soft Skin

The open fire method, using either a gas-fired or oil-fired oven furnace, will produce fairly good results in the hands of an expert treater. Possibly the majority of tools, especially the larger ones, made of oil-hardening steels are hardened in this way. It is probable that the chemical compositions of these steels were developed largely by experimentation in this type of furnace. The rate of heating therein is about correct to produce minimum distortion of the hardened and drawn tools. With the class of tools which we are considering, however, it is imperative, as has been said before, that scaling or decarburizing be practically nil; therefore success depends upon the expertness of the hardener.

Smaller tools may be hardened with fair success by using a muffle, such as suspending the pieces by hooks or wires in an empty crucible in a pot-type furnace. An alloy or even pressed steel pot may be used, although the life of the latter is comparatively short. This method, giving about the same rate of heating as the open fire, will cause but little distortion, but a good surface is at least as difficult to retain as in the semimuffle oven furnace, and the same reservations about skill of the workman apply. For both these methods the hardening temperatures recommended by the steel manufacturers, usually between 1425 and 1475 deg. Fahr., are suitable.

---

*Metallurgist Geometric Tool Co., New Haven, Conn.

Pack Hardening Requires Slightly Higher Quench

Tools such as taps and plug gages may be packed in charcoal (some prefer a mixture of three parts charcoal and one part carburizing compound) in a steel pot heated in a cylindrical pot furnace. In this practice it is advisable to heat not more than two or three tools at a time; they should be of approximately the same size, and should be arranged, with the thermocouple, at the points of an equilateral triangle or of a square, with all objects equidistant from the walls of the pot and as near the center of the pot as is practicable. The rate of heating should not be rapid, else the tools will heat unevenly. A more satisfactory method of packing, especially when a variety of shapes must be hardened, is to use ordinary carburizing boxes in an oven furnace—automatic temperature control of the furnace is very desirable—using charcoal or the above-mentioned mixture. Slightly higher temperatures, namely, 1450 to 1500 deg. Fahr., should be used with either pack method.

These methods are entirely satisfactory at these temperatures for giving a good surface. From the standpoint of distortion, however, they are not very good, except for tools whose three dimensions are about equal. Tools such as taps, owing to the slower rates of heating and longer time of holding at heat, diminish in length and increase slightly in diameter. This change can be modified by varying the hardening and drawing temperatures, but this produces undesirable metallographic structures. Although steels containing vanadium may be able to withstand some variation in hardening temperature, such changes should be made with the utmost caution. Furthermore, even charcoal carburizes slightly at higher temperatures than 1500 deg. Fahr., often resulting in the formation of brittle surfaces.

A tap one-half to one inch in diameter, for example, may contract 0.0015 in. to 0.002 in. per inch of length when pack-hardened at 1475 deg. Fahr. If the temperature be raised to 1575 deg., the shortening will be reduced to about 0.0005 in. per inch, on an average. Further raising of the hardening temperature produces little or no change in the contraction. It may be said here that temperatures of 1450 deg. and 1550 deg. Fahr. in the open fire or muffle method would usually produce expansions in length of such taps of about 0.001 in. and 0.003 in. per inch, respectively, with no decrease in diameter.

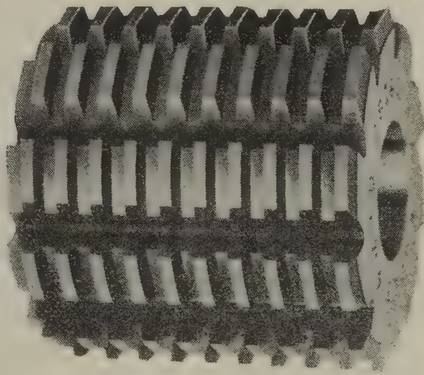

Fig. 3. Hob Mill Which Lengthened 0.0005 *In. per Inch After Heat Treatment*

Cyanide Baths May Produce Brittle Surfaces

One inevitably wonders if a bath method of hardening will prove satisfactory. A lead bath, if kept free from impurities, may give good results with very small tools, although it is not, in the writer's opinion, the most desirable for larger masses of oil-hardening steels, on account of its very rapid heating rate. Temperatures of around 1475 to 1500 deg. Fahr. should be used with a lead bath, even when hardening small pieces. Change of dimensions after lead hardening at the above range of temperatures are usually very small.

A commercial case-hardening bath using calcium cyanamid as the active agent produces good results on varied sizes of tools at about 1475 deg. Fahr., so far as distortion is concerned; the surfaces of the tools are not softer than the interiors, but if anything a trifle harder owing to absorption of nitrogen. However, the increased brittleness of the edges of a cutting tool is unquestionably undesirable. Attempts have also been made to use mixtures of commercial heat-treating salts and sodium cyanide; such mixtures have about the same characteristics as the cyanamid bath; the brittle surfaces in the hardened tools are usually even more pronounced; furthermore, it will be found very difficult to maintain a constant percentage of cyanide, and the limits for successful operations are narrow indeed.

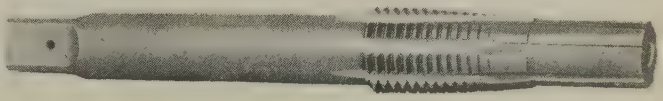

Fig. 4. Chasing Tap Which Lengthened 0.001 *In. per Inch After Heat Treatment*

Claims for Salt Mixtures Exaggerated

There are several salt mixtures on the market which are claimed to melt into baths that are perfectly inert to all steels. I have not worked with all of these baths; but upon considering only those with which I have had experience, it is my opinion that many of the claims are exaggerated. Some baths do not retain their property of neutrality for any great length of time; others never had it, at least for oil-hardening steels. Some baths require the use of rectifiers, purifiers or inhibitors, which, however, are usually only partially efficacious. These statements do not apply, of course, to all commercial salts; some apparently do what is claimed for them. All of the six or eight baths which I have tried for carbon steel hardening will, when properly used, practically eliminate scaling. The temperatures necessary for hardening tools of nondeforming steels in salt baths, to obtain the desired change in dimensions, are between 1450 and 1500 deg. Fahr. Some operators believe that a better surface can be assured by raising the temperature slightly and shortening the time of heating.

Lest the words "desired change in dimension" in the above paragraph seem foolish, the reader should remember that all tools should be tempered, and that changes of dimension may take place during the tempering operation as well as the hardening. Whatever the method of hardening, a contraction in length occurs during tempering at low temperatures. This contraction increases in amount with rising temperature until about 400 deg. Fahr. is reached, above which the rate of change decreases. Most tools of oil-hardening steels, especially cutting tools and gages, are tempered at from 275 to 375 deg. Fahr. As an example, if the hardening temperatures suggested above for salt baths and a draw of 275 or 300 deg. Fahr, for 30 to 60 min. are used, almost no dimensional change may be expected. But if, for instance, a slight expansion is desired, say 0.0005 in. per inch of length of a thread gage or tap, with the same hardness as before, the hardening temperature may be raised about 25 deg. Fahr. with reasonable hope of success. It is entirely possible to work out a schedule of temperatures and times for both hardening and tempering for the various sizes and shapes of tools treated, which, if careful control be exercised, will be surprisingly consistent in the results produced.

A final word of caution is advisable in regard to quenching: A comparatively gentle quench is sufficient to harden these steels, provided there is no surface change in carbon content during heating. A violent, swishing quench increases distortion and warping.

Recommended Heat Treatments

Fig. 3 represents a hob mill 2⅝ in. in diameter made of the later type of oil-hardening steel, containing manganese, chromium, tungsten and vanadium. This mill was not ground on the threads, but merely on the cutting edges, on the ends and the inside of the bore. This tool was packed in charcoal in an alloy carburizing box and heated to 1475 deg. Fahr. in an electric oven furnace equipped with automatic temperature control. It was withdrawn from the box by means of a wire, which had previously been attached, and quenched in oil with a slow, regular up-an-down motion parallel to the axis of the tool. It was drawn at 300 deg. Fahr. for 30 min. in an oil tempering furnace. This hob lengthened 0.0005 in. per inch.

Fig. 4 shows a chasing tap made of the same type of steel as above. This tool is a ¾ in. diameter, 12-pitch, Whitworth thread tap and was ground only on the cutting edges after hardening. It was pre-heated to about 450 deg. Fahr. and suspended vertically by a wire in a salt bath at 1525 deg. Fahr. and heated for 12 min. It was quenched in exactly the same way as was the hob mill and was drawn at 275 deg. Fahr. for 30 min. This tap expanded in length 0.001 in. per inch, which was desired.

Mining Engineers Prepare for February Meeting

Papers on the Open-Hearth, Blast Furnace and Special Steels— Fine Program for Institute of Metals

PAPERS on iron and steel will be much to the fore at the annual meeting of the American Institute of Mining and Metallurgical Engineers, Feb. 20 to 23, at the Engineers' Societies Building, 29 West Thirty-ninth Street, New York. An excellent program has been arranged.

The first session is scheduled for Monday morning, Feb. 20, at which Prof. William Campbell, Columbia University, will preside. The session will be devoted to alloys. "Critical Points in Chromium-Alloys" will be discussed by A. B. Kinzel, and he will include a description of a new type of furnace which may find a variety of applications in the future. Hugh O'Neill will present a paper on "Effect of Annealing on Cold-Worked Single Crystals of Silicon-Ferrite," and M. G. Corson will discuss "The Constitution of the Iron-Silicon Alloys," while C. R. Wohrman will present a paper on "The Heterogeneity of Iron-Manganese Alloys."

On the afternoon of the same day a session on special steels is scheduled and will be presided over by Dr. John A. Mathews. Robert Job will discuss "Types of Steel Used by Railroads, Past and Present," and C. W. Gennet, Jr., will present a paper on "The Manufacture of Some Foreign Rails." "Aircraft Steel" is the subject of a paper by E. A. Richardson, and Lloyd Jones, of the E. W. Bliss Co., Brooklyn, will discuss "Continuous Rolling of Sheets."

Sessions on Open-Hearth and Blast Furnace

A session devoted to the open-hearth furnace is scheduled for Tuesday afternoon, Feb. 21, L. F. Reinartz, chairman. "A One-Ton Acid Open-Hearth Furnace and Some Experimental Results" will be reported on by C. E. Meissner. This furnace was constructed at the Chrome Steel Works, Chrome, N. J. A. L. Feild will discuss "Rate of Carbon Elimination and Degree of Oxidation in Acid Open-Hearth Practice." The results of the study of the effect of temperature on the solubility of oxygen in iron will be presented by Dr. C. H. Herty, Jr., and J. M. Gaines, Jr. Prof. Enrique Touceda will discuss "Bailey Furnaces for Synthetic Pig Iron," and T. C. Bailey has taken as his subject "Electrically Heated Soaking Pits."

Wednesday morning, Feb. 22, will be devoted to the blast furnace, with Ralph H. Sweetser, American Rolling Mill Co., presiding. J. P. Dovel will describe what he has done to make the blast furnace a permanent structure instead of one that has to be periodically rebuilt at considerable cost in his paper, "Improvements in Blast Furnace Construction." W. R. Phibbs will describe some interesting special features in the operation of the blast furnace of the Columbia Steel Corporation at Ironton, Utah. "Gas Washing" is the title of a paper by A. J. Boynton, which he will supplement with observations based on his recent trip to Europe. "The Use of High-Alumina Slag in the Blast Furnace" will be discussed by T. L. Joseph and two associates. J. R. Campbell will give results on the cleaning of bituminous coal to reduce its ash content.

On Wednesday afternoon there will be a joint round-table conference of members of the iron and steel committee of the A. I. M. and M. E., and the American Foundrymen's Association, on the subject, "Blast Furnace Operations and the Character of Pig Iron and Castings." This will supplement the one held a year ago. Ralph H. Sweetser will be the chairman.

Howe Memorial Lecture

The annual Howe memorial lecture will be presented at 4 p. m., Monday, Feb. 20, by Henry D. Hibbard, consulting metallurgist, Plainfield, N. J., who will take as his subject "The Significance of the Simple Steel Analysis."

The annual banquet will be held Tuesday night at the Waldorf-Astoria Hotel, at which the following presentation of awards will be the feature: The Hunt gold medal to Dr. John A. Mathews, the Hunt prize to Dr. C. H. Herty, Jr., the J. E. Johnson, Jr., award to P. H. Royster, and the Saunders gold medal for achievement in mining to Herbert Hoover, Secretary of Commerce, and past-president of the Institute.

Varied Program of Institute of Metals

Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers will hold several sessions, as is the custom, with the main society during the week of Feb. 20. The meetings will be held at 29 West Thirty-ninth Street, New York.

Tuesday, Feb. 21. 2 p. m. On Lead; R. S. Dean, chairman.
Wednesday, Feb. 22. 9.30 a. m. On Metallography; Zay Jeffries, chairman.
9.30 a. m. On Secondary Metals; E. R. Darby, chairman.
2 p. m. On Light Alloys; H. W. Gillett, chairman.
4 p. m. Annual Lecture.
6 p. m. Annual Dinner at the University Club.
Thursday, Feb. 23. 9.30 a. m. On Copper; W. H. Bassett, chairman.
2 p. m. On Precious Metals; G. F. Kunz, chairman.
Friday, Feb. 24. 9.30, 11 and 2; Sub-Committees of B-2, American Society for Testing Materials.

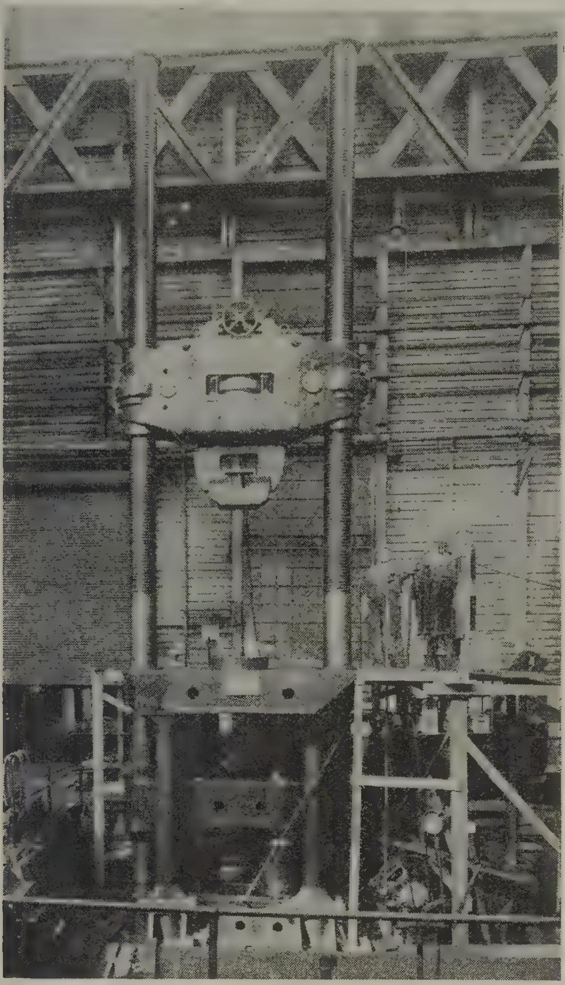
Prof. C. H. Mathewson of Yale University will deliver the annual lecture on the subject "Twinned Structure in Wrought Metals."

A feature of the annual dinner on Wednesday evening will be an intimate talk on the production of copper and copper alloys by W. H. Bassett, of the American Brass Co.

HYDRAULIC TESTING MACHINE

Universal Tests to Capacity of 1,000,000 Lb.—Designed for Car Frames

ANOTHER large testing machine of 1,000,000 lb. capacity has been completed by the Southwark Foundry & Machine Co., Philadelphia. It differs markedly from the machine of similar capacity described in THE IRON AGE of April 14. The new machine, which is from the designs of the Emery-Tatnall Co., was built for the Symington Co., Rochester, N. Y., and designed primarily for testing side frames, couplers, yokes and other parts of railroad car construction.



General View of the Machine, Showing Length of the Screws and Arrangement of Platen and Upper Crosshead

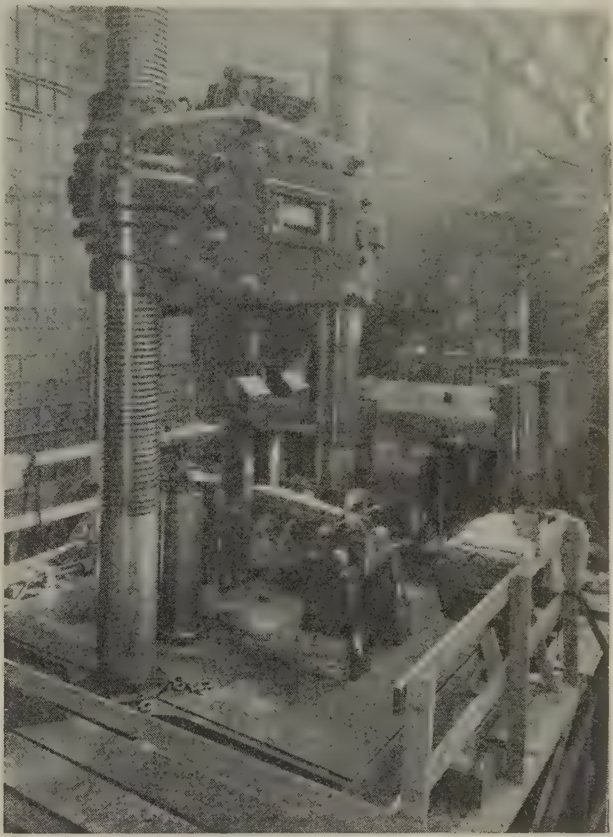
As the machine is available for both tension and compression, it is of the universal type. It has two columns in place of the four in the earlier machine, and operation is by means of four hydraulic cylinders where the earlier machine had but one. There is a clear distance between the screws of 7 ft. 1 in., the fixed bed or upper platen having a width somewhat greater than this and a length of 10 ft. Control and measuring apparatus are all on this platen, so that everything is under the hand of the operator.

One illustration taken in the erecting shop shows the machine set up with a side frame undergoing compression test. When erected in the laboratory this platen will be flush with the floor, while the lower platen, the hydraulic cylinders, etc., will all be in the basement.

Essentially this machine consists of a fixed bed carrying four hydraulic presses (18-in. plungers) and a moving yoke. This yoke consists of a crosshead between the presses, as shown in the general view. The crosshead carries the two 14-in. screw columns, which in turn carry the top cross beam containing the weighing apparatus. This beam is carried on the columns by means of two inclosed nuts which are driven by a motor and suitable gearing on the rear of the beam. This top beam, therefore, is adjustable on the columns. Its position is determined by using the motor and rotating the columns, but they are not rotated for placing stress on the test piece. Actual power for testing is given by the hydraulic presses below the table, which raise or lower the screw columns and the yokes as a unit.

These presses force the whole yoke, consisting of the two cross beams and the two columns, up or down as required. The columns slide through bushings near the bottom of the main bed. The weighting system consists of an Emery hydraulic support in the top cross beam. This support is connected with hydraulic indicators not visible in the illustration. The edge of the support is shown in the opening at the center of the massive beam.

The cast steel yoke in which the support is carried is balanced in such a manner that vertical loads in either direction on the upper platform or holder become loads of compression on the support. The view shows compression heads in place. These, however, are readily removed and spherical seated tension holders may be substituted for them. Hydraulic power is furnished with a motor-driven Hele-Shaw pump, oil being used in the hydraulic system. The reservoir holds 55 gal. of oil. As the ratio between the oil cylinder plungers and the effective pump area is about 500 to 1, the full 1,000,000-lb. capacity is obtained with an oil pressure of about 2000 lb. total, or some 1000 lb. to the square inch.



Machine Set Up for a Test. This view shows operating and recording equipment located on the table

Twentieth Annual Meeting of Institute of Metals

The twentieth annual general meeting of the Institute of Metals, which will be held in London on March 7 and 8, will include several interesting functions. The new president, Dr. W. Rosenhain, will be inducted into the chair by Sir John Dewrance, and will deliver his presidential address. Afterward 16 papers will be read and discussed. These include contributions from metallurgists in Germany, Japan and the United States, as well as Great Britain. The official program of the meeting includes a notable list of new members, 123 in all, which brings the membership close to the 2000 mark. It is striking to note what a large proportion of the new members reside abroad. Among the latest applicants for membership are André Citroën, the famous French motor car maker, and representatives of the French mint and ministry of marine.

DOUBLE-MAGNET LIFTING

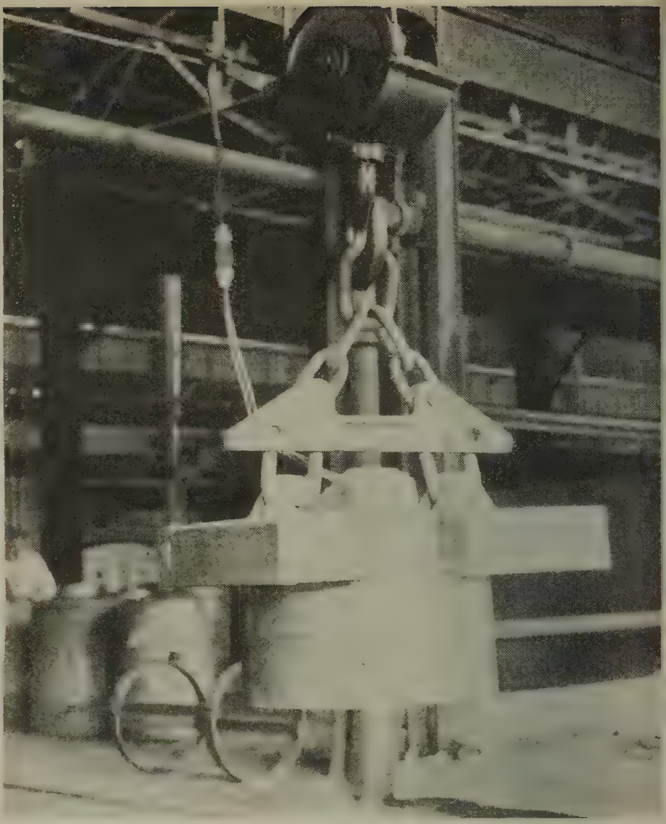
Two Magnets Obviate Expensive Binding of Strip Steel Coils

STRIP steel coils, before they leave the coiling machines at the Superior Steel Corporation plant, Carnegie, Pa., are bound with a single band around the middle of the circumference, and another across the center to hold the inside end of the strip. This is sufficient binding, as the coils are immediately piled on small trucks, and, in lots of 12, are carried to the annealing department. There they are transferred to buggies, the binding is removed and the buggies are pushed into annealing furnaces.

All of the coils, regardless of their weight, the thickness or width of the metal, are 28 in. across the outer diameter. Because of this, the center hole will vary betweeen 10 and 20 in. in diameter. The coils run from 1200 to 1800 lb. in weight, while the strip varies in width from 14 to 20 in. Every coil is bound in the same manner.

In the annealing department, two lifting magnets on a special spreader beam handle these strip steel coils. They were supplied by the Electric Controller & Mfg. Co., Cleveland. Either one of these magnets will lift the heaviest coil, if that coil is bound securely. But with the present simplified method of binding, the center turns of the coils will pull out under the pulling power of a single magnet. It was, therefore, a simple problem—two magnets versus more elaborate binding of every coil—the solution of which dictated the purchase of the two magnets.

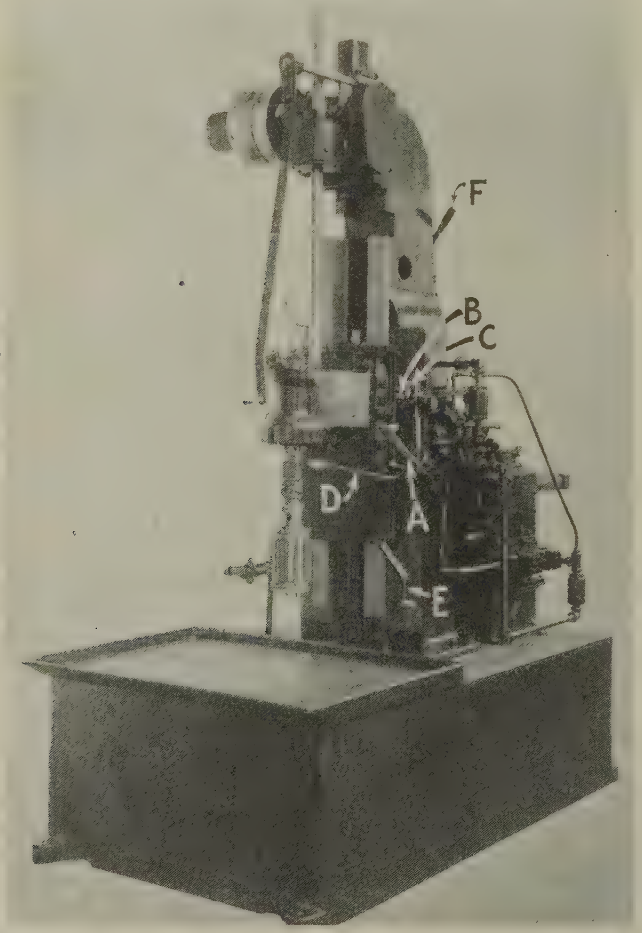
As stated before, the outer diameter of every coil is 28 in. The spreader beam designed for this job holds the two lifting magnets so that their centers are exactly that distance apart. This brings the center of pull of each magnet above the outer edge of the coil to be lifted. The major part of the lifting of a coil is done at the outer edges, so there is no tendency for the steel strip to come uncoiled. With two lifting magnets, the Superior company has done away with elaborate, expensive binding of coils on a job where, under any circumstances, the binding can be only temporary.



Lifting Coils of Strip Steel by Two Magnets, to Avoid Uncoiling Action Frequent When One Is Used

Single-Spindle Lapping Machine

For use where production requirements do not warrant the installation of a multiple-spindle lapper, and also for corrective lapping, the Moline Tool Co., Moline, Ill., is offering a single-spindle unit, designated as the No. 12.



Automatic Operation May Be Provided

The machine is available with or without the automatic feature of the company's multiple-spindle lapper, by means of which the spindle makes a predetermined number of strokes and then withdraws and stops. The accompanying illustration shows the non-automatic machine.

The base of the machine forms a reservoir and settling tank of about 2 bbl. capacity for the lapping compound. Steady flow of the compound on the lapping tool is maintained by a pump and system of piping which delivers the compound at the rate of about 30 gal. per min. The fluid drains into two drawers, which may be removed conveniently for cleaning. From the drawers it overflows into the first compartment of the base and then flows over baffle plates into successive compartments, from the last of which it is again pumped to the laps. A pan table, the working surface of which is 35 x 45 in., is bolted to the base for mounting suitable fixtures.

The drive may be either from a motor or a countershaft to the clutch pulley on the machine, from which the power is transmitted to the spindle through spiral and spur gears. The multiple disk clutch is operated by a lever which also operates a brake, stopping the rotation of spindle the instant the clutch is disengaged.

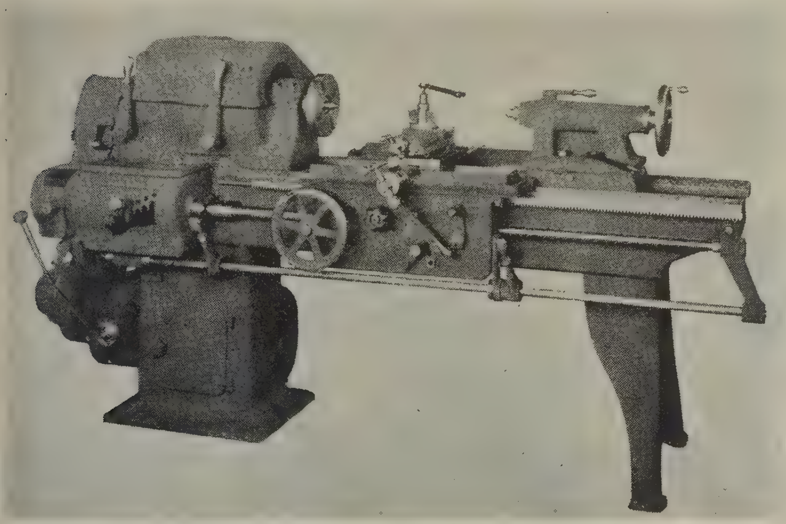
Reciprocations of the slide carrying the spindle are obtained by an Oilgear pump unit and are controlled by levers at the front of the machine. The stroke can be set for any length up to 24 in., and the rate of reciprocation can be changed by the adjustment of a valve on the pump. All reciprocating parts, such as the rail, slide and heads, are made of aluminum to minimize the weight of the reciprocating parts.

In the machine illustrated the slide is at the bottom of the stroke, but in the starting position the slide is up. To start the cycle of operations, lever *A* is pulled down, causing the slide to travel down to the position shown where pin *B* strikes knock-out *C*, reversing the direction until pin on lever D strikes knock-out C, again repeating the working cycle. To remove the lap from the work, the lever D is pulled down, the knock-out pin passes the knock-out, and the slide travels upward until pin E throws lever A into the neutral position. The machine is equipped with a One Shot centralized oiling system, which is operated by the lever F.

The slide can be set to give a maximum distance of 47 in. from the spindle nose to the table. For motor drive, a 5- to 7½-hp. 1200-r.p.m. motor is recommended. The shipping weight of the machine is approximately 6900 lb.

Multi-Speed Lathe With Four Highest Speeds from Gear Box on the Leg

The Chard Lathe Co., Newcastle, Ind., has brought out a multi-lathe, arranged so that the four highest speeds are obtained from a gear box on the leg of the machine, without use of any of the gears in the headstock. Eight additional speeds are obtainable through the headstock when heavy cutting is desired. The lathe may be driven either direct from a lineshaft or from a motor.



Eight Additional Speeds Are Obtainable Through Headstock Gears of the Multi-Speed Lathe

The four-speed gear box is cast integral with the leg of lathe and includes a bracket for mounting the motor. The drive from the motor to the gear box is by silent chain, and from the gear box to the spindle is usually by means of a wide belt. The latter may be by silent chain if desired. All gears in the gear box are hardened and all shafts are mounted in ball bearings and run in a bath of oil.

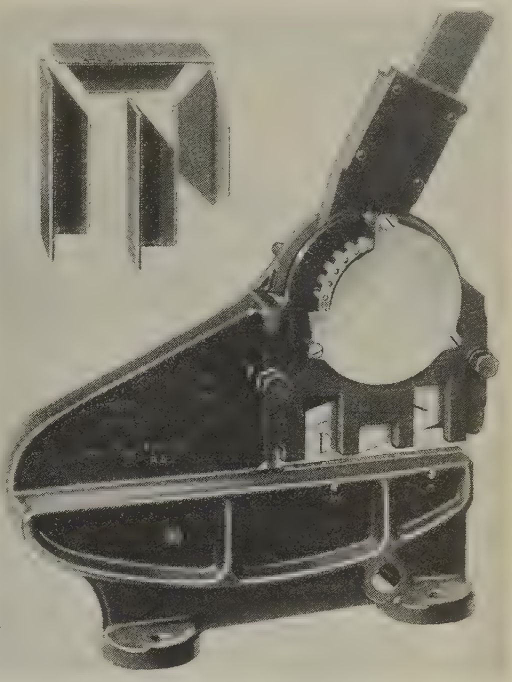
Three changes of speed are obtainable in the headstock, two through gears and one direct to the spindle, giving 12 spindle speeds that provide a finely divided range of surface speeds. Forward speeds are obtained through a friction clutch operated by levers on a rod beneath the lead screw, which levers also control a brake for stopping the spindle. All other speeds are obtained through sliding gears. All speeds are selective and all levers are within easy reach of the operator.

Power from the gear box to the spindle is transmitted to a pulley that is mounted on a sleeve on the spindle, and on which two gears are keyed. These gears transmit the power to the gears on the back shaft which have clutch teeth cut on the face of hubs. The clutches slide on keys on the backshaft to engage either of the gears on this shaft. The spindle and backshaft are made hollow to permit constant oiling of the moving parts.

Application has been made to sell the East Side plant of the Hydraulic Steel Co., Cleveland, which has been operated for several years under a receivership. It is stated that the reorganization committee, of which Walter C. Jenney, Philadelphia, is chairman, has been assured of a cash bid of $1,000,000 for the plant.

Shear for Slitting 3/16-In. Material

A hand-operated slitting shear with capacity for material 3/16 in. and less in thickness has been added to the line of the Whitney Metal Tool Co., Rockford, Ill. The machine, designated as the No. 6, is of alloy steel, drop forged, and all wearing parts are hardened.



The Eccentric Crankpin and Trunnion Bearings of the Shear Are of Roller Type

The eccentric crankpin and trunnion bearings are of roller bearing type. The shear blades are 4½ in. long and are inserted, the lower blade being adjustable to compensate for wear.

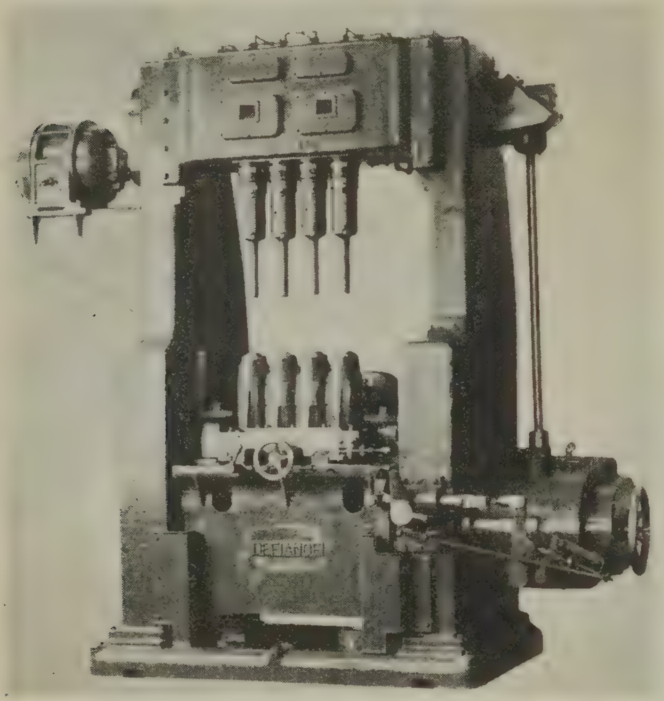
Cutting Blowpipe Designed to Prevent Backfire

One source of delay often experienced when cutting with an oxy-acetylene blowpipe is known as the "backfire" or "flash back." When the blowpipe head gets very hot, or accumulates spatterings of hot metal on the tip, or is accidentally brushed too close to the molten metal, the gas stream (a mixture of acetylene and oxygen) will start burning back in the passageways leading from the mixing chamber. When this occurs the oxygen is turned off momentarily, in order to extinguish the flame and prevent the interior of the blowpipe from being melted.

To avoid such delays, the Oxweld Acetylene Co., 30 East Forty-second Street, New York, has developed a new cutting blowpipe, known as C-14, which will not backfire, it is stated, even under the most severe operating conditions. Several improvements in minor detail are also embodied, such as the replacement of cast parts with brass forgings. Nozzles for the new C-14 are interchangeable with the older type C-2. The blowpipe can also be used with either medium-pressure or low-pressure acetylene.

Single-Purpose Fixed-Center Cylinder Boring Machine of Heavy Type

A single-purpose, four-spindle, fixed-center cylinder boring machine for the rough boring, semi-finishing or reaming of traction and gas engine cylinders having any number of bores or automobile engine cylinders cast en bloc or singly, has been brought out by the Defiance Machine Works, Defiance, Ohio. This machine, designated as the extra heavy No. 8, is a production unit with capacity for 15 to 25 cylinder blocks per hour.



Traction and Gas Engine Cylinders or Automobile Engine Cylinders, Cast en Bloc or Singly, May Be Rough Bored, Semi-Finished or Reamed on a Production Basis

Rigid construction is a feature. The frame and base castings are of heavy design, with cast ribs. The slides are broad and long and are scraped and gibbed. The feed mechanism is of unit construction, affording easy access, and is entirely inclosed. The feed gear box retains a sufficient level of oil to provide splash lubrication. All feed shaft bearings are bronze bushed and end thrusts are taken by ball bearings. Feed changes are made simply by removing a gear case cover and changing two gears. Hand adjustment for the table feed is provided, but when the machine is in operation the table automatically feeds the work to the boring tools. When the cut is finished, the table reverses automatically to fast travel, returns to the loading position and stops until engaged to bore the next cylinder. By means of double clutches in the feed box the machine can be set to feed, disengage, rapid travel up, feed again, disengage and automatically return. The drive to the spindles is either by belt from a three-step cone pulley or from a motor through a flexible coupling.

The spindles are made of hammered steel, are of large diameter, and each spindle is mounted in three bronze bearings. The nose bearing is conical in shape and has a convenient means of adjustment for taking up wear. Each spindle floats between two sets of ball bearings which receive the end thrusts. A friction brake is provided for instant stopping of the spindles. The boring tool is fitted to the spindle by a tapered shank and held in place by a long bolt extending through the spindle from the top, which eliminates the possibility of its being extracted from the spindle on the return feed.

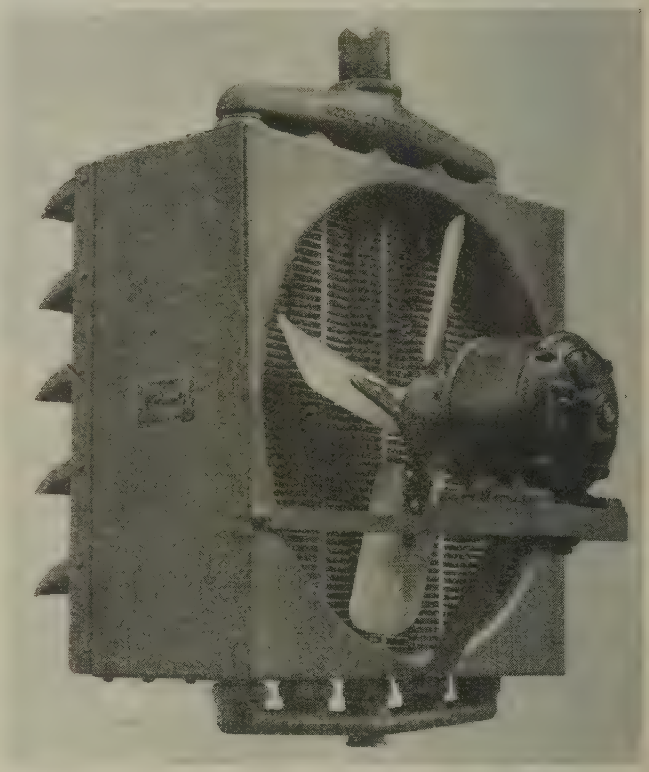
The auxiliary sliding table is operated in and out by means of screw feed driven by a separate motor mounted on the back, which actuates a right and left hand slip friction clutch. A sliding table, when used in front of the machine, permits the loading of blocks over the fixture. The latter has revolving bushings into which the pilot bars enter before the cutting takes place.

A pair of jack screws of large diameter serve to raise and lower the table. Each screw is retained in a jack and actuated by a heavy worm and worm gear through a bronze nut which is sleeved to the worm gear. Moving parts are packed in grease. A simple adjustment is provided for advancing or retarding the screws independently in order to maintain perfect alinement of the table. Thrust is taken by ball bearings. For driving the machine 15 to 25 hp. is required. Floor space occupied is 11 ft. x 6 ft. 10 in., and the net weight of the machine is 21,330 lb.

Unit Heater for Use of High-Pressure Steam

Unit heaters designed with fins and cores integrally cast and with strength in radiator sections sufficient for working pressures up to 250 lb. are being marketed by the Mechanical Mfg. Co., Pershing Road and Loomis Street, Chicago. Each radiator section, complete with fins, is cast in one piece of a special aluminum alloy. The units are tested to 800 lb. hydrostatic pressure in the shop. The cores are designed so that they offer the least possible resistance to the flow of air directed against them by the motor-operated fan, which is mounted on a bracket secured in turn to the metal casing.

Louvers, which can be adjusted independently of each other, are provided across the front of the radiator sections. The intake manifold is so proportioned that distribution of steam is uniform to all connected core or heater sections. The table shows the performance of this heater unit.



Fins and Cores Are Cast Integral, and Radiator Sections Are for Pressures Up to 250 Lb.

Steam Pressure, Lb. Gage	Air Intake, Temp., Deg. Fahr.	Equivalent Direct Radiation, Sq. Ft.	B.t.u. Output
1	60	570	137,300
10	60	662	159,000
100	60	1030	246,900

The standard model 20 "thermal unit" delivers 2600 cu. ft. a minute, with a 1/6-hp. motor operating at 1135 r.p.m.

Hungarian Pig Iron Output Higher

Production of pig iron in Hungary in 1927 totaled 215,200 tons, against 132,900 tons in 1926, according to a report received by the Iron and Steel Division, Department of Commerce, Washington, from Assistant Commercial Attaché John A. Embry, Vienna. Imports of pig iron were 30,000 tons in 1927 and 26,300 tons in 1926.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Statistical Data Concerning the Chief Consuming Industries Indicate That:

Expansion of activity in chief consuming industries is likely to be moderate.

Car and locomotive buying in January slumped badly from the high level of December.

Automobile production is clearly expanding, with the seasonal peak two or three months ahead.

Building volume continues large; residential building is the backbone; structural sales have not held up, but are now improving.

Outlook for tank plates in petroleum States should improve, as storage of oil may become a larger element.

Iron and steel exports have been much lower, December showing the smallest movement of the year.

THERE is no question but that the placing of *orders* for steel has been active, but there is some question as to whether the volume of orders represents current *requirements*. It remains to be seen whether buyers have not anticipated their requirements sufficiently to produce a lull in ordering later on. Arguments on both sides of the question may be brought forward. Perhaps the following discussion will enable the reader to draw his own conclusion.

Production Goes Above Demand Line

WE present herewith a revised chart of our composite demand line, together with the production of steel ingots. The composite demand line has been recalculated, using revised figures where necessary, and in all cases indexes of seasonal variation have been reworked. The weights used for averaging the indexes of activity in the various steel-consuming industries have been revised, also. Although we believe that the result is considerably more accurate than its predecessor, it is notable that, as often happens in such cases, the refinements introduced have made no great difference. Indeed, the sound conclusions based on the old chart were sufficient to demonstrate its substantial value.

The composite demand line, representing the average activity in the chief iron and steel-consuming industries, ceased to decline in December. In fact, it showed a slight gain in that month, which is noteworthy in view of the large decline during the three preceding months. Evidently operations in the chief consuming industries were stabilized temporarily at about the average level of the last seven years. Declines occurred in railroad traffic, building activity, mining (including petroleum), and in exports; but these declines were offset by increases in general manufacturing, machine tool orders and automobile production. The most notable increase occurred in the automobile industry.

Meanwhile steel ingot production, adjusted for seasonal variation—as are nearly all our curves—increased quite sharply. In November it had fallen below the average of the last seven years and it had been below the level of the composite demand line since last August. Its position had corrected the excesses of the preceding four months and probably resulted in the accumulation of considerable unfilled requirements. Thus, in December, steel production rose to the level of the demand curve again and in January it made the sharpest advance that has occurred since April, 1923.

This recent expansion of the ingot output seems to have been temporarily justified or even required by the increased volume of orders from railroads and automobile manufacturers. But in the case of the railroads, at least, the orders were not based on current activity; and in general it appears that a good deal of the business was driven in by advances in prices. Undoubtedly the demand line will not show any such rise

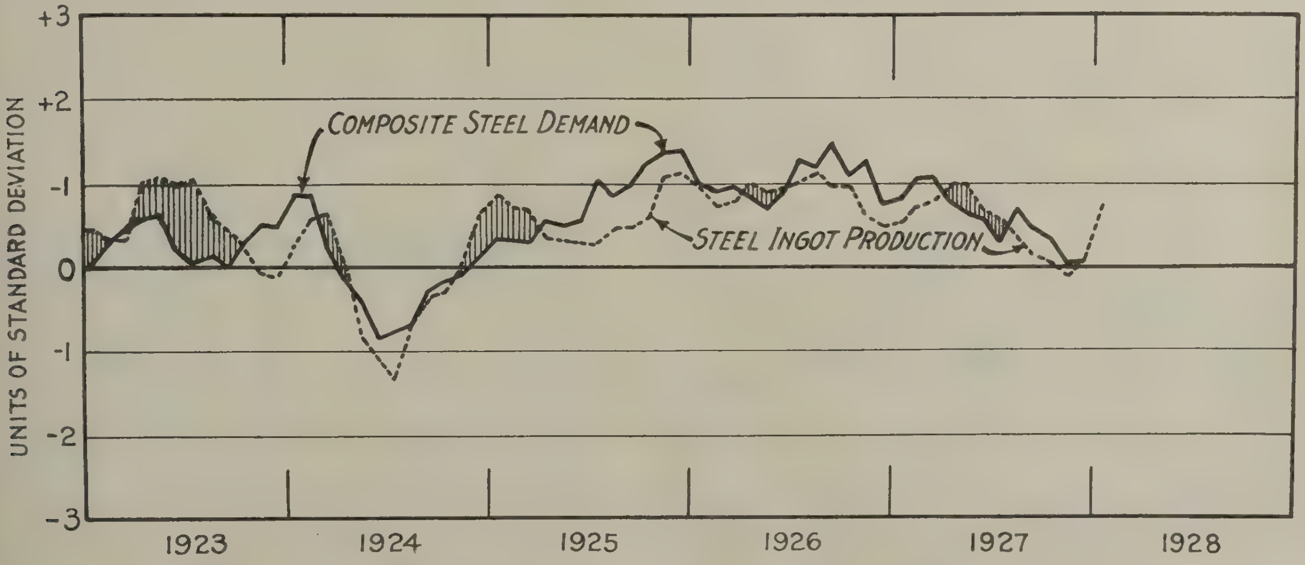


Fig. 1—Current Steel Production Made in January the Sharpest Advance in Nearly Five Years and Is Above the Curve of Composite Demand. The outlook for the immediate future is encouraging

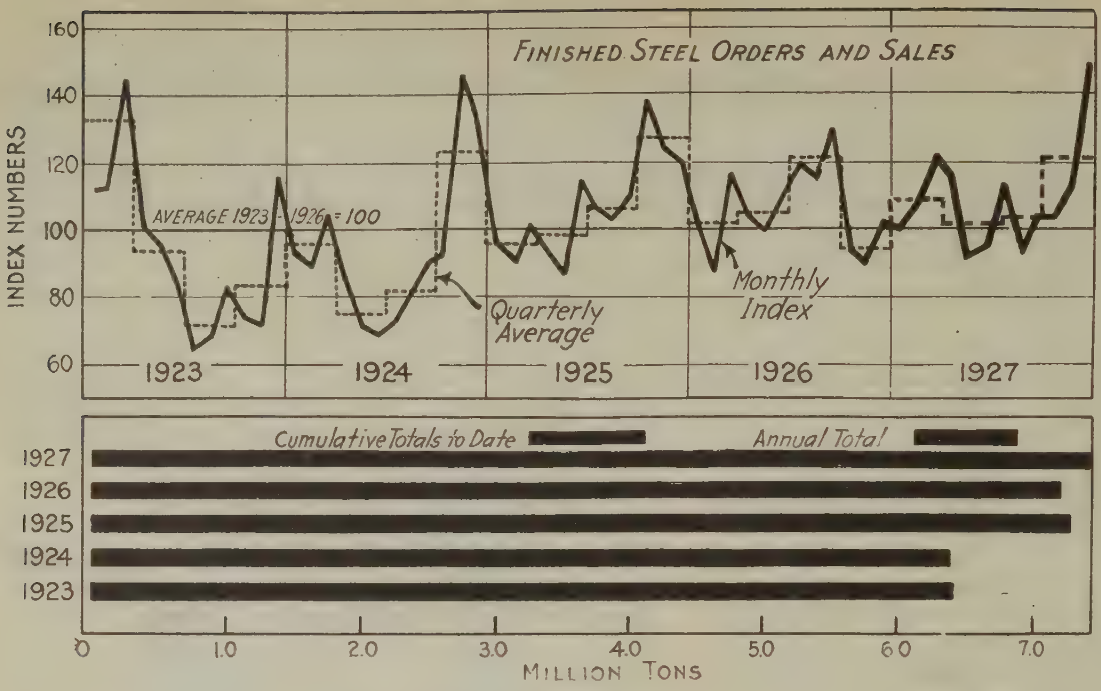

Fig. 2—Buying of Finished Steel Made a Great Spurt in December, Reflecting Accumulated Requirements. The peak of resultant production may follow in February or March

in January as occurred in the production curve, and it seems quite probable that steel production may be working into a position similar to that of early 1925, when a temporary excess developed. It is doubtful if production can hold the January pace. It should increase in February and March, which would be a normal seasonal occurrence. But in view of the sharpness of the gain in January it may be doubted if the full seasonal gain will occur during both months.

Conditions in Particular Lines

Of course, this suggestion is based partly on the doubt that February and March will show a sharp rise in the composite demand line, which brings up the outlook in the chief consuming industries. January estimates indicate that *railroad freight traffic* continued to make an unfavorable showing, though the declining trend was interrupted. Car loadings during the recent weeks indicate that the decline in loadings of miscellaneous and merchandise traffic has been checked. The recovery in general business, which we anticipate, should become apparent in increased railroad traffic before the end of February. Good buying of rails and recent reports of large equipment orders are encouraging. It must be admitted, however, that there is as yet no definite indication of any large gain in railroad requirements.

Manufacturing industries (excluding iron and steel and automobile production), after declining steadily between June and November, held about level in December. It is improbable that there will be much change in January, allowing for seasonal variation, but we look for improvement soon. Indications of an upward trend in unfilled orders and a reduction in stocks of manufactured products appeared in December. One favorable indication, too, is the fact that machine tool orders gained sharply in that month. Some let-down probably occurred in January, but seasonal developments and improvement in general business should bring gains in February and March.

The *automobile industry* is clearly expanding. Though production was small in December, it made a greater recovery than usual for the season and all indications are that the output will be steadily increased. The seasonal peak in the automobile industry does not come until April or May, and there should be some large buying of sheets, strips and other automobile material between now and that time.

The last three months of 1927 brought a larger volume of *building contracts* than did the first quarter, and January showed improvement both in building permits and in contracts awarded. A continued good volume is indicated, so that the outlook for the demand for structural steel, nails and common pipe seems good.

Mining activity, including petroleum production and drilling, is hardly satisfactory and the prospects are but fair. The outlook for the oil industry, however, is such as to indicate that improvement will occur during the year. And when such improvement does occur it is probable that oil companies will for a time be encouraged to accumulate more storage oil, which would bring a better demand for tank material. Drilling activity is at a low ebb, with no improvement in immediate prospect.

Agricultural prosperity appears to have shown no improvement during the last month or two. We note

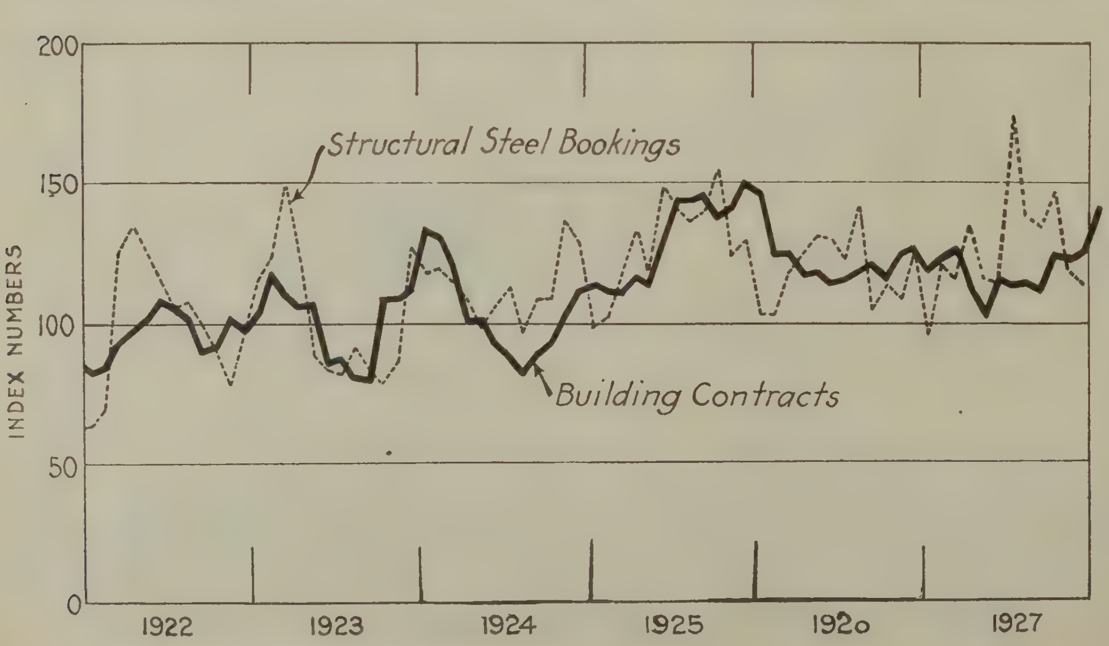

Fig. 3—Building Contracts Gained Sharply in January. Structural steel bookings dropped badly in December, but should resume a high level in the spring. January reports support this view

that in January the sales of the mail order houses fell off more than usual from December. Such sales, however, were above a year ago and trade reports continue to indicate good activity among the manufacturers of farm machinery. On the whole, the agricultural demand for steel products should be fair to good.

As to *exports*, we find that, considering the season, the foreign shipments of iron and steel fell to the lowest point of the year in December, when our adjusted index was only 4 per cent above the average of the last seven years. This compares with 10 per cent above in November and 22 per cent above a year ago.

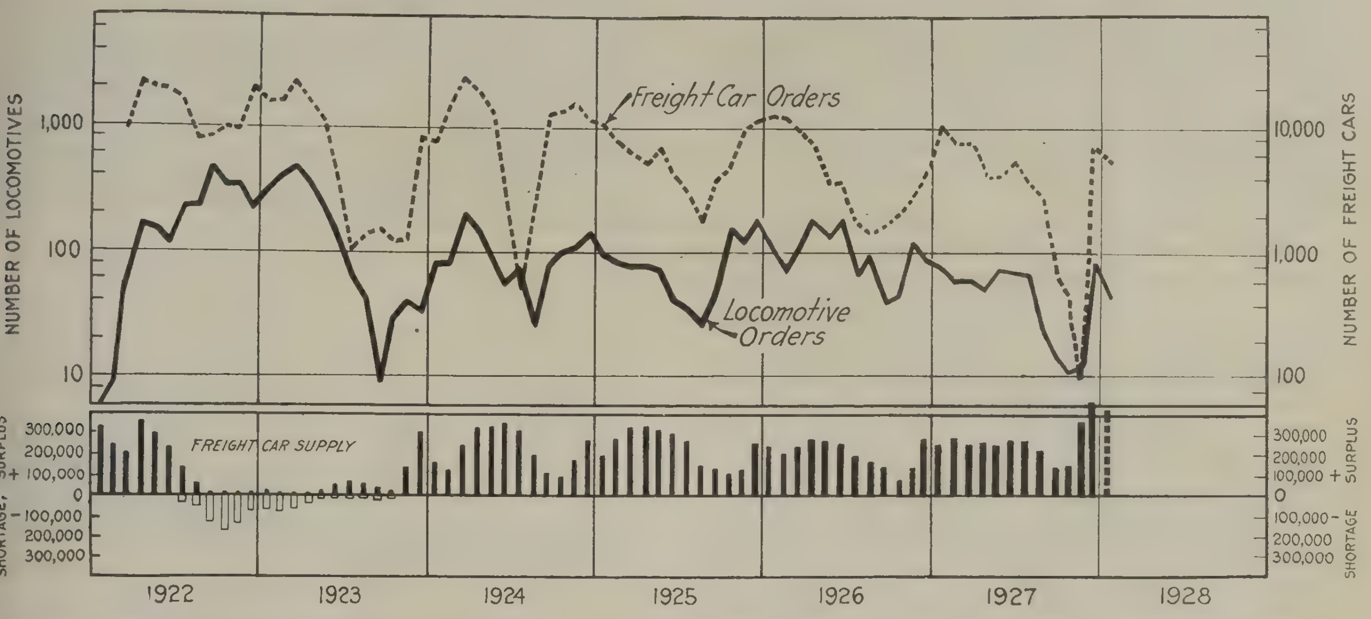

Fig. 4—Locomotive and Railroad Car Orders Dropped Sharply from December Levels. Good-sized orders in early February presage betterment in demand for certain steel products

On the whole, the prospects favor the conclusion that there will be a moderate expansion in the activity of the chief consuming industries, particularly in automobile production and in general manufacturing. Building activity promises to be well sustained and railroad freight traffic should recover within a month or two. But steel production has gone ahead so fast that there is some danger now that it will unduly anticipate requirements.

Heavy Buying Featured December

AN extraordinary wave of buying of finished steel developed in December. The total tonnage of sheets, castings, fabricated structural steel and fabricated steel plates booked in that month was higher than in any other month in recent years, if not record breaking. (Our index number represents about 50 per cent of the finished steel business, but it does not include bars, pipe, tin plate, wire or nails.)

This expansion reflects postponed buying and accumulated requirements on the part of consumers. It was due in part also to price advances, which were doubtless made with a view to driving in business. Of course, the bulk of the orders was placed at the previous low prices. Accordingly, the December buying movement may not carry through. The fact remains, however, that it brought the total sales for 1927 above those of any recent year, including 1925. It is a sad commentary on the price situation in the industry that, with such a volume of business, the profits of the manufacturers should have declined so materially in 1927.

Such an increase in buying as occurred in December, coming at a period of very low production, is bound to give a stimulus to steel making that will last for two or three months. Similar spurts occurred in March, 1923, and December, 1923, and in these cases the peak of production was not reached until three months later. Other spurts came in November, 1924, and October, 1925, and these were followed by peaks in production within two months. It, therefore, seems highly probable that the production curve will continue to rise at least through February and probably through March.

Precedent, however, casts some doubt on the succeeding months. In the past, reaction has quickly occurred following such a run-up in buying. This has, no doubt, been due in some cases to the fact that buyers have placed orders amply covering their requirements for some time ahead, and then have awaited fresh weakness in the steel markets before again making purchases. Something of this procedure is apparent in the present instance, but it seems that a considerable part of the December ordering was the result of current or nearby requirements, and if we are correct in anticipating a general improvement in business, it is reasonable to infer that there will be no such large slump in steel buying during the next half year as occurred in early 1925.

Building Contracts Hold Up Well

CONSTRUCTION activity gained sharply in January. The square feet of floor space in contracts awarded actually increased a little, being 63,717,000, although a large decline is usual in January. As a result, our adjusted index for the month is 142 per cent of the average for 1921-1925, against 126 per cent in December and 119 per cent a year ago. This represents the highest annual rate of construction activity since January, 1926, when the decline that carried down to the middle of last year began. Since May, 1927, the adjusted index of construction activity has increased 38 per cent. Moreover, building permits showed more than the usual seasonal gain in January, which proves that the residential type of building in cities and towns is contributing to the total gain in construction. This rise in permits is a strong indication that the upward trend in building will continue for a time.

Bookings of structural steel in December fell to the lowest level since June, and were below their average relation to building contracts (see Fig. 3). The sharp rise in contracts, however, forecasts a gain in structural steel bookings; this forecast is supported by current trade reports for January, which are to the effect that the average weekly awards amounted to about 50,000 tons of fabricated structural steel, against only 30,600 tons in December.

Equipment Buying Slumped After Big Gain

IN one case, at least, we already know that a December spurt in buying did not carry through into January—namely, in the case of railroad equipment. Freight car orders in January were hardly fair and locomotive orders fell to negligible proportions.

As reported by *Railway Age*, freight car orders in January numbered 2098, the great bulk coming from Southern and Southwestern roads. The figure compares with 14,114 cars in December, 17,196 cars in January, 1927, and 11,531 cars in January, 1926. Nevertheless the total for the last three months shows a fairly good level, so that a gain in February may yet save the day, as the sharp gain in December did. Some hope of this appears in current reports of large inquiries, and several good-sized orders have already been placed in early February.

We have to note that statistical indications as to the extent of freight car buying during the next month or two do not warrant any great optimism. In the first place, the volume of freight traffic in January would indicate no increased requirements; in the second place, the surplus of freight cars as last reported was the largest that has existed at any time in the last seven years. The surplus on Jan. 23 is reported at 421,393 cars, which compares with about 275,000 a year ago. There thus appears to be little reason to expect a sustained gain at this time. Moreover, several railroad executives have recently expressed a lack of optimism concerning railroad earnings during the next few months.

Only two locomotives are reported to have been ordered in January, and both of these orders came from industrial concerns. This is the smallest month's business on our record. Total shipments of locomotives, including steam and electric, fell to a new low, amounting to only 47. In spite of the decline in shipments, unfilled orders also decreased and amounted to only 222. These are the official Government figures for the entire month of January.

As shipments declined by 25 locomotives, and unfilled orders decreased by only 10 locomotives, one might infer that the total orders for the month amounted to 15 locomotives. As in the case of freight cars, the number of locomotives in storage is large. Also the percentage of bad-order locomotives is fairly low. The number in storage on Jan. 1 was 7490 against 4601 a year ago. Bad-order locomotives on Jan. 15 numbered 9140, against 9371 on the same date in 1927.

Naturally, we find that employment in railroad equipment manufacturing establishments was at a very low ebb in December.

Coke Production at Increased Rate in December

WASHINGTON, Feb. 14.—Output of by-product coke in December was 3,646,000 net tons, an increase over November of 146,000 tons, or 4.2 per cent, according to the Bureau of Mines. The average daily rate of production also increased, from 116,667 tons in November to 117,612 tons in December, a gain of 945 tons, or 0.8 per cent. Production of beehive coke in December remained practically stationary, the total being estimated at 377,000 tons. Production of all coke amounted to 4,023,000 tons, of which 90.6 per cent was contributed by the by-product ovens and 9.4 per cent by beehive ovens.

Preliminary totals for the calendar year 1927 show a production of 43,921,000 tons of by-product coke and 7,004,000 tons of beehive coke. In comparison with 1926 this is a decrease of 1 per cent in by-product coke output and of 44 per cent in beehive production.

Large Construction Activity in January

Building contracts in January in the 37 States east of the Rocky Mountains are reported by F. W. Dodge Corporation at $427,169,000. This represents the second largest January on record and is a gain of 11 per cent over January, 1927. It is a decline, however, of 11 per cent from the preceding month. Residential buildings accounted for 45 per cent of the total, continuing the lead which this type of structure has held for several years. Public works and utilities were 17 per cent, commercial buildings 16 per cent, and industrial buildings 9 per cent.

Heavier Steel Furniture Orders

New orders for steel furniture in December are reported by the Department of Commerce at $2,850,314, comparing with $2,476,230 in November. The December total was the largest since March and was somewhat larger than that of December, 1926, at $2,802,325. For the year, however, there was a falling off of 2 per cent from 1926, the total being $30,760,343, against $31,393,171 in the earlier year.

Shipments ran a little ahead of new orders in both years. In December, however, they fell below orders, being reported at $2,740,602. Unfilled orders at the end of the year are given as $1,413,880, a reduction of about 10 per cent from the figure a month earlier and about the same amount below the figure at the end of 1926.

Orders for steel shelving in December are reported at $619,276, the largest figure since last June. This compares with $574,763 in November, and with $561,979 in December, 1926. Orders for the year were $7,351,122, a slight increase over 1926. Unfilled orders at the end of the year were $605,809.

Commercial Stocks of Coal

Bituminous coal stocks in hands of commercial consumers on Jan. 1 are estimated by the United States Bureau of Mines at 55,500,000 net tons. This is almost precisely the same amount as a year earlier and is 13 per cent greater than the total of Jan. 1, 1926. It represents a shrinkage of about 10 per cent from the Oct. 1, 1927, figure of 61,900,000 tons. This shrinkage has been progressive since April 1 last, when a record tonnage of coal was on hand, estimated at 75,000,000 tons, or about double the total of a year before that.

It is estimated that the Jan. 1 total represented about 41 days' supply. This was not equally distributed among various users, however. Steel mills had a supply figured at 45 days; by-product coke plants at 38 days; other industrial plants at 44 days; coal gas plants at 79 days; electric utilities at 58 days; railroads at 41 days, and coal dealers at 27 days.

Of the steel plant total supply, 2,273,786 tons on Jan. 1, steam coal accounted for 1,296,376 tons or 42 days' supply, and gas coal, 977,410 tons, or 50 days' supply. By-product plants had 6,437,676 tons of coking coal, including 1,546,864 tons of low-volatile coal (48 days' supply) and 4,890,812 tons of high-volatile coal (40 days' supply).

The Industrial Steel & Supply Co., 26 East Jackson Boulevard, Chicago, has been organized to buy and sell industrial and railroad iron and steel scrap and industrial and railroad supplies. Officers of the new company are Lawrence C. Ryan, formerly vice-president and treasurer of the Standard Forgings Co. and the St. Louis Forgings Co., president and treasurer, and John T. McEnroe, formerly vice-president of the Benjamin Colitz Co., vice-president.

Walter Erman & Co., McCormick Building, Chicago, dealers in old materials, have changed their firm name to Erman-Howell & Co., Inc.

Schedule of the next installments of the ***Business Analysis and Forecast,*** *by* ***Dr. Lewis H. Haney,*** *Director New York University Bureau of Business Research, follows:* ***Feb. 23—*** *Position of Iron and Steel Producers;* ***March 1—*** *General Business Outlook;* ***March 15—*** *Activity in Steel Consuming Industries.*

Foundrymen Prepare Program for Philadelphia Convention

Preliminary Schedule of Technical Sessions—Many Papers Arranged For—Course in Cupola Operations a New Feature

THE program committee of the American Foundrymen's Association, in arranging for the program of meetings for the thirty-second annual convention of the association at Philadelphia, May 14 to 18, announces the following tentative schedule of technical sessions:

Monday May 14—Registration, committee meetings, and first session in cupola operation course
Tuesday, May 15—
  9.30 a. m.
    (1) Opening meeting and business session
  11 a. m.
    (2) Non-ferrous metals
    (3) Steel founding
    (4) Cast iron
  2.30 p. m.
    (5) Foundry costs and second session in cupola operation course
Wednesday, May 16—
  10 a. m.
    (6) Steel metallurgy
    (7) Cast iron
  12.30 p. m.
    (8) Round table on brass founding
  2.30 p. m.
    (9) Foundry management
    (10) Foundry coke specifications and third session in cupola operation course
Thursday, May 17—
  10 a. m.
    (11) General foundry practice
    (12) Apprentice training
  12.30 p. m.
    (13) Round table on malleable founding
  2.30 p. m.
    (14) Sand control; fourth session cupola operation course
Friday, May 18—
  10 a. m.
    (15) Materials handling
    (16) Malleable founding

The papers for these meetings, while not all the sessions have been definitely arranged, show promise of being some of the best, as a group, ever secured for an A. F. A. meeting. The interests of all the four branches of the industry have been considered, and in addition the varied interests of the metallurgists, executive, shop manager, engineer and practical shop man have been met. A partial list of the papers to be presented follows:

"Furnace Refractories for Brass Foundries," by H. M. St. John, chief metallurgist Detroit Lubricator Co., Detroit.

"Science in the Foundry," by E. F. Hess, metallurgist Ohio Injector Co., Wadsworth, Ohio.

"Risers, Their Need and Feed," by R. R. Clarke, alloy foundry, General Electric Co., Erie, Pa.

"Variables in Steel Foundry Practice," by F. A. Melmoth, Thomas Firth & Sons, Ltd., Sheffield, England; I. B. F. exchange paper.

"Economies in Oxy-Acetylene Cutting for Riser Removing," by G. O. Carter, Linde Air Products Co., 30 East Forty-second Street, New York.

"Sand Reclaiming in the Steel Foundry," by D. M. Scott, Gould Coupler Co., Depew, N. Y.

"Interdependence of Operating and Sales Departments in the Success of a Foundry," by K. V. Wheeler, Lebanon Steel Foundry, Lebanon, Pa.

"Theory of Cupola Operation in Relation to Practice," by R. B. Schaal, Roberts & Manders Stove Co., Hatboro, Pa.

"Automatic Blast Gate Control for the Cupola," by H. W. Crawford, General Electric Co., Schenectady, N. Y.

"Necessity for Creating a Casting Consciousness," by A. F. Jensen, Hanna Engineering Co., Chicago.

"The Schedule Fallacy," by J. J. Ewens, George H. Smith Co., Milwaukee.

"General Characteristics of Alloy Steel Castings," by J. W. Frank, Chicago Steel Foundry Co., Chicago.

"The Research Laboratory of the American Steel Foundries," by W. C. Hamilton, research director American Steel Foundries, Indiana Harbor, Ind.

"Temperature Measurements of Molten Cast Iron," by H. T. Wensel and W. F. Roeser, United States Bureau of Standards, Washington.

"Influences of Carbon and Silicon Variations in Cast Iron," by D. G. Anderson and G. R. Bessmer, Western Electric Co., Chicago.

"Producing High-Strength Cast Iron," by John D. Miller, Cresson-Morris Co., Philadelphia.

"Basic Principles of Management in the Foundry," by J. D. Towne, Dayton, Ohio.

"Manganese Steel," by H. P. Evans, Pettibone-Mulliken Co., Chicago.

"Stabilizing Labor and Cutting Cost by Horse Sense," by A. D. Lynch, Ohio Brass Co., Mansfield, Ohio.

"What Does the Buyer Expect for His Money?" by J. A. Marks, Packard Motor Car Co., Detroit.

"A Contribution to the Training of Labor and the Personnel of a Foundry," by A. Soupart, Director of Musee, Professional de l'Etat et des Ecoles Techniques de Morlanwetz; exchange paper of the Association Technique de Fonderie de Belgique.

"Heat Losses from a 75-Ton Hot Metal Car," by W. F. Roeser, United States Bureau of Standards, Washington.

"Surface Conditions of Castings as Affected by Core Sand Mixtures," by H. L. Campbell, University of Michigan, Ann Arbor, Mich.

"Testing Molding Sands for Durability," by M. A. Blakey, International Harvester Co., Milwaukee.

"Sand Conservation and Control in a Gray Iron Jobbing Shop," by T. F. Kiley, Brown & Sharpe Mfg. Co., Providence, R. I.

"Sand Control Methods in a Light Casting Foundry," by W. G. Reichert, Singer Mfg. Co., Elizabethport, N. J.

"Materials Handling and Its Relationship to Building Plans," by E. F. Scott, Austin Co., Cleveland.

"Reducing Scrap in the Malleable Foundry," by R. A. Greene, Ohio Brass Co., Mansfield, Ohio.

This list of papers will be supplemented by others and by reports of committees.

The technical sessions, scheduled for the mornings of the convention week, will be held in the meeting rooms of the Hotel Bellevue-Stratford and the afternoon meetings, which are all of general interest, will be held in the meeting rooms of the Commercial Museum, which will house the foundry exhibit.

The Cupola Operation Course

An innovation this year, to interest that large group of foundrymen, the practical men in cast iron foundries operating and working with cupolas, will be the four-period cupola operation discussion course. These discussion groups will be held on each of the first four days of the meeting. The leaders each day are as follows:

Monday, May 14, Dr. Richard Moldenke, "Principles Underlying Cupola Melting Processes"; Tuesday, May 15, E. J. Lowry, "Cupola Construction Details"; Wednesday, May 16, David McLain, "Cupola Charging Practice"; Thursday, May 17, H. W. Dietert, "Cupola Improvement."

Blast Furnace Practice Presented to Connecticut Foundrymen

The February meeting of the Connecticut Foundrymen's Association was held on Feb. 10 at New Britain, Conn. R. J. Linney, vice-president Chateaugay Ore & Iron Co., Lyon Mountain, N. Y., was the chief speaker. He gave an outline of the mining and preparing of ores for the blast furnace, as well as of other operations at the company's plant. Carl H. Neumann, Union Mfg. Co., New Britain, secretary of the association, announced that Walter M. Sanders, Sanders & Franklin, engineers, Providence, R. I., will speak on "Producing, Testing and Grading Molding Sands" at the monthly meeting on March 9. The Waterbury-Farrel Foundry Co. has been made a member of the association.

PIG IRON DUTY INADEQUATE

Tariff Commission Informs Congress of Present Difficulties of Administration

WASHINGTON, Feb. 14.—Difficult problems surrounding administration of the tariff act are pointed out by the Tariff Commission in its eleventh annual report to Congress. A number of them concern means of ascertaining costs of production according to requirements of the flexible provision, by which duties may be increased or decreased 50 per cent, which, in instances, the commission has found to be inadequate. A case in point relates to pig iron. The increase of 50 per cent in the duty on pig iron, proclaimed by the President, effective March 25, 1927, permitted a maximum duty of only $1.12½, raised from 75c. per ton. "Such increased duty fails by a wide margin to equalize differences in costs of production indicated in the commission's report," it is pointed out.

It also is explained that by section 315 (flexible provision) nothing shall be construed to authorize the transfer of an article from the dutiable list to the free list or from the free list to the dutiable list, although applications have been filed with the commission requesting investigations looking toward complete removal of the duties on certain articles, or the imposition of duties on articles now on the free list. It is stated that although action by the President is limited in such cases, information obtained by the commission is available for the use of Congress.

The report directs attention to an opinion of the Attorney General that in finding the differences of costs in producing foreign and domestic articles there should be taken into account, among other things, costs of transportation, where it is shown such differences in costs, as between foreign and domestic articles, constitute an advantage or disadvantage between the foreign and American producers. Prior to this opinion the commission had presented cost comparisons both with and without transportation costs. Since the Attorney General's opinion, Feb. 2, 1926, all cost comparisons have included transportation costs.

The most important question, it is stated, concerns principal markets of the United States where imported and domestic goods meet in competition. If the principal market is a port of entry, the transportation charge for imported goods is composed of the foreign inland freight and ocean transportation. The domestic plants may be scattered over a wide area.

"Upon what basis should domestic transportation to the principal market, wherever located, be calculated?" asks the commission. "Upon the basis of the nearest group of plants, the most distant group of plants, or on the basis of an average transportation charge from all plants?

"Under existing circumstances, it may be found that a principal market for the domestic products is at one point and the principal market for imported goods is at another point. In fact, the domestic and imported goods may not actually meet in the same market. Under these conditions should transportation for both domestic and imported articles be calculated to their respective markets only? In such an event how shall the commission determine the principal market?"

The report shows also that the ascertainment of invoice prices as evidence of production costs is not free from difficulties.

Old Foundries Can Be Brought Up to Date, Says Engineer

At the February meeting of the New England Foundrymen's Association Wednesday evening, Feb. 8, in Boston, Clement A. Hardy, engineer, Chicago, gave an address on "New Foundries for Old," in which he declared there is no foundation for the assertion often made that American foundrymen are slow to adopt modern methods, because there has been more improvement and advancement in foundry practice in the United States than in the rest of the world.

Mr. Hardy stated that almost any old foundry could be made into a new foundry at moderate cost, provided there was enough head room to permit the installation of handling equipment. He cited instances of improvements in corerooms, material yards, sand handling and the various other departments of foundries. Mr. Hardy is in favor of the racked ovens and said that some 25,000 are in use in this country. He illustrated, with a blackboard, changes just completed at the Builders Iron Foundry, Providence, R. I., where charging has been increased to 25 to 30 tons per day with only three men required for two cupolas.

In changing over old foundries to new, Mr. Hardy said the handling of flasks on the molding floor and in the yard, especially if the work is medium large, is highly important. It is very often the case that foundries use valuable space for storing flasks in the foundry.

Earl T. Bennington, manager Cleveland Electric Tramrail Division, Cleveland Crane & Engineering Co., Wickliffe, Ohio, who followed with an address on "Materials and Production Handling in the Foundry," illustrated how five or six different kinds of sand are handled efficiently and economically at the Cadillac Motor Co. plant. By this system, which has been adopted by the General Motors Corporation as standard, one man delivers 500 tons of sand per day.

With lantern slides Mr. Bennington illustrated many different ways of handling materials and products in widely scattered foundries, where gray iron, malleable and brass castings are made. Stress was placed on the push-button control in pouring, with ladles holding 300 to 400 lb. of metal. Some of the slides depicted handling materials and products in other industries, including wire and rod mills. He stated that the American Steel & Wire Co., Worcester, Mass., is making the largest coils of wire in the world, weighing 400 to 450 lb., and has capacity for 600-lb. coils to be made at some future date.

Henry M. Lane, consulting engineer, Detroit, will address the New England foundrymen at the March meeting.

Screw Machine Products Association Elects Officers

David Bell, David Bell Co., Inc., Buffalo, was elected president of the Screw Machine Products Association at the fifth annual meeting of the association in Chicago. Mr. Bell succeeds H. B. Lundberg, president Michigan Screw Co., Lansing, Mich.

S. G. Eastman, Belvidere Screw & Machine Co., Belvidere, Ill., was named vice-president and the treasurer is F. H. Fischer, Fischer Special Mfg. Co., Cincinnati. Mr. Fischer was also elected to the board of directors, other new members of which are J. J. Hagen, president Western Screw Products Co., St. Louis, and J. S. Cochran, president of the Mac-It Parts Co., Lancaster, Pa. Malcolm Baird continues as field secretary of the association, with offices at 232 Delaware Avenue, Buffalo.

E. F. DuBrul, general manager of the National Machine Tool Builders' Association, was one of the speakers at the meeting, his address being on the "Dollar Delusion in Depreciation Accounts." Following luncheon, a moving picture entitled "The Age of Speed" was shown by the Norton Co., Worcester, Mass. At the second business session it was decided to adopt a monthly business barometer which would indicate the relative amount of business obtained during each month and unfilled orders.

The Eastern division of the Screw Machine Products Association, the president of which is George Briggs, Screw Machine Products Corporation, Providence, held its annual meeting at the Crescent Athletic Club, Brooklyn, Feb. 10.

Salesmen and Purchasing Agents to Hold Cooperative Exhibit at Bridgeport

Tool steel, small tools, electric equipment, plating and general factory supplies are among the products to be shown at the cooperative exhibit of the Salesmen's and Purchasing Agents' Association, which will be held at the Pyramid Mosque, Bridgeport, Conn., Feb. 24 and 25. There will be more than 80 exhibitors. It is expected that the attendance will include visitors not only from Connecticut but from contiguous territory.

The purpose of the association, made up of buyers and sellers, is to foster better understanding of each other's problems and of the goods which are the basis of their contacts. The officers are: H. J. Behn, Hunter & Havens, president; A. H. Jones, Bryant Electric Co., vice-president; W. B. Osborne, Bussman Mfg. Co., secretary; and R. T. Phipps, Bullard Machine Tool Co., treasurer, all of Bridgeport.

Companies which will participate include:

Aluminum Co. of America, New Haven; American Hardware Co., Bridgeport; American Pulley Co., Philadelphia; American Swiss File & Tool Co., Elizabeth, N. J.; Apothecaries Hall Co., Waterbury, Conn.; Atlantic Mfg. Co., Milford, Conn.

Bassick Co., Bridgeport; Bay State Tap & Die Co., Mansfield, Mass.; Badger-Adamson Co., New York; Bridgeport Airport, Inc., Bridgeport; Bridgeport Brass Co., Bridgeport; Bussman Mfg. Co., St. Louis; Bunting Brass & Bronze Co., New York; Black & Decker Mfg. Co., Towson, Md.; Brown & Sharpe Mfg. Co., Providence; Bryant Electric Co., Bridgeport; Charles Bond Co., Philadelphia.

Cann & Saul Steel Co., Philadelphia; Crane Co., Bridgeport; Chisholm-Moore Mfg. Co., Cleveland; Cutting & Woods, Bridgeport; Cornwall & Patterson Co., Bridgeport; Colts Patent Fire Arms Co., Hartford; Crouse-Hinds Co., Syracuse, N. Y.; Chromium Co. of America, Waterbury, Conn.

DeMattia Wire Works, Southport, Conn.; T. L. Dickenson, New York.

Economy Fuse Mfg. Co., New York; H. M. Ellsworth Co., Bridgeport; Erie Malleable Iron Co., Erie, Pa.; Edison Lamp Works, Harrison, N. J.

Frank H. Fargo Co., Bridgeport; J. B. Ford Co., Wyandotte, Mich.

General Electric Co., Bridgeport; Graybar Electric Co., Inc., New Haven.

Hanson-VanWinkle-Munning Co., Newark, N. J.; Hawley Hardware Co., Bridgeport; Hartford Belting Co., Hartford; Heppenstall Forge Co., Bridgeport; Hilo Varnish Co., Brooklyn, N. Y.; Hunter & Havens, Bridgeport; Hessel Hoppen Co., New Haven.

Lindquist Hardware Co., Bridgeport; Ludlum Steel Co., Watervleit, N. Y.

MacDermid, Inc., Waterbury, Conn.; Manning Abrasive Co., New York; Midvale Steel Co., New York.

Johns-Manville Corporation, New York.

Norton Co., Worcester.

Quigley Furnace Specialties Co., New York.

Ridge Tool Co., Elyria, Ohio; J. H. Richardson Oil Co., Bridgeport.

Seymour Mfg. Co., Seymour, Conn.; Skinner Chuck Co., New Britain, Conn.; Standard Oil Co., Bridgeport; F. B. Stevens, Inc., New Haven; S. K. F. Industries, Hartford.

Trumbull Electric Mfg. Co., Plainville, Conn.

Unishear Co., Inc., New York.

Vanadium-Alloys Steel Co., New York.

Warren Belt Co., Worcester; Wellington Kincaid Co., Bridgeport, Conn.; Westinghouse Electric & Mfg. Co., Bridgeport; J. H. Williams & Co., New York.

Yale & Towne Mfg. Co., Stamford, Conn.

Zapon Co., Stamford, Conn.

Steel Treaters to Hold Semi-Annual Convention in California in 1929

The board of directors of the American Society for Steel Treating has decided to hold a convention in California. According to present arrangements the second semi-annual meeting will be held in Los Angeles the week of Jan. 14, 1929. Twelve other national societies will cooperate in arranging a five-day program and the event will be known as the Western Metal Congress. There will be held concurrently under the auspices of the society what is designated as the "Western States Metal and Machine Tool Exposition." The success of this is announced as already assured, over 100 Eastern companies having signified their intention to exhibit. This exposition in California will not take the place of the regular National Metal Exposition to be held in 1929. This will be held as usual during national metal week, the place and date to be announced later. Information as to special trains leaving Chicago about Jan. 8, 1929, for Los Angeles will be published later.

Shipments of Sheet Metalware

December shipments of enameled sheet metalware are reported by the Department of Commerce at 307,280 dozens, valued at $1,085,762, compared with 287,115 dozens in November, valued at $1,147,108. The December value was the smallest since July and the third smallest of the year. For the 12 months, shipments have aggregated 3,916,930 dozens, valued at $14,321,892.

Galvanized sheet metalware shipped in December amounted to 107,267 dozens, valued at $398,199. This was a sharp reduction from the November total of 138,853 dozens, valued at $544,301. In December, a year earlier, shipments were 123,381 dozens, valued at $479,876. For the 12 months in 1927 shipments were 2,109,323 dozens, valued at $8,041,226. This is a small gain from the 1926 total of 1,945,164 dozens, valued at $7,950,683.

Production of galvanized sheet metalware, which held close to shipments in each year, amounted in 1927 to 2,093,805 dozens. This is a gain of 6½ per cent over the 1926 total of 1,966,012 dozens. The gain in pails and tubs was more than this, for the total went up from 1,429,909 dozens to 1,668,725 dozens. There was a reduction of more than 20 per cent in other ware produced, which declined from 536,103 dozens to 425,080 dozens.

Steel Corporation's Unfilled Orders Increase 303,073 Tons as of Jan. 31

A large increase in the unfilled orders of the United States Steel Corporation was registered in January. The total on Jan. 31 was 4,275,947 tons, which is an increase of 303,073 tons over the 3,972,874 tons on Dec. 31. The gain in January over December was 518,430 tons. In November also there was an increase of 113,404 tons. The unfilled orders on Jan. 31 were the largest since March, 1926, when the total was 4,379,935 tons. A year ago the total was 3,800,177 tons. Thus the unfilled orders at the end of January, this year, were 475,770 tons in excess of those 12 months previous. The following table gives the unfilled tonnage by months, commencing with January, 1925:

	1928	1927	1926
Jan. 31.......	4,275,947	3,800,177	4,882,739
Feb. 28.......	....	3,597,119	4,616,822
Mar. 31.......	....	3,553,140	4,379,935
April 30.......	....	3,456,132	3,867,976
May 31.......	....	3,050,941	3,649,250
June 30.......	....	3,053,246	3,478,642
July 31.......	....	3,142,014	3,602,522
Aug. 31.......	....	3,196,037	3,542,335
Sept. 30.......	....	3,148,113	3,593,509
Oct. 31.......	....	3,341,040	3,683,661
Nov. 30.......	....	3,454,444	3,807,447
Dec. 31.......	....	3,972,874	3,960,969

The high record in unfilled orders was 12,183,093 tons at the close of April, 1917. The lowest was 2,674,757 tons on Dec. 31, 1910.

Further Reduction in Trackwork Shipments

Shipments of trackwork in the last quarter of 1927 are reported by the American Iron and Steel Institute, in revised figures, at 28,759 net tons. This is the smallest quarter for several years. Each of the three months of the quarter showed successively smaller totals than any months of the preceding two years. A slight gain was made in January, however, when the shipments totaled 9332 tons, against 9139 tons in December.

The Otis Steel Co., Cleveland, announces that it will erect an additional 125-ton open-hearth furnace at its Riverside works this year. This company completed its fifth open-hearth furnace at this plant last year.

This Issue in Brief

Stabilizes sales by diversifying output. Even in periods of intense competition and overproduction, electrical equipment manufacturer has been able to increase his business steadily by extending activities into new markets.—Page 460.

Pensions are not charity, but a business proposition. Payment of pensions to superannuated employees is a direct aid to management in keeping up efficiency, reducing accident hazards, and lowering manufacturing costs, says industrial relations counsellor.—Page 463.

Discovers way to weld gun metal. Heat the casting, before welding, to 1000 deg. Fahr., says welding engineer. After welding the rate of cooling should be about that of the original casting.—Page 465.

Muckraking era gives way to "cover it up" practice. Gross obstructions of justice are resulting from recent tendency to treat scandals with absolute silence.—Page 485.

Is there a better business barometer than pig iron production? Some statisticians regard steel ingot output as a more reliable gage. Others look upon electric power consumption with favor. But this new indicator will have to be handled with caution, as the lighting load element introduces a considerable seasonal factor.—Page 436.

Increases industrial efficiency by placing a sign bearing the foreman's name over each department. Electrical equipment manufacturer finds that this inculcates in the department head a deeper sense of responsibility.—Page 460.

Foundry saves $10,000 a year by new mechanical-handling system. Cupola charging system alone makes a saving of close to $5,000 a year, and in addition eliminates accident hazard.—Page 458.

What is the best way to train young executives? Some firms use the classroom method. Others find it best to give consecutive training in different departments, permitting the new man to sit in on conferences devoted to policy problems.—Page 463.

Makes large pipe out of bent plate by arc-welding. A lighter, smaller pipe can be used than in the case of riveting, declares Japanese manufacturer, as internal friction caused by rivet heads is eliminated.—Page 465.

In pack-hardening small tools such as taps and plug gages it is advisable not to heat more than two or three tools at a time, says metallurgist. The tools should be about the same size, and the rate of heating should not be rapid, else the tools will heat unevenly.—Page 469.

Can the steel industry maintain the January pace? Doubtful, says Dr. Haney, stating it appears that a good deal of business was drawn in by price advances. Steel production has gone ahead so fast that there is some danger now that it will unduly anticipate requirements, he declares.—Page 477.

Old foundries can be modernized at moderate cost, says engineer, provided there is enough head room to permit the installation of handling equipment. Some plants use valuable space for the storing of flasks in the foundry.—Page 480.

Pig iron duty is inadequate, says Tariff Commission. Finds that present duty of $1.12½ per ton fails to equalize differences in production costs.—Page 480.

To avoid distortion during quenching of small tools, quench the pieces gently. A violent, swishing quench increases distortion and warping.—Page 470.

Accident prevention work cuts insurance rate 70 per cent. Ohio steel foundries' rate was $2.40 per $100 of payroll a few years ago. Now it is 70 cents.—Page 485.

If the coal industry is excused from the provisions of the Sherman law, what about the other industries? If the recommendation made by Secretary of Labor Davis is heeded by Congress, other industries suffering from too much competition may be expected to request permission to form trade agreements.—Page 485.

If you are thinking of taking on a new product, give careful consideration to standardizing it as far as possible with your present products. Important economies can be gained by making parts interchangeable, and keeping to as low a point as possible the new items to be bought, made, and stocked.—Page 458.

Shortening of small tools during pack-hardening may be reduced by raising the temperature. A tap one-half inch in diameter may contract 0.0015 in. to 0.002 in. per inch of length when pack-hardened at 1475 deg. Fahr. If the temperature be raised to 1575 deg. the shortening will be reduced to about 0.0005 in. per inch on an average.—Page 469.

Steel Tonnage Prospect for 1928

JANUARY is a month of unusual importance in supplying an indication of the course of steel production. Some of the other months of the year may have important swings in the trend just ahead of them. The American Iron and Steel Institute report of Bessemer and open-hearth ingot production in January was reproduced on page 414 of last week's IRON AGE, indicating, with an estimate of electric and crucible production, a rate of 153,000 tons of all ingots per working day.

The past four years have been years of unusual steadiness in steel and their record as to monthly variations is therefore worthy of careful study at this time, since there is no fundamental reason for expecting 1928 to depart radically from the precedent thus set up. These four years had certain similarities and certain differences. They all had increasing production in the first three months and decreasing production in the next four months, while the last five months showed divergences.

A noteworthy point was that, while March was the high month of production in each of the four years, the respective March figures showed astonishingly little variation. The March average was 164,309 tons of ingots per working day, and the average divergence, either up or down, was only 1.67 per cent. The four Decembers preceding March, on the other hand, had average variations of 7.8 per cent from their average, which was 134,519 tons of ingots per working day. Accordingly when there was a low December there was a large percentage increase in the next three months, and vice versa. Production got to the same point in the end.

January has been showing less variation than December, but more than March. In 1924, January production was light, while in the next three years it was rather heavy. The January average in the past three years was 153,470 tons a day, conforming closely to the 153,000 tons just reported for last month. It is plain, then, that steel production is now in such a swing as to indicate that next month will do as well as March has done so uniformly in the past four years. The four-year average for March, as noted above, was 164,309 tons a day, while the March average in the past two years was 167,000 tons a day, and that rate seems the more natural. It would represent 9 per cent increase over last month's production, and a 90 per cent engagement of capacity according to the institute's present capacity rating.

The four increases the Steel Corporation has had in unfilled obligations, October to January inclusive, lend substantial support to such an expectation. The four-month increase was 1,127,834 tons, while the same months a year ago had a much smaller increase.

A downward turn after March has occurred in each of the past four years, but it promises to be less extensive this year, if it comes. Apparently the automobile industry will reach its high operating rate later than usual, and freight car buying is coming somewhat later than it did last winter. It now seems likely that only a very indifferent performance in the second half will keep this year from exceeding the steel output of 1927.

Lower Accident Rate in Foundries

A GOOD gage of what is being accomplished in some metal-working industries in the reduction of accidents is found in the sliding down of workmen's compensation insurance rates. Lower rates, at least in some States, cut the overhead down to the extent that the premium is reduced, although the gain from reduction in the number of employees absent because of injuries cannot be measured in dollars and cents. The steel foundries of Ohio are a conspicuous example of an industry that has done much to eliminate accidents and cut the cost of workmen's compensation insurance. The State insurance rate in this branch of the foundry industry a few years ago was $2.40 per $100 of payroll. This was reduced in the last half of 1927 to 70 cents per $100 of payroll. The State insurance rate for gray iron foundries in Ohio, formerly $1.35 per $100 of payroll, is now $1.20. Accident hazards are generally regarded as greater in steel foundries than in other branches of the foundry industry. Steel manufacturers have been especially forward in safety work, both in an educational way and in the installation of safety appliances, and this has been reflected to a large degree in the steel foundries.

While many gray iron foundries, particularly larger plants, have kept pace with the steel foundries in accident prevention work, there is the difference that many of the gray iron foundries are quite small and apparently have not given so much attention to accident prevention as have the larger plants. Because of this, foundry accidents in Ohio are more numerous in gray iron foundries, thus necessitating higher compensation rates than the steel foundries have to pay. At the same time the reduction in the insurance rate for gray iron foundries indicates that these, too, are making some progress in accident prevention.

The Recent Vogue of "Cover It Up"

A GENERATION ago the muckraker flourished, and "pitiless publicity" was the rule. Of more recent years, there has been a swing to the opposite extreme. Absolute silence is the best policy. If there is a disturbing situation existing—say nothing about it, maybe it will blow over. If there is a scandal, hush it up— people soon forget. It is a reversion to the Victorian style of "cover it up."

One plan is no better than the other. A particularly discouraging development of the gumshoe policy is the increasing use of the legal dodge: "I decline to answer on the ground that it might tend to incriminate me," or "on advice of counsel, I refuse to answer," as well as the ability of important parties to pending court proceedings to discover pressing business in South America, or that their health requires a year in Florida, or an opportunity to consummate a life-long desire to spend their declining years among the capitals of Europe.

At times one suspects an organized conspiracy of silence. When any witness (or his lawyer) can judge whether or no his information reflects upon his character, and then hide behind a legal barrier, what is the function of court? More than once such a policy has resulted in gross obstruction of justice by concealing the criminal until too late to punish him.

In such circumstances it is heartening to read the recent letter of John D. Rockefeller, Jr., to Col. Robert W. Stewart, chairman of the board of directors of Standard Oil Co. of Indiana, wanted in Washington on the odoriferous oil case, but happening to be in Havana, on his way to Mexico. The letter said: "No desire, however praiseworthy, to protect those who may have been guilty of wrongdoing justifies the withholding of any slightest fact that will help to clear up the situation."

It remains to be seen whether Mr. Rockefeller's personal influence will be sufficient to enlist the unreserved adherence of the Standard Oil Co. of Indiana to the cause of prompt justice. The fact that this plan will clear that company's name does not detract from the fundamental truth behind Mr. Rockefeller's sentiments. Neither does the enunciation of it by him add to the essential soundness of the policy of frankness and honesty. The pronouncement is notable chiefly for the prominent attention it will draw to a principle of sound business ethics, obscured by much gum-shoeing tactics. It is worthy of repetition:

"No desire, however praiseworthy, to protect those who may have been guilty of wrong-doing justifies the withholding of any slightest fact that will help clear up the situation."

Amending the Sherman Law

THERE has been less comment than might have been expected on the proposal of Secretary of Labor Davis that the Sherman Law be amended in favor of the coal industry, so that coal operators could go before the Federal Trade Commission or the Attorney-General to secure a permit to consolidate and form trade agreements. Mr. Davis advocated such modification of the anti-trust act at a meeting in Syria Mosque, Pittsburgh, Jan. 28, and presumably his remarks were given sufficient publicity to provoke response if there were genuine interest in the subject.

Perhaps, however, the public was so artless as to take it that such a procedure in favor of the coal industry would have no sequel; that since no other industry is in as poor shape as the coal industry no other would seek the pleasant relief that might thereupon be obtainable with adequate effort. Perhaps, indeed, and not improbably, Mr. Davis did not consider fully the consequences, believing that coal is in a unique position because a labor union of large membership is involved.

When the proposition is put forth by a member of the Cabinet we are entitled to weigh it carefully. Mr. Davis is quoted as having said that, while two years ago there were 260,000 miners too many, now there are 300,000 too many. One can hardly take it that he would expect the combinations he advocates would tend to increase the consumption of coal and bring about the employment of more men. Rather there would be provided more funds for the mechanization of mines. The benefit then would be largely to the coal operators, suffering at present from too much competition.

Where, then, would the line be drawn? The courts having decided long ago that the Sherman Law should be viewed in the light of reason, it is fair to take it that in any industry there should be a reasonable amount of competition and in none should there be an unreasonable amount. Few are the industries today in which the members do not feel that there is an unreasonable amount of competition.

One can hardly go so far in fancy as to believe that Congress would draw its Sherman Law amendment in form referring specifically to coal or that if it did so the courts would approve the act as constitutional. The amendment would have to be general in character, referring to the degree of competition from which relief could be sought. The interesting question then would be which other industry would first arrive in Washington. The copper producers, who have accomplished more of late than formerly in curbing their competitive spirit, would doubtless be prompt in seeking entrance into a broader field of effort in reducing their competition to reasonable proportions. The steel industry would well be entitled to seek relief.

Some very simple consolidations in steel have resulted in protracted investigations by the trade commission. One may even imagine that in course of time even the automobile industry would go to Washington.

At any rate it must be put on record that in one case at least there has been such competition as to move a Cabinet member to propose that the United States Government reduce its restrictions. If there are not other cases in the same category at present there may be in future, or the idea of how bad the competition should be before relief is justified may be modified so as to include other cases. Here is evidence that some progress is being made in our thinking on the Sherman Law.

Minimum Wage Laws Waning

MINIMUM wage legislation in the United States has lost much ground. Of the 16 jurisdictions, represented by 15 States and the District of Columbia, which have experimented with minimum wage laws for women, eight have had the legislation held unconstitutional, repealed or otherwise nullified through legal procedure, according to a survey made by the National Industrial Conference Board. In 1923 the United States Supreme Court declared minimum wage laws unconstitutional in relation to adult women, so far as their mandatory provisions were concerned.

The Conference Board points to Massachusetts as the only strictly industrial State having a minimum wage act, and this law is non-mandatory. The only penalty that the State wage board may impose is the publication of names of companies that ignore decrees recommending minimum rates for women and boys. As a consequence, the difficulties of administering the Massachusetts law have proved so great that after 12 years of operation wage decrees have been issued for only 21 occupations, in which not more than 87,000 out of an approximate total of 500,000 women wage earners in the State are employed. At the present time, says the report, the Massachusetts law is the only type of minimum wage legislation likely to be a factor in the future.

The board calls attention to the fact that mandatory minimum wage acts are operating in California, Oregon and Washington, but that they "are to be considered as enforceable only so long as there is no opposition serious enough to result in a court test, in view of the Supreme Court's repeated findings unfavorable to the mandatory type of law. Specific local conditions, such as the lack of competition from other States for the industries prevailing in these Pacific Coast States, are believed principally responsible for such absence of opposition to the law."

The Industrial Welfare Commission of California, which has jurisdiction over 130,000 women workers, recently published a report on the operation of the minimum wage law of that State. According to this survey, certain arguments that have been raised against minimum wage laws have been satisfactorily answered by California experience. Instead of the minimum wage becoming the maximum wage, more and more women workers are receiving above the minimum, now set at $16 a week. Moreover, the number of women receiving considerably higher pay is increasing. For example, in 1919, with a minimum wage of $10, only 446 women received more than $30 a week. In 1925, under a $16 minimum, the number had increased to 6084. The sub-standard workers have not suffered loss of employment, the commission finds, since the employer may apply for permits for such women and legitimate requests are granted. As for the contention that apprentices and unskilled workers would be dropped when they reached the minimum wage and their places taken by cheaper help, experience has proved, as it has elsewhere in industry, that men and women, following training, are soon absorbed in the ranks of skilled workers.

Whatever the experience has been on the Coast, the fact remains that in Massachusetts the minimum wage law has had little effect on what are generally thought of as the manufacturing industries, as distinguished from such establishments as laundries and bakeries. On the contrary, the wages of women in manufacturing industries have gone up with other wages, following economic laws. The aim of owners has not been to lower wages, but to increase volume of production per labor hour. This has been effected to an extent by better equipment and methods and, taking the average run of labor, perhaps still more by adoption of piece-work rates, which stimulate the efforts of the unwilling and the lazy. Under such conditions a minimum wage law is not needed.

Barometers of Industry

PIG iron production is still regarded in many quarters as the most reliable single business indicator we have. Its vogue appears to be on the wane, however, and efforts have been made to find a satisfactory substitute. Some statisticians have regarded steel ingot production as a more reliable gage than pig iron, partly because changing metallurgical factors have made pig iron less important in steel making and partly because of some substitution of other forms of metals for castings.

Electric power consumption is one of the new indicators. Its use in this way was discussed at a recent New York conference of economists and statisticians. The point was made that, over the period during which these figures have been available, the curve (when modified as suggested below) has been practically parallel with that of pig iron. Obviously such a measure will have to be handled with a great deal of caution. It has a large element of seasonal activity, hence the lighting load should be eliminated before attempting to use the figure. There is a rapid change under way in the electrification of industry. This must be evaluated if we are to depend on the indications of the electric power factor.

It was the consensus of opinion at the meeting referred to above, which was under the auspices of the National Industrial Conference Board, that a single indicator, whether it be one of those mentioned above, or in itself a composite of a number of items, is exceedingly helpful to industry as a gage of conditions. Sharp distinction was drawn between industrial activity on the one hand, which connotes volume only, and business conditions on the other, which involve also considerations of profits and general business welfare. It was generally agreed, however, that each line of business is subject to influences independent of the general situation and hence must have its own index, expressed or implied, as well as the general index, if courses are to be charted with satisfactory assurance.

The fact that the pig iron and steel production figures are available earlier than those of any other index we now have, and with virtually 100 per cent of completeness in them, suggests that after all they, or one of them, should continue to be the first reliance of those attempting to pilot business. Representing raw materials, and entering virtually every industry in some degree, they carry a large element of prophecy, as their history has amply proved.

NEW STEEL ASSOCIATION

Merger of Sheet and Strip Organizations Approved—G. H. Charls to Be President

DEVELOPMENTS have come rapidly since the announcement in THE IRON AGE of Feb. 9 that a merging of the National Association of Sheet and Tin Plate Manufacturers, the Hot-Rolled Strip Steel Institute and the Cold-Rolled Strip Institute into a single organization was in the making. Meetings of the three associations were held in Pittsburgh last week and reports of committees that had been appointed to investigate the proposal were presented and approved. Details of organization since have been getting the attention of the committees of the three organizations, which have delegated to G. H. Charls, commissioner of the Hot-Rolled Strip Steel Institute, and E. T. Sproull, head of the Cold-Rolled Strip Steel Institute, full authority to draw up the constitution and by-laws of the new association, which may be known as the National Association of Flat Rolled Steel Manufacturers.

E. THEODORE SPROULL GEORGE H. CHARLS

It will take a little time to work out the various details in connection with the new organization, its purposes and the scope of its activities, but Mr. Charls says that in a general way it will be patterned after the National Association of Sheet and Tin Plate Manufacturers in the matter of statistics, costs and labor bureaus, in sales promotion, production and consumption investigations, and will undertake other legal activities that not only the manufacturers but the general public may walk in the light of accurate information.

"Any agreement, understanding, combination or arrangement or any form of concerted action to curtail production, increase prices, suppress competition or otherwise restrain trade or commerce or to monopolize or attempt to monopolize any part of the trade or commerce of the country," said Mr. Charls, "is expressly excluded from the purpose or object of the association and contrary to its purposes."

All developments to date have been tentative, but the plans as they have so far crystallized, mean an organization along the lines of any business corporation, with a president and other executives with definite responsibilities. Mr. Charls will be president and he will have to assist him two vice-presidents, E. T. Sproull, who will continue his present work in connection with cold-rolled strip steel, and A. N. Flora, who has been vice-president in charge of sales of the Trumbull Steel Co., Warren, Ohio, who is to supervise the new organization's activities relating to sheets and hot-rolled strips. It is probable that Cleveland will be the location of the headquarters of the new association.

The men who are to be responsible for the direction of the new body have long been identified with the manufacture and sale of the products embraced in its activities. Mr. Charls was for many years associated with the American Rolling Mill Co. and subsequently was with the United Alloy Steel Corporation, of which he was president when it was merged with the Central Alloy Steel Co. into what is now the Central Alloy Steel Corporation. Mr. Sproull, who assumed the commissionership of the Cold-Rolled Strip Steel Institute last May, was previously for 20 years active in sales and executive capacities in the steel industry, having been with the American Sheet & Tin Plate Co. in Pittsburgh, and the Jones & Laughlin Steel Corporation before going with the Trumbull Steel Co., of which he was general manager of sales for several years; he was assistant to the president when he left that company to become general manager of sales of the Oliver Iron & Steel Corporation, Pittsburgh. Mr. Flora has been active in the affairs of the Trumbull Steel Co. and besides being vice-president in charge of sales gave much time to matters pertaining to labor and wage scales, in which he is regarded as an expert.

Otis Steel Co. to Add Three Open-Hearth Furnaces

Directors of the Otis Steel Co., Cleveland, have authorized the construction of building space and complete overhead equipment for three additional open-hearth furnaces at its Riverside plant. One furnace of 125-ton capacity will be built this year. This furnace and building extensions will involve an expenditure of approximately $550,000. At present with five open-hearth furnaces the company's ingot capacity is insufficient to meet its requirements. President E. J. Kulas, in announcing the extensions, said that, with the increased steel-making capacity, important operating savings will result which should be reflected in earnings. This was demonstrated in January when the company was able to operate on an inventory of ingots, slabs and sheet bars accumulated in the dull period late last year. This, he stated, resulted in a marked gain in earnings and prompted the directors to decide to increase the steel-making capacity.

American Rolling Mill Co. Sells Natural Gas Rights in Kentucky

Financial interests in Cincinnati, Pittsburgh and New York identified with the Hope Engineering & Supply Co., a West Virginia corporation with plants at Mount Vernon, Ohio, and with the Inland Gas Corporation, which is engaged in producing and selling natural gas in eastern Kentucky, have purchased from the American Rolling Mill Co. the natural gas rights on Armco property near its continuous sheet mill at Ashland, Ky., and also on land which the American Rolling Mill Co. had leased for natural gas development. The consideration was $3,000,000 cash.

Iron and Steel Markets

Steel Output at Sustained Rate

Slight Gain in Production of Heavy Finished Products Offset by Lower Sheet Mill Operations—Large Awards of Structural Steel—Hot-Rolled Strip Prices Advanced

STEEL production is approaching a state of equilibrium, and current market activity is limited mainly to specifying against past commitments.

A retarded rate of buying is not surprising in view of heavy purchases occasioned by an advancing market and the obvious advantage to consumers of taking full shipments against orders placed at lower prices. This development has raised the question whether buyers are not anticipating some of their second quarter needs in present specifications. The extent of such speculative activity, if there be any, cannot be measured at this time. Certainly no such motives will influence specifying against contracts for rails or releases against tonnages for specific work, such as railroad car construction or the fabrication of building and bridges.

Incidentally, much of the recent increase in mill bookings has been due to railroad purchases and construction activity. Moreover, producers making the heavier rolled products used in those avenues of consumption have experienced the sharpest gains in both bookings and output. The Steel Corporation, for example, has increased its operations to 90 per cent of capacity, as compared with 88 per cent a week ago. On the other hand, plants in the Youngstown district, a leading center of sheet production, have been forced to curtail output slightly.

Sheets are in marked contrast with the heavier rolled products. January production by independent sheet manufacturers was 99 per cent of capacity, while shipments were at the rate of only 78 per cent. The explanation for this excess in output seems to lie in lagging specifications, particularly from the automobile industry. Motor car production continues to gain, but more slowly than was anticipated. In fact, the gradual character of the increase is regarded as one of the best promises of sustained demand for steel.

Maintenance of a high rate of ingot production is assured for a month or more despite divergent situations in different finished products. The large volume of specifications against such products as bars, plates, shapes and rails is enough to make this result reasonably certain. And in a market still lacking in entirely uniform tendencies, it is well to note that at Chicago, where demand for heavier rolled products has been heavy, new business in plates, shapes and bars continues to balance output, leaving mill backlogs undiminished in size. Production at Chicago remains at 92 per cent of capacity, while the average for Pittsburgh and nearby districts is between 75 and 80 per cent.

Part of the activity of Chicago mills is accounted for by construction work. In the Chicago district alone structural steel orders for the week exceed 50,000 tons, including 19,000 tons for a Chicago civic opera building. The total for the country is close to 68,000 tons, making the week the second largest in point of tonnage so far this year. Other large awards were 11,000 tons for a bridge at Vicksburg, Miss., and 8000 tons for a viaduct in Milwaukee. Pending projects were enlarged by inquiries for upward of 29,000 tons. Two drainage improvement jobs in Los Angeles will take 6400 tons of reinforcing bars, and 4500 tons has been awarded for the Cleveland Union Terminals.

Railroad purchases include 15,000 tons of structural steel for bridges placed by the Santa Fe and 1000 steel hopper car bodies ordered by the Norfolk & Western. Except for the latter, the railroad equipment market is devoid of important awards or inquiries. The Canadian National Railways have divided nearly 30,000 tons of rails among Canadian and American mills, the latter getting 11,550 tons. The Wabash is inquiring for 4800 tons of tie plates.

The upward trend of steel prices this week extends to hot-rolled strips, on which a new price schedule for the remainder of this quarter, and for second quarter not only puts quotations $1 to $2 a ton higher, but establishes four groups of widths, each taking its own base price. Sheet manufacturers have announced the opening of books for second quarter at 2.90c., Pittsburgh, for black, 2.10c. for blue annealed, 3.75c. for galvanized and 4.15c. for automobile body sheets, Pittsburgh. Except on the latter, these were the prices announced last year for first quarter, but which did not become fully effective because of heavy sales at lower figures.

Pig iron business has been fairly brisk in some districts but almost stagnant in others, notably in Pittsburgh and the Valleys. Sales were 25,000 to 30,000 tons at Buffalo, 25,000 tons at Cleveland, 10,000 tons at New York and at Boston. At St. Louis there are inquiries for 10,000 tons. A radiator manufacturer has bought 30,000 tons for various plants for second quarter at slightly higher prices than ruled on its first quarter tonnage. A Delaware River cast iron pipe manufacturer bought 10,000 tons from the Everett, Mass., furnace. Pig iron shipments are unusually heavy at Chicago. The new base price of $20 on eastern Pennsylvania iron has become established by small-lot sales, but in New England prices are again unsettled. In some other districts prices are firmer but no higher.

Both of THE IRON AGE composite prices have advanced. Higher prices on wire products have raised the finished steel composite to 2.364c., from 2.350c. last week. It is now at the highest point since mid-September. Pig iron has gone to $17.75 from $17.67 last week, because of an advance in eastern Pennsylvania foundry iron.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Mill Operations at 75 to 80 Per Cent But New Business is Light

PITTSBURGH, Feb. 14.—Steel consumers still are specifying very steadily against old orders but seemingly are meeting the great bulk of their requirements from these releases, since new business is of very moderate proportions. This is not an altogether unexpected situation, because prices have been advancing pretty steadily since the opening of the year and it was natural that buyers should take every step to defer as long as possible paying the higher prices, and this they are doing by taking full shipments against their older and lower-priced commitments.

Comparatively light new engagements do not appear to be diminishing steel works and rolling mill operations, except possibly in the Youngstown district, where in some lines output was speeded up to a greater extent than was called for by shipping instructions. With a reduction in backlog business, notably in sheets, there has been a halting in the upward tendency in production.

Pittsburgh and nearby districts are producing ingots at between 75 and 80 per cent of capacity, an even higher operation by the leading producer making the average closer to 80 than to 75 per cent. A good order book in the various steel products at the opening of the year has been further augmented by the business driven in by the price advances, and the maintenance of steel plant activities for the next 30 days is not entirely dependent upon new business. Taking out of their purchases by buyers will be sufficient.

The second quarter promises to be an interesting one in the steel market, for most of the price advances that have been announced over the past three or four weeks have been related to that period on account of the heavy obligations that existed for this quarter's production. There is not much disposition on the part of consumers to question the claim of manufacturers that they are entitled to prices that permit a fair return, but a more interesting phase that will be determined in the quarter beginning April 1 is whether consumers are not anticipating some of their needs for the next quarter in their current specifications. Steel ingot production rose rapidly in January and is holding well to the higher rate this month. Since very little urgency has been observed in the specifications, there naturally is some concern as to whether actual consumption of steel has increased as much as production.

Makers of hot-rolled strip steel in the past week have come out with definitely higher prices, the advance averaging $2 per ton. Informally opening their books for second quarter business, sheet makers have reaffirmed the nominal first quarter prices of the common finishes and have advanced automobile body sheets $3 per ton. The prices on the common finishes represent advances of from $1 to as much as $4 a ton over those at which much of the current shipments are invoiced.

The Pittsburgh and Valley pig iron market still is dull and markedly so by comparison with other markets. There is little activity in the scrap market, although one fair-sized sale of heavy melting steel at $15 is noted. A temporary shortage of beehive oven furnace coke was created by some extra purchases by a Valley iron maker and a rise of 15c. per ton in the price does not promise to hold out the week.

Pig Iron.—This market continues to run behind others in point of activity and in developing strength in prices. The Westinghouse Electric & Mfg. Co. has put out an inquiry for its second quarter requirements of foundry iron, but does not name a specific tonnage. No other second quarter inquiries of importance are before producers and current demand still runs to small lots. Consumers are taking out iron on old orders very steadily, but the fact that so little second quarter demand yet has developed makes it apparent that the coverage given buyers in the latter part of last year was extensive. Pig iron producers still say there is no profit in present selling prices and would like to see them advance, but that is proving difficult in face of liberal stocks on furnace yards and the fact that demand is so limited. The Shenango Furnace Co., which recently blew in its No. 1 furnace, late last week put out its No. 3 furnace for relining.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	$17.25 to 17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Bars, Plates and Shapes.—Buyers are specifying well on old orders carrying lower prices than now prevail, the movement of bars being particularly good, but evidently consumers are meeting the great bulk of their requirements from steel ordered late last year and in January, as strictly new buying is of moderate proportions. Prices on new business are firm at 1.85c., base Pittsburgh, on all three products, and there is still a suggestion that with the opening of books for second quarter a higher price will be sought. Structural steel lettings are light in this district, but fabricators now find inquiry to be running a little heavier in small projects than was true recently.

Rails and Track Supplies.—Steady movement of standard-section rails against 1928 contracts is reported, but as yet not much activity has developed in spikes and other track supplies. There is nothing new as to prices.

Sheets.—Several of the independent companies late last week announced the opening of books for second quarter at 2.90c., base Pittsburgh, for black sheets; 3.75c., base, for galvanized; 2.10c., base for narrow and 2.20c., base, for wide blue annealed sheets, and 4.15c., base, for automobile body sheets. These prices, which are a reaffirmation of the formal first quarter prices, have since been announced by the American Sheet & Tin Plate Co. There continues to be free, but hardly urgent, specifying on old orders, but new business is in moderate volume. The prices just announced are being applied on new business for the remainder of first quarter, as well as on second quarter contracts, by makers representing a large part of the country's capacity, but the competition for orders for early rolling still produces some shading.

Tin Plate.—New business is very light, since all of the important consumers are under contract for their requirements for the first half of this year. Specifications on contracts are flowing in steadily enough to provide an average mill operation of approximately 80 per cent. In connection with the weakness of pig tin, tin plate makers say that it was largely discounted in the reduction made in tin plate prices last November.

Hot-Rolled Flats.—One large Pittsburgh district producer has announced the following price schedule, effective at once and applying on new business for shipment during the remainder of this quarter and on second quarter contracts: Widths under 3 in., 2.20c. to 2.40c., base Pittsburgh; 3 in. to but not including 6 in., 2.10c. to 2.20c., base; 6 in. to but not including 12 in., 1.90c. to 2c. The Chicago base prices are $2 per ton over the Pittsburgh bases. On strips from 12 in. to 24 in. wide, 16-gage and heavier, prices are to be based on plates at 1.85c., base Pittsburgh, and blue annealed at 2.20c., base Pittsburgh. It is expected that other makers will adopt this price schedule. Specifications on old orders are good, but new business is light.

Ferroalloys.—Liberal shipping instructions against contracts for spiegeleisen are reported, but takings of ferromanganese still are moderate and there has been a slight letdown in ferrosilicon. New business does not amount to much. Prices are unchanged.

Semi-Finished Steel.—There continues to be a fairly heavy movement of billets, slabs and sheet bars in keeping with good operating rates of non-integrated makers of strips, sheets and tin plate, but open market activity is limited. Forging quality billets and blooms reflect in demand the upward trend of automobile production. The pipe market is not active enough to produce much specifying of skelp. Wire rods are moving well against contracts for this quarter, but new business amounts to little, since users generally are well covered. The present price of $44, base Pittsburgh or Cleveland, is not being paid frequently or on much tonnage.

Wire Products.—Good movement is noted of these products against first quarter contracts, carrying lower prices than now are generally quoted, but it is a little early for much second quarter business and because of full coverage of buyers for this quarter, there are few new demands. There is no evidence that producers are going below $2.65 per keg, base Pittsburgh, for nails and $2.50 per 100 lb., base, on plain wire, but getting these prices on any considerable amount of tonnage necessarily waits on the spring movement into consumption and the incident reduction of jobbers' stocks. Stocks of nails in second hands are believed to be heavy enough to cause some slackness in second quarter ordering.

Tubular Goods.—Inquiry has reached some producers for approximately 400 miles of 20-in., 22-in. and 24-in. pipe for a gas line to run from Amarillo, Tex., to Kansas City, but the formal inquiry for the pipe for the gas line to run from Monroe, La., to St. Louis is yet to reach the mills, although it is understood that banking interests have expressed willingness to finance the project. While there continues to be a steady expansion in the demand for standard-weight pipe, there has

Alloy Steel Bars

(F.o.b. Pittsburgh, Chicago or Ohio Mill)

S. A. E. Series Numbers		*Base Per* 100 *Lb.*
2100*	(½% Nickel, 0.10% to 0.20% Carbon)	$2.90 to $3.00
2300	(3½% Nickel)	4.00 to 4.10
2500	(5% Nickel)	5.00 to 5.25
3100	(Nickel Chromium)	3.00 to 3.10
3200	(Nickel Chromium)	4.75 to 5.00
3300	(Nickel Chromium)	6.75 to 7.00
3400	(Nickel Chromium)	6.00 to 6.25
5100	(Chromium Steel)	3.00 to 3.10
5200*	(Chromium Steel)	7.00 to 7.50
6100	(Chrom. Vanadium bars)	4.00 to 4.15
6100	(Chrom. Vanad. spring steel)	3.50 to 3.75
9250	(Silicon Manganese spring steel)	3.00 to 3.15
	Carbon Vanadium (0.45% to 0.55% Carbon, 0.15% Vanad.)	4.10 to 4.20
	Nickel Chrome Vanadium (0.60 Nickel, 0.50 Chrom., 0.15 Vanad.)	4.05 to 4.20
	Chromium Molybdenum bars (0.80—1.10 Chrom., 0.25—0.40 Molyb.)	4.00 to 4.25
	Chromium Molybdenum bars (0.50—0.70 Chrom., 0.15—0.25 Molyb.)	3.05 to 3.10
	Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)	4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in. the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5 and 2½%, and on galvanized by 1½ points, with supplementary discount of 5 and 2½%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel		*Charcoal Iron*	
2 to 2¼ in.	27	1½ in.	+18
2½ to 2¾ in.	37	1¾ to 1⅞ in.	+ 8
3 in.	40	2 to 2¼ in.	— 2
3¼ to 3¾ in.	42½	2½ to 3 in.	— 7
4 to 13 in.	46	3¼ to 4½ in.	— 9

Beyond the above discounts, 7 fives extra are given on lap welded steel tubes and 2 tens to 2 tens and 1 five on charcoal iron tubes.

Standard Commercial Seamless Boiler Tubes

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

been no appreciable gain in the call for oil well pipe, except from California, where drilling is fairly active, and unless there is a decided change in the oil situation, pipe makers will have to place considerable dependence this year on line pipe business. Most of the oil well pipe going to California is seamless. In keeping with the upward tendency in steel prices in general, some talk is heard of a possible stiffening in pipe prices. This originates with jobbers, who, on account of uncertainty in prices, are said not to have made much money and they would welcome a step by manufacturers which would stabilize the market. On standard-weight pipe the makers are quoting the card discount plus 1, 5 and 2½ per cent beyond on carloads, but since the latter part of last year that quotation has not been strictly observed.

Cold-Finished Steel Bars and Shafting.—Buyers still are specifying in good fashion against first quarter contracts, but it is early for second quarter business and not much new spot business is developing in view of the fact that consumers are well covered for this quarter. On new business makers want 2.30c., base Pittsburgh or Chicago, but current shipments are mostly priced at $2 a ton less. Takings for parts for a low-priced motor car are moderate and some producers have not had orders for almost two weeks.

Cold-Rolled Strips.—Makers generally have opened books for second quarter business at 3.15c., base Pittsburgh or Cleveland, for lots of 1 up to 3 tons, or 2.90c. for lots of 3 tons or more. Current specifications on first quarter contracts, carrying prices $3 per ton below the new quotations, are sufficient to provide an operation of approximately 85 per cent of capacity. On second quarter business, fender stock strips are quoted at 4.30c. for No. 20 gage and at 4.35c. for No. 22 gage.

Bolts, Nuts and Rivets.—Demand for bolts and nuts is steady but it imposes no strain upon productive capacity. Rivets are not showing much life. Prices of these products are firm.

Coke and Coal.—Spot beehive oven coke is quotable at $2.75 per net ton at ovens, but the causes which led to this price, representing an advance of 15c. a ton, have disappeared and there is doubt that this price will hold to the end of the week. The putting in of a second furnace by a Valley pig iron producer occasioned the extra demands that shortened the supply over the latter part of last week, but this producer since has taken off a furnace and now needs no extra supplies. Foundry coke prices are the same as a week ago. The coal situation presents nothing new except in the effort of the miners' union to give life to a strike that practically has long ceased to exist. There is to be a Senatorial inquiry into the situation.

Old Material.—The market is stronger on machine shop turnings, which have sold at $11.50, and also is higher on blast furnace material because of the fact that Ohio melters are again taking shipments. Heavy melting steel has been sold for delivery at one point in the district at $15. This grade still is quotable from $14.75 to $15.25, as dealers are paying the latter price on short orders at one destination and are getting supplies at $14.75 for delivery on short sales at another. Compressed and bundled sheet scrap commands a little more money than recently. Other grades show no particular change, and the market as a whole does not show the activity it did in former years when there was as sharp an increase in steel works operations as there has been in the past six weeks.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$14.75 to $15.25
Scrap rails	14.25 to 14.75
Compressed sheet steel	14.25 to 14.75
Bundled sheets, sides and ends	13.25 to 13.75
Cast iron carwheels	14.00 to 14.50
Sheet bar crops, ordinary	15.00 to 15.50
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	14.75 to 15.25
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	11.00 to 11.50
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	16.75 to 17.00
Railroad coil and leaf springs	16.75 to 17.00
Rolled steel wheels	16.75 to 17.00
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.00 to 11.50
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	10.00 to 10.25
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.00 to 15.25
Malleable Grades:	
Railroad	14.75 to 15.25
Industrial	14.25 to 14.75
Agricultural	13.75 to 14.25

Cement coated nails, per keg	3.05

Ironton Iron and Steel Companies May Be Merged

Eastern interests are reported to be conducting negotiations looking toward the consolidation of iron and steel companies in the Ironton, Ohio, district. Options have been obtained on the properties of the Marting Iron & Steel Co., the Belfont Steel & Wire Co., the Norton Iron Works Co., excluding the Norton blast furnace, and the Ashland Steel Co. If the options are exercised the companies will be taken over and operated under one management and by-product coke ovens will be erected on the river front near the Marting and Belfont furnaces.

It is said that the plan, if carried out, will result in cutting down considerably the cost of producing pig iron at Ironton and will enable that district to regain some of the merchant iron business it has lost in recent months.

Such consolidation would include the blast furnaces of the Marting and Belfont companies, the nail and wire mill of Belfont, the wire cloth plant of Norton and the Bessemer steel mill of the Ashland Steel Co. The Norton furnace would be retained by the present owners to supply hot metal to the open-hearth furnaces of the Ashland plant of the American Rolling Mill Co. This furnace is now being modernized by the addition of new equipment.

The Belfont furnace of the Belfont Steel & Wire Co. was blown out on Feb. 2.

Rates on brass ingots and on copper scrap and brass scrap in carloads, from Newark, N. J., to points in New England territory are not unreasonable, according to a recent decision by the Interstate Commerce Commission in dismissing complaints by the Federated Metals Corporation.

Chicago

Structural Steel Contracts 50,000 Tons—Ingot Output Steady at 92 Per Cent

CHICAGO, Feb. 14.—This is another heavy week in structural and bridge awards, the total reaching well up to 50,000 tons. Foremost among new contracts is 19,000 tons for the Chicago Civic Opera Building. The Santa Fe has awarded 15,000 tons of 1928 bridge work to the American Bridge Co., which will also furnish 11,000 tons for the main spans of a bridge across the Mississippi River.

The railroad equipment market can be gaged only by the size of specifications from car builders. The largest single inquiry in the Chicago market is for 500 cars. The trade believes that three or four large lots are still to come, but the railroads from which the inquiries are expected are marking time.

Specifications for finished steel products exceed production by a fair margin. Output holds steady at 92 per cent of ingot capacity. Wire mill engagement at 75 per cent clearly indicates the return of credit in farm communities. Orders for sheets have expanded and hot mills have been speeded at least 10 points in the week. The price structure in all steel commodities is more firmly established and Chicago producers are finding a wide field and less competition as natural territories become more clearly defined by freight differentials from producing points. New buying in plates, shapes and bars balances well with output so that steel mill order books are not diminished in size, notwithstanding heavy production.

Pig Iron.—Shipments of Northern foundry iron over the first half of February are a shade heavier than in the last two weeks in January, when local sellers shipped a larger tonnage of pig iron than in any like period since the fourth quarter of 1926. Shipping orders exceed output and producers are drawing heavily on stocks at the furnaces. The melt in malleable foundries is growing. While sales are not so heavy as last week, they are in good volume when it is considered that the first quarter is half over and second quarter buying would not normally get under way for several weeks. A user located north of Chicago is in the market for 2000 tons of foundry iron. Charcoal iron is moving in carloads at $27.04, delivered.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—New buying in these commodities is dull. Prices for ferromanganese are steady at $100, seaboard. Car lots of 19 to 21 per cent spiegeleisen bring $32, Hazard, Pa. Release orders on ferrosilicon are in good volume.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Plates.—Deliveries on plates have advanced to a range of four to six weeks following heavy specifications from car builders and structural shops. Rolling schedules are well rounded out on universal mills, the more extended shipping dates applying particularly to that commodity. Considering the large capacity available there is an uncommonly good run of orders for wide sheared plates. Inquiry for tank plates now stands at 6000 tons, the increase over last week representing the requirements of several small users. Bids will go in this week on 2000 refrigerator cars for the Pacific Fruit Express. The Rock Island has come into the market for eleven 72-ft. gas-electric cars in addition to the 36 passenger cars inquired for a week ago. Engineers for the Chicago & Eastern Illinois are considering changes in design on the freight equipment that railroad will buy and it may be a week or 10 days before orders are placed. Prices are firm at 1.95c. to 2.05c., Chicago, for delivery until April 1. Producers are noncommital as to price policies for steel to be delivered in the second quarter.

Mill prices on plates per lb.: 1.95c. to 2.05c., base, Chicago.

Structural Material.—Of primary interest in the local market is the announcement that the McClintic-Marshall Co. will fabricate the 19,000 tons of structural steel required for the Chicago Civic Opera Building. This award, coupled with reports that two other building projects requiring a total of 30,000 tons of steel are near the closing point, makes this a most unusual week in structural business. Fabrication has been awarded at Milwaukee on 8000 tons required for the Sixteenth Street viaduct. Fresh among the large bridge requirements of the railroads is the announcement that the Missouri Pacific will take 4000 tons for a span at Little Rock, Ark. Deliveries on shapes now range from two weeks to six weeks and contracts recently placed indicate that shipments will soon be further extended. Fabricators are enjoying a substantial volume of business, but shops are not yet filled to the point where prices can be put above the levels of recent months.

Mill prices on plain material per lb.: 1.95c. to 2.05c., base, Chicago.

Rails and Track Supplies.—In new business this week is dull. Orders for standard section rails are small and bookings of track accessories were not over 6000 tons. Rail mills in the Chicago district are engaged at nearly full capacity. Track supply production stands close to the normal capacity of the trade supplied from mid-Western mills. Open weather of the past few weeks is favorable to track work and railroads are calling for rail deliveries in full accord with the shipping schedules arranged earlier in the year. Demand for light rails is dull.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Bars.—New buying in mild steel bars continues to run ahead of shipments, while current specifications are keeping pace with deliveries from mills. Shipping orders from cold drawn manufacturers indicate that that industry is operating close to capacity. Road machinery plants are busy and farm machinery makers are holding to full schedules. Specifications for iron bars are light and backlogs are small. The situation is such that producers hesitate to ask higher prices and quotations remain at 1.90c., Chicago. One local producer of alloy steel bars is operating at capacity. Prices are firm. Demand for rail steel bars is swinging in line with that for other finished steel products. Specifications for the week exceed production by a comfortable margin for the first time since last fall. Deliveries are still prompt, but producers have been quick to take advantage of the easier arrangement of rolling schedules and they are not willing to give the "overnight" service which has been characteristic of this market for many months. Mill books have also grown, but not to the point where much consideration is being given to quotations above 1.80c., Chicago Heights mills, which is now the ruling price. Bed makers and barn equipment manufacturers are busy.

Mill prices per lb.: Soft steel bars, 1.95c. to 2.05c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Cast Iron Pipe.—So far as public lettings and open inquiry are concerned, this market is about as dull as at any time in the past year. The only business of size in the market is 2000 tons of pipe on which Detroit has taken figures. It is reported that French makers entered the low bid. Several American foundries quoted figures close to $30, Birmingham. The freight rate from that point to Detroit is $7.92. Several orders this week from contractors total a fair tonnage, and based on actual inquiry a substantial amount of business is looked for from public utility operators. Sellers still talk of advances in prices, but nothing definite will be known until quotations made in Detroit are disclosed.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $34.20 to $36.20; 4-in., $38.20 to $40.20; Class A and gas pipe, $4 extra.

Sheets.—Present prices on sheets will no doubt be reaffirmed for second quarter. Some producers already have opened books for that period. Chicago delivered prices are 3.05c. for black sheets, 3.90c. for galvanized and 2.25c. to 2.35c. for the blue annealed product. Indications given a week ago that users' requirements would expand are well borne out, and production, following greatly increased specifications, has been increased to 88 per cent of hot mill capacity. Rolling schedules are now more than a week in advance for the first time in several months. It is evident that stocks in the hands of users are low because the bulk of release orders specify delivery at the earliest convenience of mills. New sales in all grades of sheets are quiet. Competition in the Southwest is keen and prices quoted are below the general level of the market.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Billets.—Shipments of billets are in fair volume. Rerolling billets 4-in. and over are quoted at $33 a gross ton.

Hot Rolled Strip.—Shipments of this commodity are steady, but new sales are in small volume. Prices still show the effects of keen competition.

Wire Rods.—Local producers are now quoting the one price of $45, Chicago. This commodity is moderately active.

Reinforcing Bars.—Sales are light but shipments from warehouses have been comparatively large because of the open winter. Shop backlogs continue to dwindle and output is only a shade above 40 per cent of capacity. There still remains a sizable tonnage of road reinforcement to be placed. Prices are steady at 2.30c. to 2.75c. for billet steel reinforcing bars out of warehouses and 1.80c. to 1.85c., Chicago Heights mills, for rail steel. Recent awards and new inquiries are shown on page 506.

Bolts, Nuts and Rivets.—Producers announce a revision in price schedules on small rivets. Carloads are being quoted at 70 per cent off list by some makers, while others are giving 70 and 10 per cent. Specifications for bolts and nuts are steady and a fair business in spot sales is reported.

Wire Products.—Demand for wire and wire products continues to expand and Chicago producers are now using close to 75 per cent of plant capacity. Less than a year ago it was variously estimated that 65 per cent of wire mill capacity represented the requirements of this country. Specifications from the manufacturing trade are in good volume and jobbers, finding turnover more rapid than had been anticipated, are forwarding liberal orders. Several sizable railroad purchases have been made and, judging from specifications already issued, the bulk of this tonnage will be taken out at an early date. The demand is diversified both as to source and commodity, and it has left mill stocks in a well-balanced condition.

Coke.—Foundry consumers of by-product coke are more insistent on prompt delivery and shipments against first half contracts are heavy. Quotations on spot business are $9, f.o.b. local ovens, and $9.50, delivered in the Chicago switching district.

Old Material.—Mixed tendencies of a week ago are now more apparent in the Chicago scrap market. Users of the large tonnage grades give indication that they have placed orders for more scrap than they can conveniently handle, particularly at the rate at which sellers are anxious to ship. Some buyers have tightened inspections. Outcoming scrap is more than adequate to meet present shipping instructions. Dealer trading is less active and those sellers who have materials coming out on track are pressing sales, thus giving buyers the impression that prices may sag. As a general rule, dealers are paying $12.75 for heavy melting steel, but $13 has been paid when exacting inspection was in prospect. Cast iron borings and busheling are more plentiful. A purchaser has refused cast iron borings at $10.75 a gross ton, delivered, and a buyer of steel angle bars has made an offer of 25c. below recent market quotations. The Rock Island is offering 9000 tons and the Wabash will sell 2000 tons.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	14.25 to 14.75
Hydraulic compressed sheets	11.00 to 11.50
Drop forge flashings	9.75 to 10.25
Forged, cast and rolled steel carwheels	15.50 to 16.00
Railroad tires, charging box size	16.25 to 16.75
Railroad leaf springs, cut apart	16.25 to 16.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	14.50 to 15.00
Coil springs	16.50 to 17.00
Electric Furnace Grades:	
Axle turnings	13.00 to 13.50
Low phosphorus punchings	14.25 to 14.75
Low phosphorus plate, 12 in. and under	13.50 to 14.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	10.25 to 10.75
Short shoveling turnings	10.25 to 10.75
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	15.00 to 15.50
Cupola Grades:	
Steel rails less than 3 ft	15.25 to 15.75
Angle bars, steel	14.50 to 15.00
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	14.25 to 14.75
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	14.00 to 14.50
Iron arch bars and transoms	19.25 to 19.75
Iron car axles	21.50 to 22.00
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	11.00 to 11.50
No. 2 railroad wrought	11.50 to 12.00
No. 1 busheling	9.25 to 9.75
No. 2 busheling	4.25 to 4.75
Locomotive tires, smooth	12.50 to 13.00
Pipes and flues	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.50 to 14.00
No. 1 agricultural cast	13.50 to 14.00
Stove plate	11.25 to 11.75
Grate bars	11.50 to 12.00
Brake shoes	11.75 to 12.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.35c. to 2.75c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb	$3.20
Common wire nails, base per keg	3.00
Cement coated nails, base per keg	2.90

To Tell of Sparrows Point Development

"Recent Developments at the Sparrows Point Plant of the Bethlehem Steel Co." is the title of a paper to be read March 3 before the Philadelphia district section of the Association of Iron and Steel Electrical Engineers. The author is F. O. Schnure, electrical superintendent of the Sparrows Point plant. The meeting will be held at 7.30 p. m. at the Engineers' Club, 1317 Spruce Street. Plans are in the making for a visit on May 5 to the Conowingo, Md., hydroelectric plant.

New York

Pig Iron Sales of 10,000 Tons—Sheet Prices on Firmer Basis

New York, Feb. 14.—Pig iron sales by local brokers aggregated fully 10,000 tons for the week. This total is above the average, although only half as large as that for the previous week. The Washburn Wire Co., Phillipsdale, R. I., has closed against its inquiry for 5000 tons of basic iron. This tonnage, however, was not included among the sales of New York brokers. There is a good run of small-lot purchases, and indications of increasing melt are seen in repeat orders and in the hastening of shipments against contracts. More interest is being shown in second quarter requirements. The American Radiator Co., New York, has purchased about 30,000 tons, representing second quarter requirements of plants not regularly supplied by its subsidiary, the Tonawanda Iron Corporation. This company is still in the market for 2000 tons of foundry iron for second quarter delivery at Gloucester, N. J. Another second quarter inquiry from a melter in this district calls for 1500 tons. While current prices are slightly higher than those which ruled on much of the first quarter tonnage booked, the recent advance to $20, base furnace, on eastern Pennsylvania foundry iron is still largely untested. Quotations on Buffalo foundry iron are not entirely free from irregularities, although concessions below $17, base furnace, are less frequent than some weeks ago. Efforts of an idle furnace to liquidate remaining yard stocks, now estimated at 5000 tons, have proved a disturbing market factor.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 22.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.89 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 23.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Ferroalloys.—Neither the agents of British producers, nor the importers of Norwegian and Canadian alloy report any new business. Specifications on contracts are moderate, and it is probable that a large number of consumers were well stocked with the alloy through purchases made at the end of the year. In spiegeleisen there has been a fair amount of carload business the past week or so. Prices of both alloys are unchanged.

Reinforcing Bars.—Tonnage placed thus far in February has been in considerably less volume than was the case in the preceding month, but local offices have been kept rather busy figuring work which will be placed in the early spring. On the small orders which have made up the bulk of the tonnage placed recently prices have been firm.

Finished Steel.—During the last week the volume of orders has been checked somewhat, and it seems that the buying movement which began early in the new year has reached a peak, temporarily at least. Yet there has been nothing to indicate the beginning of a recession, and the tendency toward firmer prices is still serving to supply the mills with heavy specifications on old contracts. Continued improvement in the volume of business in plates and shapes is being reflected in a firmer price structure, and the minimum prices of 2.14½c., at New York, for shapes and 2.17½c. for plates are representative of the market. Talk of further price advances is also bringing out negotiations for a number of projects which might have remained dormant until later in the year. Fabricated prices, however, are barely reflecting the increased cost of plain material, and fabricators seem more interested in securing backlogs than in obtaining a better margin of profit. Several large jobs placed recently in New York have reflected this tendency. Awards of fabricated structural steel in the metropolitan territory during January, as reported to the Structural Steel Board of Trade, amounted to 30,000 tons, the figure not including bridges, subways, etc. This compares with 36,900 tons in December and with 38,000 tons in January, 1927. Practically all the mills represented in this district have adopted the new sheet prices, namely 2.90c., Pittsburgh, for black, 3.75c. for galvanized, and 2.10c. to 2.20c. for blue annealed. A number of sales of carload lots and less have been made at these figures. An advance in hot-rolled strip has also been announced. While mills seem to be adhering to 2.65c., Pittsburgh, for nails and 2.50c. for plain wire, most consumers are fairly well covered for this quarter and there has been little opportunity to test these quotations.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c.; plates, 2.17½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Warehouse Business.—Purchasing has been slightly larger than in the early part of last month. The wide range in black and galvanized sheet prices continues,

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.34c.
Soft steel bars and small shapes	3.24c.
Iron bars	3.24c.
Iron bars, Swedish charcoal	7.00c. to 7.25c.
Cold-finished shafting and screw stock—	
Rounds and hexagons	3.40c.

---

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

jobbers in local New Jersey quoting on a basis of 4.20c. per lb. for black and 4.95c. per lb. for galvanized, while New York warehouses offer black sheets at 4c. per lb., base, and galvanized at 4.70c. per lb. Cold rolled strip steel prices have been revised, effective Feb. 12, to a range of 5.15c. to 5.40c. per lb.

Cast Iron Pipe.—There has been a little activity during the past week, with some purchases by private companies and a few scattered lettings of small tonnages by municipalities. A number of large projects are said to be under consideration for early spring negotiation. Prices are firmer with some suggestions of advances. Both Northern and Southern makers are adhering to the present quotation of $28 per ton, Birmingham base.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Coke.—Slightly better foundry operations in this territory are giving some strength to the prices for foundry coke, but no improvement in spot demand is noted. The market for the furnace grade is very quiet. Standard foundry is quoted for prompt shipment at $4 to $4.50 per ton, Connellsville, and standard furnace at from $2.75 to $3 per ton, Connellsville. Delivered prices are: To northern New Jersey, $8.03 to $8.53; to New York or Brooklyn, $8.79 to $9.29; to Newark or Jersey City, $7.91 to $8.41. By-product coke continues at $9 to $9.40 per net ton, delivered Newark or Jersey City.

Old Material.—Consumers are less inclined to delay shipments of scrap, but there has been no buying of consequence, so that business is largely confined to filling old contracts. No. 1 heavy melting steel is being bought at $13.50 per ton, delivered eastern Pennsylvania, and yard grade at $10.50 to $11 per ton, delivered. Most brokers are paying $11 per ton, but in a few cases only $10.50 is paid on shipments of yard steel to a Phoenixville, Pa., mill. A local foundry consumer of stove plate recently purchased a small tonnage at $11 per ton, delivered, and brokers are offering $8.50 per ton, New York, for foundry grade, with the offering price for steel mill grade $8.75 per ton, New York. Representatives of German steel mills are still seeking to purchase heavy melting steel for export to Germany. A sale of about 15,000 tons for export to Europe is reported.

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	7.00 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	8.75 to 9.00
Machine shop turnings	6.75 to 7.50
Short shoveling turnings	7.00 to 7.50
Cast borings (blast furnace or steel works)	6.75 to 7.50
Mixed borings and turnings	7.00 to 7.50
Steel car axles	16.00 to 16.50
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)	8.75
Forge fire	6.75 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought, long	9.00 to 9.50
Rails for rolling	10.50 to 11.00
Cast iron carwheels	11.25 to 11.75
Stove plate (foundry)	8.50 to 9.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.00 to 11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.75 to $14.25
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.75 to 12.25
No. 2 cast (radiators, cast boilers, etc.)	11.25 to 11.75

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.60c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb.	$2.90
No. 9 galvanized wire, per 100 lb.	3.35
Common wire nails, base per keg	2.90

---

*Net base, including boxing and cutting to length.

Cleveland

Bars and Shapes in Good Demand—Hot-Rolled Strip Prices Advanced

CLEVELAND, Feb. 14.—Demand for steel bars and structural material in specifications against contracts continues fairly heavy. Consumers are taking out material at a rate that indicates that they will order about all the steel covered by first quarter contracts. Plates are not active but are moving better than a few weeks ago. Some car lot business is coming out in steel bars, plates and structural material at the new 1.85c. price, which is holding. New demand for sheets in this territory is rather slow, but the automotive industry is taking heavy shipments of sheets, strip steel and alloy steel.

Hot-rolled strip steel has been advanced $1 to $2 a ton and mills have opened their books for the second quarter at the advance. Some of the sheet mills have also opened their books for the second quarter at the present regular quotations. An increase in production schedules is planned by some of the automobile companies for next month. The bulk of the steel business in this territory is coming directly or indirectly from the automotive industry, but orders from this source are hardly up to expectations. Some of the parts makers have only a moderate amount of business. This is evidently due, partly at least, to the fact that the Ford Motor Co. is still operating at a very limited rate.

In the structural field, not only has inquiry improved, but the outlook for building work in this territory is more promising than for some time.

Pig Iron.—The market continues active, with sales of 25,000 tons in foundry and malleable grades by Cleveland interests during the week, which was somewhat less than during the previous week. While many foundries are buying for the second quarter, others are inclined to purchase only for their early needs, so that they can more closely balance purchases with their requirements. These see no incentive to cover far ahead as long as there are no indications of higher prices and they can secure good deliveries on current orders. The Lake furnace price is holding to $17 in this territory, but producers are still absorbing freight by going to $16.50 for shipment to some competitive points. In Michigan, where the price has strengthened recently, the market is now established at $18. Shipments are running ahead of those in January, largely because of the liberal amount of iron that is being taken by the automotive industry. Shipping orders from radiator, heating furnace and stove manufacturers show a gain, but northern Ohio foundries are taking only moderate shipments.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Shipments of Lake Superior ore from Lake Erie ports are rather light, amounting to 320,432 tons in January as compared with 449,361 tons in the same month last year. Shipments for the season until Feb. 1 were 26,707,158 tons, as compared with 31,050,208 tons during the previous year. The dock balance is slightly less than that of a year ago, being 6,288,000 as of Feb. 1, compared with 6,692,124 tons on the same date a year ago.

Bolts, Nuts and Rivets.—Bolt and nut manufacturers are getting a fair volume of well distributed orders from jobbers, the automotive industry, railroads and other consumers. Recent price advances on steel bars, wire and wire rods have a tendency to make the tone of the market firmer. The industry is operating at approximately 60 per cent. The demand for rivets is not active.

Sheets.—Several of the mills have opened their books for the second quarter at the present regular quotations of 2.90c., Pittsburgh, for black, 2.10c. for blue annealed, 3.75c. for galvanized and 4.15c. for auto body sheets. New business is rather light but specifications from the automotive industry in Michigan continue good and permit the mills to maintain heavy operations. Efforts to make a higher price basis effective have not yet succeeded on galvanized sheets, on which there is a shading of around $3 a ton. The price on blue annealed sheets appears to be well maintained and black sheets are firm at 2.90c.

Strip Steel.—Makers of hot-rolled strip have issued new price schedules under which prices are from $1 to $2 a ton above those that have been prevailing. In the new schedules the dividing line between very narrow material and the next classification is 3-in. strip instead of 2-in., as at present. The new prices are 2.20c., Pittsburgh, for under 3 in. wide, 2.10c. for 3-in. to 6-in., inclusive, and 1.90c. for 6 to 12-in., inclusive. Strip over 12 in. wide will carry the blue annealed sheet or plate base, as at present. The new prices apply to hoops and bands, but cut hoop is unchanged at 2.30c. The new prices apply to desirable orders, and for small lots mills are asking $4 a ton above the round lot price for 3 in. and narrower material and $2 a ton on other widths. The new prices will apply on second quarter contracts, for which mills have opened their books. Cold-rolled strip is firm at 3.15c., base Cleveland, or 2.90c. for 3 tons and over, and mills have also opened their books for the second quarter for cold-rolled strip at the present price, and for fender stock at the recently advanced price of 4.30c., Cleveland.

Semi-Finished Steel.—There is some activity in forging billets in car lots. Sheet bar specifications are holding up well, but there is very little new business.

Nails and Wire.—A $2.55 price on nails has not disappeared in some sections, but this is evidently quoted by some small makers and is not being met by the larger producers. Specifications are coming out in good volume.

Reinforcing Bars.—Awards include 750 tons for grade elimination work in Cleveland. Small-lot inquiry has improved. Rail steel bars are now generally quoted at 1.75c., mill.

Warehouse Business.—Sales show a slight gain over last month. Prices are firm. The recent advance in mill prices has not been followed by any change in warehouse prices except on galvanized sheets.

Coke.—Furnace coke is weak. Foundry grades are dull. Quotations are unchanged at $8, Painesville, for by-product foundry coke, or $9.01, delivered Cleveland, and $3.75 to $5.10, ovens, for Connellsville foundry coke and $2.75 for heating coke.

Old Material.—The only activity reported is the purchase by a Cleveland consumer of 3000 to 5000 tons of blast furnace scrap at $11. Scrap is being produced faster than it is being consumed and some of the mills have become badly congested with material, necessitating further restrictions. This is having a weakening effect on the market. Blast furnace scrap is being freely offered at $10.50. Quotations on other grades are unchanged.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.00 to 11.25
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.50
Mixed borings and short turnings	10.50
No. 2 busheling	10.50
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Philadelphia

Steel Specifications Slow—Tonnage of Heavy Melting Steel Bought

PHILADELPHIA, Feb. 14.—Purchasing of both pig iron and steel has been light, but prices are generally steady. Specifications against contracts on bars and shapes are reported to be coming through rather slowly, consumers' requirements evidently being somewhat smaller than had been expected earlier in the quarter. As a result, some carry over of present contracts into the next quarter would not be surprising, although heavier specifications may develop as spring activity begins.

Black and galvanized sheet prices are slightly firmer, but concessions are still reported on desirable business. Some shading of both strip steel and blue annealed sheets has appeared, but most makers are not inclined to meet the lower quotations.

Despite general quietness in pig iron, furnaces are evidently maintaining the new price basis of $20. A Delaware River pipe maker is reported to have closed on a sizable tonnage with a New England furnace.

Pig Iron.—About the only inquiry of consequence for second quarter delivery is about 2000 tons of foundry iron for the Gloucester, N. J., plant of the American Radiator Co. A cast iron pipe maker on the Delaware River is understood to have closed on about 10,000 tons of foundry iron with a New England furnace. Current purchasing of foundry iron is limited to occasional orders for one or two carloads, but consumers with contracts are in most cases accepting shipments without delay. The new basis of $20 per ton, furnace, seems to be fairly well established, although there have been no large tonnages bought since the price became effective.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26
East. Pa. No. 1X	21.76
Basic (delivered eastern Pa.)	19.50 to 20.00
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to 24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to 24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to 25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to 25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Consumers are slower in providing mills with specifications on their contracts. The current quotation of 1.85c. per lb., base, Pittsburgh, is being maintained on new business.

Shapes.—There is evidently a fair volume of tonnage involved in projects for the immediate future, but fabricators are specifying moderately against contracts. On current business, mills are quoting 2c. per lb., Bethlehem; 1.97½c. per lb., Pottsville, or 2.12c. to 2.13c. per lb., delivered Philadelphia.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, $\frac{3}{16}$-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.40c.
Round-edge iron	3.50c.
Round-edge steel, iron finished, 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.35c.
Cold-finished steel, squares and flats	3.85c.
Steel hoops	3.85c. to 4.15c.
Steel bands, No. 12 gage to $\frac{3}{16}$-in., inclusive	3.60c. to 3.90c.
Spring steel	5.00c.
Black sheets (No. 24)	4.25c.
Galvanized sheets (No. 24)	5.10c.
Blue annealed sheets (No. 10)	3.15c.
Diamond pattern floor plates—	
¼-in.	5.30c.
$\frac{3}{16}$-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

Plates.—Mills report a good volume of shipments against contracts, but new business is limited for the most part to small lots. Prices are being maintained at 2c. per lb., Coatesville, or 2.10c. per lb., delivered Philadelphia.

Sheets.—On both black and galvanized sheets there is slightly less tendency to offer the concessions from the market price that were obtainable a few weeks ago. Some shading of 2.90c. per lb., Pittsburgh, on black and 3.75c. per lb., Pittsburgh, on galvanized, however, is still in evidence. Recently a seller of strip steel sheets is reported to have quoted lower than 2.10c. per lb., base, but most makers are not inclined to meet this lower quotation.

Ferromanganese.—Selling of lots of 100 tons or less continues and prices are unchanged at $100 per ton, seaboard.

Warehouse Business.—Prices are unaltered, although the present volume of purchasing from stock is small. The recently adopted quantity differentials on steel bars and small shapes are evidently being maintained by jobbers.

Imports.—In the week ended Feb. 11, 353 gross tons of pig iron from the Netherlands was received at this port. Ore imports were confined to 600 tons of chrome ore from Cyprus. Other imports were 50 tons of steel bars from Belgium and 35 tons from France, 189 tons of structural shapes from Belgium and four tons of steel scrap from the United Kingdom.

Old Material.—A mill at Coatesville, Pa., has closed on 15,000 to 20,000 tons of No. 1 heavy melting steel in the past week. Except for this purchase the scrap market continues quiet. A Phoenixville consumer, evidently receiving a sufficient tonnage of stove plate at $13 per ton on present contracts, is now offering $12.50 per ton, delivered, and will pay $11 per ton, delivered, for machine shop turnings. A Lebanon, Pa., user of specification pipe is temporarily delaying shipments on contracts.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	15.00 to	15.50
Bundled sheets (for steel works)	10.50 to	11.00
Machine shop turnings (for steel works)		11.00
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast boring (for steel works and rolling mill)		11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars		13.00
Stove plate (for steel works)		13.00
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to	18.50
Couplers and knuckles	16.00 to	16.50
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.00 to	10.50
Machine shop turnings (for rolling mill)		11.00
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to	13.50
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire	11.00 to	12.00
Steel rails for rolling	15.00 to	15.50
Cast iron carwheels	15.50 to	16.50
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	14.50 to	15.00

Busbar Supports Designed for Flexibility in Arrangement

A new line of busbar supports, known as the modified hollow square type, is being offered by the Westinghouse Electric & Mfg. Co. The supports consist of heat-treated aluminum alloy clamps which are insulated from the standard 1¼ in. pipe of the mounting support by means of high-grade micarta tubes. The bus support is designed for 4 in. x ¼-in. busbars and for a maximum of 4000 volts. It may be adjusted to carry one or 12 bars. This feature allows the bus to be tapered as feeders are tapped off, or allows the easy installation of additional bus copper to provide for an increasing load. The hollow square arrangement of bars minimizes the influence of both skin effect and proximity effect, and will allow the copper to be used at its maximum efficiency. These supports are particularly adapted to heavy low-voltage bus construction.

Canadian Imports and Exports of Iron and Steel for 1927

TORONTO, ONT., Feb. 14.—Figures on Canada's imports and exports of iron and steel for 1927 are announced as follows:

Iron and Steel Imports into Canada

	1927	1926
Iron ore	$2,875,624	$2,853,549
Pigs, ingots, etc.	1,889,729	1,569,929
Rolling mill products	44,112,343	47,710,207
Tubes, pipes and fittings	3,727,361	3,834,837
Wire	3,334,551	3,129,673
Engines and boilers	16,920,299	13,907,730
Machinery	46,237,754	38,683,540
Tools	2,489,459	2,336,648

Iron and Steel Exports from Canada

	1927	1926
Iron (total)	$67,831,274	$75,602,162
Pigs, ingots, etc.	2,868,356	1,569,390
Scrap	782,407	646,644
Rolled products	1,929,139	2,685,979
Bars and rods	657,880	1,004,810
Rails	963,383	516,983
Machinery	5,591,523	4,451,443

Iron and Steel Production of Saar Increases Above Pre-War

WASHINGTON, Feb. 14.—Production of pig iron in the Saar in 1927 aggregated approximately 1,780,000 metric tons, against 1,638,051 tons in 1926 and 1,374,514 tons in 1913. The output of crude steel last year was 1,900,000 tons, compared with 1,734,161 tons in 1926 and 1,718,540 tons in 1913, according to the Iron and Steel Division, Department of Commerce. The Saar industries are members of the Continental Steel Entente and also are affiliated with a number of comptoirs. The report says that the several plants have made every effort to modernize and develop their installations.

James A. Farrell and M. C. Taylor Inspect Alabama Plant

BIRMINGHAM, Feb. 14.—James A. Farrell, president and chief executive officer, and Myron C. Taylor, chairman of the finance committee, of the United States Steel Corporation, arrived in Birmingham on Feb. 8, inspected properties of the Tennessee Coal, Iron & Railroad Co., and departed on Feb. 10. The visit of these two officials brought out a number of reports relative to proposed new developments, one specifying a new tube mill. At the office of the Tennessee company it was stated that these reports were without foundation at this time.

Louvain Memorial to Be Dedicated By Engineers This Year

The Louvain Library, destroyed by the Germans during the World War, and restored by American benefactions, will be dedicated on July 4 of this year, according to present plans, says a statement by the Engineering Foundation, 29 West Thirty-ninth Street, New York. The Belgian ambassador and Whitney Warren of New York, the architect, have both assented to this date, the foundation announced, and the sanction of the Louvain authorities is expected.

The foundation is arranging for the presence of a delegation of American engineers at the dedicatory ceremonies. Under the auspices of the foundation, a clock and carillon will be placed in the tower of the new library building at a cost of $80,000, to be subscribed by members of the engineering profession in this country. Up to Jan. 25, $32,300 had been contributed by 1880 engineers. The clock and carillon, the gift of 56,000 American engineers, will be installed "in memory of the engineers of the United States of America who gave their lives in the service of their country and its allies in the Great War, 1914-1918." Dr. Edward Dean Adams will head the United States engineering contingent at Louvain.

Boston

Pig Iron Prices Unsettled Again—Sales Totaled About 10,000 Tons

BOSTON, Feb. 14.—The show of firmness in pig iron from furnaces in Buffalo and east of Buffalo has not been maintained. Buffalo steel mills, out of the pig iron market a week or 10 days ago, have re-entered and taken No. 2X tonnages at $16.50 a ton base, furnace, and No. 1X at $17. Not all Buffalo stacks have met these prices, but furnaces east of Buffalo are competing. Current buying is for first and second quarter, mostly for deliveries straddling these periods. Sales the past week approximated 10,000 tons, and included 1000 tons No. 2 plain and No. 2X split three ways, stacks east of Buffalo taking 700 tons. Another sale was 2000 tons of No. 2X and No. 1X, divided between Buffalo and other Eastern furnaces, and still another was 1000 tons of two grades. Smaller sales ranged from 500 tons down to car lots, with eastern and western Pennsylvania, Virginia and Alabama irons cutting very little figure.

Prices of foundry iron per gross ton; delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$21.41 to	$21.91
Buffalo, sil. 2.25 to 2.75	21.41 to	22.41
East. Penn., sil. 1.75 to 2.25	23.15 to	23.65
East. Penn., sil. 2.25 to 2.75	23.65 to	24.15
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Cold-Rolled Strip.—Cold-rolled strip steel continues in good demand, but buying is of a hand-to-mouth character. Competition from Middle Western mills has practically disappeared, but it is keen among Atlantic seaboard mills. The Worcester, Mass., mill is holding to 3.30c. per lb. base, on lots of 1 to 3 tons and at 3.05c. on larger lots.

Sand.—Because of the comparatively low melt of iron in New England this winter, indications are that the spring molding sand buying movement will be slow in getting under way. Sand is $2.75 a ton, that price having been in effect since December, last, when it was $2. A meeting will shortly be held in New York in the interest of lower freight rates on sand.

Bars.—Mill representatives report some forward buying of steel bars, but most of the business placed so far this year has been for immediate consumption. Current prices are 1.85c. to 1.90c. per lb., base Pittsburgh. Reinforcing bars from stock, are 2.70c. to 2.75c. per lb. base, mostly 2.70c. For mill shipment, 1.90c. per lb., base, Pittsburgh, is the prevailing price, or 2.26½c. delivered in New England.

Warehouse Business.—Warehouse prices on cold-finished steel bars have been advanced 10c. per 100 lb. to 3.45c. per lb. base, for rounds and hexagons. Quantity differentials have been changed.

Coke.—Business in by-product foundry coke is not improved. Foundry coke remains at $11.50 a ton, delivered within a $3.10 freight rate zone. Business in domestic fuel is holding up well, but little impression has been made on stock piles at ovens. The general asking price is $8.50 a ton on cars Everett, Mass., but concessions have been given on specified sizes.

Old Material.—Unfavorable weather and continued low prices have combined to curtail the movement of old material in the past week. Most producers of scrap are willing to sell only when stocks become burdensome. This is especially true of heavy melting steel. Pennsylvania steel mills are drawing lightly upon New England scrap dealers, and the foundry melt does not permit expansion in textile and machinery cast sales. Prices remain unchanged.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to	$9.25
Scrap rails	8.50 to	8,75
No. 1 railroad wrought	10.50 to	11.00
No. 1 yard wrought	9.50 to	10.00
Machine shop turnings	6.00 to	6.25
Cast iron borings (steel works and rolling mill)	6.00 to	6.25
Bundled skeleton, long	6.50 to	7.00
Forge flashings	7.00 to	7.25
Blast furnace borings and turnings	6.00 to	6.25
Forge scrap	6.00 to	7.00
Shafting	13.00 to	13.50
Steel car axles	15.50 to	16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	8.00 to	8.50
Rails for rolling	10.00 to	10.50
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$14.00 to	$14.50
No. 1 machinery cast	14.50 to	15.00
No. 2 machinery cast	12.50 to	13.00
Stove plate		11.00
Railroad malleable	13.00 to	13.50

Warehouse Prices, f.o.b. Boston

	Base per Lb.

Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

St. Louis

Pig Iron Inquiries for 10,000 Tons—Wabash to Buy 4800 Tons of Tie Plates

ST. LOUIS, Feb. 14.—Sales of pig iron during the last week totaled about 3000 tons—2500 tons by the Granite City maker and 250 tons by a leading Southern interest, but inquiries exceed 10,000 tons. The melt is increasing and prices are firmer. Stove foundries are operating five days a week, and the jobbing foundries report an increased melt. The principal inquiry is for 4000 tons for a radiator manufacturer. A railroad car

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, $\frac{7}{16}$-in. and smaller, 100 lb. or more	70
Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

builder wants 1000 tons, and local and nearby melters are inquiring for 5000 tons in scattered lots.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Movement of domestic grades is fair because of cold weather, but buying is less than production and stock piles are increasing at by-product ovens. Industrial grades are moving freely.

Finished Iron and Steel.—The principal inquiry before the market is for 4800 tons of tie plates for the Wabash Railroad. Buying of plates, shapes, bars and sheets is showing improvement, and prices are said to be holding well on all of these items. Warehouse business continues light in the territory as a whole, but is more active in the city of St. Louis. Structural fabricators report a quiet week.

Old Material.—Active items in the old material list showed a decline of 25c. a ton, and the market is still suffering from the effects of heavier shipments to this district than can be assimilated by its industries, although they are very busy. Railroad lists include: Rock Island, 10,000 tons; Chesapeake & Ohio, 7929 tons; Wabash, 1870 tons; Ann Arbor, 70 tons; Great Northern, 46 carloads; Nickel Plate, 24 carloads; Chicago, Milwaukee & St. Paul, 21 carloads; Kansas City, Mexico & Orient, 3 carloads; Standard Oil of Indiana, 3 carloads.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$11.75 to $12.25
No. 1 locomotive tires	12.75 to 13.25
Heavy shoveling steel	11.75 to 12.25
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.00 to 14.50
Railroad springs	14.50 to 15.00
Bundled sheets	8.75 to 9.25
No. 2 railroad wrought	11.75 to 12.25
No. 1 busheling	10.25 to 10.75
Cast iron borings	9.25 to 9.75
Iron rails	13.50 to 14.00
Rails for rolling	14.25 to 14.75
Machine shop turnings	7.75 to 8.25
Steel car axles	20.00 to 20.50
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	10.25 to 10.75
Steel rails, less than 3 ft.	15.75 to 16.25
Steel angle bars	13.00 to 13.50
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	14.50 to 15.00
Railroad malleable	12.00 to 12.50
No. 1 railroad cast	13.50 to 14.00
Stove plate	13.75 to 14.25
Agricultural malleable	12.00 to 12.50
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Youngstown

Valley Steel Producers Averaging Slightly Under 75 Per Cent Operation

YOUNGSTOWN, Feb. 14.—Total specifications, orders and shipments of leading local steel makers for the first half of this month are approximately the same as in the same period last month. January, however, was a month of heavy shipments because of the large December specifications. The increase in plant operations to take care of the enlarged January movement seems to have been sufficient to supply all demands that have developed since the opening of the year. Instead of a further increase in the output of steel, some companies have found it necessary to ease down a little to escape getting ahead of their order books. Taking in the Steel Corporation units in the Mahoning and Shenango Valleys, which as in other districts appear to be doing better than independent company plants, the district is producing ingots at an average somewhat under 75 per cent of capacity, but that rate is above performance of some of the independent companies.

While some gain is noted in the demand for buttweld pipe, there has been no improvement in the call for drill and drive pipe and casing and orders for line pipe appear to have been materially reduced. Heavy shipments of nails in January and of other wire products, following the recent advance in prices, have been succeeded by something of a lull in new business in these items. The district appears to have produced sheets a little more rapidly than they were being specified and there has been a moderate letdown in mill operations to bring about balance between output and demand. The report about steel bar business is uniformly favorable and there is practically full operation of the bar mills in this area.

An increase in the movement of sheet bars is noted. In pig iron there is lifelessness in marked contrast with the activity reported from other producing centers. Steel makers here are not buying much scrap and their takings of ferroalloys and other raw materials have been lighter this month than last.

The bright feature of the situation is that prices are showing firmness. Manufacturers do not expect to be obliged to take any business in bars for second quarter shipment at less than today's price of 1.85c., base Pittsburgh, and there are predictions that the price for that period will be 1.90c. Sheet makers feel that 2.90c., base Pittsburgh, for black sheets on second quarter business is as low as they should go, while for galvanized 3.75c., base, and for blue annealed 2.10c., base, on sizes up to 40 in. wide, with 2.20c. for sheets wider than 40 in. are uniformly the second quarter ideas of producers.

Buffalo

Pig Iron Sales Exceed 25,000 Tons—Steel Business Improves

BUFFALO, Feb. 14.—Pig iron prices are firmer and sales over the past week or 10 days have probably reached 25,000 to 30,000 tons. The Massey-Harris Harvester Co. has closed for at least part of its inquiry for 2000 to 4000 tons of foundry and malleable. A 1000-ton malleable lot was closed, as well as two lots totaling 1500 tons of foundry. A Pennsylvania consumer placed 1000 tons of foundry and another inquiry from Pennsylvania was for 1000 tons of foundry. The American Tube & Stamping Co., Bridgeport, Conn., is said to have placed 3000 to 5000 tons of basic. A current inquiry is for 1500 tons of malleable and included in prospective business are a dozen lots ranging from 200 to 500 tons of foundry and malleable. Producers hear that the melt is increasing considerably and there is talk of higher prices on pig iron. Prices quoted are firmer.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	$17.00 to 17.50
Basic	16.50 to 17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Business continues to improve and prices are firm. Bar and shape mill operation is around 85 per cent. The 1.95c. Buffalo price is steady. Sheet mill operation is 85 per cent and prices are firm at 2.90c. for black; 3.75c. for galvanized, and 4.15c. for automobile body sheets. Price cutting has disappeared. Most of the sheet business is for prompt shipment, with a steady demand from the automobile industry. Specifications for bolts and nuts are sufficiently better to maintain operations at 60 to 65 per cent, and quotations are firm.

Old Material.—Increasing mill operation is making for a better demand, with evidences of a shortage of

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

strictly No. 1 heavy melting steel. Most of the yard stocks are low and mill stocks are not heavy. Sales of knuckles and couplers have been made, and there has been some selling of railroad malleable at $15.50.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades		
No. 1 heavy melting steel	$14.75 to	$15.25
No. 2 heavy melting steel	13.25 to	13.75
Scrap rails	13.75 to	14.25
Hydraulic compressed sheets	13.25 to	13.75
Hand bundled sheets	9.00 to	9.50
Drop forge flashings	11.50 to	12.00
No. 1 busheling	13.25 to	13.75
Heavy steel axle turnings	12.75 to	13.25
Machine shop turnings	9.00 to	9.25
Acid Open-Hearth Grades		
Railroad knuckles and couplers		16.50
Railroad coil and leaf springs		16.50
Rolled steel wheels		16.50
Low phosphorus billet and bloom ends	17.00 to	17.50
Electric Furnace Grades		
Heavy steel axle turnings	12.75 to	13.25
Short shoveling steel turnings	11.00 to	11.50
Blast Furnace Grades		
Short shoveling steel turnings	10.75 to	11.00
Short mixed borings and turnings	10.50 to	11.00
Cast iron borings	10.50 to	11.00
No. 2 busheling	9.00 to	9.50
Rolling Mill Grades		
Steel car axles	17.00 to	17.50
No. 1 railroad wrought	12.50 to	13.00
Cupola Grades		
No. 1 machinery cast	14.50 to	15.00
Stove plate	13.00 to	13.25
Locomotive grate bars	11.00 to	11.50
Steel rails, 3 ft. and under	17.00 to	17.25
Cast iron carwheels	13.00 to	13.50
Malleable Grades		
Railroad		15.50
Agricultural		15.50
Industrial		15.50

San Francisco

Price Advances on Steel Products Extend to Pacific Coast Trade

SAN FRANCISCO, Feb. 11.—(*By Air Mail*).—Advances in the c.i.f. prices on several domestic iron and steel products, following recent announcement of higher levels in the Eastern markets, were announced this week. Shape mill representatives and fabricators are encouraged by the number of new and pending projects up for figures. The largest award of the week involved 2400 tons of structural shapes for the Northern Life Insurance Building, Seattle, secured by the Wallace Bridge & Structural Steel Co. and the Hofius Steel & Equipment Co. of Seattle.

Pig Iron.—A tabulation of imports for November shows a total brought in at Pacific Coast ports of 1794 tons, compared with 811 tons for the previous month. Los Angeles took 650 tons and San Francisco 595, the remainder going to Portland and Seattle. Most of this material came from India. Demand is by no means heavy, most foundries having sufficient stock on hand to take care of their requirements for two months. Prices continue unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to	$26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to	26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to	25.00
**German foundry, sil. 2.75 to 3.25		24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Shapes.—Awards for the week exceeded 3600 tons and, in addition to the 2400 tons mentioned above, the Stubbs Co., St. Louis, took 600 tons for a building for the Government at Cristobal. Pending business calls for 27,000 tons. An inquiry for 800 tons of sheet steel piling for the Coyote Point bridge across San Francisco bay has been withdrawn as other material will be used. Structural material imported in November totaled 4961 tons as compared with 2041 tons for the preceding month. Of this total, San Francisco fabricators took 2983 tons and Los Angeles interests 1331 tons. More than half of this tonnage came from Belgian mills. Domestic prices are firm at 2.35c., c.i.f.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, 3/16-in. and over	3.15c.
Small angles, under 3/16-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.95c.
Blue annealed sheets (No. 10)	3.90c.
Galvanized sheets (No. 24)	5.50c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.40
Cement coated nails, 100-lb. keg	3.40

Plates.—The only plate award of importance was booked by the Worth Steel Co. and involved 250 tons for the Mare Island Navy Yard. No action has been taken on 5000 tons of plates and shapes for a Standard Oil tanker. Inquiries include 170 tons of universal plates for 800 box cars for the Western Pacific Railroad and approximately 400 tons for three months' requirements for the Standard Oil Co., San Francisco. Plate prices have been advanced $1 a ton, from 2.25c. to 2.30c., c.i.f.

Bars.—Several important reinforcing bar tonnages will be up for figures in the near future. Two of these projects involve over 6500 tons for two drainage district improvement jobs in Los Angeles. Bids are being taken for 600 tons for the Big Dalton Dam at Los Angeles. In November 2843 tons of foreign merchant and reinforcing bars entered Pacific ports. San Francisco took 1645 tons and Portland and Los Angeles about 600 tons each. Close to 1000 tons of this total came from French mills.

Cast Iron Pipe.—Lettings this week included 154 tons of 4 to 8-in. class B pipe for Chehalis, Wash., booked by the Pacific States Cast Iron Pipe Co.; 369 tons of 4 to 8-in. class B for the improvement of streets in Paradise Hills, San Diego, taken by the United Concrete Pipe & Construction Co. of San Diego; 217 tons of 6 to 10-in. class B for the improvement of Long Beach Boulevard, Lynwood, Cal.; 153 tons of 6 to 10-in. class B for the improvement of Main Street, San Diego, awarded to the Butterfield Construction Co. of San Diego, and 119 tons of 8-in. class B for Eureka, Cal., taken by B. Nicoll & Co. Bids have been opened on 1244 tons of 6 to 12-in. class C and D pipe for Vancouver, B. C., and on 156 tons of 4 and 8-in. class B for the improvement of Pacific Street, Oceanside, Cal. Bids will be opened soon on 222 tons of 4 to 8-in. class B for Armona, Cal., and on Feb. 21 for 3095 tons of 4 to 12-in. class B for Southgate, Cal. Importations during November totaled 1782 tons as compared with 2043 tons for the previous month. Nearly 1500 tons was shipped by French foundries.

Steel Pipe.—Some improvement in demand is reported. The Grinnell Co. was low bidder on two lots of welded steel pipe for Los Angeles. One specification called for 100,000 ft. of 6-in. involving 950 tons, and the other for 30,000 ft., or 285 tons.

Cold-Rolled Material.—Prices have advanced $2 a ton in this market and current business, such as it is, is being quoted on at 2.30c., base Pittsburgh, or equivalent.

Wire Products.—Wire nail prices have been advanced by from $3 to $4 a ton and practically all producers are now holding to the new level of $3.10 per keg, c.i.f. Coast ports.

Sheets.—Sheet prices have been advanced $3 to $4 a ton and the new prices appear to be firm at 2.75c., 3.60c. and 4.40c., c.i.f. Coast ports, on blue annealed, black and galvanized sheets, respectively. The Southern Pacific Co. has an inquiry out covering three months' requirements.

Warehouse Business.—Out-of-stock prices on nails have been advanced from 3.25c. to 3.40c., and black sheets, 24 gage, from 4.80c. to 4.95c. Galvanized sheets, 24 gage, have advanced from 5.35c. to 5.50c. and blue annealed, 10 gage, from 3.75c. to 3.90c.

Revenue freight loaded in the week ended Jan. 28 is reported by the American Railway Association at 902,832 cars, a gain of more than 2 per cent from the 884,095 cars of the preceding week. The total has been consistently below the corresponding figures of the two preceding years, the most recent comparison being with 943,879 cars in the corresponding week of 1927 and 925,696 in 1926.

Cincinnati

Pig Iron Dull—Scrap Weak—Steel Shipments Continue at Good Rate

CINCINNATI, Feb. 14.—Dullness pervades the southern Ohio pig iron market. Sales and inquiries have been so few that dealers have had to go back many years to find a parallel condition. The situation at Ironton is far from satisfactory, the shutting down of the Belfont furnace having brought to a temporary halt at least all production of merchant pig iron at that point. The Belfont company has considerable iron on its yards over and above the tonnage required to fill current contracts. The Marting Iron & Steel Co., on the other hand, has reduced its stocks substantially in the last few months, but still does not find prices sufficiently high to justify blowing in either of its furnaces. Southern Ohio foundry iron continues on a basis of $19, furnace. Lake Erie makers are reported to be quoting $17, base Cleveland, and whether they will go under that figure to obtain orders at points where they are at a freight disadvantage is uncertain. Alabama and Tennessee irons are firm at $16, base Birmingham, in the South, but sales north of the Ohio River have been of little consequence. The demand for Jackson County silvery iron is fair and prices are steady.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25		$20.89
So. Ohio malleable	$20.14 to	20.89
Alabama fdy., sil. 1.75 to 2.25		19.69
Alabama fdy., sil. 2.25 to 2.75		20.19
Tennessee fdy., sil. 1.75 to 2.25		19.69
Southern Ohio silvery, 8 per cent		26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Makers of bars, shapes and plates report that specifications and orders have declined slightly in the past week. Nevertheless, operations of industrial consumers in this district show no diminution, and shipments from mills are going forward on a gradually expanding scale. The seasonal lull in structural steel is holding back activities in that line. Small fabricators are increasing production as a result of obtaining numerous small jobs, but the larger companies report a dearth of important projects. Quotations on bars, structural shapes and plates remain firm at 1.85c., base Pittsburgh. Conditions in the sheet market are considered favorable. The American Rolling Mill Co. has followed the lead of other companies by announcing the following prices for second quarter: 2.10c., base Pittsburgh, for blue annealed, 2.90c. for black, 3.75c. for galvanized and 4.15c. for automobile body sheets. The company's operations at its four plants have been increased to full capacity, and recent bookings have been fully equal to the volume of production. Orders have been well balanced among all consuming lines, specifications from automobile manufacturers having been particularly good. The wire goods market has been more active than usual, the demand for nails having been brisk. Specifications against old contracts have been sizable. Common wire nails are quoted at $2.65 per keg, Pittsburgh or Ironton, and plain wire at $2.50 per 100 lb., Pittsburgh or Ironton. Sales of cold-rolled bars and of cold-rolled strip steel have turned upward in the past two weeks.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforcing bars	3.15c.
Rail steel reinforcing bars	3.00c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb.	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb.	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

Reinforcing Bars.—Bids on a new building for Christ Hospital, Cincinnati, are being taken by Tietig & Lee, architects, Cincinnati. The bar requirements probably will total 250 tons. Prices of new billet bars range from 1.85c. to 1.95c., base Pittsburgh. Producers of rail steel stock have advanced quotations $1 a ton to 1.80c., base mill, but will go to 1.75c. to secure attractive orders.

Warehouse Business.—The basis upon which reinforcing bars are being quoted for delivery out of local jobbers' warehouses has been changed so as to set up a differential of $3 a ton between new billet and rail steel bars. The new schedule calls for 3c. on rail steel bars and 3.15c. on new billet stock for delivery in the metropolitan Cincinnati district. For shipment to other points, new billet bars are priced at 3.05c. Readjustments also have been made on a number of products for delivery to Southern cities so that the delivered price is equalized with that from other markets which have a freight advantage over Cincinnati. However, this has in nowise affected the general list of quotations applying in the metropolitan Cincinnati area. Sales have been moderate in volume.

Coke.—Specifications for by-product foundry coke are at a fairly good rate and promise to continue on the present basis through February. Movement of beehive foundry coke from the Wise County and New River districts has been sluggish, but prices have remained firm in the face of a somewhat stagnant market.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates, $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—A further recession in sales has occurred in the past week with the result that quotations on a few items have been adversely affected. Mills in this district are buying small quantities of material to meet current requirements, but are paying far less for their scrap than dealers predicted a month ago. Without exception foundry grades are quiet.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.50 to	$12.00
Scrap rails for melting	12.25 to	12.75
Loose sheet clippings	9.00 to	9.50
Bundled sheets	9.50 to	10.00
Cast iron borings	8.00 to	8.50
Machine shop turnings	8.50 to	9.00
No. 1 busheling	10.50 to	11.00
No. 2 busheling	7.50 to	8.00
Rails for rolling	13.00 to	13.50
No. 1 locomotive tires	13.50 to	14.00
No. 1 railroad wrought	11.50 to	12.00
Short rails	16.50 to	17.00
Cast iron carwheels	12.75 to	13.25
No. 1 machinery cast	16.00 to	17.00
No. 1 railroad cast	13.50 to	14.00
Burnt cast	8.00 to	8.50
Stove plate	9.00 to	9.50
Brake shoes	10.00 to	10.75
Railroad malleable	12.75 to	13.25
Agricultural malleable	12.25 to	12.75

Birmingham

Pig Iron Firmer—Steady Demand for Steel Continues

BIRMINGTON, Feb. 14.—The pig iron market is said to be somewhat firmer. Sales last week were slightly larger than in the one preceding, but new business continues mostly in small lots. Several sizable orders are pending. These will be booked for first quarter, with a carry-over into second quarter allowed. Second quarter inquiries are developing but furnaces are not booking or quoting at this time. Foundry iron quotations remain on a $16 base. The Tennessee company has blown in Bessemer No. 2 and it is now on basic. This offsets the blowing out of the Sloss-Sheffield No. 1 city furnace, which is to be rebuilt and enlarged. Seventeen furnaces are in blast in the district.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil.	$16.00
No. 1 foundry, 2.25 to 2.75 sil.	16.50
Basic	15.00

Finished Steel.—A fairly steady demand upon the mills continues, in line with market conditions of the past several weeks, but structural steel and plate fabricators report only a nominal amount of new business. The Tennessee company has put on another open-hearth furnace at the Fairfield Works, now operating five. At Ensley eight and nine are producing. The Gulf States Steel Co. continues with four.

Cast Iron Pipe.—A good volume of business is developing in small tonnage orders. Several jobs are coming up in Georgia, Mississippi and Florida. Plant operations have slightly increased. Base price, for immediate delivery, is now $28.50 and $29.

Coke.—There is very little spot demand at the present time as most of the first quarter requirements have been booked. Shipments are going forward at a steady rate. Quotations for both spot and contract remain at $5.

Old Material.—Demand for steel rails is better, but business in other lines shows but little improvement.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00 to 8.50
Stove plate	13.00 to 14.00
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	15.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Detroit

Motor Car Companies Increasing Production Schedules Over 1927

DETROIT, Feb. 14.—The volume of steel bookings in the Detroit district is still on the increase, with about 5 per cent gain during the past week. This is largely accounted for in the rapidly mounting production schedules of the principal automobile companies.

For instance, the Graham-Paige Motors Corporation turned out 1497 cars last month, as compared with 1374 for the same month a year ago, and 1021 for December, 1927. The Chevrolet Motor Co. produced 91,681 cars and trucks in January, as against 73,676 in January, 1927. The schedule for this month has been set at 110,000 cars and trucks.

The Packard Motor Car Co. brought out 4150 cars in January of this year, as compared with 3857 in December and 2300 in January a year ago. The schedule for this month will surpass the January figure.

The Oakland Motor Car Co. turned out 3095 cars in January of this year, as against 2217 for the same month a year ago. The corresponding figures for Pontiac are 16,178 for January of this year, and 5824 for the same month a year ago. The schedule for the present month of Oakland and Pontiac combined is set at 22,268.

The Hupp Motor Car Corporation produced 3610 cars last month, 3763 during the month previous to that, and 2749 in January a year ago.

The Hudson-Essex January, 1928, production ran to 25,390, as against 12,000 in January a year ago. The objective at the Hudson-Essex plant is 1460 cars per day, which will be reached in the near future.

Dodge Brothers' production of cars and trucks is mounting steadily, and will reach a figure of 1650 units per day about March 1.

The Ford Motor Co. is still behind its schedule, the present rate being approximately 1200 cars per day, but 2000 cars per day may be reached by March 1, which would be 30 days behind the original estimate.

The Buick Motor Co.'s production for January of 17,042 is a big advance over the previous month, which showed only 12,900, but the January figure is below that for the same month a year ago of 18,260.

The Reo Motor Car Co. turned out 2384 cars in January, as against 2322 a year ago. February production will show a substantial increase over January.

Prices on automobile steel generally are firm. There have been no large orders in structural shapes, bars and plates during the last week. However, there has been a satisfactory increase in small-lot structural orders.

With no sales involving large tonnage during the past week in this district, market conditions on old material are about the same as a week ago. A decline of 25c. per ton was recorded on hydraulic compressed scrap and flashings. The general feeling seems to be that the present prices are about at the bottom.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$12.00 to $12.50
Borings and short turnings	8.75 to 9.25
Long turnings	7.75 to 8.25
No. 1 machinery cast	14.50 to 15.50
Automobile cast	18.00 to 19.00
Hydraulic compressed sheets	10.50 to 11.00
Stove plate	11.50 to 12.50
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	9.75 to 10.25

Canada

Railroad Orders Placed With Canadian and American Mills

TORONTO, ONT., Feb. 14.—The past week has been active in the iron and steel industry of Canada. New business has been in larger volume than for some time and many lines of industry have benefitted. The Algoma Steel Corporation, Sault Ste. Marie, Ont., the British Empire Steel Corporation, and a number of other Canadian companies shared in the orders placed by the Canadian National Railways, which included the following: For Canadian lines, 10,115 tons of 100-lb. rails, 7881 tons of 85-lb. rails, 647 gross tons splice bars, 141 gross tons of bolts, 208 gross tons spikes, 1121 gross tons plates, 49 gross tons shimming spikes and 56,020 rail anchors. Orders placed by the Canadian National Railways with United States firms for American lines include 11,550 gross tons of 100-lb. rails, 33 gross tons of bolts, 71 gross tons of splice bars, 74,788 rail anchors, 19 gross tons of spikes and 195 gross tons of tie plates.

The mills at Sault Ste. Marie, Ont., Hamilton, Ont., and at Sydney, N. S., are running almost at capacity.

Pig Iron.—Pig iron sales are showing slow but steady improvement, though most melters are covered by contract to the end of March. A good demand is reported for prompt shipment and orders for from 100 to 500 tons are appearing. Six furnaces in Canada are now in blast. While there has been no change in pig iron prices in the Toronto market, producers are asking slightly higher prices in Montreal.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	$25.00 to $25.50
No. 2 foundry, sil. 1.75 to 2.25	25.00 to 25.50
Malleable	25.00 to 25.50
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—Considerable tonnages of old material have been thrown on the market lately and this has had a softening effect on prices. Recent purchases of heavy melting steel by dealers have ranged from $8 to $9 per gross ton, Toronto.

Dealers' buying prices:

Per Gross Ton	Toronto	Montreal
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	6.00
Boiler plate	7.00	7.00
Heavy axle turnings	7.50	7.50
Cast borings	7.50	6.00
Steel turnings	7.00	6.50
Wrought pipe	5.00	6.00
Steel axles	14.00	19.00
Axles, wrought iron	16.00	21.00
No. 1 machinery cast	....	16.00
Stove plate	....	12.00
Standard carwheels	....	14.50
Malleable	....	13.00
Per Net Ton		
No. 1 machinery cast	15.00	....
Stove plate	9.00	....
Standard carwheels	13.00	....
Malleable scrap	13.00	....

NON-FERROUS METAL MARKETS

The Week's Prices

Cents per Pound for Early Delivery

Zinc, St. Louis	5.60	5.62½	5.62½	5.62½	5.62½

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, Feb. 14.—All the markets are quiet, with the price tendency downward in some. Copper has generally held its own despite some shading. Tin has gone to new low levels on this movement, with buying quite heavy. Lead prices have been reduced for the first time in some weeks. Zinc is a little weaker, with demand very light.

Copper.—Demand both from foreign and domestic consumers has been very light the past week. The few sales of electrolytic copper that have been made have, in most cases, been done at around 14.07½c., delivered in the Connecticut Valley, but a quotation of 14.12½c. is still maintained by practically all large producers. The shading has been done in most cases by one or two custom smelters. The statistics for January which appeared early this week, were considered favorable to sellers. They showed a reduction in mining of ore in January of about 200 tons a day, and a decrease in stocks of metal in both the blister and refined condition of about 9000 tons. It is stated that consumers, both here and abroad, particularly the latter, still have considerable metal to purchase for delivery this month and in March. Because of this and the statistical condition of the industry, some producers are optimistic and expect a buying movement in the near future. The Lake copper market is quiet, but firm, at 14.25c. delivered.

Tin.—New low prices, accompanied by large sales, have been the feature of the week. Not less than 1700 tons changed hands and possibly the total ran as high as 2000 tons. Consumers bought freely, but the market continued to decline. The weakness is ascribed partly to the anxiety to make sales and to the attitude of consumers who have been buying on a scale downward and not on reactions. Yesterday, when the market was closed here because of the holiday, the London market broke over £5 per ton, but rebounded today about £3 per ton. The local market has not been very active today, with moderate sales of futures reported at 51.75c. to 51.87½c. and with spot Straits tin quoted nominal at 51.87½c. New York. In London today spot standard tin was quoted at £231 5s., future standard at £233 15s. and spot Straits also at £233 15s., all quotations about £7 per ton less than a week ago. Arrivals thus far this month have been 2110 tons, with 5070 tons reported afloat.

Lead.—For the first time in many weeks the American Smelting & Refining Co. reduced its contract price from 6.50c. to 6.35c., New York. The fact that the outside market had practically reached this level was the cause of the reduction. In St. Louis quotations range from 6.10c. to 6.15c. The market is generally quiet, with demand moderate.

Zinc.—Prime Western zinc has hovered around 5.62½c., St. Louis, for the past week and today is a little lower at 5.60c., St. Louis, or 5.95c., New York. Demand is reported as only moderate, and the market is generally very quiet. Ore prices at Joplin fell $2 per ton last week to $36. Sales were only 7000 tons, with production at about 12,500 tons. Statistics for the month of January show stocks of refined metal to have been reduced about 1200 tons.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c., with shot nickel at 36c., and electrolytic nickel at 37c. per lb.

Antimony.—This market is very quiet, with Chinese metal for spot delivery quoted at 11c. and futures at 11.12½c. New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in ingots, is quoted at 23.90c. per lb. delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Feb. 14.—This week is characterized by a steady flow of orders, many of which are for more extended delivery. Prices for tin and lead are lower. The

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	54.50c. to 55.50c.
Tin, bar	56.50c. to 57.50c.

old metal market is moderately active and prices are steady.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 54c.; lead, 6.30c.; zinc, 5.75c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.25c.; pewter, No. 1, 34c.; tin foil, 40c.; block tin, 50c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

REINFORCING STEEL

Los Angeles Drainage Improvement Will Take 6400 Tons—4500 Tons in Cleveland Terminals

TWO drainage improvement jobs in Los Angeles, requiring 6400 tons, brought the week's new inquiries to a total of 8150 tons. Awards of 8200 tons included 4500 tons for the Cleveland Union Terminals. Awards follow:

PHILADELPHIA, 225 tons, school at Seventeenth and Tasker Streets, to American Steel Engineering Co.

CAMDEN, N. J., 900 tons of rail steel bars, building for Camden Cold Storage Co., to unnamed bidder.

MAYVIEW, PA., 250 tons, Pittsburgh Municipal Hospital, to Carlem Engineering Co.

CHICAGO, 110 tons of rail steel bars for road work, to Concrete Engineering Co.

EVANSTON, ILL., 400 tons of rail steel bars for Boltwood public school, to Calumet Steel Co.

TACOMA, WASH., 500 tons, Union Bag Co. plant, to Pacific Coast Steel Co.

SEATTLE, 350 tons, Northern Life Building, divided between Pacific Coast Steel Co. and Northwest Rolling Mills.

SEATTLE, 250 tons, garage, to Pacific Coast Steel Co.

CLEVELAND, 750 tons, Whitehouse Crossing grade elimination, to Bourne-Fuller Co.

CLEVELAND, 4500 tons, work for Cleveland Union Terminals Co., to Bourne-Fuller Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 250 tons, pier for Erie Railroad.

CHICAGO, tonnage being estimated, cooperative apartment building at 1325 Astor Street.

CHICAGO, tonnage being estimated, Drake Tower; B. H. Marshall, architect.

CHICAGO, 300 tons, apartment building at 14 West Elm Street; William Bernhard, architect.

ST. LOUIS, 380 tons; building for Lindell Trust Co. at Grand and St. Louis Avenues, 150 tons; southern approach to Municipal bridge across Mississippi River, 130 tons, and garage at Thirteenth and St. Charles Streets, 100 tons.

LITTLE ROCK, ARK., 100 tons, bridge over Arkansas River for Missouri Pacific Railroad; E. A. Hadley, St. Louis, chief engineer.

LOS ANGELES, 5200 tons, Drainage District Improvement No. 23; bids about March 12.

LOS ANGELES, 1220 tons, Drainage District Improvement No. 22; bids taken.

LOS ANGELES, 600 tons, Big Dalton Dam; bids Feb. 20.

SAN DIEGO, CAL., 100 tons, pier foot of E Street for United States Navy; bids March 3.

The Concrete Reinforcing Steel Institute will hold its fourth annual meeting at the Edgewater Gulf Hotel, Biloxi, Miss., March 19-21. M. A. Beeman, Tribune Tower, Chicago, is secretary.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	10.00c.	11.25c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.75c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	4.25c.	4.75c.
Zinc	3.75c.	4.25c.
Sheet aluminum	12.75c.	14.50c.
Cast aluminum	12.75c.	14.50c.

RAILROAD EQUIPMENT

Norfolk & Western Orders 1000 Hopper Bodies—New York Central Inquires for Ten Locomotives

FALLING somewhat below the average of recent weeks, railroad buying included few large orders. Purchase of 1000 hopper car bodies by the Norfolk & Western was the outstanding transaction. A South American road has made inquiry for a list of miscellaneous cars. The New York Central will buy 10 locomotives for service on the Boston & Albany. Details of the week's business follow:

Norfolk & Western has ordered 1000 hopper car bodies from Ralston Steel Car Co.

Delaware & Hudson has ordered three mail and baggage cars from American Car & Foundry Co.

State Railways of Uruguay have made inquiry for the following items: Three first class passenger coaches, one Pullman coach, two dining cars, two baggage cars, 10 box cars, 32 stock cars and one auxiliary crane.

Anglo-Chile Nitrate Co. has ordered 50 flat cars from American Car & Foundry Co.

Tennessee Copper Co. has ordered one six-wheel switching locomotive from American Locomotive Co.

Sinclair Refining Co. has ordered one six-wheel switching locomotive from Baldwin Locomotive Works.

Amtorg Trading Corporation has placed an order for 200 dump cars with American Car & Foundry Co.

Chicago & Alton has ordered seven baggage and mail and two postal cars from Pullman Car & Mfg. Corporation.

New York Central is inquiring for 10 locomotives for service on Boston & Albany.

Northern Pacific has ordered one articulated-type locomotive from American Locomotive Co.

Chicago, Rock Island & Pacific will buy 11 70-ft. passenger, baggage and mail service gas-electric cars.

Toronto, Hamilton & Buffalo has ordered two locomotives from Montreal Locomotive Works.

New York Metal Merchants Hold Dinner

The Metal Merchants' Credit Association, New York, held its fourth annual dinner at the Waldorf-Astoria Hotel, Feb. 9. The dinner was followed by an entertainment. Guests of the association included representatives of the Bethlehem Steel Co., Youngstown Sheet & Tube Co., Central Alloy Steel Co., Apollo Steel Co., American Rolling Mill Co., Weirton Steel Co., Superior Sheet Steel Co., Republic Iron & Steel Co., Eastern Rolling Mill Co. and the Newton Steel Co. Officers of the association for 1928 are: J. George Fuchs of Hoffman & Scofield-Bruce & Cook, Inc., New York, executive secretary, and Richard H. Lippincott, Jr., of Dickerson, Van Dusen & Co., New York, vice-chairman.

One outstanding feature of United States shipments of agricultural implements in 1927 was the large total which went to Canada, amounting to $29,791,472. This was 33 per cent of the total shipped to all countries and exceeded the shipments to all of Europe by more than $8,000,000, according to the Agricultural Implements Division, Department of Commerce.

FABRICATED STRUCTURAL STEEL

Awards of 67,900 Tons—19,000 for Chicago Building and 15,000 in Santa Fe Bridge Work

WITH 19,000 tons for the Chicago Civic Opera Building, 15,000 tons in bridge requirements for the Santa Fe railroad, 11,000 tons for a bridge at Vicksburg, Miss., and 8000 tons for a viaduct at Milwaukee, structural awards during the last week amounted to 67,900 tons. This total has been exceeded but once in the present year. New projects added to pending work totaled 29,300 tons, the largest of which was an oil tanker for the Standard Oil Co. Awards follow:

New York, 900 tons, building for Empire Mortgage Co. on Fifth Avenue, to Hay Foundry & Iron Works.

Philadelphia, 400 tons, building for Bell Telephone Co., to Shoemaker Bridge Co.

Taylor, S. C., 400 tons, foundry building, to Southern Engineering Co.

State of Michigan, 170 tons, bridge work for State Highway Commission, to Massillon Bridge & Structural Co.

Newark, N. J., 850 tons, Journal Square station and office building, to American Bridge Co.

Philadelphia, 950 tons, Ninth Bank & Trust Co. Building, to Bethlehem Fabricators, Inc.

Philadelphia, 150 tons, addition to West Philadelphia Title & Trust Co., to Robinson Iron & Steel Co.

Washington, 1000 tons, addition to Bennings power plant, Potomac Electric Power Co., to Jones & Laughlin Steel Corporation.

Zanesville, Ohio, 180 tons, two sand barges for Muskingum River Sand & Gravel Co., to Jones & Laughlin Steel Corporation.

Vicksburg, Miss., 16,000 tons, railroad and highway bridge; 11,000 tons for superstructure, to American Bridge Co., and 5000 tons in approaches, to Virginia Bridge & Iron Co., the latter previously reported.

Bogalusa, La., 200 tons, building for Bogalusa Paper Co., to the Virginia Bridge & Iron Co.

Ann Arbor, Mich., 550 tons, First National Bank Building, to Whitehead & Kales.

Detroit, 320 tons, Bank of Detroit, to Guibert Steel Co., Pittsburgh, previously reported awarded to a local fabricator.

Bloomington, Ind., 700 tons, building for University of Indiana, to an unnamed bidder.

Chicago, 19,000 tons, Civic Opera House, to McClintic-Marshall Co.

Chicago, 300 tons, Harlam Avenue bridge, to American Bridge Co.

Chicago, 1400 tons, Sheridan Towers apartment building, to Hansell-Elcock Co.

Chicago, 300 tons, building for Straus & Schram, to Butler Street Foundry & Iron Co., local.

Atchison, Topeka & Santa Fe, 15,000 tons for 1928 bridge work, to American Bridge Co.

Milwaukee, 8000 tons, Sixteenth Street viaduct, to Julius C. Theilacker, 5924 Washington Boulevard, Milwaukee, for fabrication only; separate bids being taken on erection.

Tacoma, Wash., 1250 tons, buildings for Union Bag & Paper Co.; 500 tons to Hofius Steel & Equipment Co., 250 tons to Lidgerwood Pacific Co., and 500 tons to Star Iron & Steel Co.

Seattle, 2300 tons, Northern Life Building, equally divided between Wallace Bridge & Structural Steel Co. and Hofius Steel & Equipment Co.

Cristobal, Canal Zone, 600 tons, Government building, to Stubbs Co., St. Louis.

Mare Island, Cal., 250 tons of plates for Navy Yard, to Worth Steel Co.

San Francisco, 263 tons, apartment building at Pacific and Laguna Streets, to McClintic-Marshall Co.

San Francisco, 130 tons, apartment building at Gough and Fern Streets, to Golden Gate Iron Works.

San Francisco, 120 tons, theater on Geneva Street, to Mortenson Construction Co.

Fresno, Cal., 500 tons, ice plant for Pacific Fruit Express Co., to Minneapolis Steel & Machinery Co.

Los Angeles, 200 tons, power house, Fifty-eighth and Figueroa Streets, to McClintic-Marshall Co.

Honolulu, 800 tons, office building for Alexander & Baldwin, to Honolulu Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

State of Vermont, 500 tons, highway bridges for flood rehabilitation.

New York, 900 tons, pier for Erie Railroad.

Rochester, N. Y., 2200 tons, high school; bids taken Feb. 23.

Philadelphia, 600 tons, building for Temple University.

Pennsylvania Railroad, 500 tons, bridge work.

Washington, 1500 tons, building for Department of Agriculture.

Winston-Salem, N. C., 3000 tons, manufacturing building for Reynolds Tobacco Co.

Cleveland, 2100 tons, addition to open-hearth plant of Otis Steel Co.

Rittman, Ohio, 400 tons, building for Ohio Box Board Co.

Cleveland, 130 tons, conveyor house for Kelly Island Line & Transport Co. at Marblehead, Ohio.

Philadelphia, 1800 tons, building for Integrity Trust Co. at Sixteenth and Walnut Streets, to be let by Peyton Realty Co., 300 Madison Avenue, New York.

Indianapolis, Ind., 2500 tons, department store.

Kenosha, Wis., 500 tons, hotel and theater.

Chicago, 900 tons, approach to LaSalle Street Bridge.

Chicago, 600 tons, garage at 112 West Lake Street.

Chicago, 400 tons, produce market at Eighty-ninth Street.

Little Rock, Ark., 3000 tons, bridge over Arkansas River, for Missouri Pacific Railroad; E. A. Hadley, St. Louis, chief engineer.

Oakland, Cal., 300 tons, telephone building, Forty-fifth Street and Telegraph Avenue; bids being taken.

San Francisco, 800 tons sheet piling for Coyote Point bridge across San Francisco Bay; inquiry withdrawn.

San Francisco, 125 tons, hall for Native Daughters of Golden West; bids opened.

San Francisco, 5000 tons plates and shapes, oil tanker for Standard Oil Co.; Newport News Shipbuilding & Dry Dock Co., low bidder.

Seattle, Wash., 1500 tons plates, 78-in. penstock for Cedar River project for city; bids Feb. 17.

Olympia, Wash., 235 tons, Wind River bridge; bids opened.

Los Angeles, 600 tons, plates and shapes for two 80,000-bbl. tanks for Pan-American Petroleum Co.; bids taken soon.

Forming an American Pressed Metal Association

On Feb. 28 those interested in forming an association of pressed metal manufacturers will meet at the Cleveland Athletic Club, Cleveland, at 9.30 a. m., to discuss the report of the organization committee and adopt a permanent form of organization. This is the result of the meeting of a group of stamping manufacturers held in Cleveland Jan. 20.

Republic Earnings Less—Sharon Steel Hoop Profits Decrease

The Republic Iron & Steel Co., New York, had net profits in 1927 of $3,018,282, equivalent after preferred dividend payments to $4.22 per share of common stock. This compared with $5,065,022 or $11.05 a share in 1926. Profits of the company during the last half of 1927 were less than $1,000,000, while the company earned over $2,600,000 in the corresponding period of 1926. Unfilled orders of finished and semi-finished steel amounted to 140,809 tons on Dec. 31, 1927, as compared with 88,383 tons on Sept. 30 and with 157,250 tons at the end of 1926.

Earnings of the Sharon Steel Hoop Co., Sharon, Pa., were $555,519 in 1927, after all charges, comparing with $1,295,542 in 1926.

British Iron and Steel Output Light in January

London, England, Feb. 14 (*By Cable*).—Pig iron production in January was 560,600 gross tons, while that of steel ingots, including castings, was 626,200 tons. The corresponding production in December was 559,100 tons of pig iron and 604,900 tons of steel.

A comparison of the January production with the monthly rate for previous years is shown in the following table in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Average monthly	855,000	638,600
1920—Average monthly	669,500	755,600
1922—Average monthly	408,500	490,100
1923—Average monthly	620,000	706,800
1924—Average monthly	609,900	685,100
1925—Average monthly	519,700	616,400
1926—Average monthly	203,500	296,700
1927—Average monthly	607,800	758,200
1928—January	560,600	626,200

PERSONAL

C. W. Heppenstall, president Heppenstall Forge & Knife Co., Pittsburgh, observed the thirty-fifth anniversary of his connection with that company by entertaining its officers and veteran employees at a banquet in the main office on Feb. 11. He began his career as an office boy for the Trethewey Mfg. Co., now the Heppenstall Forge & Knife Co., in 1893. Following the dinner a moving picture showing all the operations of the different departments of the works was presented. After the moving picture B. B. Weinberg, general manager of sales, presided, and a number of officers and employees made talks on their experiences during employment with the company. A. P. Naylor, the oldest employee in service, on behalf of the employees of the Heppenstall Forge & Knife Co. and the Heppenstall Forge Co., a subsidiary company at Bridgeport, Conn., presented Mr. Heppenstall with a hand engraved bronze tablet. Mr. Heppenstall talked on the history of the Heppenstall family and company and the growth of the plant.

C. W. HEPPENSTALL

Arthur Dufty has been appointed manager of the Bantam Ball Bearing Co., Bantam, Conn., relieving W. S. Rogers, president, of all details of direct management. Mr. Dufty was graduated from Purdue University, Lafayette, Ind., in 1899, and was for 16 years superintendent of buildings and purchasing agent at Purdue. Later he was for three years business manager at Oberlin College, Oberlin, Ohio, before going into commercial lines for himself at Cleveland.

Ledyard Heckscher, who some months ago resigned as president of the Alan Wood Iron & Steel Co., Philadelphia, has resigned as president and director of the Rainey-Wood Coke Co., 52 Vanderbilt Avenue, New York. Alan D. Wood has been elected to succeed him as a director of the coke company and has also been made assistant treasurer.

W. S. Isherwood, general sales manager of the AC Spark Plug Co., Flint, Mich., has been appointed a member of the board of governors of the Automotive Equipment Association.

Frank J. Wachter, vice-president and sales manager of the cutlery division, Landers, Frary & Clark, New Britain, Conn., has resigned. He had been associated with the company for 15 years.

Charles L. Newcomb, general manager Dean Pump Works, Worthington Pump & Machinery Corporation, Holyoke, Mass., has resigned, and is at St. Petersburg, Fla., for the winter. He has been succeeded by Hugh Benet, formerly with Bartlett Hayward Co., Baltimore.

T. M. Manley, who has served in various capacities for the Morse Chain Co., Ithaca, N. Y., for about 20 years, has recently been appointed manager of the district including the Mohawk Valley, northern New York, Vermont, western Massachusetts and northeastern Pennsylvania, with headquarters at the company's main office.

Roy F. Druschky, recently in the St. Louis sales department of the Wagner Electric Corporation, St. Louis, has been placed in charge of a branch office opened by the company at 475 West Peachtree Street, Northeast, Atlanta, Ga. His territory will include Georgia, Alabama and Florida.

J. C. Ward, president of the Edgar Allen Steel Co., Inc., 194 Front Street, New York, sailed for England on Feb. 3, after a visit of several months in the United States and Canada.

LeRoy J. Zorn, executive vice-president of the J. H. Channon Corporation, Chicago, has been elected president of the company.

R. T. Stafford, for some years manager of the Northwest branch of the Allis-Chalmers Mfg. Co., Seattle, has been made assistant manager of the electrical department of the Pittsburgh Transformer Co., Pittsburgh. He has been succeeded by John Alberts, who has been connected with the company as representative in Europe and also in Portland, Ore., and San Francisco.

W. A. Carmer, traffic manager for the Bass Foundry & Machine Co., Fort Wayne, Ind., has been elected president of the Fort Wayne Transportation Club.

Arthur Maulding has been appointed general foreman of the steel plant of the Mount Vernon Car Mfg. Co., Mount Vernon, Ill. Robert Elliott has been made assistant superintendent.

T. B. Cram, for 19 years closely identified with the furnace industry, is now associated with Holcroft & Co., Detroit, contracting engineers, as special representative.

W. S. Hovey, president Fairbanks, Morse & Co., Chicago, will address the Mid-West Power Conference at a luncheon meeting to be held at the Hotel Stevens, Chicago, on Feb. 17. His subject will be "The Engineer's Part in Business."

Arthur E. Vail, for the past nine years superintendent of the Upper Level plant of Aluminum Co. of America, Massena, N. Y., has resigned. He has been connected with the Aluminum company at its various plants for 13 years.

W. J. Longmore has been appointed consulting supervisor of purchases Westinghouse Electric & Mfg. Co., East Pittsburgh; E. R. Norris, general works manager of all manufacturing operations; A. W. Bass, assistant to the vice-president; S. E. Marks, director of traffic, and C. G. Taylor, general purchasing agent. Mr. Longmore has been with the company since 1881 and since 1891 has headed the purchasing department. Mr. Norris, who for several years has been director of works equipment, began his connection with the company in 1892 as a general mechanic at the Newark works. He has been located at the East Pittsburgh plant since 1894. Mr. Bass started with the company in 1912 in charge of graphic statistics, and in 1921 was made director of works records. Mr. Marks entered the employ of the company in 1891 in the purchasing department, and since 1923 has been director of traffic and shipping. Mr. Taylor became assistant purchasing agent in 1895, purchasing agent in 1917, and a few years ago was made director of purchases.

C. S. Slack has been elected general manager of the Wise Industries, 1033 Mount Elliott Street, Detroit, manufacturer of cap nuts and stampings. He succeeds M. M. Wise, who has resigned.

D. F. Miner has been appointed manager of the material and process engineering department, Westinghouse Electric & Mfg. Co., East Pittsburgh. He has been with the company since 1919. He was graduated from Clark College, Worcester, Mass., in 1912, and did post-graduate work at Worcester Polytechnic Institute which brought him degrees in arts, science and electrical engineering.

W. R. G. Baker has been appointed managing engineer of the radio department of the General Electric Co., Schenectady, N. Y. He succeeds Adam Stein, Jr., who has joined the executive staff of Acoustics Products Co., a holding company recently organized to take over a number of radio phonograph companies. Mr. Baker has been connected with radio development of the General Electric Co. since it became active in this field.

—

George J. Klein, of the Novelty Lighting Corporation, Cleveland, was elected president of the Artistic Lighting Equipment Association, 711 Graybar Building, New York, at the association's annual convention held recently in Cleveland.

—

Edgar B. Thomas, for the past 15 years engaged in general engineering practice and building construction, has been added to the contract department staff of the H. K. Ferguson Co., Cleveland, engineer and builder. Mr. Thomas is chairman of the Cleveland Chamber of Commerce rivers and harbors committee, vice-president of the National Rivers and Harbors Congress and vice-president of the Great Lakes Harbors Association. He is a past president of the Cleveland Engineering Society.

—

R. F. Arndt, sales representative of Poole & McGonigle, Portland, Ore., structural steel fabricators, has been made a director of the Builders Exchange of Portland, representing interests of the steel industry.

—

J. B. Green, president of the Fusion Welding Corporation, Chicago, is spending the month of February on a lecture tour, his subject being the flow of welding metal in oxy-acetylene and metallic arc welding. The lectures are based on research work done by the engineering department of the Fusion Welding Corporation, and are being given at welding conferences held under the auspices of a number of State universities. Mr. Green will also speak at the annual meeting of the American Institute of Electrical Engineers in New York.

—

M. W. McArdle, vice-president and general manager of the Chicago Flexible Shaft Co., Chicago, has been elected president of the company. He has been associated with the organization for 20 years.

—

Dana Summers has been oppointed general superintendent of the Chicago Steel & Wire Co., Chicago. He has been identified with wire manufacturing plants for 15 years.

—

E. J. Shuler, for the last eight years in charge of welding operations for the New Orleans Public Service Corporation, New Orleans, has joined the engineering staff of the Fusion Welding Corporation, Chicago.

—

Julius A. Pfeiffer, recently vice-president of the Northwestern Expanded Metal Co., Chicago, has been made director of sales of the fireproof materials division, Milwaukee Corrugating Co., Milwaukee.

—

E. T. Weir, president Weirton Steel Co., Weirton, W. Va., is in Nassau, British West Indies, for a stay of about six weeks.

—

T. M. Girdler, recently elected president of the Jones & Laughlin Steel Corporation, was the guest of honor at a dinner at the Duquesne Club, Pittsburgh, on Feb. 10, given by members of the Lehigh Alumni Association of Pittsburgh. Mr. Girdler was graduated from Lehigh University in 1901. The affair was sponsored and directed by Taylor Allderdice, president National Tube Co.; Frank Bell, president Edgewater Steel Co.; T. J. Bray, president Republic Iron & Steel Co.; F. R. Dravo and R. M. Dravo, Dravo Contracting Co.; C. D. Marshall and H. H. McClintic, McClintic-Marshall Co.; H. D. Williams, president Pittsburgh Steel Co.; F. A. Merrick, vice-president Westinghouse Electric & Mfg. Co., and R. T. Morrow, assistant to vice-president Pennsylvania Railroad.

E. S. Chamberlain has joined the Triplex Machine Tool Co., New York, as machine tool salesman. In the past he has been connected with the National Tool Co. and the Kearney & Trecker Corporation, representing both companies in the New York territory.

—

J. Ramsey Speer, president Mackintosh-Hemphill Co., Pittsburgh, will address the Pittsburgh Foundrymen's Association at its regular monthly meeting and dinner at the Fort Pitt Hotel, Pittsburgh, Monday evening, Feb. 20. His subject will be "Where Does the Foundryman Find His Profit?"

—

H. M. Davison, who has been with the Hayward Co., 50 Church Street, New York, for a number of years, the last seven as general manager of sales, has resigned.

Foundry Equipment Manufacturers Elect Officers

At the annual meeting of the Foundry Equipment Manufacturers Association, in Cleveland, Feb. 7, the following officers were elected for the ensuing year: President, S. C. Vessy, W. W. Sly Mfg. Co., Cleveland; vice-president, Henry W. Standart, Northern Engineering Works, Detroit. H. Cole Estep, Penton Building, Cleveland, was re-elected secretary-treasurer. Mr. Standart was also elected a director for the term ending February, 1931, together with A. F. Jensen, Hanna Engineering Works, Chicago. Mr. Vessy was re-elected a director. In addition to the foregoing the board now includes T. W. Pangborn, Pangborn Corporation, Hagerstown, Md., past president, and E. O. Beardsley, Beardsley & Piper Co., Chicago.

The report of the secretary-treasurer showed that the association has reached a high point in number of members and in financial resources. The reports on business conditions showed that somewhat better conditions have prevailed since the first of the year. It was agreed to take steps to enlarge and amplify the statistical work of the association.

The members were addressed by Whiting Williams, Cleveland, on the subject, "What is Industry Doing to Us?" and by E. F. DuBrul, manager National Machine Tool Builders Association, who discussed the possibility of common action between trade associations to invoke those provisions of the Clayton Act relating to unfair practices with respect to unethical buying methods.

Obituary

John J. Treat, assistant superintendent Yale & Towne Mfg. Co., Stamford, Conn., and a former mayor of Stamford, died at the Stamford Hospital Feb. 7. He was born at New Haven, Conn., in 1873.

—

Edward R. Wiggins, advertising manager for French & Hecht Mfg. Co., Davenport, Iowa, died Jan. 31, after a brief illness, aged 41 years. He had been associate editor and contributor to various technical journals until a few years ago when he entered the advertising field.

—

Fred J. La Motte, superintendent of the Tonawanda Iron Corporation, the pig iron producing subsidiary of the American Radiator Co., died at Tonawanda, N. Y., on Feb. 11, of pneumonia. He had been in charge of the Tonawanda furnace for four years, having come there from the Chicago district.

The Bureau of Supplies and Accounts, Navy Department, will open bids next Tuesday for 250 tons of black medium steel plates for use in construction of light cruisers Nos. 28 and 29, one-half of the tonnage to be delivered at the Mare Island and the other at the Puget Sound navy yards. Bids will also be opened at the same time for 80 tons of black medium steel rivet rods for use in constructing cruiser No. 29, building at Mare Island.

Training and Paying Executives

Concluded from Page 463

leading to better organization and managerial efficiency, most companies have become interested in pensions.

In favoring the non-contributory pension plan, in which the company sets aside a certain amount each year for future payments, Mr. Cowdrick mentioned several weaknesses of the contributory plan. In the contributory plan the employer is really dealing with money which is not his own and must become involved in cumbersome records and bookkeeping. He must also adjust the payments of those who leave the service of the company before the pension time. The contributory plan likewise forces all employees to take part, and compulsion in such matters is not popular among workers.

Non-Contributory Plan Really a Savings System

Expressing opposition to the contributory pension plan, J. M. Larkin, assistant to the president, Bethlehem Steel Corporation, stated that as this system is really a means of encouraging saving among workers, he would prefer some sort of a thrift or investment plan which did not conceal its real motive under another name. Mr. Larkin stressed the fact that a pension plan is an investment and not a form of benevolence. With this fact in mind, the speaker urged the study of possible pension plans with emphasis on their social benefits rather than their cost.

Dr. Irving Clark, Norton Co., Worcester, Mass., stated that a great many workers who are retired on pension might have been kept at work much longer if adequate medical supervision had been provided in the plant. These men, who are often forced to retire because of some chronic disease contracted in late middle life, might, with proper medical care, have stayed on the job and remained of considerable value to their company both in producing power and in maintaining morale among their fellows. At the same time a worker is much more contented at work than retired on pension.

Training Men on the Job

A plea for the keeping of a detailed record of successful methods for training men on the job was voiced by H. G. Kenagy, Life Insurance Sales Research Bureau, Hartford, Conn. He deplored the lack of any definite technique for the training of workers. He characterized job analysis or the determining of what must be taught as the first step in training. The instructor should then arrange duties in the order of their difficulty and, after demonstrating proper methods, let the student try things for himself and become adequately efficient at one task before assuming new duties. Particularly important, Mr. Kenagy stated, is the measurement of a man's ability to learn and the assignment of his new work accordingly. Throughout the training period the men in charge should retain an experimental attitude and in that way build up a knowledge of the subject for future use.

Mid-Winter Safety Conference

Safety measures in steel and allied plants will feature a meeting of the Chicago district section of the Association of Iron and Steel Electrical Engineers, to be held on the evening of Feb. 21. Three papers will be presented and discussed. John P. Eib, safety director Illinois Steel Co., Joliet, Ill., will read a paper on "Education as a Means in Accident Prevention," featuring 5,028,640 man-hours in his plant without a lost-time accident. "Electrical Safety Circuits, Their Uses and Construction," by W. M. Runyon, engineer Crouse-Hinds Co., Syracuse, N. Y., and "Codes for Use in High-Tension Practices," by C. L. Baker, Bethlehem Steel Co., Johnstown, Pa., are the two other papers. The meeting will follow a dinner, and will be held at the Electric Power Club, 30 North Dearborn Street, Chicago.

Sintering a Variety of Materials

Concluded from Page 466

dition arose at the plant of the E. & G. Brooke Iron Co., Birdsboro, Pa.

Since the process simultaneously desulphurizes and sinters materials efficiently, the treatment of French Creek ore had been anticipated as a possibility from the start of the sintering plant. The French Creek mines produce ore that may be desulphurized to 0.1 per cent when crushed to ¼-in. size and sintered with about 3.5 per cent carbon. Fine crushing permits obtaining a uniform mixture, thus eliminating the variation that existed in run-of-mine lump ore.

Results obtained in improved furnace operation, from sintering tests of this material, were so satisfactory that it was decided to build a crushing plant to operate in conjunction with the sintering plant. The latter, built by the American Ore Reclamation Co. in 1911, and continued in operation until April, 1919, produced over 200,000 gross tons of sinter. A second plant, with an American Ore Reclamation Co. machine 42 in. x 57 ft. 4 in., was placed in operation in February, 1919. Plant No. 2, adjacent to the old installation, was housed in a timber building. In May, 1920, the new sintering plant, as well as the crusher installation, were totally destroyed by fire, after having produced about 100,000 tons of sinter. Notwithstanding the heavy loss, the Brooke company decided to build a larger and more modern plant immediately. This included a new crushing plant.

(To be concluded)

Sheet Steel Orders in January Ran 28,800 Tons Ahead of Shipments

January sales of the independent sheet steel manufacturers reporting to the National Association of Sheet and Tin Plate Manufacturers ran almost 28,800 tons in excess of the shipments for that month, but instead of an increase of that amount in the unfilled orders at the end of January that item was lower, as compared with one month before, by more than 51,000 tons. This is partly explained by an increase in the month in unshipped orders. Observations made during the month that production was high in relation to shipments are confirmed by the actual figures, which show that shipments were 77.6 per cent of capacity, while the production was 89.6 per cent. The statement for January, with comparisons, follows:

	January	December	November
Total number of mills	720	719	718
Capacity per month	486,550	472,064	485,350
Per cent reporting	72.6	72.6	72.6
Sales	302,921	530,197	344,519
Production	316,541	260,130	232,041
Shipments	274,126	221,689	224,789
Unfilled orders	694,197	745,393	437,306
Unshipped orders	110,945	97,630	92,678
Unsold stocks	59,508	53,474	52,966
Percentages to Capacity			
Sales	85.7	154.7	97.8
Production	89.6	75.9	65.9
Shipments	77.6	64.7	63.8
Unfilled orders	196.5	217.5	124.2
Unshipped orders	31.4	28.5	26.3
Unsold stocks	16.8	15.3	15.0

New Strip Mill for Steel & Tubes, Inc.

Steel & Tubes, Inc., Cleveland, will build a new continuous hot-strip mill at its Elyria, Ohio, plant. This will have a capacity for rolling strip up to 14 in. wide. Construction is planned to start in about six months.

Prices Still Higher on Continent

Advances in Both Pig Iron and Finished Steel—British Boiler Plates Lower—Germany Gets Railroad Order

(By Cable)

LONDON, ENGLAND, Feb. 13.

HOME demand for Cleveland pig iron continues to improve, but export sales are still small. Imports of ontinental iron are diminishing, last month's arrivals f pig iron totaling only 15,000 tons. The total of iron nd steel imports was 284,000 tons. Cleveland iron akers have not yet recaptured the Scottish market, ut sales are increasing.

Hematite is steadier as a result of some sales to taly and Germany of special analysis iron and imroved domestic demand for mixed numbers. Foreign re continues quiet, but prices are firm as a result of he Swedish strike.

Finished steel is generally quiet for export, but doestic demand is steady. Steel plate and shape makrs are endeavoring to form a central selling agency or export, but they are meeting with opposition and rospects of success are not considered hopeful.

January exports were 20,670 gross tons of pig iron, f which 200 tons went to the United States. Total exports of iron and steel were 332,185 gross tons.

Tin plate is active, the increasing cost of foreign steel bringing consumers into the market in anticipation of an early advance in the tin plate minimum price. Works are well sold ahead and if all the present inquiry matures will be booked for many months, as output is still restricted. Some makers have booked orders for December shipment.

Galvanized sheets are active and some good tonnages have been placed with makers, enabling them to advance prices. Black sheets are moderately active.

Continental markets continue to advance with demand good and some shortage of supplies. British users of semi-finished have paid £4 14s. ($22.90) per ton, f.o.b. for sheet bars and £4 13s. ($22.65) per ton, f.o.b. for 2-in. billets. Merchant bars have sold for export at £5 5s. per ton (1.16c. per lb.) f.o.b. There has been some heavy business in beams at as much as £4 14s. per ton (1.04c. per lb.), f.o.b. The German output for January is reported at 1,400,000 metric tons of pig iron and 1,600,000 tons of steel ingots.

FRENCH PRICES ADVANCING

Formation of Sales Offices for Semi-Finished Steel and Beams Stabilizes Market

PARIS, FRANCE, Jan. 29.—While there is a fair volme of purchasing for current needs, business is deeloping largely from a desire on the part of consumrs to increase their stocks at present prices in expecation of advances when the proposed national compoirs for semi-finished material, bars and beams are esablished, Feb. 15. Money is easier than for some time, ut costs of production and distribution will probably e increased soon by an advance in freight rates.

Prices are generally firm and in some markets there s a decided tendency to advance, but improvement is lmost exclusive with iron and steel producers. Manufacturing industries generally have but little work on their books. There is increased unemployment in certain regions.

Pig Iron.—Producers of phosphoric foundry iron at a recent meeting decided to advance domestic prices 10 fr. (40c.) per ton for February. The new basis for No. 3 foundry is 435 fr. ($17.05) per metric ton, f.o.b. furnace. Deductions for quantity purchases have been reduced. On purchases of 100 to 199 metric tons the reduction is 2 fr. (8c.) instead of 3 fr. (12c.) per ton; on 200 to 499 tons the reduction is 4 fr. (16c.) instead of 5 fr. (20c.) per ton; on 500 to 999 tons the reduction is 6 fr. (24c.) instead of 10 fr. (40c.) per ton and for more than 1000 tons the reduction is 8 fr. (32c.) instead of 12 fr. (48c.) per ton. Medium phosphorus foundry iron has been advanced 10 fr. (40c.) per ton. The expected decrease in prices of coke has not been

British and Continental European prices per gross ton, except where otherwise stated, f. o. b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0 18s.			$4.39		
Bilbao Rubio ore*	1 1½			5.24		
Cleveland No. 1 fdy.	3 7½			16.44		
Cleveland No. 3 fdy.	3 5			15.83

(a) Nominal.

large. Furnace grades have declined 5 fr. (20c.) per ton and foundry grades 8 fr. (32c.). There is a question whether these reductions will be applied to existing contracts. At a recent meeting of the entente of French, Belgian and Luxemburg producers of pig iron, it was decided that export prices be maintained for Switzerland and Italy and in other foreign markets the conditions of competition will be followed.

Ferroalloys.—As a result of the agreement between British and Norwegian ferromanganese producers prices are becoming stable. Other producers of ferromanganese are following the price set by the British and Norwegian furnaces.

Semi-Finished Material.—The new selling organization for semi-finished products and beams is to take over sales Feb. 15. Meanwhile producers entering into the agreement have decided to maintain prices until the new organization begins to function. Most mills are well booked with business and deliveries vary from five to 12 weeks. Export business is improving and prices are beginning to advance, although total purchasing is still small. Blooms are quoted at £3 19s. to £4 3s. ($19.25 to $20.21) per ton and billets at £4 5s. to £4 8s. 6d. ($20.70 to $21.55) per ton, f.o.b. Antwerp.

Finished Material.—The market on beams is strong as a result of the formation of the selling organization. Steel bars have advanced to about £5 per ton (1.10c. per lb.). Demand for wire rods is good and prices are strong but unchanged. Sheet prices are being maintained while negotiations are carried on for formation of a selling organization to control the sheet market. Even in the export market, sheet prices, affected by these negotiations, show a tendency to advance.

New German Tube Company Bought by United Steel Works

Hamburg, Germany, Jan. 30.—The Niederrheinische Stahlwerke A. G., the newest German steel corporation is now entirely controlled by the Vereinigte Stahlwerke A. G. (United Steel Works). The controlling company purchased a majority of the shares through the German Tube Syndicate. It is announced that there will be no interruption in construction of the new tube plants for the Niederrheinische interests and the first tubes by a new process, the Sack-Gasse-Verfahren, will be produced about September of this year.

Public Arbitrator in Germany Handles Many Cases

Hamburg, Germany, Jan. 30.—Recent statistics given out by the public arbitrator for Germany show that during 1925 a total of 4087 labor disputes were settled by the arbitrator, in 1926 a total of 5043 were settled and in 1927, with December estimated, 5907 cases were arbitrated. Of all wage disputes in Germany, 55 per cent were settled by the public arbitrator in 1926 and 59 per cent in 1927.

Despite the apparently satisfactory showing by the public arbitrator, neither employers nor employees are satisfied. It has been pointed out that both the employer and the workmen present exaggerated demands to the arbitrator, who is forced to assume full responsibility in making a decision that is fair to both sides in the controversy.

Large Railroad Order Goes to Germany on Reparations

Hamburg, Germany, Jan. 30.—The French Government has placed a large railroad material order for the French West African colonies with the United Steel Works, Klockner Works and other German manufacturers. The contract, which will be delivered on reparations account during the next 14 months, includes 640 miles of track, 30 freight cars, 11 locomotives, 70 passenger cars and station equipment and cranes.

HIGHER MARKET IN BELGIUM

Reduced Competition from France Aids Price Advance—Buyers Offer Bonuses

Antwerp, Belgium, Jan. 30.—Reflecting the decide increase in purchasing that has developed recently prices are beginning to advance. Much of the presen demand for iron and steel seems to be of a speculativ nature, but producers maintain that prices are still to low and continued increases seem to be expected. I some quarters, however, it is pointed out that the advance in prices has been too rapid to present a health condition and some reaction may develop. On the othe hand, export trade is showing decided improvemen with French mills filling their books with domestic orders. Belgian rail mills have taken some importan tonnages from the state railroads.

Pig Iron.—Buying has been in good volume an prices are firm. No. 3 phosphoric foundry iron is unchanged for export at £3 2s. to £3 3s. ($15.10 to $15.34) per ton, f.o.b. Antwerp. Bessemer iron is quoted at £ 18s. to £3 ($14.13 to $14.61) per ton, f.o.b. Antwerp.

Semi-Finished Material.—Although the volume o transactions is still small prices are firm. Buyers ar seeking concessions, but mills show no inclination t shade their original quotations. Blooms range from £ to £4 3s. ($19.48 to $20.21) per ton and billets from £ 6s. to £4 8s. 6d. ($20.94 to $21.55) per ton, f.o.b Antwerp. There is a good demand for sheet bars an some scarcity for prompt shipment is appearing. Current prices are about £4 10s. ($21.92) per ton, f.o.b Antwerp.

Finished Material.—Mills in most cases are not seeking additional business. Buyers are offering to pa slight advances. Prices for steel bars continue to advance and it is only on a large tonnage that less tha £5 per ton (1.10c. per lb.) is obtainable. Beams hav moved upward with competition from French mill temporarily reduced by a heavier home demand and current quotations range from £4 9s. to £4 10s. per to (0.98c. to 0.99c. per lb.). Corrugated bars are quoted a £5 5s. per ton (1.16c. per lb.), f.o.b. Antwerp. Ho rolled hoops are on a basis of £6 per ton (1.32c. per lb. f.o.b. Antwerp, and wire rods continue firm at £5 10s per ton (1.21c. per lb.).

Finds Reinforcing Bars Are Construction Material; Take Lower Tariff

A decision favorable to importers has been rendered on deformed steel bars by Justice I. F. Fische of the United States Customs Court, Second Division Galveston, Tex. The court finds that the plaintiff i justified in claiming that deformed steel bars are properly dutiable under paragraph 312 of the Tariff Act, which applies to construction materials, dutiable at 1/5 of one cent per lb. instead of under paragraph 304, which applies to semi-finished material, and plain steel bars, dutiable at 3/10 of one cent per lb. when the value is not more than 1.50c. per lb.

The decision of Judge Fischer concludes:

"We are of the opinion that within all the prevailing decisions on the subject these deformed bars are structural shapes, since that is their chief if not exclusive use. Certain it is that they are *ejusdem generis* with the beams, girders, joists, angles, channels, and other structurals shapes enumerated in paragraph 312. We therefore sustain the claim alleged in the protest under the latter paragraph and reverse the decision of the collector in each instance as to this merchandise."

The Government has 60 days in which to appeal this decision to a higher customs court and action along this line seems to be expected by importers. Meanwhile entries of deformed bars will be paid for by the importer at the higher rate under protest so that should the decision be sustained the excess duty will be refunded. Bars may be brought in at the lower rate if a bond is posted by the importer covering the amount of the excess duty.

Machinery Markets and News of the Works

AILROAD LIST OF 21 TOOLS

t. Louis-San Francisco Will Take Bids Up to Feb. 20 on Inquiry

usiness So Far This Year Ahead of Like Period in 1927—Automobile Companies Buying but Not Heavily

RAILROAD inquiry for machine tools has been enlarged by a list of 21 items on which the St. Louis- an Francisco will take bids up to Feb. 20. The Santa e is expected to place orders this month against re- nt inquiries. Railroad buying so far this year has een relatively light.

The principal activity in the Detroit and Cleveland arkets is brought about by expanding production of itomobile companies. The Packard Motor Car Co. is placed an order for a fair-sized lot of multiple bindle drilling machines, and the Ford Motor Co. continues to buy for production of its model, but on a moderate scale. Taken altogether, the business coming from the automotive industry is not as heavy as in some recent years at this time.

Machine tool sales during the first six weeks of 1928 are reported by some companies to be 20 per cent larger than in the corresponding period of 1927, but the improvement has not been evenly distributed and the result is a variation in the rate at which machine tool plants are operating. A large volume of business is pending, however, and should conditions industrially continue to improve it is expected that the present margin over the first quarter of last year will be maintained.

The National Acme Co., Cleveland, was one of the larger buyers during the week, ordering a considerable amount of equipment for the manufacture of shock absorbers for automobiles. Inquiries from the General Electric Co. at Schenectady, N. Y., has increased its recent inquiries to cover about 12 tools.

New York

NEW YORK, Feb. 14.

A GOOD volume of machine tool inquiry is accumulating but purchasing is light. The railroads continue inactive but industrial users of tools are in the market for single pieces of equipment. The General Electric Co. has issued further inquiries the past week bringing the total to about 12 tools. The New York Central Railroad has several outstanding inquiries, but has not yet announced that it is ready to place business.

Among recent purchases are a 62-in. heavy-duty and a -in. standard boring mill by a Milwaukee company; 18 x -in. used Norton grinder by a company in Wheeling, W. a.; 8-in. rotary surface grinder and No. 1 jig boring ma- ine by a clock manufacturer in Middle West; two 5-in. itomatic milling machines by a New Jersey company; 13 x -in. lathe by a Massachusetts manufacturer and one also a company in Cleveland; No. 2 jig boring machine by a ol and die maker in Detroit; 21-in. Aurora drill by a man- acturer and a 13 x 30-in. lathe by a water company in alifornia.

Bids will soon be asked by Otis Elevator Co., Wells Ave- ie, Yonkers, N. Y., for a two-story addition, to cost in ex- ss of $50,000 with equipment. Engineering department at mpany headquarters, Eleventh Avenue and Twenty-sixth reet, New York, in charge.

Safe-T Stat Co., Inc., 79 Bridge Street, Brooklyn, manu- cturer of electrical equipment, has arranged merger with . G. Nagel Electric Co., Toledo, Ohio, and will consolidate oduction at latter plant.

Artcraft Auto Lamp Co., 141 West Fifty-fourth Street, ew York, manufacturer of automobile headlights, etc., has ased space at 9-11 Franklin Street for expansion.

Fur Merchants' Cold Storage Co., 248-50 West Twenty- ghth Street, New York, will soon take bids for a ten-story ldition to cold storage and refrigerating plant, to cost in cess of $250,000 with equipment. Brutus Gundlack, 110 ast Forty-second Street, is architect; Ophuls & Hill, Inc., 2-14 West Forty-second Street, is architect.

International Power & Paper Co. of Newfoundland, Ltd., erated by International Paper Co., 100 East Forty-second reet, New York, is disposing of a bond issue of $4,866,000, rtion of fund to be used for expansion, including property rchase of newsprint mill and hydroelectric generating plant west coast of Newfoundland. A. R. Graustein is president both companies.

Hinde & Dauch Paper Co., Sandusky, Ohio, manufacturer of corrugated fiber containers, corrugated boards, etc., has succeeded to plant and business of Thompson & Norris Co., 212 Concord Street, Brooklyn, manufacturer of kindred products, and will continue as a division of its organization.

William Shary, 41 Union Square, West, New York, architect, will soon begin construction of a two-story automobile service, repair and garage building to cost about $100,000 with equipment.

National Carbon Co., 30 East Forty-second Street, New York, is planning expansion at its plant at Fremont, Ohio, with facilities for output of 120,000 dry cell batteries per day. Plant at 580 Henderson Street, Jersey City, N. J., heretofore given over to this manufacture, will be transferred to Fremont, as well as plant at East St. Louis, Ill. Jersey City unit will be converted for Eastern storage and distributing service.

Fire recently damaged portion of works of American Name Plate Mfg. Co., 117 Imlay Street, Brooklyn, manufacturer of metal name plates.

Lancia Motors of America, Inc., 140 West Fifty-seventh Street, New York, lately organized to assemble Lancia automobiles, with parts imported from Italy, is arranging for installation of equipment at former plant of Fiat Co., Poughkeepsie, N. Y. Anthony G. Fokker, head of Atlantic Aircraft Corporation, 110 East Forty-second Street, has been elected president.

Godfrey M. Ricci, 224 Smith Street, Perth Amboy, N. J., architect, has revised plans for a new ice-manufacturing plant to cost close to $35,000.

Huff Airplanes, Inc., Perth Amboy, N. J., has begun superstructure for initial units for its aircraft assembling plant, and will have buildings ready for equipment in March. Entire project will cost in excess of $75,000.

Public Service Electric & Gas Co., Public Service Terminal, Newark, has plans for a two-story power substation at Rahway, N. J., to cost more than $50,000 with equipment. Plans are also under way for similar station at Princeton, N. J., to cost close to like sum. Company has arranged for bond issue of $43,689,000, portion of proceeds to be used for expansion.

Elizabethtown Water Co., 64 Broad Street, Elizabeth, N. J., is reported planning installation of pumping plant at Bound Brook, N. J., with filtration unit.

Richards Chemical Co., 198 Warren Street, Jersey City, N. J., has work under way on a new one and two-story plant, to cost approximately $100,000 with equipment. Edward M. Paterson, 76 Montgomery Street, is architect.

American Electric Switch Corporation, Minerva, Ohio, has acquired Nyelec Switchboard Co., 422 East Fifty-third Street, New York. Nyelec company will retain New York office factory and personnel and will be operated as Nyelec division of American corporation. Both companies manufacture safety switches, fuse panels, panelboards, switchboards and other electrical equipment.

Safety Cable Co., division of General Cable Corporation, formerly at 114 Liberty Street, New York, is now located at 420 Lexington Avenue.

Leeds, Tozzer & Co., Inc., 75 West Street, New York, has been appointed special representative in Eastern states for Thew Shovel Co., Lorain, Ohio, and Universal Crane Co., Elyria, Ohio.

New England

BOSTON, Feb. 13.

LOCAL machinery dealers again report a falling off in business the past week and the market is nearer a standstill than at any time this year. Sales included a No. 3 Lapointe broaching machine, hydraulic lifting equipment, a small amount of sheet metal-working equipment for a local school, a 14-in. lathe, three or four small drills, one press and miscellaneous used equipment.

New England machinery manufacturers are doing much better than dealers, several reporting good sales. A Connecticut manufacturer the past week sold 21 tools, some for domestic and some for foreign use. Many small New England shops that have inquired for equipment apparently have abandoned purchases, temporarily at least, as anticipated work has not developed. A western Massachusetts plant is expected to close on several tools this week, and some large New England users indicate they will buy equipment shortly.

Small tools are fairly active, sales the past week being the largest for any similar period this year. Expensive gages also are included in this business.

All metal-working and other equipment of Worthington Pump & Machinery Co., East Cambridge, Mass., to be retained has been moved to other subsidiary plants. Cambridge plant is disposing of equipment not needed, and is seeking purchasers for its foundry and main plant.

Work has started on a one-story, 32 x 52 ft., work shop by Providence Granite Co., 210 Kinsley Avenue, Providence. Pneumatic equipment is required.

A manufacturing plant to replace one in North Woburn, Mass., recently destroyed by fire, is contemplated by Merrimac Chemical Co., 148 State Street, Boston. J. B. Rutter, company's engineer, has plans.

York Ice Machinery Corporation, 200 Causeway Street, Boston, engineer, is preparing plans for a one-story, 80 x 150 ft., ice manufacturing plant for Brockton Ice & Coal Co., 426 Main Street, Brockton, Mass.

Smith & Walker, 80 Boylston Street, Boston, architects, have closed bids on a one-story, 34 x 44 ft., pumping station at Beverly, Mass., for South Essex Sewage Commission, of which B. F. Snow is chairman.

Commercial Bodies, Inc., of New Jersey has leased space at 128 Brookline Street, Cambridge, Mass., for repair and manufacture of motor vehicles and automobile bodies.

Schein & Levine, 44 Broadway, Chelsea, Mass., have plans for a one-story 90 x 100 ft., press room for Panco Rubber Co., 31 Highland Street, Chelsea.

Strand & Sweet Mfg. Co., Winsted, Conn., enameled wire, will shortly start construction of a wire coil manufacturing plant unit.

Plans are in progress for a one-story, 40 x 60 ft., substation for Brockton Edison Electric Illuminating Co., Brockton, Mass. Stone & Webster, Inc., Boston, is engineer.

Bids for construction of the Hartford, Conn., trade school will be requested early in March.

Independent Lock Co., 78 Winter Street, Fitchburg, Mass., will shortly start erection on a two-story, 40 x 154 ft. addition. Morris Falk, president, will supervise work. Plans are private.

General Motors Corporation has under consideration erection of an assembly plant at Stoughton, Mass., on property with frontage of 1600 ft. on New York, New Haven & Hartford Railroad.

Plans are nearing completion for a manufacturing plant at Webster, Mass., for Waterhouse Co., Tracy, Conn., boats and automobile bodies. Plans are private.

Bids have been asked on general contract by E. Ingraham Co., 392 Main Street, Bristol, Conn., manufacturer of clocks and mechanisms, for a one-story addition, 25 x 161 ft., to be used primarily as a press department. Max J. Unkelbach, Bristol, is architect.

H. C. Hearne, 1389 Main Street, Springfield, Mass., arc tect, has completed plans for a three-story automobile s vice, repair and garage building, 110 x 140 ft., to cost excess of $100,000 with equipment.

E. H. Hotchkiss Co., Hoyt Street, Norwalk, Conn., man facturer of snap fasteners and kindred metal goods, h awarded general contract to Hewlett Co., Main Stre Bridgeport, Conn., for a one-story addition, 50 x 132 ft., cost close to $40,000 with equipment. Ballinger Co., 1 South Twelfth Street, Philadelphia, is architect and engine

Cadillac Automobile Co. of Rhode Island, 9 Federal Stre Providence, has awarded general contract to C. I. Bign Construction Co., 184 Washington Street, for a one-sto service, repair and sales building, to cost approximate $115,000 with equipment.

Back Bay Hotels Garage, Inc., Boston, care of Geor Nelson Meserve, 260 Tremont Street, architect, has beg erection of three-story and basement service, repair a garage building, to cost in excess of $500,000 with equipme

Brockton Gas Light Co., 54 Main Street, Brockton, Mas is said to have plans under way for a one-story automob service, repair and garage building, 125 x 125 ft., for co pany motor trucks and cars, to cost upward of $80,000 wi equipment. C. H. Tenney Co., 200 Devonshire Street, Bosto is architect and engineer.

C. A. Cook Co., 18 Osborn Street, Cambridge, Mass., ma ufacturer of typewriter chairs and kindred equipment, h acquired a factory at Ashland, Mass., and plans early moval for increased output.

St. Louis

ST. LOUIS, Feb. 13.

BIDS are being asked by Board of Public Service, Louis, O. D. Tillay, secretary, until Feb. 21, for thr forced draft fans, with turbine drives, air ducts, etc.; al for two boiler feed pumps and one house pump.

D. M. S. Motor Repair Co., 2615 Warwick Bouleva Kansas City, Mo., recently organized, has engaged J. Hogg, Walsix Building, architect, to prepare plans for two-story machine repair and parts plant, to cost close $40,000 with equipment.

Sapulpa Refining Co., Sapulpa, Okla., is considering building portion of oil refinery recently destroyed by fi with loss in excess of $125,000 including equipment.

North Arkansas Power Co., Mountain Home, Ark., considering construction of new electric light and pow plant, and ice-manufacturing plant at Salem, Ark., whe franchise has been secured, to cost in excess of $75,0 with machinery. Wyatt Wolf is head.

H. D. Lee Flour Mills Co., Salina, Kan., has plans a new mill and elevator to cost about $140,000 with m chinery. I. L. Zerbe, 139 South Santa Fe Avenue, architect in charge.

Curtiss-Robertson Airplane Mfg. Co., St. Louis Flyi Field, Bridgeton, Mo., has revised plans for a local pla one-story and part basement, 60 x 250 ft. and 40 x 60 and one-story operating unit, 32 x 40 ft., to cost in exce of $75,000 with equipment. McDonald & Condie, 502 Nor Taylor Avenue, St. Louis are architects.

Western Power, Light & Telephone Co., Salina, Ka operating public utility properties in Kansas, Missouri a Oklahoma, is disposing of a bond issue of $2,750,000, portion of proceeds to be used for extensions and improv ments, including transmission line construction, and acqu sition of ice-manufacturing plants and other utilitie Nathan L. Jones is president.

Board of Education, University City, Mo., is consideri installation of manual training equipment in new seni high school to cost $500,000. Ferrand & Fitch, 6188 Delm Boulevard, St. Louis, are architects.

Oklahoma Gas & Electric Co., Oklahoma City, Okla., h plans for extensions and improvements in steam-operat electric power house on Noble Street, including installati of boilers, turbine equipment and auxiliary apparatus, cost in excess of $200,000. Byllesby Engineering Co., 2 South La Salle Street, Chicago, is engineer.

Champlin Refining Co., Enid, Okla., is said to be pla ning construction of a new 6-in. pipe line from its prope ties at Seminole to Watchorn, about 100 miles.

Board of Education, Holbrook, Neb., plans installation manual training equipment in a new two-story and bas ment high and grade school, to cost about $110,000, f which superstructure will soon begin. Arthur D. Bake Clinic Building, Grand Island, Neb., is architect.

Oklahoma Natural Gas Corporation, Oklahoma Cit Okla., has arranged for bond isuse of $14,000,000, a porti of proceeds to be used for expansion and improvement including acquisition of other properties, pipe line and st tion construction.

Cleveland

Cleveland, Feb. 13.

Machine tool sales and inquiries dropped off somewhat the past week. The National Acme Co., Cleveland, has made additional purchase of considerable equipment including multiple spindle drilling machines, milling machines and broaching machines for manufacturing automobile shock absorbers. In the Detroit territory, the Packard Motor Car Co. placed a round lot of multiple-spindle drilling machines and another automobile manufacturer purchased two large turret lathes. The Ford Motor Co. continues to buy equipment, mostly in single machines. There is little activity outside the automotive field. No business is in prospect in the near future from railroads in this territory.

Cleveland Heater Co., 1900 West 112th Street, Cleveland, having plans drawn for a one-story addition to cost close $40,000 with equipment. George S. Rider Co., Century uilding, is architect and engineer. Leo Friedman is presi- nt.

Board of Education, Northfield, Ohio, is considering in- allation of manual training department in one and two- ory high school to cost $150,000, for which plans will soon completed by T. R. Ridley, 109 North Union Street, Akron, nio, architect.

Ohio Power Co., Canton, Ohio, has arranged for a bond sue of $10,018,000, a portion of proceeds to be used for pansion and improvements, including transmission line nstruction.

International Harvester Co., 2905 Chester Avenue, Cleve- nd, headquarters at Chicago, is considering erection of a ie-story factory branch, service and repair works on East fty-fifth Street to cost about $100,000 with equipment.

Board of Education, Cleveland, is said to have plans for addition to the city trade school for foundry work, to st approximately $40,000.

Upson-Walton Co., Cleveland, informs The Iron Age that recent news item listed this company as a manufacturer wire rope, cables, etc., whereas its wire rope mill was ld some years ago to American Cable Co. Upson-Walton . now specializes in ship chandlery and allied articles.

Glen L. Martin Co., Cleveland, manufacturer of airplanes, ll move its plant to Baltimore, Md., where new works will placed in operation early next year. Cleveland plant will ntinue in operation until June, 1929. Entire output at esent is being taken by United States Navy Department d removal is due to fact that this department insisted on cation of plant at some point on Eastern coast.

Statement in these columns Feb. 2 that Variety Machine Stamping Co., 3404 Tate Avenue, Cleveland, is building ant was in error; it will be built in spring. Company has rchased No. 7 Bliss press with tonnage blow of 245 tons ich will take 54-in. stampings.

Gulf States

Birmingham, Feb. 13.

BOUT 15 acres has been leased by Alabama, Tennessee & Northern Railroad Co., Mobile, Ala., for a local terminal rd, locomotive shop, freight buildings, etc., to cost about 00,000. Project will include an engine house, with repair cilities, turntable, coal-loading and handling equipment. . Troxey is chief engineer.

Seaboard Coal Mining Co., 25 Broad Street, New York, s plans for a coal terminal on site of former plant of abama Drydock & Shipbuilding Co., Mobile, Ala., with ading, conveying and other mechanical handling equipment, cost $150,000.

Southern Ice & Utilities Co., Odessa, Tex., will soon begin nstruction of a one-story ice-manufacturing plant, to cost 0,000 with equipment.

Peden Iron & Steel Co., Houston, Tex., has foundations der way for a one-story unit, 125 x 130 ft., for production column spirals, bar-bending and kindred steel and iron rvice, to cost more than $85,000 with equipment. Travel- crane, hoists, bar-bending and other equipment will be stalled.

West Texas Utilities Co., Dallas, Tex., is considering re- ilding portion of its power house and ice-manufacturing ant at Memphis, Tex., recently destroyed by fire, with loss $40,000 with equipment.

Alabama Water Service Co., Birmingham, is planning rchase of two 200-kva. electric generators with auxiliary uipment, for power station of Dallas Electric Co., Dallas, ., a subsidiary.

Corpus Christi Boiler, Welding & Machine Works, Inc., Carrizo Street, Corpus Christi, Tex., has awarded general contract to E. L. Darby Construction Co., Chaddick Building, for one-story plant, 55 x 150 ft., to cost about $30,000 with equipment. A 5-ton traveling crane will be installed.

Atlas Mfg. Co., Orlando, Fla., is considering installation of equipment for manufacture of tin cans, and is desirous of securing information regarding cost, etc.

Transcontinental Oil Co., Waggoner Building, Fort Worth, Tex., is reported planning construction of an oil refinery at Port Arthur, Tex., to cost upward of $175,000 with equipment.

Rice Mfg. & Distributing Co., Gulfport, Miss., R. L. Rice, president, has leased a building on Windham Avenue, Laurel, Miss., and will remodel for manufacture of safety automobile lighting equipment, control apparatus, etc.

Planters' & Shippers' Compress Co., Corpus Christi, Tex., has acquired about 80 acres on waterfront and plans construction of one-story cotton compress, with total floor space of about 400,000 sq. ft. Installation will include two high density compress units, monorail conveyor system and other mechanical equipment. Entire project will cost more than $900,000 with machinery. E. A. Parry is industrial engineer, in charge.

Cree & Co., Cross Plains, Tex., operating a mechanical works, are considering erection of a one-story machine and forge shop at Coleman, Tex., to cost about $18,000.

Philadelphia

Philadelphia, Feb. 13.

Plans have been filed by Sterling Motor Truck Co., Forty-eighth and Chestnut Streets, Philadelphia, for a one-story service, repair and sales branch, 182 x 220 ft., to cost in excess of $85,000 with equipment. Clarence E. Wunder, 1520 Locust Street, is architect.

Francis J. MacDonald, president Philadelphia Ship Repair Co., Mifflin Street Wharf, Philadelphia, has concluded arrangements for purchase of ship repair yard and drydocks of William Cramp & Sons Ship & Engine Building Co., in Kensington district. Last noted company discontinued operations there several months ago. Sale does not include machine shops and foundries, this group having been taken over by Cramp-Morris Industrials, Inc., recently organized to manufacture hydraulic and electric power equipment, etc.

Pennsylvania Salt Mfg. Co., Widener Building, Philadelphia, has filed plans for a power house addition, to cost approximately $50,000 with equipment.

Pennsylvania Water & Power Co., Holtwood, Pa., will soon ask bids for construction of a new hydroelectric generating plant on the Susquehanna River, about nine miles from present station, to cost in excess of $20,000,000 with transmission lines. Company is affiliated with Consolidated Gas, Electric Light & Power Co., Baltimore, which will use bulk of new capacity.

Locust Construction Co., Sixth and Locust Streets, Philadelphia, is considering erection of a three-story automobile service, repair and garage building, to cost approximately $150,000 with equipment.

Riley Milk & Ice Co., Pitman, N. J., plans for addition to its cold storage and refrigerating plant, to cost $100,000 with machinery.

Crescent Insulated Wire Co., Trenton, N. J., has awarded general contract to Karno-Smith Co., Inc., Broad Street Bank Building, for one-story addition, estimated to cost $15,000.

Bids will be received by Bureau of Supplies and Accounts, Navy Department, Washington, until Feb. 21 for metal propeller blades, propeller hubs and propeller hub sleeves for Philadelphia Navy Yard, and for yards at Lakehurst, N. J.; San Diego, Santa Monica and Mare Island, Cal., schedule 8458; until Feb. 28 for lighting and power cable for Philadelphia Yard, schedule 8487.

American Gas & Electric Co., 30 Church Street, New York, has secured property near Pennsville, N. J., as site for steam-operated electric generating plant to be built and operated by its subsidiary, American Electric Power Co., same address. Initial station will have a capacity of 100,000 kw. Steel tower transmission lines will be built. Entire project is reported to cost more than $7,000,000. Stevens & Wood, Inc., 120 Broadway, New York, is engineer.

Board of Education, Lawrenceville, N. J., plans installation of manual training equipment in two-story junior high school, to cost $300,000, for which plans will be drawn by P. L. Fowler Co., 224 East Hanover Street, Trenton, N. J., architect.

Lehigh Portland Cement Co., Allentown, Pa., has arranged for preferred stock issue to total close to $1,000,000, a portion of fund to be used for expansion.

C. H. Bonner, Crafton, Pa., and associates, have organized Latrobe Paperboard Co., to operate a mill at Latrobe, Pa., for manufacture of paperboard, corrugated paper products, etc. Mr. Bonner will be treasurer; N. J. Wallace, Oakdale, Pa., will be an official.

Hamilton Watch Co., Lancaster, Pa., is disposing of a preferred stock issue of $4,800,000, a portion of proceeds to be used for expansion, including acquisition of plant and business of Illinois Watch Co., Springfield, Ill. Both plants will be continued in service.

Bureau of Water, Department of Public Works, City Hall, Philadelphia, is asking bids until Feb. 21 for a sand-washing machine, contract 913; also for pig lead, contract 910; and for furnishing and installing chlorinators, contract 912. Alexander Murdock is director.

Pittsburgh

PITTSBURGH, Feb. 13.

THE machine-tool market is showing a good degree of activity and while individual sales, in most cases, are for single tools, they are numerous enough to make a very satisfactory total. Most of the orders are against inquiries that have been up for some time, but there is a fair sprinkling of awards against recent requests for prices. New inquiry is moderate, but dealers are uncovering some requirements by personal solicitation.

Officials of Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, and duPont Viscoloid Co., 330 Fifth Avenue, New York, have formed Pittsburgh Safety Glass Co., capitalized at $1,000,000, to manufacture laminated shatterproof glass under trade name Duplate. Plans are under way for new plant at Creighton, Pa., near site of present works of Pittsburgh Plate Glass Co., to cost more than $1,000,000 with machinery. B. P. Davis, Jr., of duPont Viscoloid Co., which is a subsidiary of E. I. duPont de Nemours & Co., Wilmington, Del., will be chairman of board of new organization; H. S. Wherrett, vice-president of Pittsburgh Plate Glass Co., will be president.

Dravo Contracting Co., Neville Island, Pittsburgh, operating a boat-building and repair yard for steel barges, etc., has completed plans for a one-story addition, 125 x 200 ft., to cost in excess of $85,000 with equipment.

Linde Air Products Co., 30 East Forty-second Street, New York, is said to have plans for a one-story works, 80 x 120 ft., at Erie, Pa., to cost in excess of $125,000 with equipment.

Fostoria Glass Co., Moundsville, W. Va., has awarded general contract to R. R. Kitchen Co., 37 Nineteenth Street, Wheeling, W. Va., for a two and three-story addition, 75 x 260 ft., for furnace division, lehrs and other equipment to cost in excess of $100,000 with machinery.

Erie Foundry Co., Erie, Pa., maker of forge shop equipment, has removed its Detroit office to 335 Curtiss Building, West Grand Boulevard and Hamilton Avenue. R. B. McDonald is in charge.

Packard Motor Car Co. of Pittsburgh, 4709 Baum Boulevard, has filed plans for a one-story service, repair and parts building at 4710 Maripoe Street, estimated to cost $75,000.

Detroit

DETROIT, Feb. 13.

BIDS are being asked by Packard Motor Car Co., 1580 East Grand Boulevard, Detroit, until Feb. 27, for a one-story addition on Bellevue Avenue, to be equipped for metal stamping service, reported to cost in excess of $100,000, with machinery. Albert Kahn, Inc., Marquette Building, is architect and engineer.

National Gas & Electric Corporation, Battle Creek, Mich., has concluded negotiations for purchase of electric light and power properties of Central States Utilities Co., at Monroe, Grand Haven and Coldwater, Mich., and will consolidate with its other properties in the State. Plans are under way for extensions and betterments, including transmission line construction.

Consumers' Power Co., Jackson, Mich., is planning the early installation of a meter repair and reconditioning shop at its local gas-generating plant, reported to cost in excess of $40,000 with equipment; a new addition will be constructed for mechanical fan boosters and governor equipment. Plans are under way for expansion in other districts of the State, including large outdoor electric power substation at Alma, to cost more than $100,000; new transmission line from Belding to Orleans, Mich.; and extensions and betterments of plant and system of Gardiner Light Co., Stanton and Langston, Mich., recently acquired, including transmission line construction.

Advance Pattern & Production Co., 3024 West Fort Stree Detroit, manufacturer of metal patterns and mechanica equipment, has plans under way for a one-story addition o Temple Street, to cost approximately $25,000, with equipmen O'Dell & Diehl, Donovan Building, are architects. E. Ritter is secretary and treasurer.

Superior Foundry Corporation, Grand Rapids, Mich., ha awarded general contract to I. K. Parsons & Son, Gran Rapids, for a one and two-story foundry, 75 x 175 ft., t cost approximately $100,000 with equipment. Wernette McCarthy, Houseman Building, are architects.

Universal Magnesite Products Co., Escanaba, Mich., considering a new one-story addition to cost close to $20,00 with equipment. Work will begin in the spring.

St. Joseph Paper & Board Co., St. Joseph, Mich., plan rebuilding portion of its mill recently destroyed by fir with loss reported more than $200,000 with equipment.

C. S. Klein, Detroit Saving Bank Building, Detroit, arch tect, has plans under way for a one-story ice-manufacturin plant, 50 x 175 ft., for company whose name is temporaril withheld, to cost about $100,000 with machinery.

South Atlantic States

BALTIMORE, Feb. 13.

BIDS will be asked on general contract before close month by C. Hoffberger & Co., 530-40 East Monumen Street, Baltimore, operating ice and cold storage plant for an 11-story cold storage and refrigerating plant add tion to cost approximately $900,000 with machinery. Joh H. Wickersham, Appel Building, Lancaster, Pa., is enginee

Board of Commissioners, District Building, Washingto is asking bids until Feb. 23 for four air compressors, pavin breakers and accessory mechanical equipment for highwa department; on Feb. 24 for four concrete mixers for high way department; and until Feb. 28 for one horizonta centrifugal motor-driven air compressor complete, for pow plant in District Building.

Blue Ridge Talc Co., Henry, Va., is considering rebuildin portion of plant destroyed by fire Feb. 6, with loss in exce of $80,000 with machinery. Same fire also destroyed work of Community Electric Co., on neighboring site, with los approximating $75,000. This plant, also, will be rebuilt.

Claude Neon Lights of Maryland, Inc., Baltimore, ca of Industrial Management Corporation, 12 Clay Street, en gineer, has plans for establishment of a local plant fo production of sheet metal signs, equipped with special Neo lighting devices.

Chesapeake Paper Board Co., Key Highway and line Baltimore & Ohio Railroad, Baltimore, will take bids in abou 30 days for one-story addition, including improvements present mill, to cost about $80,000 with machinery.

George A. Mahone, 7 St. Paul Street, Baltimore, is head of project to construct an automobile service, repair ar garage building on site of Preston Gardens, remodelin portion of existing structures, to cost in excess of $500,00

Industrial Electric & Machine Co., 507 East Russell Stree High Point, N. C., has awarded general contract to R. Cottam, Perry Street, for a one-story addition, 30 x 132 f to cost about $45,000 with equipment. Traveling crane wi be installed.

Mill Devices Co., Gastonia, N. C., A. B. Carter, hea manufacturer of textile mill equipment, plans constructio of a new factory for manufacture of gears, nuts, bolts an kindred products, to cost more than $80,000 with machiner

Bureau of Supplies and Accounts, Navy Departmen Washington, is asking bids until Feb. 21 for wire cloth fo Eastern and Western navy yards, schedule 8445; also fo pumping machinery and spare parts for Norfolk, Washingto and Philadelphia yards, schedule 8460; until Feb. 28 for on turret lathe for San Diego yard, schedule 8469; until Fe 28 for one pipe and nipple-threading machine, one flexib hand-block belt sander and one rotary slitting shear fo Mare Island yard, schedule 8473; until Feb. 21 for tw Diesel engines, two oil pumps, one windlass, one bilge pum one air compressor and one air tank for Charleston Nav Yard, schedule 8497.

Stanley Milling Co., Stanley, Va., is considering rebuild ing portion of plant recently destroyed by fire, with loss excess of $100,000 with machinery.

Ferguson Gear Works, Inc., Gastonia, N. C., is said to contemplating a new one-story plant to cost more tha $25,000 with equipment.

Enfield-Norfleet Co., Charlotte, N. C., automobile deale has plans for a two-story service, repair and garage build ing, totaling about 25,000 sq. ft. of floor space, to cost mor than $100,000 with equipment. Lockwood, Greene & Co Charlotte, are architects and engineers.

The Crane Market

GOOD inquiry for cranes is developing in the New York, New England and Pittsburgh districts, but purchasers are low in placing orders. In addition to a good volume of nquiry for single locomotive cranes, the Amtorg Trading orporation, 165 Broadway, New York, is reported to be sking prices on nine 40-ton locomotive cranes for the nieper River electric project in Russia. As the buyer is nterested in securing kerosene motor driven cranes, it is elieved that European competition for the business will be evere. In the field of overhead cranes F. L. Smidth & Co., 0 Church Street, New York, are inquiring for a 25-ton, 22-ft. pan crane, either hand operated or one motor, 80-ft. lift. he Western Electric Co., New York, has not yet closed on 25-ton locomotive crane. The Gulf Refining Co., Bayonne, . J., is inquiring for a ½-ton, 18-ft. span, underhung hand ower crane.

In the Pittsburgh district it is expected that the Wheeling teel Corporation will soon close for several mill type cranes or Steubenville, Ohio. Cranes will be required in plant hanges, the Carnegie Steel Co. is planning for its Homestead orks and in the open-hearth project at its Mingo, Ohio orks. The Pittsburgh Safety Glass Co., which will build plant at Creighton, Pa., for the manufacture of non-shattering glass, is expected to be in the market for overhead cranes.

Among recent purchases are:

Union Bag & Paper Corporation, 233 Broadway, New York, 25-ton locomotive crane for Tacoma, Wash., from Industrial-Brownhoist Corporation.

Certain-Teed Products Corporation, 100 East Forty-second Street, New York, 10-ton crawl-tread locomotive crane from unnamed builder.

American Smelting & Refining Co., 120 Broadway, New York, 2-cu. yd. 97-ft. span bucket crane from Western builder.

Vermont Foundry Co., Windsor, Vt., used 5-ton overhead traveling crane from unnamed seller.

Stahleker Steel Corporation, Boston, 2-ton electric traveling crane for its Cambridge plant, from unnamed builder.

New England Public Service Co., Augusta, Me., 40-ton, 28-ft. span hand power crane with two 20-ton trolleys from Whiting Corporation.

United Electric Railway Co., Providence, R. I., two 1½-ton electric hoists from Chisholm-Moore Mfg. Co. and two 4-ton electric hoists from Shepard Electric Crane & Hoist Co.

Buffalo

BUFFALO, Feb. 13.

ARRANGEMENTS have been made by Metalace Corporation, 373 Seventh Street, Buffalo, recently organized, for referred stock issue of $250,000, majority of proceeds to be sed for expansion and development. Company will speciale in a line of enameled metal products and proposes to add list of products.

Ewart C. Hugh, head of Hugh Co., 190 Elk Street, Buffalo, anufacturer of sheet metal goods, is at head of a project construct and operate a local plant for manufacture of etal alloy boats, with base of aluminum. Company will be rmed to be known as Metal Alloy Boat Co., and initial lant unit will be erected on site adjoining works of Hugh o. Others interested in new company include H. L. Chisolm, Jr., W. P. Wells and J. T. Snyder.

H. J. Heinz Co., 1062 Progress Street, Northside, Pittsurgh, canned food products, has filed plans for a new facry branch and distributing plant at 145 Marion Street, uffalo, to cost $50,000.

Rochester Gas & Electric Corporation, Rochester, N. Y., as applied for permission to extend its transmission lines Monroe and Ontario Counties, including power substation cilities. Company will also make extensions in gas system, cluding pipe line construction.

Board of Education, Gloversville, N. Y., contemplates inallation of manual training equipment in addition to high hool to cost $350,000. W. Brown Van Dreser, 31 West ulton Street, is architect.

Curtiss Aeroplane & Motor Co., 74 Kail Street, Buffalo, as taken out a permit for a one-story addition to cost close $20,000.

Indiana

INDIANAPOLIS, Feb. 13.

CONTRACT has been let by Bishop, Knowlton & Carson, 312 North Meridian Street, Indianapolis, architects, to rown-Mack, Inc., 226 East Michigan Avenue, for a threeory and basement automobile service, repair and garage ilding, 100 x 165 ft., at 1452 North Pennsylvania Street, ported to cost close to $200,000 with equipment.

Standard Plating Works, Goshen, Ind., has broken ground r a one-story addition, reported to cost in excess of $16,000 ith equipment.

McCord Radiator & Mfg. Co., Plymouth, Ind., headarters at Chicago, manufacturer of automobile radiators d radiator cores, gaskets, etc., has arranged for a bond sue of $2,500,000, a portion to be used for expansion in ants and facilities. A. C. McCord is president.

Board of Education, Evansville, Ind., contemplates the stallation of manual training equipment in proposed twoory and basement grade and high school at Lincoln and cCormack Avenues, estimated to cost $300,000, for which ds have been asked on general contract. Fowler & Karges, urniture Building, are architects.

Craftsman Tool Co., Marion, Ind., has plans for a new e-story plant, estimated to cost close to $45,000 with uipment.

Pierce Governor Co., Anderson, Ind., manufacturer of speed control equipment for internal combustion engines, is arranging for the sale of a stock issue of 60,000 shares, a portion to be used for expansion in manufacture.

Chicago

CHICAGO, Feb. 13.

ALTHOUGH this market is showing a fair degree of activity, the lack of large lists and the effort necessary to follow up small business is keenly felt. Sales the past week were smaller in volume, but inquiry enlarged by the Santa Fe list is promising. The St. Paul is in the market for a 16-in. x 8-ft. lathe. A pipe manufacturer at Milwaukee is erecting an addition and may require some new machinery in the spring. Deliveries are satisfactory. There has been a fair movement in used machinery. It is reported that price advances are being considered on several lines of machine tools.

Crowe Name Plate & Mfg. Co., 1749 Grace Street, Chicago, manufacturer of metal name plates, etc., is said to be planning a one-story addition to cost more than $23,000 with equipment.

Container Corporation of America, Inc., 111 West Washington Street, Chicago, manufacturer of solid fiber containers, corrugated board specialties, etc., has arranged for stock issue to total $3,330,000, a portion of proceeds to be used for expansion.

Great Northern Utilities Co., Shelby, Mont., is completing plans for a new power house with gas engine units using natural gas, generators, and auxiliary equipment, to cost in excess of $250,000 including transmission line construction. A. H. Sikes is manager.

Dayton Co., Eighth Street and Nicollet Avenue, Minneapolis, Minn., has plans for a four-story, basement and subbasement addition to its automobile service, repair and garage building, to cost more than $300,000. Long & Thorshov, Andrus Building, are architects.

Eagle Furniture Co., 1828 South Fourth Street, Rockford, Ill., has work under way on a three-story and basement factory addition, 60 x 60 ft., to cost upward of $85,000 with equipment. Peterson & Johnson, Swedish-American Bank Building, are architects.

Joseph W. McCarthy, 139 North Clark Street, Chicago, architect, has been selected by Holy Name Trade School, care of William Hoffman, 721 Cass Street, to prepare plans for a boys' trade and vocational school at Lockport, Ill., to cost in excess of $100,000 with equipment.

Minnesota Power & Light Co., West Superior Street, Duluth, Minn., has taken over former plant of Deetz Sheet Metal Works, 104 Garfield Avenue, and will remodel for a new equipment storage and distributing plant to cost $110,000. Charles C. Olsen is engineer.

Carney Co., Mankato, Minn., has begun rebuilding portion of its local cement mill, recently destroyed by fire, to cost $125,000 with equipment. George Pass & Son, Eckle Building, are architects.

Hinde & Dauch Paper Co., Sandusky, Ohio, manufacturer of corrugated fiber containers, corrugated paper goods, etc., has plans for a one-story unit at Sullivan, Ill., to cost more than $90,000 with machinery.

City Council, Emmetsburg, Iowa, is considering installation of a municipal electric light and power plant to cost upward of $30,000 with equipment.

Board of Education, Storm Lake, Iowa, is considering installation of manual training equipment in two-story high school to cost $175,000, for which plans are being prepared by Keffer & Jones, Masonic Building, Des Moines, Iowa, architects.

M. A. Erickson, head of Rugby Light & Power Co., Rugby, N. D., is planning construction of a new steam-operated electric power house at Kenmare, N. D., to cost about $75,000 with equipment.

Iowa Railway & Light Co., Cedar Rapids, Iowa, will make extensions in its power plant at Nevada, Iowa, including installation of additional equipment, to cost $35,000.

Cedar Rapids Engineering Co., Cedar Rapids, Iowa, will build a shop addition, 60 x 100 ft. O. F. Paulson Construction Co. is general contractor.

Hutchins Co., Inc., 410 Phoenix Building, Minneapolis, has been organized to manufacture D. K. pressure lubricator, patented device with meter for dispensing grease in transmissions and differentials of automobiles. Company has assembly plant, but is in market for tanks, fittings, etc.

Cincinnati

CINCINNATI, Feb. 13.

DESPITE a falling off of fresh orders for machine tools the past week, sales the first six weeks of 1928 show an increase of approximately 20 per cent over the corresponding period last year. The amount of pending business which should be placed in the next 60 days is the basis for the prediction that this margin over 1927 will be maintained throughout the first quarter. The improvement, however, has by no means been well distributed among machine tool companies. Some builders have profited recently by an impressive volume of orders, while others have obtained only a meager supply. This condition has resulted in spottiness, so far as operations of local plants are concerned.

The St. Louis-San Francisco Railway Co. is inquiring for 21 tools, bids for which close on Feb. 20. Action on the Santa Fe list is expected this month. Automobile companies are making a fair number of purchases and will be heavy buyers in the near future. A local builder has sold eight 18-in. engine lathes for shipment to the Pacific Coast.

St. Louis-San Francisco Tool List

The following motor-driven tools are for 440-volt, 3 phase, 60 cycle current. Bids will be received by B. T. Wood, vice-president and chief purchasing officer, St. Louis, until Feb. 20.

One traverse gaining machine.
One model F. G. Micro internal grinder with two sets of grinding wheels.
One Niles combination journal turning and axle lathe.
One No. 2 Williams crusher and pulverizer.
One 90-in. Putnam heavy duty driving wheel lathe.
One No. 220 Jarecki pipe threading machine.
One metal band saw with six extra blades.
One Niles 96-in. 600-ton driving wheel press.
One Warner & Swasey No. 4-A hollow hexagon turret lathe with 25-in. swing.
Two wood-boring motors, similar to Independent Pneumatic Tool Co.'s No. 62.
One Pels punch and shear with 30-in. throat.

The following equipment also will be purchased:

One 100-ton spring testing machine.
Three Cyclone 5-ton high-speed chain hoists.
One 24-in. heavy-pattern American crank shaper.
One Leeds-Northrup recording pyrometer and temperature control for 6-ft. x 40-ft. car type heat treating and annealing furnace.
Two Model 5021-A automatic temperature controllers of thermocouple type.
One 3000-lb. Baker electric truck.

Plans are under consideration by Peters Cartridge Co., First National Bank Building, Cincinnati, for a new three-story plant at Kings Mills, Ohio, to cost more than $60,000 with equipment. Van Leyen, Schilling, Keough & Reynolds, 3440 Cass Avenue, Detroit, architects.

Tennessee Box Co., Johnson City, Tenn., manufacturer of wooden boxes and containers, has acquired former plant of Von Cannon Lumber Co., and will remodel to double capacity of present mill.

Shelby Electric Co., 392 South Main Street, Memphis, Tenn., manufacturer of electrical specialties, has awarded general contract to F. J. Ozanne & Co., Empire Building, for new one-story plant, to cost close to $45,000 with equipment. E. L. Harrison, Fidelity Bank Building, is architect.

P. J. Bradshaw, International Life Building, St. Louis, architect, has plans for a four-story motor bus service, repair and terminal building, 200 x 300 ft., at Louisville, to cost $350,000 with equipment. J. Graham Brown, Fourth Street and Broadway, Louisville, is head of project.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until Feb. 24 for 100 wheel assemblies, circular 221; until Feb. 23 for 20,000 ft. high tension ignition cable, circular 222; until Feb. 23 for 50 pilot director assemblies, circular 223; and until Feb. 27 for 30,305 lb. sheet iron and 41,500 lb. cold rolled steel, circular 226.

United States Foil Co., Thirtieth Street and Grand Avenue, Louisville, is having plans prepared for three-story brick and steel office, manufacturing and warehouse buildings at Hale and Grand Avenues. Ossian P. Ward, Louisville, is architect.

J. F. Kurfees Paint Co., 201 East Market Street, Louisville, has completed plans for four-story addition, of concrete slab construction with brick curtain walls. Joseph & Joseph, Louisville, are architects.

F. J. Ozanne & Co., Memphis, Tenn., have been awarded contract for erection of factory and sales building for Shelby Electric Co., at Iowa and Main Streets, Memphis. It will be of saw tooth design and will be completed within three months.

Pacific Coast

SAN FRANCISCO, Feb. 8.

PLANS are being arranged by Pacific Coast Steel Co., Rialto Building, San Francisco, for a new unit at its plant at South San Francisco, to be equipped for the manufacture of bolts, nuts, rivets, etc. Appropriation of $500,000 has been approved.

Department of Water and Power, 207 South Broadway, Los Angeles, has filed plans for a two-story and basement power substation, 75 x 103 ft., at 5736 South Figueroa Street, reported to cost $110,000, with machinery. E. F. Scattergood is chief engineer.

Coast Machinery Co., Los Angeles, has leased a one-story factory to be constructed by Austin Co. of California, 777 East Washington Street, on Merrill Avenue, estimated to cost $100,000. Present works will be removed to new location and capacity increased.

Benbow Power Co., Benbow, Cal., recently organized, has made application for permission to construct and operate a hydroelectric power plant on the South Fork of Eel River, to be used for mining and other service, reported to cost in excess of $200,000, with transmission lines.

Pacific Gas & Electric Co., San Francisco, is disposing of a bond issue of $20,000,000, a portion of fund to be used for expansion and improvements, including transmission line and other construction.

Pacific Fruit Express Co., 65 Market Street, San Francisco, is reported planning a car repair and reconditioning works at Tucson, Ariz., where site was recently acquired, for refrigerator car service, to cost more than $200,000, with equipment. Company is a subsidiary of Southern Pacific Co.

Northwest Power & Light Co., Port Angeles, Wash., has made application for permission to use water from Elwha River for a proposed hydroelectric power development, with initial plant to have capacity of 22,000 hp., reported to cost in excess of $1,000,000, with transmission lines.

Armijo High School District, Fairfield (Solano County), Cal., has plans under way for a one-story machine shop and manual training unit at its group school, reported to cost about $35,000, with equipment.

Mullenbach Electrical Mfg. Co., 116 East Sixteenth Street, Los Angeles, has been organized to manufacture switchboards, panel boards, cabinets and electrical control distribution apparatus. Plant is completed and in operation.

Work has been started on construction of large machine shops for Southern Pacific Railroad at Eugene, Ore., estimated cost $250,000. H. E. Wilder, contractor, Eugene, has the contract.

Montgomery Mfg. Co., is building new plant on West Spokane Street, Seattle, for manufacture of disk wheels for automobiles.

Winner Tool Co., Puyallup, Wash., has increased capital stock from $50,000 to $100,000, and will make some additions to plant.

Ballard Drop Forge Co., Seattle, has taken over agency for State of Washington for Williams form and column clamp, made by Hawley Mfg. Co., Chicago.

Foreign

PLANS are being arranged by Government Wood Chemical Trust, Soviet Russian Government, Moscow, for a new turpentine and resin plant at Barnaoul, Siberia, reported to cost in excess of $400,000. During next 36 months same interests propose to build five similar plants at various points in Siberia. American-Russian Chamber of Commerce, 143 West Fifty-seventh Street, New York, has information regarding the project.

A canning company at Goteborg, Sweden, has plans under way for construction of a new five-story factory. Machinery to be purchased will include separating equipment, refrigerating machinery, sterilizing and exhausting equipment, can-making machinery, etc. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Sweden No. 267053; also at American Consulate, Goteborg, H. C. von Struve, consul.

Nippon Electric Power Co., Ltd., Tokyo, Japan, has arranged for sale of $9,000,000 bond issue in United States, portion of proceeds to be used for extensions and improvements, including power plant and transmission line construction. Company has work under way on a steam-turbo electric generating plant with a capacity of 40,000 kw. Yoshizo Ikeo is vice-president.

A company at Perth, Australia, has plans for a new local plant for production of fending and barbed wire. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Australia No. 60014; also at American Consulate, Sydney, Australia, Charles F. Baldwin, assistant trade commissioner.

London & North Eastern Railway Co., London, England, is arranging early construction of a freight classification yard at Cambridgeshire, including sorting classification facilities for more than 3600 cars, hydraulic retarders, repair and reconditioning facilities, etc. Entire project is estimated to cost close to $1,500,000. Information at office of American Consulate, London, William L. Cooper, commercial attaché.

Bwana M'Kubwa Copper Mining Co., Ltd., Capetown, South Africa, operated by Anglo-American Corporation of South Africa, Ltd., same address, has arranged for increase in capital to £3,500,000. A new bond issue of £1,000,000 (about $4,800,000) is being arranged, portion of proceeds to be used for installation of an additional plant at Bwana M'Kubwa mining properties.

H. C. Atkins Mfg. Co., 2318 Randolph Street, St. Louis, has appointed following agents: H. Romeyn Smith, Inc., 12 Lispenard Street, New York, in metropolitan New York; Leon Commerford, Washington, in Middle Atlantic States; Southern States Sales Co., Albany, Ga., in Southeastern States, and Brown & Brady, San Francisco and Los Angeles, on Pacific Coast.

Canada

TORONTO, Feb. 13.

MACHINE tool sales the past week were augmented by several lists from Canadian industrial companies which are building additions to plants or have new works under construction. The Canadian National Railways have closed on a machine for polishing and finishing tubes; 14-ft. radius jib crane; emery wheel stand; 48-in. Bertram carwheel borer, with Davis carwheel boring tool; several air compressors; 8½-in. Westinghouse compressor and an automatic valve grinder. Other lists are appearing and a volume of business is pending.

While Canadian dealers and builders are securing a large portion of the machine tool business, a considerable number of current orders is also going to the United States. During the month of November Canadian industrial companies imported from the United States tools and machinery valued at more than $520,000. It is understood that the bulk of this demand is for equipment that is not produced here, and must of necessity go to the United States.

Alan Campbell and associates have purchased building, machinery, stock, etc., of Canadian Radiant Electric Co., Grimsby, Ont., and will remove equipment to Bowmanville, Ont., where it will be installed in plant of Bowmanville Foundry Co. Company will operate under name of Canadian Radiant Co. Officers include Alan Campbell, president; C. E. Rehder, vice-president; directors, Peter Campbell, P. A. Thompson, Montreal, and Arthur Campbell, Montreal.

Armstrong, Siddeley Motors, Ltd., operating in association with Ottawa Car Mfg. Co., Ottawa, Ont., has completed arrangements for manufacture of aero engines.

Modern Tool & Die Works, Essex, Ont., contemplates erection of an addition.

London Airports, Ltd., London, Ont., will call for bids about March 1 for construction of two steel hangars, 40 x 40 ft. Machine shops will be erected later.

Ratepayers of Collingwood, Ont., carried a by-law authorizing construction of a grain elevator to cost $800,000, by Collingwood Elevator Co. Building will be of reinforced concrete and have capacity of 2,000,000 bu. C. D. Howe & Co., 704 Whalen Building, Port Arthur, Ont., are engineers.

Crown Cork & Seal Co., Ltd., 87 Parliament Street, Toronto, has secured new site and will erect a one-story factory, 120 x 200 ft., to cost $100,000. Wells & Gray, Confederation Life Building, Toronto, have been awarded general contract.

I.T.S. Rubber Co. of Canada, Ltd., 30 Alpine Avenue, Toronto, has had plans prepared for erection of a $30,000 addition.

Only One Blast Furnace in Africa

AFRICA has only one blast furnace, but even with this monopoly it has rather hard sledding because the market for the product is so small that the output of the furnace is not fully absorbed. The furnace is at Newcastle, Natal, South Africa, on the main line between Durban and Johannesburg. It furnishes basic pig iron for the Union Steel Corporation of South Africa, Ltd., by which it is owned, and foundry iron is supplied to foundries throughout South Africa. Last year the furnace produced 37,850 tons in the nine months ended Sept. 30, when it was blown out because of overproduction, and it will not be relighted until about the middle of this year. Coke is produced from South African coal, and the ore used is mined in South Africa and runs 40 per cent iron, 6 per cent silicon and 5 per cent carbon. J. K. Eaton is resident director of the furnace property.

E. Thibault, St. Therese, Que., has been awarded contract for erection of a factory, 80 x 150 ft., at Joliette, Que., for C. Muir Rubber Co., Ltd., 437 Bourget Street, Montreal. C. A. Reeves, 83 Craig Street West, Montreal, is architect.

Western Canada

C. D. Howe & Co., Whalen Building, Port Arthur, Ont., and Vancouver, are preparing plans for erection of a grain elevator at foot of St. Andrews Avenue, Vancouver, B. C., to cost $1,000,000 for Randall, Gee & Mitchell, Winnipeg and Vancouver.

Stuart, Cameron & Co., Ltd., Vancouver, B. C., has been awarded contract for construction of a 1,000,000 bu. grain elevator at New Westminster, B. C., for the New Westminster Harbor Commissioners.

NEW TRADE PUBLICATIONS

Automatic Feeds for Punch Presses.—F. J. Littell Machine Co., 4125 Ravenswood Avenue, Chicago. Catalog No. 27, 6 by 8½ in., 48 pages. Several roll feeds and roll feed combinations are described, as well as dial, magazine hopper, pusher, and chute and slider feeds. Pages are also devoted to stock reels and special machines. The feeds are designed for stock ranging in thickness from 0.001 to 1.40 in., and up to 7½ in. wide.

Grinding Wheel Chuck.—Norton Co., Worcester, Mass. Booklet describing the features of the company's chuck for segmental grinding wheels.

Hot Pressing of Brass Parts.—Zeh & Hahnemann Co., 182 Vanderpool Street, Newark, N. J. Four-page bulletin outlining the advantages and method of producing hot pressed brass parts. Information is given on the metals, dies, and machines employed.

Adding Nickel to Cast Iron.—International Nickel Co., 67 Wall Street, New York. Instruction card, showing methods whereby nickel may be alloyed with foundry iron, either in the cupola or in the ladle, and notes on proper mixtures for particular services. A 4-page pamphlet entitled "High Duty Requirements" describes the general effect of nickel in cast iron.

Nitralloy and the Nitriding Process.—Ludlum Steel Co., Watervliet, N. Y. 24-page pamphlet describing properties of aluminum-chromium steels, and the means whereby they may be given an intensely hard, corrosion resisting surface by heating at 875 deg. Fahr. for from 2 to 90 hr. in an atmosphere of ammonia, followed by a slow cooling.

Large Metallographic Equipment.—Bausch & Lomb Optical Co., Rochester, N. Y. Describes metallurgical microscope and camera with permanently aligned optical system. Fine focusing adjustment carries only 4 oz. weight, enabling heaviest specimens to be kept permanently in focus. Shock absorbers also eliminate vibration. Accessories are available for photographing at all magnifications from several thousand down to full size.

Gate Hoists.—D. J. Murray Mfg. Co., Wausau, Wis. Booklet devoted to facilities of company for manufacture of gate hoists for power reservoir and irrigation dams.

Rails and Accessories.—Sweet's Steel Co., Williamsport, Pa. General catalog listing and describing the company's products, which include light steel rails, special plain splice bar sections, heavy steel rails and special rail sections, track bolts and spikes, fabricated portable track, steel mine room ties, light steel angles and miscellaneous products.

Bolts, Nuts, Rivets and Screws.—Pheoll Mfg. Co., 5700 Roosevelt Road, Chicago. General catalog presenting company's standard lines. Included are special machine screws and bolts, cap and set screws, stove bolts and rods, special rivets, machine screw nuts, stove bolt and cap nuts, semi-finished steel and brass nuts, wing nuts, threaded rods, wire and studs, brass washers and metal stampings.

Time Recorders.—Esterline-Angus Co., Indianapolis. Bulletin 1127 containing description and specifications of company's new time recorder.

Ventilating Equipment.—American Blower Corporation, Detroit. Bulletin 3504 devoted to company's type SE steel plate blower. Full specifications are provided.

Low-Temperature Carbonization of Coal.—International Coal Carbonizing Co., 200 Madison Avenue, New York. Catalog KSG-2 of 12 pages is devoted to the KSG process, developed in Germany. Description of the process is given, with a diagram showing the flow of materials and gases through the system. Many elements of the plant are illustrated, while the description covers the pertinent facts.

Unit Heaters.—Buffalo Forge Co., Buffalo. Four-page folder with illustrations, describing a floor-type high-pressure unit designed to recirculate the air in heating a factory building.

Handling Equipment.—Revolvator Co., 336 Garfield Avenue, Jersey City. Bulletin 81 of four pages illustrates many types of handling and loading equipment for warehouses and manufacturing plants. The illustrations show the equipment in use.

Floor Crane.—Manley Mfg. Co., York, Pa. Bulletin of two pages illustrating and describing portable floor cranes of one and two-ton capacity. These are both the gantry and the jib type and are operated by chain block or other manual means.

Aerovane Blowers.—Bayley Blower Co., Milwaukee. Catalog 32 of 34 pages illustrates and describes blowers for forced draft and other purposes, made on the aerovane model. Most of the volume is taken up with dimension and clearance diagrams, and tabular matter related to the capacities of the different sizes of blower included.

Steel Racks.—Lewis-Shepard Co., Watertown, Mass. Folder of four pages devoted to arc-welded steel storage racks, designed to store any size or shape of material. Layouts may be made to suit any requirements.

Lift Trucks.—Lewis-Shepard Co., Watertown, Mass. Folder devoted to a "complete family" of lift trucks, portable elevators, and lift truck platforms. The arc-welded platform is arranged for entrance of the lift truck on all four sides. A power-operated stacker, a jack-lift, and a single stroke lift truck complete the list.

Notes on Machining Alloy Steel.—International Nickel Co., 67 Wall Street, New York. Compares machineability of various alloy steels, as reported from recent investigations. Recommends profile and angle of tool, and cutting speed and feeds best for steels of various tensile strengths.

Electrical Supplies.—Westinghouse Electric & Mfg. Co,. East Pittsburgh. The 1928-1930 catalog, 1200 pages, presents the electrical and mechanical features and application information for all supply apparatus and appliances manufactured by the company. In addition, it describes and illustrates a representative list of large motor and generating apparatus. All equipment obtainable through district offices or agent-jobbers is completely described and illustrated.

—

Calendar.—Committee on Public Relations of Eastern Railroads, New York. Following the style of calendar used for several years, the various days through 1928 are given colors, representing respectively the number of days' revenue necessary to pay for certain of the major expense items of the railroads. The first 151 days are required to pay the year's wages, then 24 days' pay for locomotive fuel, 69 days for materials and supplies, 24 days for all other operating expenses, 22 days for taxes and 40 days for interest and rents. There remain 23 days to pay for dividends and only 13 days to make improvements out of earnings or to make up losses of leaner years.

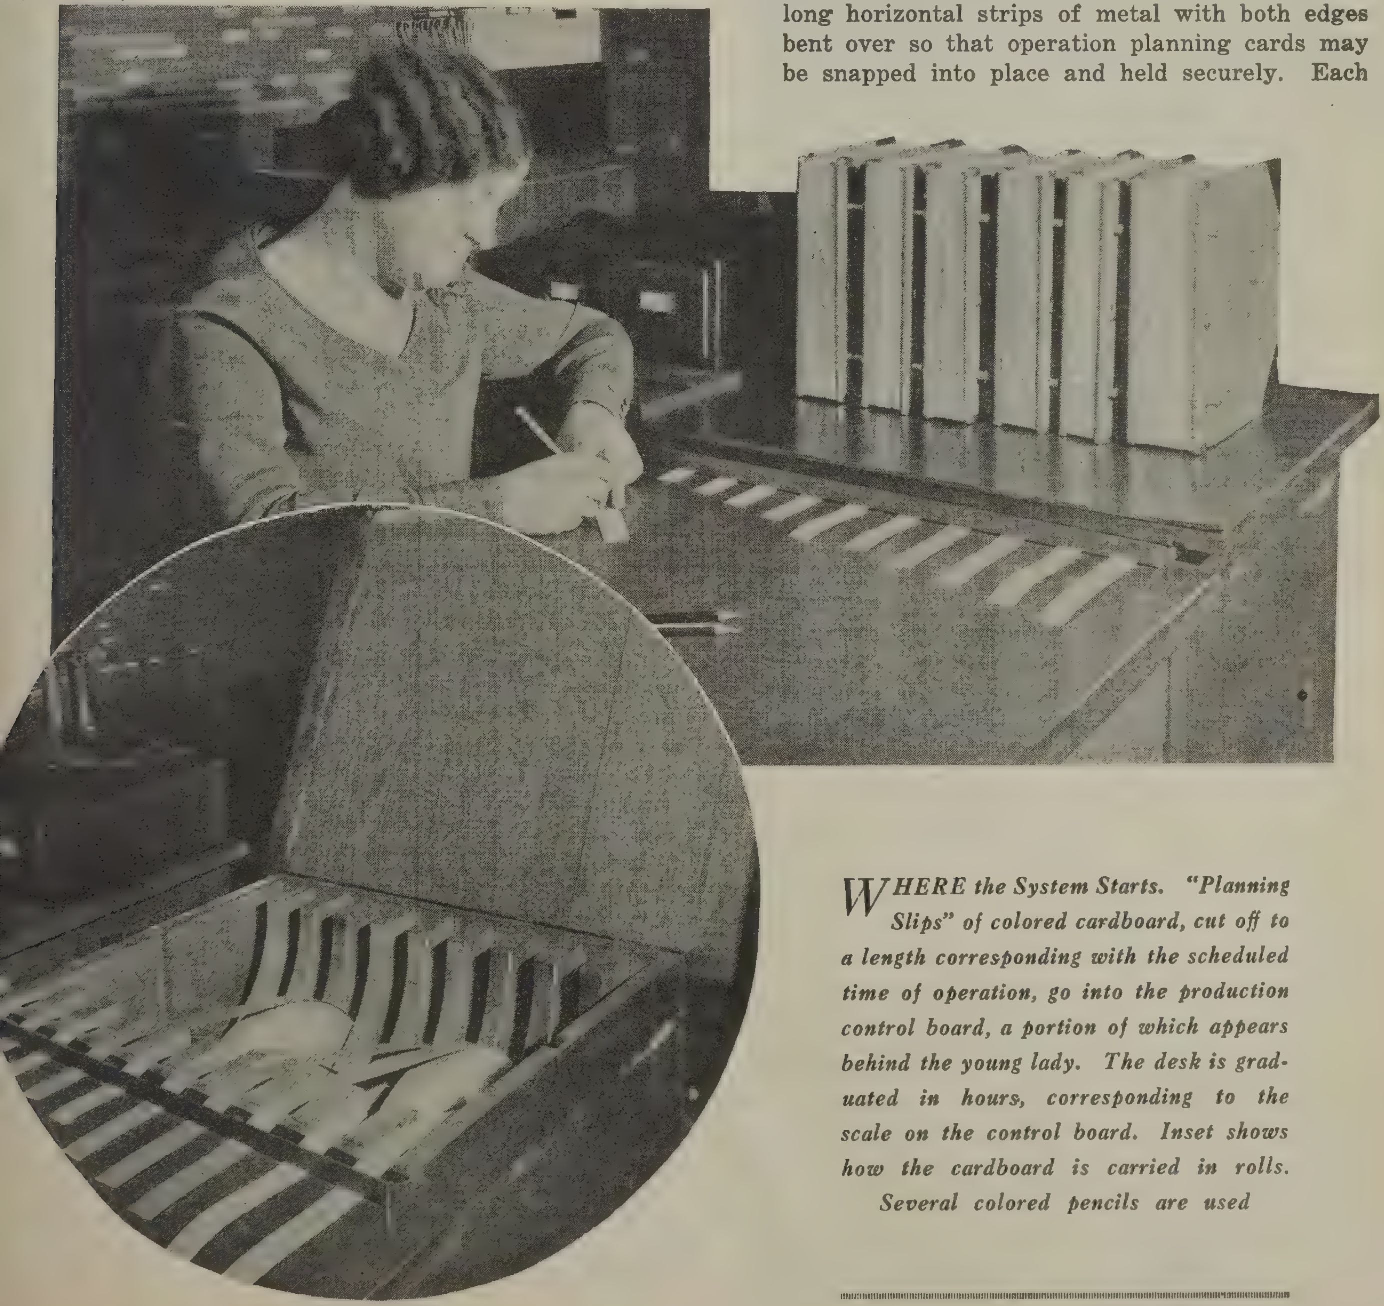
Production Control in Pump Plant

Interlocking System Relieves Foremen of Much Routine "Paper Work"—A Long Look Ahead —Employee Morale Considered

BY SIDNEY G. KOON

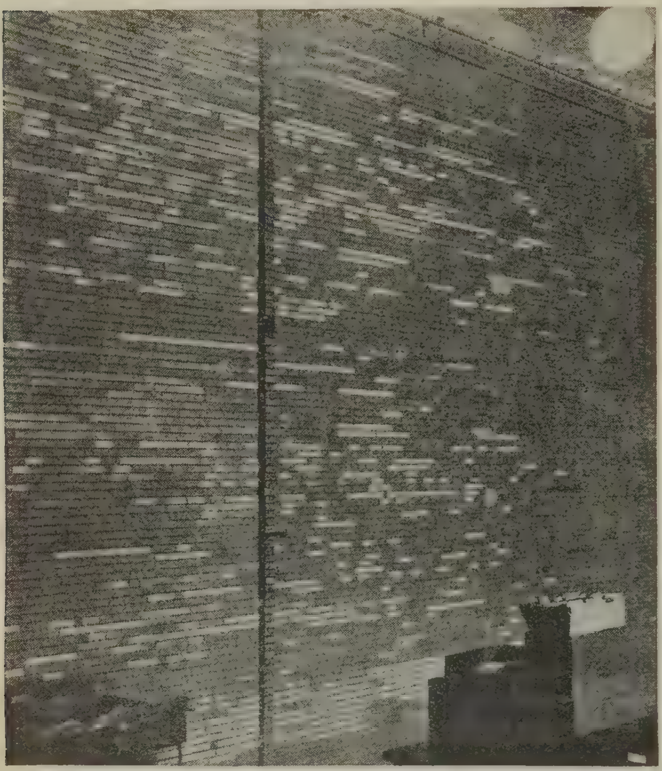
CONTROL of production in the manufacture of a considerable line of pumps of various descriptions is handled by the Nash Engineering Co., South Norwalk, Conn., in a very effective manner. For the most part all production machines in the plant are scheduled for some time in advance, some of the schedules running as far ahead as two months. A visual control board occupies the entire side of a good-sized room and from floor to ceiling. Access to the upper portion is provided by a sliding ladder.

Essentially this board consists of about 110 long horizontal strips of metal with both edges bent over so that operation planning cards may be snapped into place and held securely. Each



WHERE the System Starts. "Planning Slips" of colored cardboard, cut off to a length corresponding with the scheduled time of operation, go into the production control board, a portion of which appears behind the young lady. The desk is graduated in hours, corresponding to the scale on the control board. Inset shows how the cardboard is carried in rolls. Several colored pencils are used strip is about 1¼ in. wide and runs the whole length of the room. A vertical bar of wood, running on rails top and bottom, may be moved from left to right along this board. This forms the synchronizing element, based on the dates carried across at the top of the board. The bar carries on its face the designation of the various machines, one represented by each strip. This same designation or number appears at the end of the board.

Each operation card or *Planning Slip* on the board indicates by its color the type of pump to which it applies. The one shown is canary yellow. The card indicates by its length the estimated total time required for performing the particular operation involved, on the number of pieces designated. It carries on its face the drawing number (D-4141), the lot number (7658L2), the number of pieces to be produced (100), the standard time for each piece (0.06 hr.), the scheduled machine (No. 67), the character of the operation (A-1, meaning ream and cut off), the set-up (15,948) of tools to perform the A-1 operation, and occasionally other information. *B*, in lower right corner, indicates the next destination of the piece, for the next subsequent operation.



AT Left Is a Section of the Production Control Board, Which Fills the Whole Side of the Room. The vertical bar is the synchronizing measure, as explained in the text

As the card designates the total time estimated for the operation, its length corresponds with the product of the number of pieces (100) multiplied by the standard time (0.06 hr.) for each piece. Each card remains on the board until the particular operation it represents is finished, when it is at once removed.

Tool Room an Element in Control

As a part of the system, a control card or *Home Set-Up* in the tool room designates all the operations —facing, drilling, counterboring, etc.—which may be required on a given piece, at a given machine. It lists the tools, jigs and other equipment necessary to perform each operation and gives the drawing number.

Associated with this is the *Set-Up Requisition* card shown, which again designates the number of the set-up, blueprint number, machine number and operation, and tells the day and hour when the set-up will be needed at the machine. In the case shown, the hour is given as 11 a. m., and the card calling for this set-up will normally be sent to the tool room, by the foreman, about 8 a. m.

In the tool room the complete outfit of all the tools, jigs and other tool room equipment required to perform the operation is put together in a metal basket, in advance of the time it is required at the machine. This basket contains also a leather envelope with transparent celluloid face, in which are placed the blueprint governing the operation, a card giving detailed instructions as to what is to be done to the piece on that machine, and a slip designating the operator who is to perform the work.

Scheduling usually takes such a form that this assembly of tools in the metal basket may be made several hours in advance of the stipulated time of use. Sometimes this is the day before but almost always it is at least an hour ahead of use, except in emergency cases. On delivering the set-up to the operator, the tool clerk obtains a check or receipt for it.

When the job is finished the returned basket of tools is inspected. Such tools as require it are sharpened, and then put back into place, ready for the next job. Jigs and other fixtures are put into shape, if such action is necessary, and otherwise the equipment is placed in condition for reissue when called for. The original envelope, containing the blueprint and instructions as to the work, comes back with the tools, so that the same items may be reissued when the next lot of the same piece is to be machined.

Check Cards Keep Foremen Posted

Each foreman's office has a set of *Machine Schedule* cards, showing for each machine in his department the schedule for two weeks. Each day is represented by a rectangular space on the card, in which are entered the pertinent facts regarding what is to be done on that machine during that day. These data are the same as were used on the operation planning cards (planning slips) of the production control board, and the symbols are the same as there.

A vertical blue line (here shown about 1 p. m. on Monday) designates the scheduled beginning of a sequence of operations. The scheduled end of the sequence is shown by a vertical red line, here indicated at the close of work on Friday. When each such item is started on the machine a red line is drawn diagonally across the rectangle. When the job has been completed a blue line is drawn on the other diagonal, thus cancelling the rectangle.

Each day a clerk from the production control office checks up on these cards. If he finds a shortage or a failure to live up to schedule he follows this up, determines the cause, and sees that it is corrected or

properly reported. This relieves the foreman of the necessity to spend his time in following up such details. It leaves him free to exercise his proper functions of supervising the operation of his department, assisting any operator who needs it and generally exercising control over the work.

Each lot of castings or other parts going through in process, except where the pieces are so large that they are handled separately, is contained in a box on a transfer skid. These skids are moved mainly by means of hand-elevating trucks, with capacity of about 5000 lb. A *Lot Identification* card is put in each box, showing the sequence of operations to be performed on the parts in the box.

There may be two or three operations at one machine before the parts are transferred to the next machine. The card shown has the four operations called for by the other cards used here as illustrations of how the system is carried out. As soon, however, as one man has finished his work on such a lot of castings, he signals for a truck man to remove the boxload to the machine where the next operation is to be performed.

Usually six or eight large pumps go through on a single schedule or lot order. Smaller units go in lots of 25 to 50, while the parts which are used to the extent of several in a single pump, or which are interchangeable, or which are in large use through repeated reorders for pumps, go through in lots of 100 to 200 or more.

Two more cards complete the system. The *Stock Requisition* card is practically self-explanatory. It shows the amount of stock required to machine 100 pieces of D-4141 and tells the stock clerk when the material is wanted. The *Lot Record* card is kept in the inspection department until the work is delivered to stock. Then the lower portion of the card is removed and sent to the cost department, properly filled in. It carries data needed in figuring costs. The cost department, by this time, has received the job card, showing the time put in by the operator on this lot.

Examples of Special Work

While routine work is carried through as above, special machines have been purchased from time to time to do specific tasks. About two years ago a Cincinnati duplex miller was put in to mill both faces of a casting at one set-up. This was a new piece of work which previously had not been required.

One two-unit gang drill was set up for drilling both sides of a cast iron tank. The two sides required separate set-ups of drills. Each spindle of the machine is equipped with a multiple-spindle drilling head. Two tanks are drilled at once, one under each head. One tank has its left side drilled, while the other is being drilled on the right side. As soon as this job is completed, the two pieces are interchanged in position so that the opposite sides can be drilled. One man and a helper operate this machine, which has capacity for using 42 drills at once.

One example of work is a bronze shaft or spindle about 18 in. long, turned from a solid, rough bar, with several different diameters at intervals along its length. One man, an expert in non-ferrous work, turns these shafts at the rate of about one an hour. He was reported to have made over 20,000 of them with only one shaft spoiled. Several go-no-go gages are used in checking the different diameters, as all of these shafts have to pass a rigid inspection.

Materials handling in the plant is very simple. It is almost entirely by means of hand-operated elevating trucks, some of which run as high as 7000 lb. in capacity, but most of them are of 5000 lb. A few electric trucks are used, one of which is fitted with a davit-type crane. There is some fairly heavy work handled in the plant, although, for the most part, the pumps are of relatively small size. Some base plates over 5 ft. square were in process of machining. These are fitted to carry the pump, the motor and a compression tank.

New developments, experimental work, repairs, emergency work of all kinds, so far as possible, are sent through a separate department. The object of this is to avoid disturbing the production schedule on machines engaged in regular routine work. This independent department is equipped with a variety of machines capable of doing practically all the work which may be turned out in the regular departments. For the most part, however, it cannot do the work so economically as it can be done in the special-purpose machines used in regular production. It does, however, furnish a desirable auxiliary and, particularly for developing new lines, it is especially useful.

Employee Morale Important

It frequently happens that a certain machine is not scheduled for work for a day, or perhaps two or three days. This does not mean that the regular operator of that machine is without work. He is transferred to another machine, or even on occasion to another department. This keeps him continually employed, helps morale and incidentally results in the company's having a better trained personnel than would be possible with men each capable of doing a single job only.

Labor turnover is reported to be very small. The policy expressed in the preceding paragraph is partly responsible for this. The men are asked for suggestions, even on jobs which have been studied out and definitely scheduled as a result of several years of experience. Men who have been in the plant for five years or more receive full pay on a two weeks' vacation each summer. Those who have been employed for a shorter period receive proportionate portions of their pay, but all have the regular vacation period.

About 500 men are employed, practically all on day rates. There has been very small change in the total number of employees in the past five years, practically all of the terminations of employment having been made good by new employees almost at once.

National Meeting of Materials Handling Division

Preliminary announcement has been made of a meeting April 23 and 24 at the Hotel Benjamin Franklin, Philadelphia, of the materials handling division of the American Society of Mechanical Engineers. This is the first nation-wide meeting which this division has held. More than 2000 engineers, members of the society, are enrolled in the division, which fact indicates the active interest in this subject.

The tentative program includes a foundry session the first morning, at which will be presented two unusual systems of handling installed in foundries—one steel and the other cast iron. Monday afternoon will be devoted to inspection of various plants in Philadelphia, featuring efficient handling systems. An informal dinner Monday evening will be addressed by speakers of national prominence, covering certain aspects of materials handling.

Tuesday morning a session will be devoted to external handling and transport. Papers will be presented on handling of materials at railroad terminals and marine terminals and on door-to-door distribution. In the afternoon indoor and bulk handling will be considered, including papers on production control as tied up with handling methods. In the evening the session will be devoted to mechanization of coal mines, being a joint session with the National Coal Association and the Philadelphia section of the American Institute of Mining and Metallurgical Engineers.

Mechanical Handling of a Variety of Products Cuts Costs 25 Per Cent

BY BURNHAM FINNEY*

THAT materials handling methods widely adopted by companies concentrating on mass production of a single article, such as an automobile, can be successfully applied by smaller metal-working plants is the experience of Hobart Brothers Co., Troy, Ohio. Even though the company's transportation problem was made intricate by the variety of products manufactured, it has recently introduced a roller and belt conveying system, supplemented by the use of hand-lift trucks, which has cut down costs approximately 25 per cent. Furthermore, it is now possible to turn out considerably more material without adding to the floor space previously occupied.

The fact that the company's activities are spread over six different lines of products, some of which bear a close relationship to others, but each of which differs in construction from the other five, has not interfered with the practical working out of a successful materials handling scheme. Through careful planning it has been possible to arrange departments in consecutive order so that the material in process follows a continuously progressive route from the beginning of assembling operations until the finished machine is placed in freight cars for shipment to customers. Conveyors also have been installed for handling material when it is received.

Conveyor System Expedites Final Assembling

Arrangement of the final assembly department is such that parts are ready at the point of assembly. On one side of the conveyor track are stored the parts which have been processed in the machine shop and which require no sub-assembly work. On the opposite side, running at right angles to the conveyor, are metal cabinets containing small parts, this portion of the plant being known as the small assembly department. It is here that sub-assemblies are made so that parts

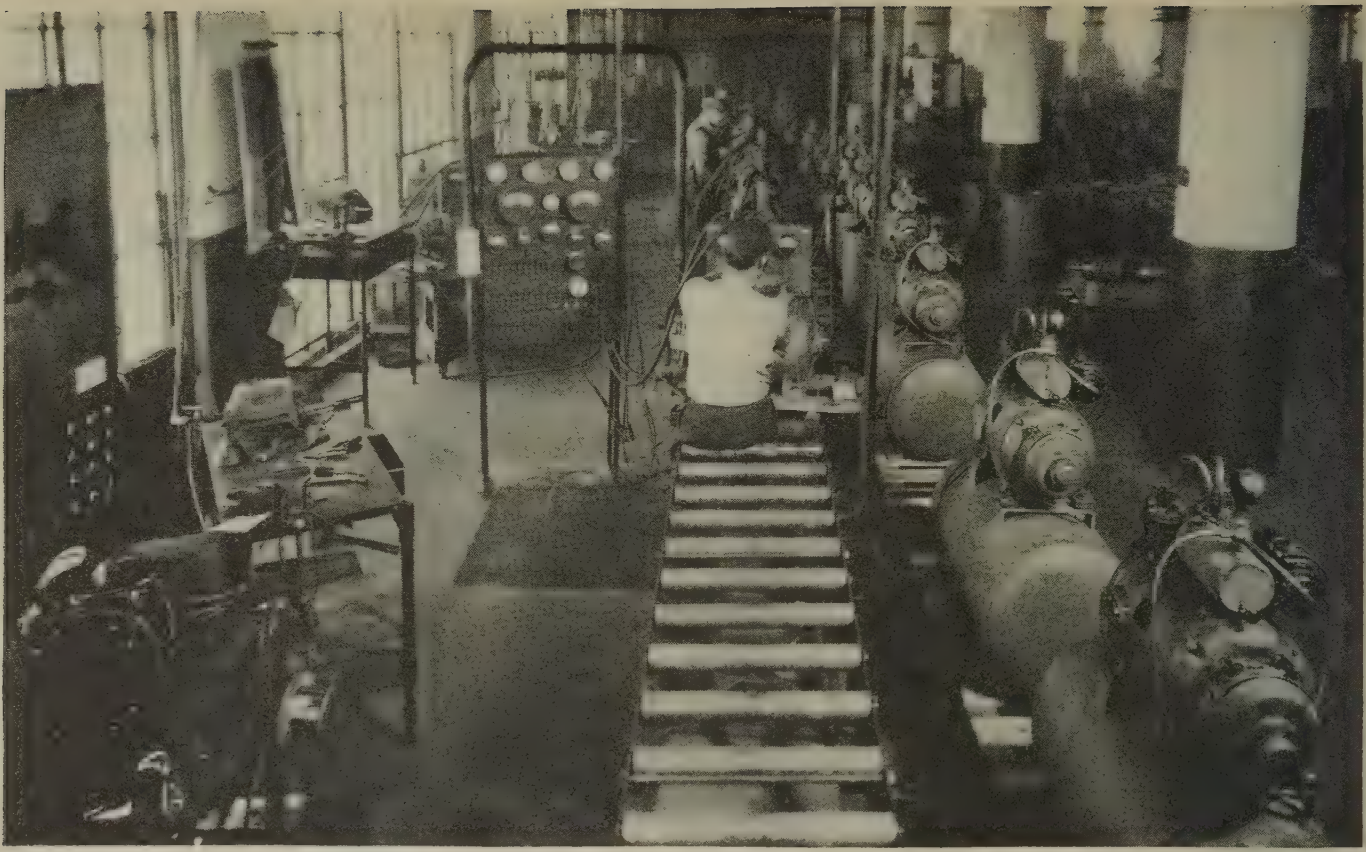
DIRECT Progression of Materials from Receiving Doors Through Various Departments to Final Assembly and Shipping Room Is Facilitated by the Use of Conveyors and Trucks. At right is a plan view of the first floor. Below are shown assembly room on second floor and shipping department on first floor.

---

*Resident editor THE IRON AGE, Cincinnati.



Separate Conveyors of Different Heights Are Used in the Testing Department. The lower conveyor is used to handle air compressors, as shown. The switchboard (at left) is located so that all instruments are in full view of the tester making final adjustments

are at the proper place for the final assembly operation.

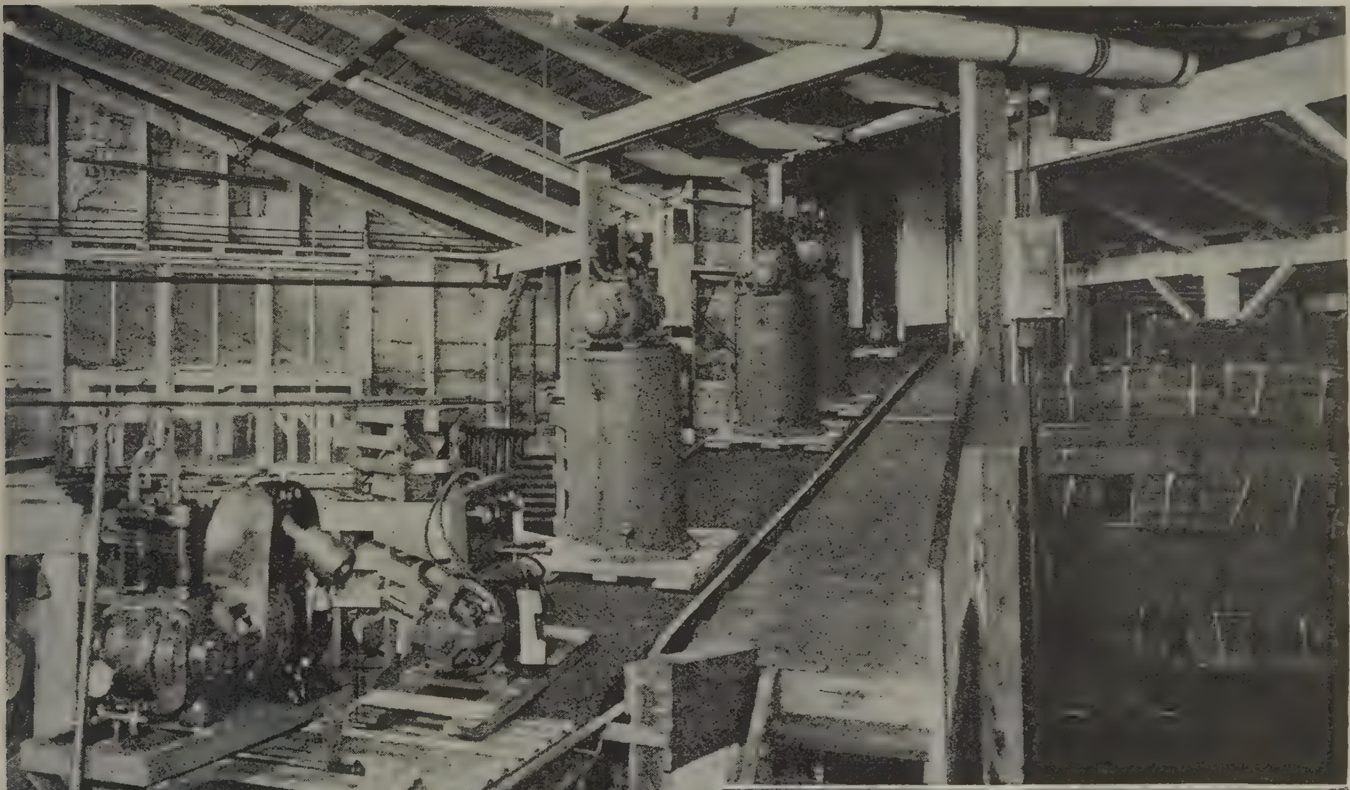
After the conveyor leaves the assembly department, it branches into two tracks paralleling each other for passage through the testing department. This plan was deemed advisable because of the difference in height of the constant potential battery chargers and of the air compressors manufactured by the company. The former go through the testing department on a roller conveyor track 24 in. high; the latter pass along on a track only 8 in. high. For the final test a switchboard is so located that all instruments can be seen by the operator who is making adjustments.

Assembled Machines Conveyed to First Floor for Painting

From the testing department the machines are carried on an electrically-driven belt conveyor through a

Conveyor in Final Assembly Department. To the right is the small assembly department in which sub-assemblies are made from parts stored in the metal cabinets. To the left of the conveyor are stored parts requiring no sub-assembly work passageway on the roof of a portion of the plant and thence down into the paint department on the first floor. At the end of the passageway the belt conveyor goes down a slight incline at the bottom of which the machines pass on to a roller conveyor. They are moved a short distance to a point where they are sanded previous to passing through the paint spray booth to receive their final coat of paint.

After painting, all machines continue on the roller conveyor to the final test operator who subjects them to a rigid examination. The machines then are packed for shipment by the progressive method. Those to be sent out immediately are taken on the conveyor through a door nearby on to the loading platform; others, which temporarily are to be placed in stock, are diverted by means of a switch in the conveyor track to a siding where they remain until shipped.



As Assembled Products Leave the Testing Department They Are Carried on a Motor-Driven Belt Conveyor through a Covered Passageway Over the Roof of Part of the Plant to the Paint Department

(At Right) Assembled Machines Enter the Paint Department on a Motor-Driven Belt Conveyor, Which Delivers Them to a Roller Conveyor

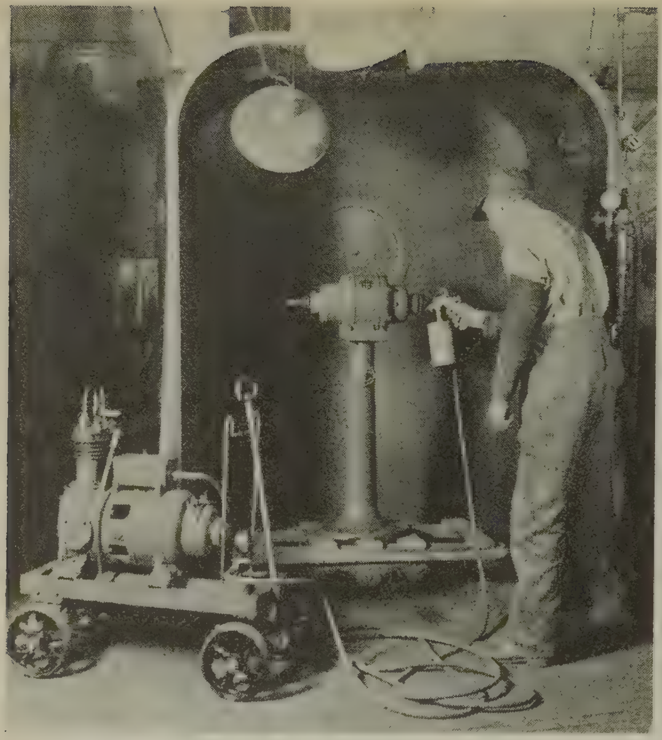
So far as possible, machines of one type are assembled, painted and packed for shipment in groups. For example, 20 air compressors may go down the assembly line in consecutive order, occupying the attention of workmen for 2 hr., before the assembly of a battery charger is begun. When a change is made, 10 battery chargers may be put through. This policy, however, cannot be followed rigidly because it is sometimes desirable to assemble several different kinds of machines simultaneously.

Rush orders are given special handling, the conveyor system giving way in favor of small hand trucks, which can be moved about easily and quickly as necessity demands.

Conveyors and Trucks Used to Handle Raw Materials

Rough castings are received at the door of the factory from automobile trucks and are transferred to a gravity roller conveyor which takes them to the grinding department. From that point they move in electric lift trucks to the machine shop, where all of the machining operations are performed. The trucks are placed alongside the operator, so that the time expended by him in handling the castings is minimized. After being machined, the castings are again put into electric lift trucks and are taken by elevator to the processed stock department on the second floor adjacent to the assembly conveyor track.

Stock other than castings is brought into the plant through a second entrance. Steel sheets are stored at one side of a passageway which runs the length of



Rush Orders Are Given Special Handling on Small Hand Trucks

the building. As they are needed they are trucked on a specially designed electric lift truck to the punch presses nearby and thence to the core and the armature-winding departments. Then they go by elevator to the assembly department on the second floor. Some of the sheets are moved by truck to the stator department instead of to the armature-winding department before being transported to the assembly floor.

Compressor Tanks Moved to Assembly Department by Electric Truck

Tanks for air compressors take a course which deviates somewhat from that of other material. In the tank department steel plate stock is sheared to the proper length and is formed into the desired shape. Then the tanks pass successively through the operations of riveting and welding, including the welding of fittings, testing and painting. All welding is done by means of the company's own HB portable electric arc welder. When the tanks are completed, they are transported by electric lift truck to the assembly department.

An intermediate step between machining and assembling castings is filling, sanding and painting. Castings are taken from the machine shop to the filling and painting room where they are filled and put on a roller conveyor for overnight storage. The next morning they are dry enough to have the plain, curved and straight surfaces sanded by a sanding machine located at the end of the conveyor. After this operation, the castings travel again by conveyor to the finish sanders, which are situated in a separate room specially protected against dust. From this room the castings go by conveyor to a spray booth where they are painted ready for use by the assembly department.

Recently the company has established its own brass foundry, and plans now are being prepared for erecting a gray iron foundry, in which practically all of the castings going into the company's products will be made. In keeping with the general policy followed elsewhere in the plant, the foundry will be equipped with the latest mechanical handling conveniences to effect savings in transportation costs.

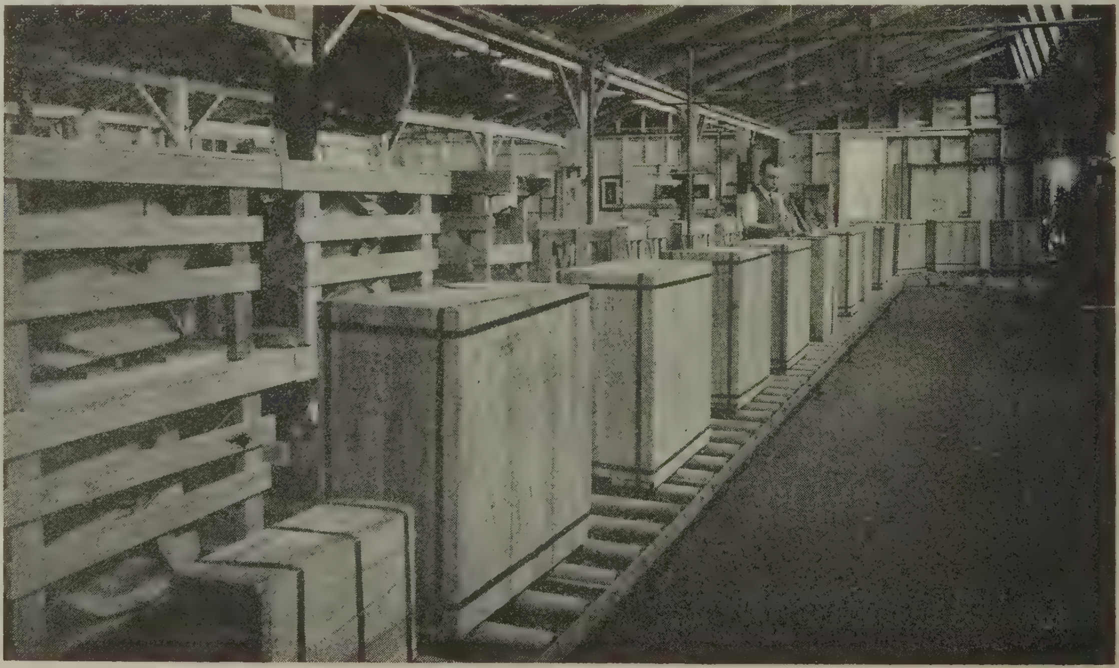
Handling Equipment Permits Production of a Complete Machine Every 20 Min.

Since the installation of the conveying system, the company is able to produce a complete machine every 20 min., whereas the output previously had been considerably below this record. In addition, the efficiency of the workmen has been increased, because they have at hand almost without effort on their part the product on which they are working, the conveyors having been built so that the material would be at the most advantageous working level. Moreover, the manufacture of numerous products, totaling 30 sizes and items, has not rendered impractical or costly the operation of roller and belt conveyors operated on much the same principle as those in plants featuring quantity production of a single product.

A mining institute, open to all men interested in any branch of the mining industry will be held at the College of Mines, University of Washington, Seattle, during the week beginning March 5. Prospectors, miners, mine owners, persons interested in metallurgy, investors in mining enterprises, and the public generally are invited to attend. This institute will take the place of the winter mining session which originated at Seattle in 1897 and continued for 28 years.

From the proceeds of an issue of $11,000,000 6 per cent debenture bonds just made the Pittsburgh Steel Co., $5,000,000 is to be reserved for the construction of a by-product coke plant. The remainder is to be used to refund outstanding bonds of the company, and the payment of bank loans contracted during the course of extending the properties.

Products Crated for Shipment Are Moved by Roller Conveyor to the Loading Platform. Machines assembled for stock are held in storage



Synchronous Motors for Rolling Mills

Steel Mill Units of Constant Speed—Welded Construction in Vogue—High Efficiency Is Combined with a Starting Torque Adequate for Most Mills

BY W. T. BERKSHIRE* AND H. A. WINNE*

DRIVING main rolls is universally recognized as very heavy duty. The loads are high and are applied and relieved suddenly. A motor driving a single stand will run between passes with only 5 to 10 per cent load, due simply to mill friction. As the metal strikes the rolls the load jumps almost instantly to possibly 100 or 150 per cent of normal and is as suddenly reduced when the metal leaves. This happens several times a minute.

If such a drive has been properly selected, several passes on each bloom or billet may require 150 to 175 per cent normal load on the motor. As the load is so intermittent in character, the motor is selected with the idea of permitting some of the passes to come up to these limits, so long as the root-mean-square value of the load is within the normal rating of the motor. If the heavier passes are of not more than 3 or 4 sec. duration, a flywheel may be utilized to reduce the peak loads on the motor and power system.

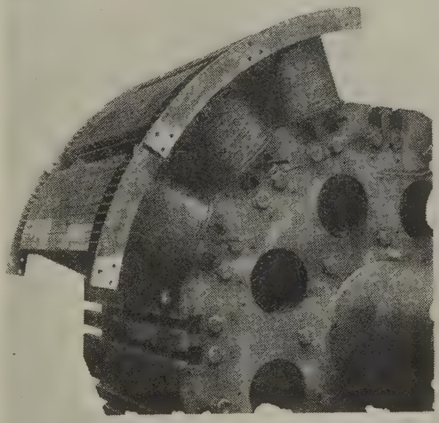
Practically the only reason synchronous motors have not been widely used on mill drives in the past is because their starting characteristics are not so desirable as those of the wound-rotor induction motor. For 100 per cent kva. input the induction motor develops approximately 100 per cent rated torque at starting; whereas the synchronous motor will give from 30 to 60 per cent starting torque, with the same kva. input, at a much lower power factor. However, the torque obtainable from a synchronous motor is ample to start most types of mills and its other advantages make it the logical choice in many cases.

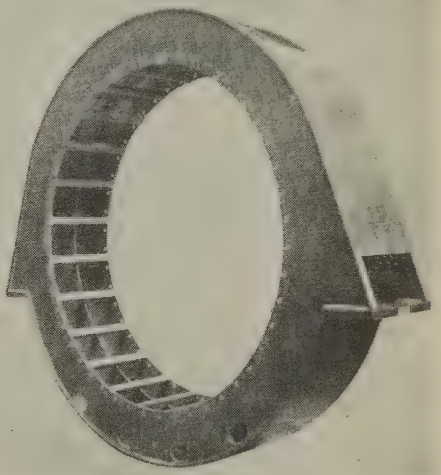
A synchronous motor can be designed for fully as high maximum or pull-out torque as an induction motor. For steel mill service this pull-out torque varies from 225 to 300 per cent of normal full-load running torque. The synchronous motor has the advantage that, for any reduction in applied line voltage, the pull-out torque decreases only in direct ratio to the voltage, whereas the torque of an induction motor decreases as the square of the voltage.

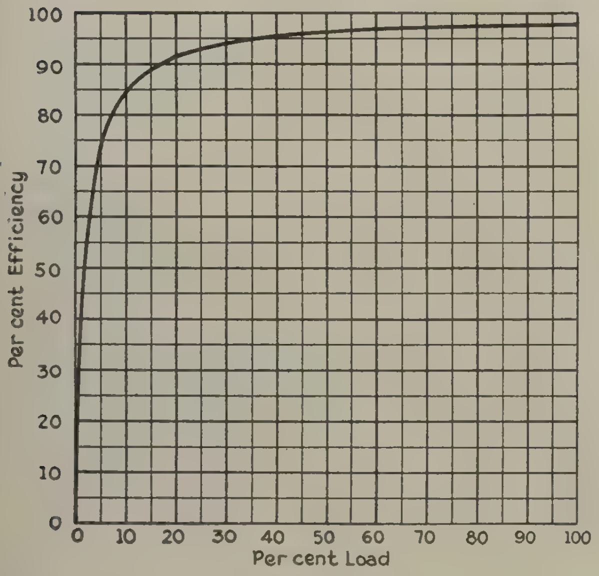
ROTOR Assembly (Right) of 6500-Hp. Synchronous Mill Motor for 6600 Volts

Fabricated Stator Frame (Extreme Right) of 16-Pole 4500-Hp. Motor for Bethlehem Steel Co.

Efficiency Characteristic Curve (Below) from a Large 25-Cycle Synchronous Motor







Efficiency

One curve shown illustrates the high efficiency obtained from large synchronous motors of 25 cycles. The 60-cycle units show about the same characteristics. The fact that approximately 75 per cent efficiency is obtained at 5 per cent of normal load is noteworthy.

The full load efficiency of synchronous motors for steel mill service varies from 0.5 to 2 per cent more than that of corresponding induction motors. This better efficiency, of course, means some saving in power cost.

Construction

The stator frames of the earlier motors of this type are of cast iron. Those built within the past year and a half, however, are fabricated of steel plates securely welded together, and braced to form an exceedingly strong and rigid structure. To the inner periphery of the frame are welded steel dovetailed keys. The core laminations are held on these keys and clamped between heavy welded steel finger flanges. Air ducts are provided in the core and complete ventilation is further accomplished by the use of air slide wedges.

Because of their size and weight, the stator coils in these large motors are insulated carefully to protect them from mechanical injury. After their assembly in the stator, the end projections are securely laced to insulated steel bracing rings supported from the stator frame. The larger machines are supplied with resistance temperature detectors. The stator coils are liberally designed to take care safely of sudden overloads, or the condition where the motor may be required to develop its maximum torque as an induction motor.

---

*General Electric Co., Schenectady, N. Y. This is a brief abstract of a paper read Nov. 29 at a regional meeting, in Chicago, of the American Institute of Electrical Engineers.

The rotor spiders of the machines of small diameter are built up of laminations punched from heavy steel plates. Those of larger diameter are of cast steel. The laminated pole pieces are either dovetailed into the punched rotor or secured to the cast rotor by means of bolts screwed into steel keys imbedded in the pole pieces.

RELATIVE BASE DIMENSIONS OF THE TWO TYPES OF MOTORS, FOR SEVERAL DIFFERENT RATINGS

Field windings are usually of edgewise-wound copper strip. Here again great care is given to the insulation between the turns of the winding, and of the coils as a whole, from the pole pieces and rotor spider. A recent improvement in design consists in the addition of fins to the ends of the field coils, which are made by simply projecting every second or third turn during winding. These fins provide an increased area of radiating surface on the ends of the coils and have proved very effective in reducing the field temperature.

Field of Application

The field of application of the synchronous motor in main roll service is limited to strictly constant speed drives. This eliminates it from consideration on reversing mills, mills requiring flywheels and mills needing adjustable speed.

It is not as a rule advisable to attempt to apply it to any type of mill which may have to be started with metal in the rolls, such as a cold strip mill, nor to cold sheet mills, which have excessively high friction. Such mills may require at starting considerably more torque than is needed to carry their full load at full speed. Unless the motor is sufficiently small in comparison to the power system so that it can be started at full voltage, difficulty may be experienced in getting started and synchronized.

Foundry Jib Crane of Great Flexibility

Design Fitted for Work in Limited Space—Unusual Ball Bearing Arrangement—Electric Welding Employed in Attaching Crane Supports

HANDLING molds mechanically in a limited space is a problem which has been solved by the Fox Furnace Co. (division of American Radiator Co.), Elyria, Ohio, by the erection of a specially designed jib crane which takes the place formerly occupied by a wooden building column. This column was replaced by a length of 8-in. double-strong pipe, on which the crane is mounted. The crane swings a complete circle, covering one-half of two bays. It handles molds for heating furnace castings from two molding machines, transferring them from one machine to the other, and also placing them on the foundry floor for pouring.

Combined Radial and Thrust Ball Bearing
Shepard Electric Hoist
Two Case Hardened Pins and Rollers Bearing On Side of Pipe
Molding Machine
Molding Machine

Jib Crane with 360-Deg. Swing for Handling Loads to and from Molding Machines

A feature of the crane, as shown by the drawing, is that the load is taken partly by a combined radial and thrust ball bearing on the column, and directly under the boom, and partly by two roller bearings at the lowest point on the supporting bracket. In the radial and thrust ball bearing sixty ½-in, balls are used. The housing is a steel forging. The rollers and pins of the bracket bearing are case-hardened steel. The crane is equipped with a 1-ton Shepard electric hoist and carries a boom load of 2500 lb. It is so designed that, if there should be an overload of the boom, the bracket supporting the boom will fail before the column shows any tendency to buckle.

In addition to the roof load, the crane column supports two overhead crane runways which cover adjacent bays, one carrying a 3-ton traveling crane and the other a 2-ton crane. Brackets supporting the two crane runways are electrically welded to the crane column.

As the bearings assure a smooth action of the crane, little effort is required to move the load. The crane was designed and built by H. A. Jahraus, consulting contracting engineer, 1878 Haldane Road, Cleveland.

Simplified Practice on Forged Tools

As a result of meetings held early in 1924 representatives of the Forged Tool Society and other interested firms in the trade recommended that 300 of the 665 then existing varieties of forged tools be eliminated. Included in this classification are picks, mattocks, hoes, bars, wedges, sledges, and anvil and blacksmith's tools. Last year an effort was made to simplify the eye sizes, and the United States Bureau of Standards has now issued Simplified Practice Recommendation No. 17 giving the details of the sizes and shapes proposed, 10 in number (as compared with approximately 120 in use in the past).

This pamphlet is issued in advance of formal approval by all factors in the industry, and comments or criticisms will be welcomed by the Bureau of Standards.

The Koppers Co., Pittsburgh, will occupy 11 floors of the new 32-story Koppers Building, which is now being erected at Grant Street and Seventh Avenue, that city. Graham, Anderson, Probst & White are architects and E. P. Mellon is consulting architect. Completion is set for Jan. 1, 1929.

Era of Individualism Passing

Iron and Steel Industries of California Are Told That Cooperation and Understanding Between Buyers and Sellers Are Necessary to Prosperity

"PRICE-CUTTING is the most vicious practice ever introduced into business," said Charles F. Abbott, executive director American Institute of Steel Construction, in an address on "Wasted Profits" at the fourth annual meeting of the Iron, Steel and Allied Industries of California at Del Monte, Cal., on Feb. 18. "Wherever price-cutting exists," he added, "profits are thrown away. It is purely a case of out-guessing competition, with the price trend always downward. Failure to maintain a one-price policy leads to a deep pit, the bottom of which no organization has ever reached alive.

"Furthermore, the practice is directly contrary to the interests of the buyer. While the law of supply and demand operates it is economically sound for the buyer to try to get the best possible price, but to drive a bargain below the line of a fair profit, good quality and proper service is poor business in the long run. Substitutions, inferior quality and inadequate service logically follow. The buyer suffers and pays in the end a price much greater than one based upon cost plus a fair profit.

"The era of narrow, selfish individualism is passing. We are entering upon a new era of cooperation and cordial understanding between buyer and seller, producer and distributer, and the individual units of our industries. Cooperation between all the elements of an industry is becoming the price of survival."

Steel Industry Needs Intelligent Cooperation

He added that the steel industry is in need of intelligent, aggressive cooperation of a wider scope than is represented by any of its trade organizations now in existence. He advocated work along lines of standardization and simplification, better business methods, better competitive conditions within the industry, protection of the industry against encroachments of competing industries, and broader markets and better profits for all steel products.

Attacking the enormous waste which goes on in the United States, Mr. Abbott said that it is in the field of distribution that the greatest waste prevails. He said that the American Institute of Steel Construction is now working to eliminate some of the wastes that come within the scope of its own field.

Research a Means to Eliminate Waste

"Research has proved one of the most effective means," said Mr. Abbott, "of reducing the tangible causes back of the wholesale squandering of our opportunities for more profitable business. Profits depend largely upon continuous research. Reduced costs, improvement in quality and new uses are among the possibilities.

"The market for steel, like the market for all other products, must be nourished and developed. A survey of the market for steel would unquestionably reveal missed opportunities for the sale of many millions of tons. Neglect of such possibilities adds millions to the wasted profit account.

"Research furnished an essential part of the data required for the standard specification for structural steel for buildings, and the standard specification for fireproofing structural steel buildings, formulated by committees appointed by the American Institute of Steel Construction. The first specification is effecting a saving of about 10 per cent of the amount of steel required for any steel frame building in those cities in which its use has been authorized. The fireproofing specification reduces costs by eliminating the unnecessary dead loads demanded by obsolete fireproofing methods.

"The institute is now cooperating with the manufacturers of electric and gas welding devices in a program of research regarding the use of welding in the erection of structural steel. Tests are being conducted in the laboratories of the University of Toronto, and there is reason to believe that it may be possible to bring the costs of steel construction still lower through the use of the welding process.

"It is, of course, scarcely necessary to point out that all research resulting in a reduction of costs tends to promote the wider use of the product, since it places it in a more favorable position in the struggle with competitive materials for the buyer's favor. Lower costs have much the same effect as improvements in quality, or better adaptation to the consumer's preferences.

Steel Being Displaced for Bridges

"Steel is suffering a serious displacement in the field of highway bridge construction. The public is being educated to believe that steel bridges are unsightly, expensive, and lacking in durability. In Pennsylvania it is next to impossible to erect a steel highway bridge, because those in control hold that there are two conditions under which steel is justified: When the span and height are such as to make concrete impracticable, and where there is no way to get the additional funds required for concrete.

"It is strange that such a situation should exist in the State that is the home of the steel industry. Other States enforce restrictions favoring competition, and the number of such States is increasing.

"If the public wants artistic steel bridges, why not build them? The shortest route to a sale is to overcome resistance by meeting the buyer's desires. Why should steel always be painted black or some other unattractive color? Why shouldn't the steel industry initiate research designed to provide the data for the construction of beautiful steel bridges?

Potential Markets for Steel Not Scratched

"As to the development of new uses for steel, steel roadbeds, steel railroad ties and steel for residences provide promising fields for expansion. Steel-frame residences have already passed out of the experimental stage, but we have not yet even scratched the surface of the potential market.

"The yearly increase in the country's population amounts to 2,242,875, or 6145 persons a day. The average number of persons in a family is 4.33; so it is necessary to provide 1419 new homes every 24 hr. This means that 517,935 new homes are needed each year to take care of the increase in population alone. By no means all families live in individual dwellings, but granting the exceptions, think what the proper cultivation of the residence market offers the steel industry in the shape of a new and steady demand for its product!

"An encouraging indication that the steel industry is awakening to the necessity of studying the market is given by the recent organization of a commercial research department by the Colorado Fuel & Iron Co. The future sales activities of this company will be based upon accurate information as to customers, prospective customers, market possibilities, buying influences and economic trends.

Solution of Business Problems Lies in Group Action

"When one stops to consider that the volume of business is as great as, or greater than, the volume in previous years, the absurdity of the present demoralization and lack of profits becomes apparent. The rem-

Why Some Drill Rod Steels Fail

Typical Failures Cited—A Particular Case Critically Analyzed—Good and Poor Structures —Stresses Involved

BY OSCAR E. HARDER*

DURING the past few years much attention has been paid to the failure of metals by fatigue, or probably the better term is "progressive fatigue." Outstanding examples of such researches are those conducted under the direction of Prof. H. F. Moore, reported in Bulletins 124, 143 and 156, of the engineering experiment station of the University of Illinois, and those by Dr. D. J. McAdam, Jr., of the United States Naval Engineering Experiment Station, Annapolis, Md.

An excellent piece of work, particularly with reference to the mechanism of the progressive fatigue failure, is that by Francis F. Lucas, of the Bell Telephone Laboratories, New York, published in the *Transactions* of the American Society for Steel Treating, Vol. XI, page 531 (1926). Professor Moore and Mr. Lucas have paid special attention to the progressive failure through the metal and have given us considerable information with reference to how the failure takes place.

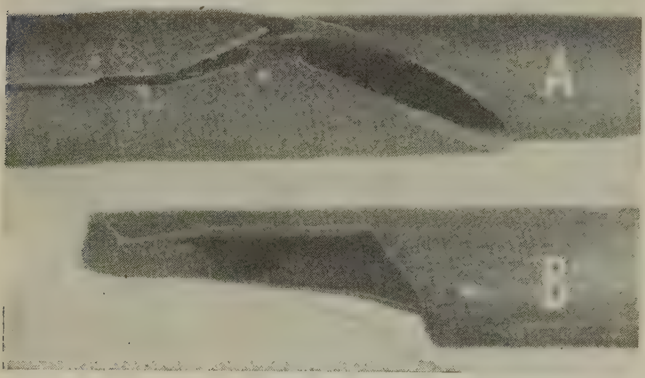

Fig. 1—One of the Most Common Types of Failures in Diamond Drill Rods

Doctor McAdam, in the *Proceedings* of the American Society for Testing Materials (1926) and R. R. Moore of the engineering division, United States Air Service, at McCook Field, Dayton, Ohio, in the same volume, have paid special attention to the influence of combined corrosion and fatigue stressing.

There are numerous other publications on fatigue of metals, but it is not considered necessary in this brief paper to review all the literature on the subject.

So far as the writer is aware, fatigue failure in diamond drill rod has not been reported in the literature. In the study of the failure of ordinary drill rod by the United States Bureau of Mines, some types of failure were reported which may have been due to progressive fatigue. Recently the writer was called upon to examine and report on a failure in a piece of 1¼-in. outside diameter diamond drill rod. This rod had failed while drilling a hole about 2600 ft. deep, and a microscopic examination of the rod indicated that the failure was of the progressive fatigue type.

Typical Failures of Diamond Drill Rod

What is believed to be the most common type of failure in diamond drill rods is shown in Fig. 1, which is about one-half actual size. If the stresses to which the rod is subjected are analyzed, there are three important ones:

(1) Torsion due to the rotation during the drilling operation. This stress is repeated but not a repeated reversed stress. The magnitude of the stress may be calculated from ordinary formulas.

(2) Repeated reversed bending, a stress which is encountered in the case of crooked drill holes which are not uncommon.

(3) Stress due to pressure of the cooling water as it is forced through the pipe. This hydrostatic pressure produces two kinds of stresses: Radial stress, which is always a compressive stress, and tangential stress, which is always a tensile stress and is a maximum at the inner surface of the cylinder. As the radius increases this stress approaches the internal pressure, but the maximum stress is always greater than the internal pressure.

The failure under examination was a longitudinal split in the pipe which started near one of the couplings and progressed a distance of some 12 in. A macrograph of a section of the rod at a magnification of 2½ diameters is shown in Fig. 2.

Casual examination revealed little that was unusual, but more careful study showed that, in addition to the one fracture which caused failure, there were four others starting from the inside of the tube and progressing outward in the positions indicated by the numbers in Fig. 2. These cracks were barely visible with the unaided eye, but became very interesting when studied at higher magnifications, as will be discussed later.

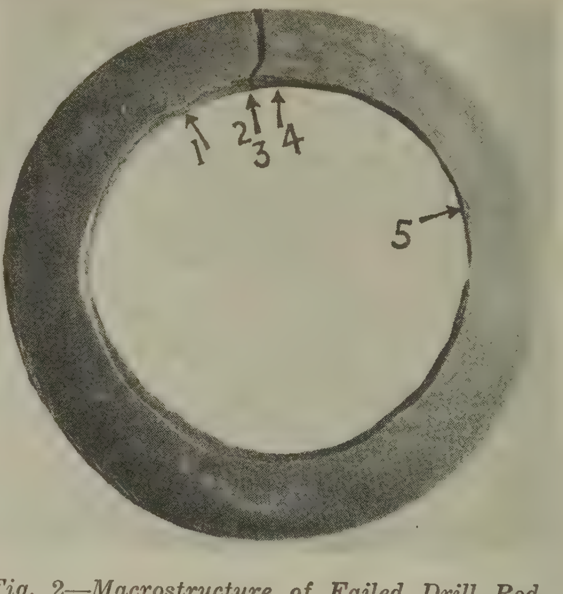

Fig. 2—Macrostructure of Failed Drill Rod, Showing Positions of Fractures. Half original size

The chemical analysis of the drill rod gave the following results:

	Per Cent		Per Cent
C	0.24	S	0.051
Mn	0.48	Si	0.004
P	0.009		

It represents a material of unsatisfactory composition in two particulars. The carbon is only 0.24 per cent, whereas it should have been perhaps 0.35 to 0.40

Fig. 3—*Reveals Pronounced Banding of the Structure.* *Figs.* 4 *and* 5 *show uneven distribution of the carbon*

per cent. Second, the sulphur is quite high and suggests the possibility of sulphide segregations.

The microscopic examination of the rod indicated two objectionable structures. First, there is pronounced banding of the structure; that is, long bands of ferrite, as illustrated by the light areas in Fig. 3, and these are separated by more or less banded areas of pearlite, shown dark in the figure. Second, there is an uneven distribution of the carbon, as shown in Figs. 4 and 5. Fig. 4 would indicate that this particular part of the drill rod was decarburized to a considerable extent, and Fig. 5 indicates a concentration of the carbide and probably concentration of sonims, or non-metallic inclusions. A concentration of sonims might be attributed to the fact that the steel was not clean, while a decarburized zone such as shown in Fig. 4 might be due to ingotism, or more likely it was due to burning out of the carbon in upsetting the drill rod at the end.

An attempt was made to determine the amount of the segregation by making use of the sulphur print, which indicated that there was considerable segregation of sulphides.

How the Fatigue Fracture Progressed

The various fractures were examined microscopically but before discussing these in detail, it seems to the point to quote from the summary in Mr. Lucas' article previously referred to:

> 1.—Non-metallic inclusions in ingot iron are a potential source of weakness when such metal is subjected to reversed cycles of stress.
>
> 2.—Iron carbide when occurring as inclusions in ingot iron is not a source of weakness.
>
> 3.—Non-metallic inclusions seem to be insecurely seated in the metal, and the boundary between the inclusion and the metal is the path often followed by the fatigue crack.
>
> 4.—The non-metallic inclusions act as "stepping-stones" for the fatigue crack.
>
> 5.—Grain boundaries do not appear to be a potential source of weakness.

From a study of the photomicrographs of the fractures it appears that the direction of the progress of the fracture has been determined largely by non-metallic inclusions. The observations here would seem to be in complete agreement with the findings of Mr. Lucas. In one case the progress of the fracture was particularly interesting. First there was a large slag inclusion which came to the surface of the metal and, undoubtedly, constituted the notch effect as regards fatigue resistance. The failure then progressed into the metal and, near the end of the fracture, passed through one of the very badly segregated areas.

Causes of the Failure

Referring to the three stresses encountered in the service of diamond drill rod, it is evident that the maximum stresses due to rotation and bending are at the outside surface of the tube. While one of the stresses, due to the hydrostatic pressure, produces a maximum tensile stress at the inner surface of the tube, it is not believed that this stress is sufficient under operating conditions to cause failure. The failure in this particular rod, however, has apparently started from the inside.

There are two seemingly plausible explanations for this phenomenon. If, in the manufacture of the drill rod, the inside was left rough and striated in a longitudinal direction, the notch effect may have been sufficient to cause the failure to start on the inside of the drill rod even though the stresses were lower than on the outside. Second, it is obvious that the tube is badly corroded inside and the failure may have been the result of a combination of the notch effect and corrosion fatigue such as had been reported by Doctor McAdam and R. R. Moore.

The low carbon content of this drill rod, and therefore its lower physical properties, would undoubtedly lower its endurance limits, and it might be expected to fail at lower fiber stress than drill rod of higher carbon content. As previously pointed out, the structure is banded and furthermore there is segregation and a considerable amount of non-metallic inclusions. It should also be pointed out that the wall thickness is non-uniform, being about 0.050 to 0.060 in. thinner at the point where the failure occurred than on the other side.

Structure of Satisfactory Material

It should be said, by way of explanation, that this particular drill rod represents stock which had been on hand for a long period of time, stock which was probably purchased about the close of the war when various industries were buying the steel they could get

Figs. 6 *and* 7—*Photomicrographs of Drill Rod Steels Which Are Considered Satisfactory Material at the Present Time*

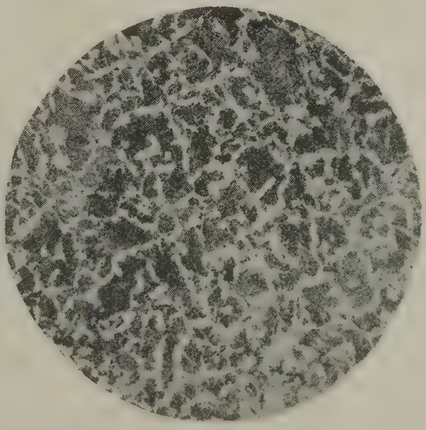

Fig. 6

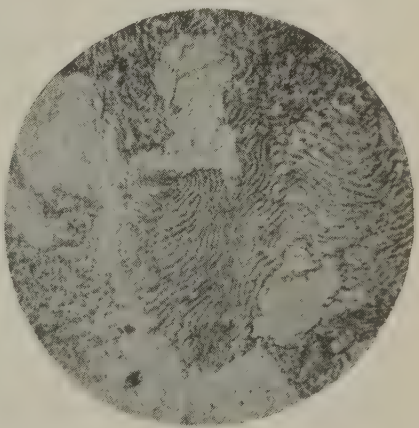

Fig. 7

regardless of the fact that it did not completely satisfy their specifications.

Photomicrographs of drill rod samples which are considered satisfactory material at the present time are shown in Figs. 6 and 7. These represent steel containing about 0.40 per cent carbon, and a macroetch, as well as these photomicrographs, showed a homogeneous structure and general freedom from sonims.

Summary and Conclusions

1.—What appears to be a typical progressive fatigue failure in diamond drill rod has been noted.

2.—The cracks have been observed to start from the inside of the pipe and to progress outward, contrary to what would be expected from the intensities of the fiber stresses.

3.—A combination of notch effect and corrosion has been suggested as the cause of the position of the cracks.

4.—It has been indicated that the quality of the steel as revealed by the microstructure has an important bearing in progressive fatigue failures.

5.—The importance of care in handling stocks of raw materials and inspection has been indicated.

Magnetic Alloys Named and Defined

Several Important Brands in Common Use Described in Terms of Properties and Composition

It has lately become the custom to christen newly developed alloys with names chosen with the idea of indicating something of the nature of the material. Many of these names have already become familiar, but in the field of magnetic materials there seems yet to be some confusion in many cases as to the real meaning. For example, there is uncertainty on the part of some with regard to the alloy which has been called "permalloy." Is it good material for permanent magnets or not? With this situation in mind the following brief description of some of the more recently produced alloys may be of interest and value.

Permalloy.—So named because of its high permeability, this alloy, which is 78 per cent nickel and 22 per cent iron, has a maximum permeability, when properly heat treated, more than 50 times as great as that of pure iron. This remarkably high permeability is exhibited under the influence of very weak magnetizing forces and consequently the material is exceedingly valuable in the construction of the magnetic cores of apparati which operate with feeble electric currents. On account of its relatively low saturation value (about one-half that of pure iron), its usefulness is restricted to applications where the magnetizing forces are very small, as they are in most types of communication apparatus. One of the most interesting applications is its use in the loading of submarine cables. Permalloy has very little magnetic hysteresis and consequently is not suitable for permanent magnets.

Hipernick.—This "high-permeability-nickel" alloy has equal amounts of nickel and iron. It does not give as high permeability as permalloy but has an initial permeability, under suitable heat treatment, more than ten times that of pure iron with a maximum permeability upward of 50,000, which is roughly 25 times that of pure iron. Its principal advantage lies in its less sensitiveness to the effect of mechanical strain and its response to the ordinary method of heat treatment by slow cooling. It has found its main use in the cores of audio frequency transformers and current transformers.

Copernick.—This does not contain copper as the name might seem to imply, but has the same chemical composition as hipernick. By means of a different heat treatment, however, somewhat different magnetic properties are obtained. The principal characteristic is a considerable range of flux density in which the permeability has little variation, hence its name "constant-permeability-nickel." This condition is obtained at some sacrifice of initial and maximum permeability, but both are considerably higher than for the best silicon transformer steel, being of the order of 1200 and 15,000 respectively according to the heat treatment.

"A" Metal.—This is a high-frequency induction furnace product consisting of iron, nickel, and copper. The copper content is 6 to 8 per cent. It was developed primarily for use in the cores of audio frequency transformers and similar applications. It has a range of inductions in the neighborhood of 4000 gausses in which there is little variation in permeability and so gives very little distortion, due to the direct current component usually present in audio frequency transformers.

Thermalloy.—A temperature-sensitive alloy of approximately 66.5 per cent nickel, 30 per cent copper, and 2 per cent iron. The permeability falls off with increase in temperature in a nearly linear manner. By varying the composition and heat treatment, almost any desired characteristics can be obtained. The material has been successfully used for magnetic shunts in watthour meters for the compensation of errors due to variations in temperature.

K. S. Magnetic Steel.—This permanent magnet steel was developed by the Japanese metallurgist Kotaro Honda and named by him in honor of Baron S. Sumitomo whose financial support made possible the investigation leading to its discovery. By means of the addition of a substantial percentage of cobalt to magnet steel of the ordinary composition, a steel was produced having remarkable magnetic properties. Without sacrifice of residual induction, this alloy gives a coercive force more than three times as great as that of the best practical magnet steels previously produced. With proper attention to design, it is possible to reduce the amount of steel required for a given purpose to about one-third of that required for the older types of magnet steel. It is also possible to make stable magnets of forms not practicable with the steels previously available. On account of the high cost of cobalt and somewhat more expensive methods of production, K.S. magnetic steel is not generally an economical material, however, and its use is justified only where considerations of weight or space are of paramount importance.

Cobaltcrom.—As the name implies, the distinguishing ingredients of this permanent magnet steel are cobalt and chromium. The percentage of cobalt is generally lower than in the K.S. magnetic steel and the chromium content is higher. These steels are produced in England and come in two grades "Special" and "Double Special." The residual induction is somewhat lower than for the ordinary magnet steels, but the coercive force values compare favorably with the K.S. magnetic steel described above. A rather complicated heat treatment is specified for these steels, but with care very good results can be obtained.

Permanite.—This is a permanent magnet steel having properties intermediate between those of cobaltcrom and the ordinary magnet steels in common use. It might be called a cobalt-chrome-tungsten alloy. The coercive force is about 50 per cent higher than ordinary tungsten or chromium magnet steels and the residual induction is about the same. The same statements with regard to design and cost that apply to the other types of cobalt magnet steels are applicable to permanite.

Nomag.—As its name would indicate, this material is hardly a magnetic alloy. It is a practically non-magnetic cast iron which owes its non-magnetic characteristic to the presence of about 6 per cent of manganese. Machinability is obtained by the addition of about 9 per cent of nickel. It has a high electrical resistivity and is useful where the ordinary mechanical properties of cast iron are desired but where a magnetic material would be objectionable.

American Steel Treaters in Canada

Winter Sports and Technical Programs Divide Attention of Members

Uses of Alloy Steels and Heat-Treatment Problems Considered

TECHNICAL programs held by the American Society for Steel Treating in Montreal last week (Feb. 16 and 17) warranted a better attendance from both Canada and the States. For quality of original papers and vivacity of discussion the meetings were the equal of any held by the society at its general meetings.

About 100 members from New England, the North Atlantic and Central States were entertained by the local chapter with a full program of sleigh riding, tobogganing, ski jumping and professional hockey. These winter sports, as well as visits to various resorts, made the occasion one long to be remembered by those from milder and dryer climates.

Four manufacturing plants held open house. Canadian Steel Foundries, Canadian Vickers, Dominion Engineering Works and Dominion Bridge Co. all seemed to be working near capacity. The general impression a casual visitor retains of these operations is that much more attention to small details is given by both management and workmen, the sum of which undoubtedly contributes to high quality in the output. Really notable machinery and structures are being constructed in these modern plants.

Chromium and Nickel Steels

MOST of the papers had to do with alloy steels and the adaptability of various alloys for practical purposes. Space prevents a full abstract of all those presented. Several had to do with chromium and nickel analyses.

Cast Chrome Irons

V. T. Malcolm, metallurgical engineer Chapman Valve Mfg. Co., Indian Orchard, Mass., presented a paper on "Cast Chrome-Irons" which mentioned the foundry difficulties and the requirements of the finished castings. He said that cast chrome-irons are really corrosion-resisting mild steels, and are essentially different from stainless steels by having lower carbon. (In discussion it was mentioned that castings also carry considerably more silicon; a successful analysis is 0.15 per cent carbon, 17 per cent chromium. E. C. Bain said that he would judge that carbon would have to be less than 0.45 per cent carbon if the chromium was 18 per cent, to insure that the material would resist corrosion.) Such castings, after annealing at about 1550 deg. Fahr., are soft and malleable, and machine without great difficulty. Physical properties are given in the accompanying table.

Ultimate strength	100,000 lb. per sq. in.
Yield point	75,000 lb. per sq. in.
Maximum allowable working stress at 1000 deg. Fahr.......	12,000 lb. per sq. in.
Melting point	2,750 deg. Fahr.
Scaling point (maximum temperature for continuous operation)	1,600 deg. Fahr.

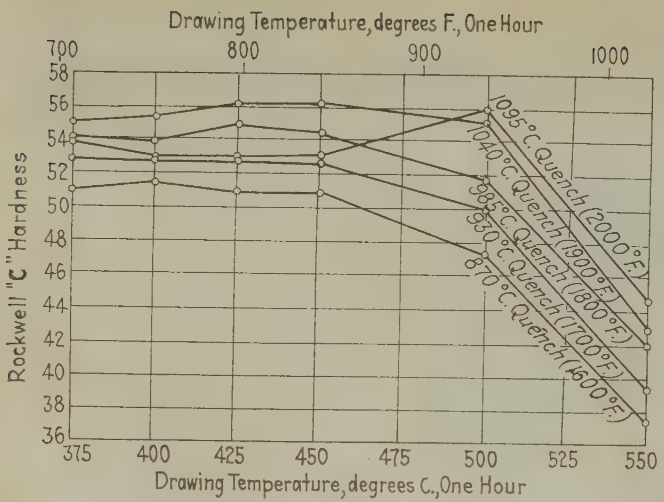
In melting, extreme care is necessary to avoid oxide inclusions. Good clean scrap, reducing conditions during melting, thorough refining and degasifying are all necessary. Highest skill in molding and temperature control during pouring are required. Operations must be adjusted so that the alloy will not burn or cut into the sand, so that it will shrink no more than a controllable amount, clean easily and solidify into a dense fine-grained metal with carbides uniformly and finely dispersed. In order to remove iron-rich scale or adhering dirt it is customary to pickle castings in hydrochloric acid, wash them, and then immerse in concentrated nitric acid. This produces a surface film which is passive to atmospheric corrosion.

During the discussion it was brought out that English metallurgists are more successful in making high-temperature erosion and corrosion-resisting castings than are the Americans. Nickel is added to some analyses when making castings up to 1000 lb. in weight, and in order to reduce the necessity of heat treating parts of non-uniform cross-section. If carbon can be kept low enough so that the chrome-iron casting is exclusively a solid solution of ferrite plus chromium plus carbon, then the only things which heat treatment can do, other than relieve internal strain, is to cause grain growth (which is especially active when silicon is up) or reduce coring.

N. L. Mochel of the Westinghouse Electric & Mfg. Co., Philadelphia, said that at present not all the commercial requirements can be met simultaneously by chromium or chromium-nickel castings. High-pressure steam fittings especially give trouble; nearly all machined castings are comparatively porous. Complexity of form seems also to increase enormously the foundry difficulties. Some striking successes have been accomplished, however. He mentioned particularly the fact that his organization has a large tank made of a chrome-iron casting which has held concentrated nitric acid for three years without damage.

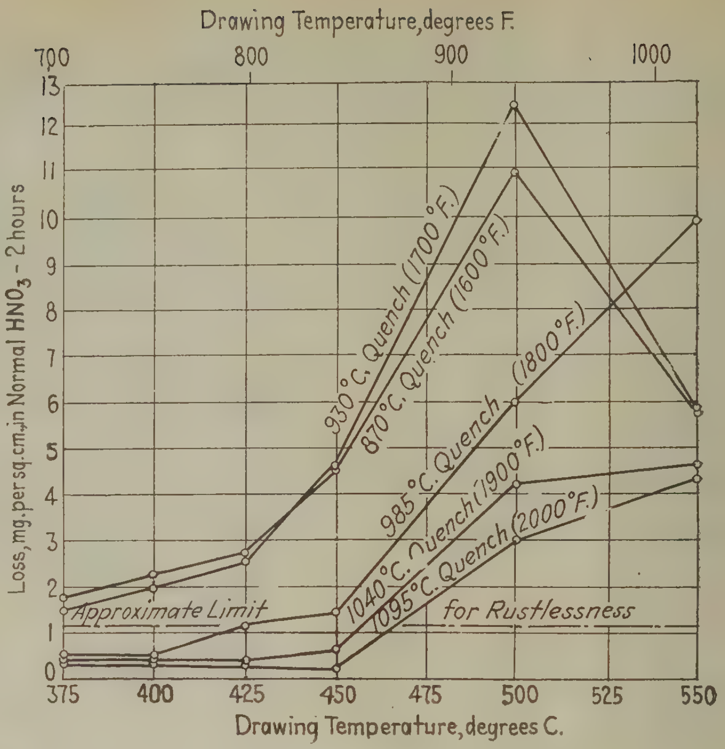
Reasons Why Stainless Steel Resists Rust

Edgar C. Bain of the Union Carbide and Carbon Research Laboratories presented a paper entitled "X-Rays and the Constituents of Stainless Steel." A detailed study was made of a thin commercial sheet analyzing as follows: Cr 17.4, C 0.77, Mn 0.43, Si 0.25 and Ni 0.24 per cent. A series of test pieces, systematically quenched and drawn, gave hardness and corrosion tests as shown in the diagrams. (Loss of weight



Hardness of Quenched Stainless Steel Is Not Much Affected Until Drawn Above 500 Deg. C.

High Temperature Quench and Low Temperature Draw Give Maximum Resistance to Corrosion (At Right)



in circulating weak nitric acid is an evaluation of atmospheric corrosion). A distinct secondary hardness developed by drawing a 1095 deg. C. quench to 500 deg. C. indicates that some austenite is retained after this high quench. If this steel is to have good rust resistance it must have a high quench and a relatively low draw.

Systematic X-ray investigations were also made. The paper shows clearly how to interpret these diffraction patterns. In all instances, ferrite "doublets" appeared at the 550 deg. C. draw, which Mr. Bain interpreted to indicate the sudden disappearance of martensite and internal strain. Patterns of residual carbide were distinctly shown in all specimens quenched from 1040 deg. C. and lower, which did not change in appearance after the various draws, this indicating that they did not materially increase in number or effective size. The steel quenched from 1040 deg. C. had faint austenitic lines; the one quenched from 1095 deg. C. had the austenite pattern as well marked as the ferrite pattern.

After a brief account of the constitution of the rustless irons, stainless steels and chrome irons, Mr. Bain advanced the following considerations to account for the observed phenomena:

1. That 12.5 atomic per cent chromium in solid solution in either alpha iron or gamma iron (whether as ferrite, austenite or some intermediate phase) is sufficient to resist oxidation by atmosphere or acid exposure.
2. That in annealed or excessively drawn steels practically all the carbon is held in complex carbides, containing a higher Cr: Fe ratio than the surrounding ferrite.
3. That this may cause the ferrite immediately adjacent to have a chromium content less than 12.5 atomic per cent, and readily rust, despite the fact that the chemical analysis of the entire sample may be correct.
4. Heating and quenching dissolves and disperses these carbides, but care must be taken to heat hot enough and long enough, and to avoid high temperings (which reforms the carbide particles).
5. If chromium is high enough by a safe margin, the steel or iron is rustless in all conditions.

Toughness of Chromium-Nickel Steel

In order to determine whether an S.A.E. 3265 steel is better than the more usual 3250, B. F. Shepherd, assistant metallurgist, Ingersoll-Rand Co., Phillipsburg, N. J., made some tests on the following steels:

	S.A.E. No. 3250 *Per Cent*	Low-Nickel *Per Cent*	High-Carbon *Per Cent*
Carbon	0.50	0.51	0.63
Manganese	0.40	0.51	0.47
Nickel	2.35	1.75	1.85
Chromium	0.95	0.95	1.00

Silicon in these steels was 0.25, sulphur 0.013 and phosphorus 0.01 per cent.

Izod, tensile and hardness tests are contained in his paper entitled "A Note on the Hardness and Impact Resistance of Chromium-Nickel Steel," and are summarized in the table. Annealed bars were rough ground to 0.015 in. of size, hardened and finish ground to shape. Izod bars were then notched by grinding with a 45-deg. notch, 1/64 in. deep, 0.01-in. radius at the bottom. Results were consistent, the average spread in the groups of three being three units, or 13 per cent of the impact value.

Oil quenching was done from lead baths. Tempering was done in an electric furnace for 2.5 hr. Bars either quenched, or quenched and drawn, at 300 deg. Fahr. broke under the head, thus illustrating the fact that "hard" parts fail by concentrated local stresses. The unyielding character of the steel prevents that slight local distortion and plastic flow which would uniformly distribute the load. When quenched from 1450 deg. and drawn at 550 the following results were obtained:

	S.A.E. 3250	Low-Nickel	High-Carbon
Proportional limit..	233,750	over 200,000	228,750
Ultimate strength..	264,500	275,000	273,500

Nickel Steel in Boiler Construction

"Alloy Steel for Boiler Construction" was discussed by Charles McKnight of International Nickel Co., New York. While nickel steel boilers were installed in the United States cruiser Chicago, built many years ago, and in one locomotive built by the Baldwin Locomotive Works in 1904, the Canadian Pacific Railway Co. may be regarded as pioneering when in 1926 it built 44 locomotives with nickel steel boilers and fireboxes. By this means the steam pressure was increased 25 per cent (from 200 to 250 lb.) without increasing the thickness of the plate. Characteristics of the 3 per cent nickel steel used are shown in the table. Cold bend tests show it to have about the same ductility as carbon steel.

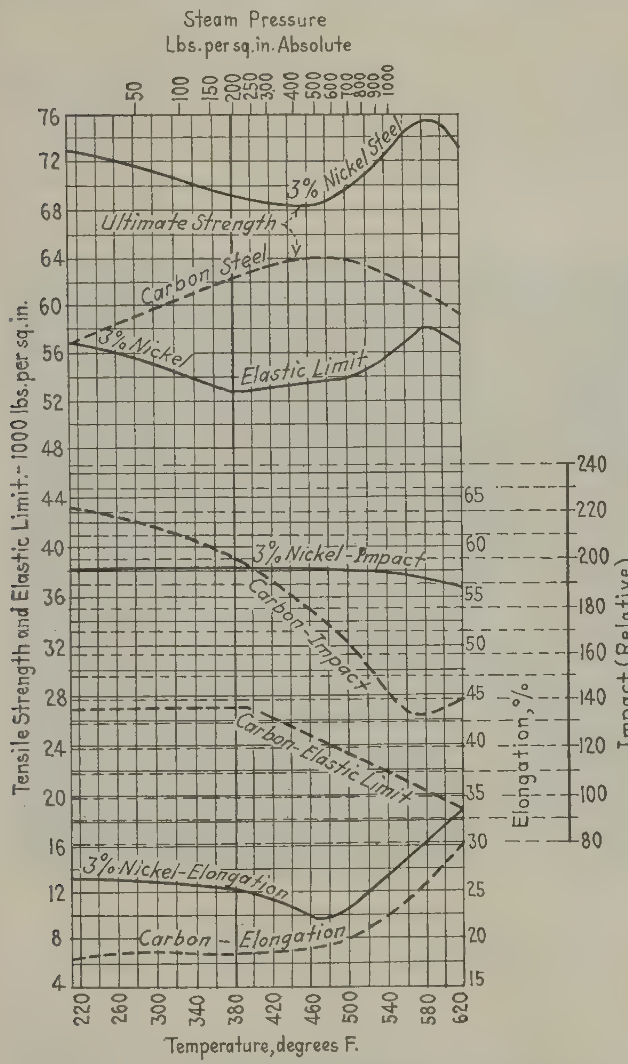

Fig. 1—Comparison of Physical Properties of Carbon and Nickel Steel at High Temperatures

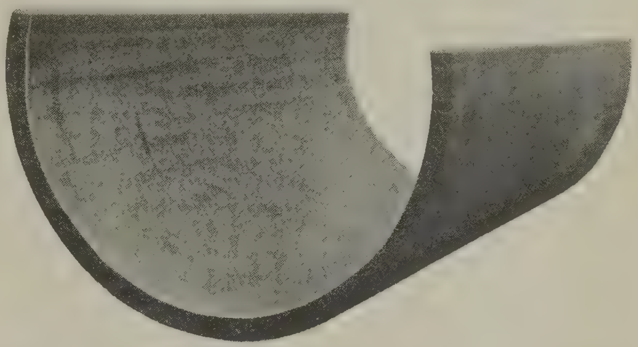
Fig. 1 gives physical properties at elevated temperatures, as determined by P. Goerens.* While this investigation is reliable the results are not comparable with others by investigators using different test pieces, and steels with different histories. It is especially necessary for boiler steel to cool slowly after rolling—the usual passes through leveling rolls are in effect a quenching.

Manufacturing procedure is as follows: A well killed steel is cast in big end-up molds with hot tops. Crop 40 per cent to avoid pipe. Chip all surface defects. Heat slowly, and conduct rolling so as to insure best possible surface, and finish at a good red heat. Pile hot plates promptly, one on top of another, and cover pile with sand. Plates should require 8 hr. to come to black heat.

In the boiler shop no special difficulties are met. Either carbon steel or nickel steel rivets can be used. Welding by either gas or arc process is perfectly feasible when using nickel steel welding rod. Mr. McKnight also feels that the increased resistance to corrosion conferred by the nickel content, and the high elastic limit of the material, will minimize corrosion cracking so troublesome in the highly stressed regions between staybolt holes.



Two-Inch Nickel Steel Plate for Babcock & Wilcox High Pressure Boiler

Nickel steel staybolts were described in THE IRON AGE, Dec. 29, 1927, page 1785. Low-carbon tubes with about 2 per cent nickel have been in extensive naval use for 25 years, and outlast carbon tubes many times. They are also successful for stationary boilers, whereever water conditions are bad. This analysis has the property of developing a glossy surface to which scale does not adhere.

Properties of Nickel Steel and Carbon Steel Boiler Plate

	Nickel Steel		Carbon Steel

Heat Treatment and Tool Steel

ANOTHER group of papers considered methods of heat treatment, microscopic examination and the effect of impurities on high speed tool steel.

Putting Internal Stresses to Work

Internal stresses are usually the designer's bugaboo, but W. J. Merten of Westinghouse Electric & Mfg. Co., East Pittsburgh, proposes to put them to good use. Langenberg's methods of increasing the strength of gun tubes by expanding them hydraulically rest upon the same principle. G. M. Eaton† also has shown that coiled springs may be much improved by quenching in an internal spray.

In high-speed turbine shafts and disks the centrifugal forces induce large stresses in tension. If such pieces are quenched so that the periphery cools first, the resulting internal stresses are in tension, which obviously reduces the factor of safety in the design. Mr. Merten calls attention to the fact that compressive stresses of from 5000 to 15,000 lb. per sq. in. may be placed in hollow forged or bored disks as follows: Mount the disk before heating on a mandrel, and when ready to quench place the mandrel on suitable rollers and spin the disk rapidly, meanwhile spraying pressure water on the center of the disk. Subsequent tempering

---

*Paper entitled "Die Kesselbaustoffe," in *Zeitschrift des Vereines Deutscher Ingenieure,* Jan. 19, 1924.

†*Transactions,* American Society for Steel Treating, November, 1927.

relieves these quenching stresses somewhat, but never entirely, as evidenced by slight changes in dimension after machining. At any rate, those that are left are in such a disposition as to increase the margin of safety during operation, rather than the opposite.

In presenting his paper, Mr. Merten pointed out that the great difficulty in heat-treating such a forging as a complete rotor for a big turbo generator led them to manufacture it of a series of disks, placed side by side and held together by bolts extending from one bearing boss to the other. These disks are about 20 in. thick, 56 in. in diameter, have an 8-in. bore, and weigh 7500 lb. each. By means of the quenching described, and this method of sectional construction, the slots cut in the assembled rotor could be deepened so much that the extra coils thus provided for increased the electrical rating of the machine from 50 to 75 per cent. A. B. Kinzel also said that this same principle was utilized by saw smiths, who were in the habit of quenching the rim of high-speed circular saws, then smithing the center to put compression on the circumference. Studies showed that these induced stresses amounted to 18,000 lb. per square inch; machines have also been developed to perform this work under close control.

Case Hardening with Ammonia

Vanadium steel case hardens excellently in ammonia at 950 deg. Fahr., according to results reported by A. B. Kinzel, of Union Carbide and Carbon Research Laboratories, Long Island City, N. Y. Aluminum alloy steels for this purpose have already been developed by Fry, in Germany,[*] and the process of low-temperature nitrification without scaling or distortion is commercially attractive.

Ordinary calorized steel will not harden usefully in ammonia, because the aluminum concentration at the surface is too high; a long, high-temperature anneal after calorizing will diffuse aluminum inward to the necessary degree, but the double process is undesirable; it also scales the surface.

A short, low-temperature calorizing treatment on carbon steel or chromium steel at 1020 deg. Fahr. for 2 hr. gave a good case after nitrification. No embrittling resulted; the bar before treatment had Izod impact of 80, and 78 afterward.

Chromium, silicon, manganese, tungsten and titanium steels are not so good as aluminum for the process. Zirconium steels appear erratic.

A series of 0.06 per cent carbon steels alloyed with vanadium were tried. With vanadium above 0.5 per cent a nitrogen case with maximum hardness (67 Rockwell "C") was secured. More vanadium is required as the carbon increases; it seems that the ferrite must contain at least 0.4 per cent vanadium. Vanadium may be economized by adding chromium, manganese or silicon, or combinations of these, to the higher carbon steels, which alloys replace some vanadium in the complex carbide. One per cent plain carbon steels may be successfully treated after packing in powdered ferrovanadium and heating as follows:

Stage	Gas Atmosphere	Temperature	Time
Decarbonize	Hydrogen	1290 deg. Fahr.	30 min.
Vanadiumize	Nitrogen	1690 deg. Fahr.	2 hr.
Nitrogenize	Ammonia	950 deg. Fahr.	15 hr.

If the high-carbon steel originally contained 0.5 per cent vanadium, the middle stage can be omitted.

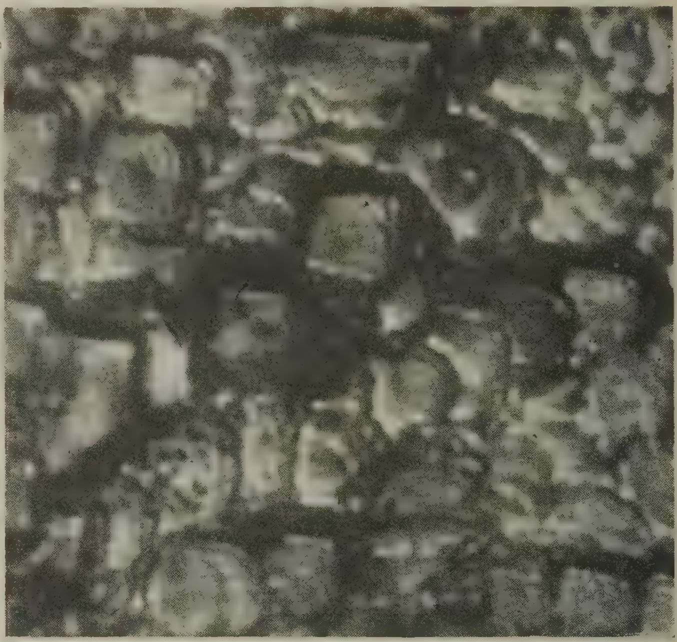
H. A. De Fries, metallurgist Ludlum Steel Co., Watervliet, N. Y., described recent developments in aluminum steels for nitride case hardening. Straight aluminum, or chromium-aluminum steels, with or without nickel, will produce very hard surfaces, but all of them are subject to "Krupp Krankheit" or brittleness after heating at moderate temperatures. For instance, a steel with original impact value of 15 would test only 2.5 after heat treatment. One quarter per cent molybdenum corrects this defect. The impact loss is only two units, regardless of whether the core is tested, or the test piece case hardened before testing. Present practice is to use aluminum from 0.25 to 1 per cent, molybdenum 0.15 to 0.60 per cent, and low chromium. Ten to 15 hr. in ammonia at 875 to 950 deg. Fahr. is sufficient to give a case, comparable in Herbert pendulum hardness to cases developed on plain aluminum steels in a much longer time. Such parts installed in high-speed automobile engines are giving superior resistance to abrasion.

P. C. Osterman, American Gas Furnace Co., Elizabeth, N. J., confirmed the statement that molybdenum-aluminum steels give the hardest cases in ammonia, and the quickest penetration. Eight hours is all that is necessary for some commercial parts. Nitrification of ordinary carbon steels will probably be much used to induce a superior degree of corrosion resistance. Alloy steels, covered with mill scale, may be given a hard and useful case by nitrogen; a soft friable shell is produced, easily removable, and under this a hard surface is found.

When questioned regarding the use of these materials for gages, Mr. Kinzel said that aluminum steel changed 0.0003 in. per inch after nitrification; vanadium steel changed less than half as much.

Crystals Within Metallic Grains

Results of a new method of preparing metal samples for microscopic examination were shown by R. G. Guthrie, Peoples' Gas Light & Coke Co., Chicago, and J. Fletcher Harper, Allis-Chalmers Mfg. Co., Milwaukee, in a paper entitled "Crystal Micrography." Work has thus far been confined to pure metals or solid solutions, which, in the authors' opinion, appear much alike because conventional polishing methods produce a film of cold-worked metal which is only in special instances removed by the etching solutions. By methods which were not divulged an optically plane surface is produced by them, which after short pickling develops what would ordinarily be called etching pits, but which Messrs. Guthrie and Harper believe to be the real crystallographical constitution of the metallic grains. From the preliminary studies, certain ideas were advanced, tentatively, on the nature of martensite, and slip bands and the effect of plastic deformation. No evidence is found in high-power micros of the presence of amorphous material at the grain boundaries.



Hot Forged Armco Ingot Iron, Slowly Cooled but not Heat-Treated. Etched with hot concentrated hydrochloric acid. Magnified 2500 diameters

In the discussion the warning was sounded that the appearances developed may be more apparent than real. E. C. Bain, of Union Carbide & Carbon Research Laboratories, reminded those present that plastic flow and ruptured surfaces may give large single crystals the appearance of being made of a number of different blocklets, whereas thousands of X-ray spectograms failed to show any mixed orientation in such a single crystal. R. S. Archer, of Aluminum Co. of America, also warned against hasty conclusions, recalling the pronouncement that duralumin, which would season crack, is coarse grained (under the X-ray analysis) whereas fine grained material is permanent, and some ingenious speculations are based thereon. This pronouncement was made after a limited number of examinations, and has recently been shown to have no basis in fact.

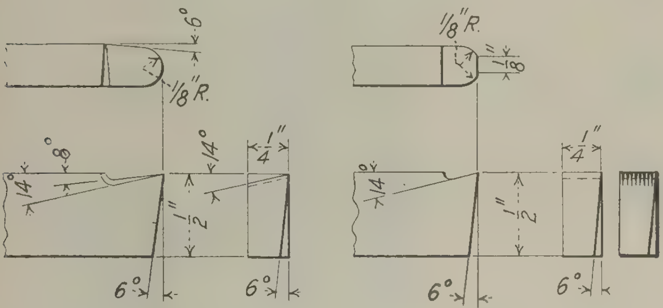
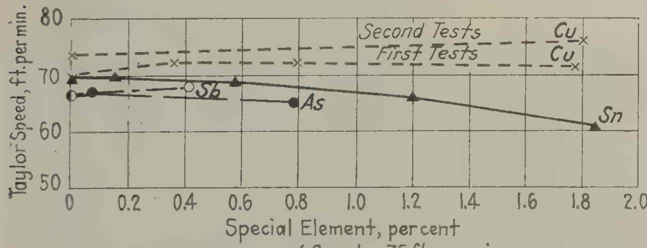
Impurities in Tool Steel

Some tool steel of the low-tungsten, high-vanadium type was melted in the electric furnace at the United States Bureau of Standards, poured into a ladle containing measured amounts of the impurity, cast into 55-lb. ingots, cooled, annealed, surfaced, reheated, and forged or rolled into 1½-in. square bars. Antimony up to 0.4 per cent, arsenic to 0.8 per cent, copper to 1.8 per cent and tin to 1.8 per cent were added. Cutting tests were then made, and results were reported by H. J. French and T. G. Digges in a paper entitled "Effects of Antimony, Arsenic, Copper and Tin in High-Speed Tool Steel."

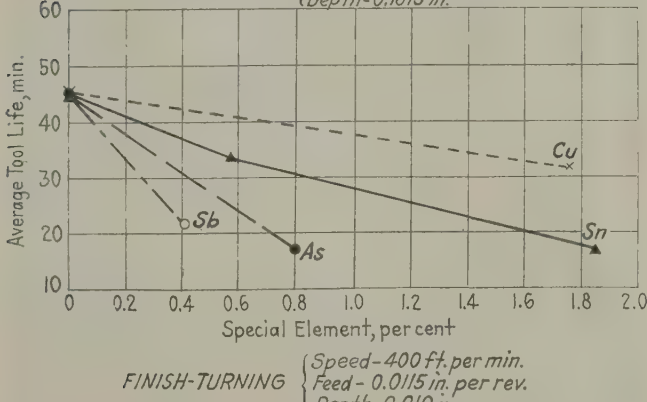


Lathe Tools Used in Tests. Roughing tool at left, finishing tool at right. After breakdown, finishing tool has corrugations on nose

Test tools of the shape illustrated were made and compared with a commercial steel known to represent the capabilities of the type chosen. In the rough-turning tests, figured back to the Taylor speed, the effect of the added metals is not great—copper in fact seems to improve the tool, a fact verified by a second test. Finish-turning tests have not yet been standardized, but in this instance were done by setting two tools in one holder for equal depth of cut. The "trailer" tool will then do no cutting as long as the "leader" shows no wear. Experience shows that when the leader has worn about 0.002 in. the trailer begins to cut, and this time marks the life of the leading tool. As compared with the standard tool, all four added metals show marked detriment to a finishing tool. The authors conclude, therefore, that these elements should be excluded from the melt by careful selection of scrap and alloys if the best high-speed steel is to be made.



ROUGH-TURNING {Speed – 75 ft. per min. Feed - 0.028 in. per rev. Depth - 0.1875 in.



FINISH-TURNING {Speed - 400 ft. per min. Feed - 0.0115 in. per rev. Depth - 0.010 in.

Copper, Tin, Antimony and Arsenic Affect Durability of Finish Turning Tools More Than Rough Turning Tools. All tests run without coolant

The steels with 1.7 per cent antimony and 1.8 per cent tin were very hot short, and could not be forged. The others forged; some developed surface cracks which were later machined out. The tin-bearing steels smoked during forging like molybdenum steels. None of the added elements caused any material change in hardness (either as quenched or after drawing at various temperatures) from that of the standard tool after equivalent heat treatment, with the exception of the tin-bearing steels which had about the same hardness after quenching at 2200, 2400 or 2500 deg. Fahr., and at all draws up to 900 deg. Microscopic examination revealed no abnormalities in any of the steels.

Finishing tools have a curious appearance after breakdown. As shown on the sketch they are ground with a blunt nose. After failure the end is corrugated with little ridges, extending down from the cutting edge about ⅛ in. and spaced according to the feed given the tool.

A steel manufacturer in commenting upon the difference between added impurities and residual impurities existing in the original ores or metals, said that the total of arsenic, antimony and tin must be less than 0.1 per cent in order to avoid trouble in rolling high-speed steel, especially on the thin edges. Chemical analyses of such elements in slight amounts is very difficult, however, and the user of impure ferrotungsten is never sure of just what he is getting.

Gray Iron Research Committee Meeting Changed to Pittsburgh

The meeting to consider a proposed organization for research work in gray iron foundry practice, which is being organized by the Philadelphia Foundrymen's Association and which was called to meet in Philadelphia on March 13, as published in THE IRON AGE, Jan. 26, page 309, has been changed to Pittsburgh for the same date. This is the result of a conference between the Philadelphia committee and representatives of the Western committee, held in Philadelphia on Feb. 7.

According to a tentative agenda, the summary of the Western viewpoint will be given by Walter Seelbach. with that of Philadelphia opinion presented by Walter Wood. This will be followed by an address by some prominent manager of a non-competing association and by general discussion.

Definition of Term for Special Annealing Wanted

The committee on heat treatment of ferrous castings of the American Foundrymen's Association calls the attention of steel foundrymen to tentative standard A-119-27-T of the American Society for Testing Materials, entitled, "Tentative Definitions of Terms Relating to Heat Treatment Operations." Under this heading the term "annealing" is defined as "a heating and cooling operation of a material in the solid state." This definition is necessarily broad in order to cover all types of annealing practice now in use. A full discussion of the subject appeared in the issue of the *Bulletin* of the American Foundrymen's Association for December, 1927.

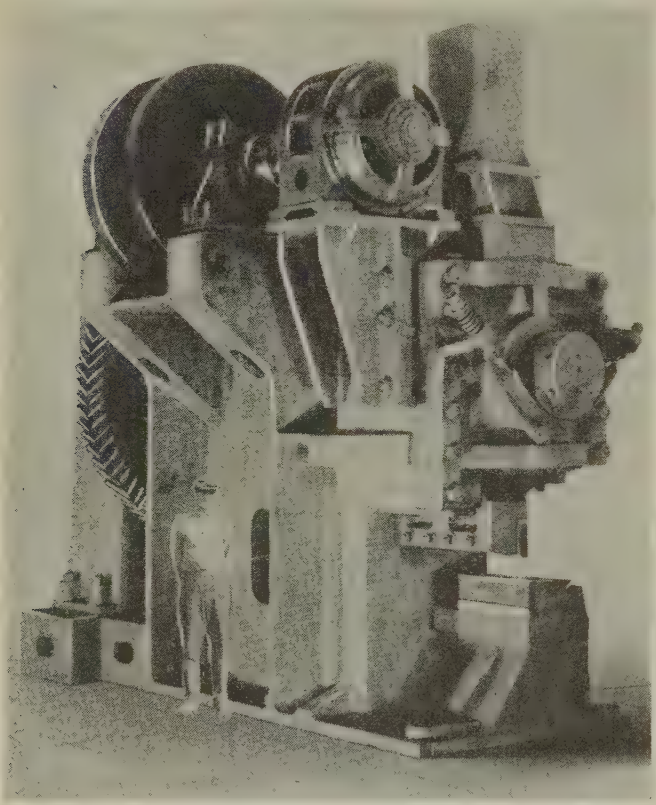
It has been suggested that a specific term be proposed for steel foundry slow-cool annealing practice in which castings are heated above the critical, followed by furnace cooling. Those interested in the question are invited to send their comments and criticisms to A. W. Lorenz, chairman of the committee, care of the Bucyrus-Erie Co., South Milwaukee, Wis.

Total apparent consumption of babbitt metal in January, based on reports received by the Department of Commerce from 31 firms, was 4,928,517 lb., compared with 4,465,787 lb. in December, and 5,439,689 lb. in January, 1927.

Large Shear Cuts Cold Alloy Steel Bars 5 In. and Less in Diameter

A new open-throat shear of large capacity and having improvements which facilitate operation and reduce maintenance has been brought out by the Mackintosh-Hemphill Co., Pittsburgh. The capacity is for cutting 4½-in. square or 5-in. round cold alloy steel. The stroke of the shear is 6½ in. and cuts are made at the rate of about 15 per min.

The massiveness of the machine may be noted from the illustration. The height is approximately 16 ft. and the weight is about 225,000 lb., 80,000 lb. of which is in the shear frame alone. The pressure at the knife is 1,400,000 lb. A 125-hp. motor, mounted on top of the frame, is employed to drive the machine. Drive gears are also mounted on top of the shear, which arrangement is intended to provide increased floor space around the machine and place the motor drive where it is less exposed to injury.



Alloy Steel May Be Sheared at the Rate of Approximately 15 Cuts Per Min. The weight of the machine is 112 1-2 tons

All gears, including master gear and pinion, have herringbone cut teeth with a solid apex. The motor pinion and motor gear shaft are provided with ring oil bearings having babbitt lined shells fitted in steel bearing bases which are rigidly keyed and bolted to the shear frame. Symmetrically spaced on the pinion shaft are two 63-in. flywheels which serve to equalize the load on the motor shaft bearings. The flywheels, as well as all gears, are inclosed in oil-tight covers.

The eccentric shaft has a square end on which the loose clutch slides. It is supported in two bearings on the frame of the shear and by an outboard bearing at the clutch end, as well as by one in the face plate. The eccentric is provided with a solid bronze slide which is mounted on the top ram. Bronze liners are also placed between the ram and the shear frame, and the front side of the ram is equipped with an adjustable wedge for taking up wear. An air-operated jaw clutch is also mounted on top of the frame.

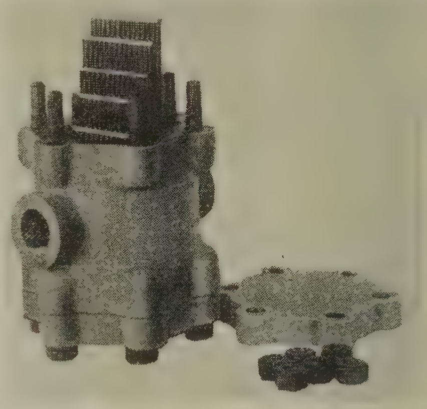
The top knife block is balanced by means of a double spring at the top of the shear which is easily accessible for adjustment or replacement. To insure the stopping of the top knife block in the upper position, a band brake is provided at the end of the eccentric shaft. This comes into action automatically as the ram reaches the top of its stroke and goes out of action when the material is being cut. Lubrication of this machine has been given thorough attention.

Purifier For Use in Connection with Air, Steam and Gas Lines

The Andrews-Bradshaw Co., division of the Blaw-Knox Co., Pittsburgh, has brought out a "pipe line Tracyfier" for use in connection with air, steam or gas lines up to 3 in. The device is similar in principle to the company's larger purifying device known as the Tracyfier.

In saturated steam lines the device is said to remove all moisture, delivering standard specification steam that is free from solids, both soluble and insoluble. It may also be used in gas-producer steam lines to maintain more uniform hydrogen content in the gas and in the steam lines leading to the tar burners on open-hearth furnaces. In the latter application the dried steam is said to produce a shorter, hotter and more uniform flame, save approximately a gallon of tar per ton of steel, and keep the checker chambers cleaner. In connection with air lines, one "pipe line Tracyfier" may be used for drying and cleaning the air for several tools, and it is claimed that in lowering the out-of-service time the output of each pneumatic tool is increased. The device may be used also for removing, either for recovery or elimination, of drops of liquid carried by gases.

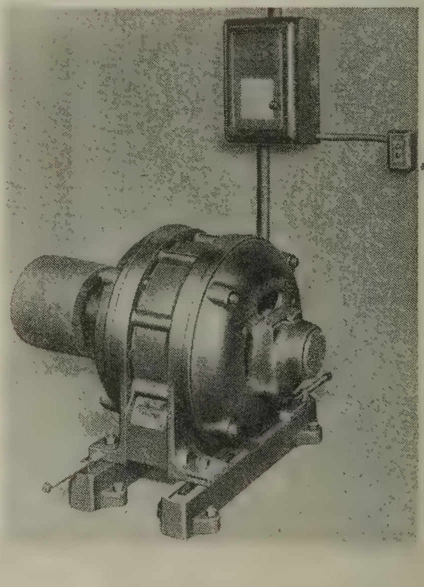
In Air Lines, One Purifying Unit Will Dry and Clean the Air for Several Tools



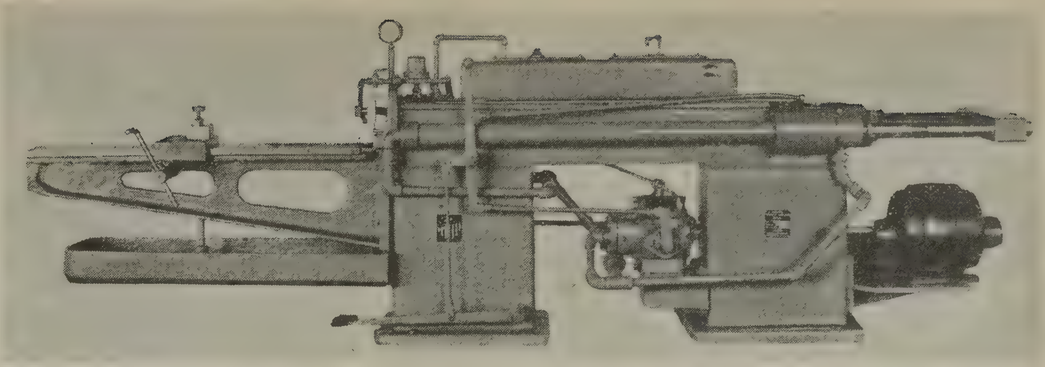
Induction Motors Designed for Starting on Full Line Voltage

Line Start squirrel-cage induction motors designed for starting on full line voltage have been placed on the market by Allis-Chalmers Mfg. Co., Milwaukee.

Starting Equipment Consists of Magnetic Switch With Push-Button Control



These motors are normal torque, high reactance machines and will not, it is stated, draw starting current in excess of the limits recommended by the electrical apparatus committee of the National Electric Light Association. They are available in ratings from 7½ to 30-hp., 600 to 3600 r.p.m., low voltage, and with either sleeve or roller bearings. Magnetic switch with push-button control is the only starting equipment required.



Broaches Up to 50 in. Long May Be Used. Cutting speeds range from 0 to 28 ft. per min.

Broaching Machine With Variable Cutting and Return Speeds

Variable speed hydraulic cutting and return strokes and twin-cylinder construction are features of a new No. 2 hydraulic broaching machine which has been added to the line of the American Broach & Machine Co., Ann Arbor, Mich.

The range of cutting speed is from 0 to 28 ft. per min. and the return speeds up to 60 ft. per min. are obtainable. The stroke is sufficient to permit use of broaches 50 in. long. The machine is fitted with hand and foot lever controls and a direct-reading gage that indicates the amount of pressure applied. The front of the machine has a finished face which extends to within a few inches of the floor and to which support tables or fixtures may be attached. The unit illustrated is equipped with the support table, carriage and oil pan.

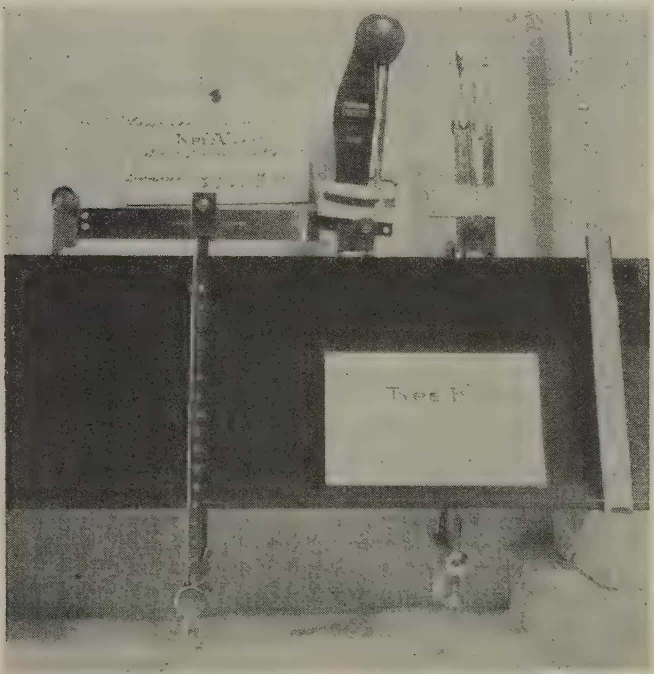
Twin-cylinder construction, used in other horizontal hydraulic broaching machines built by the company, is emphasized as giving the advantage of applying pressure on the full area of the piston and avoiding high pressure against the packing glands. The bore in the cylinder is 2¼ in. The machine is fitted with three rams, 2½ in. in diameter, one in each cylinder and one for operating the sliding head, all three being connected by means of a cross head and all moving simultaneously. Cylinders are of steel, machined and honed to assure high finish, and are fitted with pistons having two conventional type piston rings and leather cups. The oil tank has capacity of approximately 15 gal. The pump operates under pressure of 1000 lb.

The bore in the face of the machine is 5 in. in diameter. The pulling head is tapped 2 in., 8 pitch. Vertical adjustment of 1½ in. above center, and 1 in. below center is provided. The sliding head is fitted with hardened steel shoes which operate in box-shaped ways. The speed of the pump is 900 r.p.m. A 5-hp., 900 r.p.m. constant-speed motor is recommended. The weight of the machine is 4000 lb.

Tensometer or Strain Gage

To measure accurately the extension of a material under test in a tensile testing machine, the Southwark Foundry & Machine Co., Philadelphia, is putting out the Huggenberger tensometer, of which an illustration is given. This is manufactured in Zurich, Switzerland, and avoids the use of the dial indicator. It is based on the lever principle and is made in several types for varying uses.

That shown at the left of the illustration is type A, with a tilting knife edge at the lower right extremity of the working section. This is essentially a laboratory instrument, possessing the requisite precision and sensitivity. The lever multiplication is about 1200 to 1, which makes it possible to measure a change in the length of a specimen when this change is as much as 0.00001 in.



Two Forms of the Tensometer Are Here Shown. That at left is the high-precision type for laboratory use; at right is the outdoor type, which may be used regardless of exposure to rain, snow or dust

Type B, shown at the right of the illustration, is of more rugged construction and is designed for use in the field. The lever muiltiplication is about 1000 to 1, giving about the same sensitiveness in measurement. This instrument can be used even under exposure to dust, rain, and snow, as all moving parts are outside the frame, where they may be readily cleaned and inspected.

Spang, Chalfant Reorganization Completed

Henry Chalfant, who was chairman of the board of Spang, Chalfant & Co., Inc., Pittsburgh, prior to the merging with that company of the Standard Seamless Tube Co., continues as chairman in the new and enlarged company, while W. C. Fownes, Jr., who was treasurer and general manager Standard Seamless Tube Co., becomes chairman of the executive committee. Gordon Fisher continues as president, Charles F. Cruciger as vice-president and treasurer, and C. R. Barton, who was general superintendent Standard Seamless Tube Co., and W. J. Hampton, who has had charge of operations, for Spang, Chalfant & Co., are vice-presidents of the new company. These men and J. H. Hillman, Jr., W. S. Mitchell, A. B. Sheets, I. C. Chalfant and C. F. Beachler comprise the board of directors.

The capital structure of the new company consists of 150,000 shares 6 per cent cumulative preferred stock of $100 par value, and 1,000,000 shares of common stock of no par value, of which 117,500 shares of the preferred and 750,000 shares of the common have been issued. Of $12,000,000 first mortage 5 per cent sinking fund bonds authorized, $10,000,000 is to be issued, the proceeds to be used for the acquisition of the business and assets of the Standard Seamless Tube Co. The company has acquired 100,000 shares of 375,625 shares of common stock outstanding of the Oil Well Supply Co., having a present market value of approximately $3,500,000. The old Spang, Chalfant & Co. was capitalized at $7,000,000 and the Standard Seamless Tube Co. at $2,000,000.

Germany Imports More Machinery

Buys More Special Machinery but Fewer Machine Tools—Trade with United States Strongly Favorable to This Country—German Output Recovers

BEFORE the war, machine tools formed a large share of the German machinery imports, particularly those coming from the United States, according to a report by Theodore Pilger, American trade commissioner, Berlin, Germany. Since the war this trade in machine tools has never returned to the pre-war levels, but a part of the loss has been replaced by the sale of much special industrial machinery. This is of a widely varied type, such as road-building equipment; conserving, canning and packing machinery; printing and paper-working machinery, and special-purpose equipment for all industries which are now being modernized.

The amount of machinery imports in 1927 was 62 per cent of the amount imported in 1913, and the value of imports in 1927 was 130 per cent of 1913. The price per pound of machinery imported into Germany rose from 11c. in 1913 to 24c. in 1924, and was 23c. in 1927. In the past year German machinery imports exceeded 1926 imports by nearly 50 per cent, in both value and tonnage. The United States has been furnishing a considerable part of these increased imports, and German industrialists are looking here for the latest and most modern equipment in every field.

German Machinery Exports 87 Per Cent of Pre-War Volume

Exports in 1925 and in 1926 averaged about 35 per cent of the total German machinery production, but because of the increased domestic demand, 1927 exports were probably not over 30 per cent of total production. In 1927, 458,000 tons of machinery was exported with a value of 870,000,000 marks, about 87 per cent of the pre-war value, when corrected for the higher price level. The price per pound on machinery exported has also shown a steady rise in recent years, in 1911 to 1913 averaging 12c.; in 1924, 18c.; in 1926, 19c., and in 1927, 20c. The gain may be largely attributed to the use of less metal of a better quality than was used in pre-war years. Furthermore, German machinery manufacturers are now using better cost accounting systems than before, their quotations on foreign business are beginning to rise somewhat.

It also appears that considerable progress has been made in improved design, based principally upon the better raw material now obtainable. Germany is now using higher grade iron ores imported from Sweden, Spain and Morocco, instead of the low-grade "spath" ore from the Siegerland and the "minette" ore from Lorraine. Furthermore, Siemens-Martin furnaces are being used in the manufacture of steel to a much greater extent than heretofore.

Textile machinery is the most prominent group of German exports, followed by metal-working and power-generating machinery and agricultural implements.

Trade with United States Almost Balanced in Tonnage

In 1926, 70 per cent of Germany's total machinery exports were sold to other parts of Europe; 11.6 per cent to Latin America; 7 per cent to Asia; 4.7 per cent to the United States and Canada, and 1.5 per cent to Africa.

Official statistics recently issued by the German Government for 1927 show that German machinery exports to the United States (13,528 metric tons) were only 99 metric tons greater than the German machinery imports from the United States. Despite the virtual balance in weight, by value the balance is strongly favorable to the United States, as the pound price of the United States exports is much over the pound price of German exports.

In 1913 the United States was in thirteenth place as a buyer of German machinery. In 1924 it was fourteenth; in 1925 fifteenth, but in 1926 it rose to sixth place as a German machinery customer. In 1925 the United States bought 8153 metric tons of German machinery, valued at 18,990,000 marks; in 1926, 17,839 tons, valued at 34,639,000 marks, and in 1927, 13,528 metric tons (value not yet made public). Although 1926 was, therefore, an extraordinary year, it does appear that the United States is steadily increasing its purchases of German machinery.

Factors Contributing to Recovery of German Machinery Industry

Much of the recovery made by the German machinery industry since the beginning of 1924, according to Mr. Pilger's report, may be attributed to corporate consolidations, cartels, foreign loans made to Germany during the period, Government support of engineering industries, and good labor at low wages. Although exports by tonnage have not quite reached the high mark of 1913, it is believed that 1927 was one of the greatest production years in the country's history.

Financial Structure and Loans

German machinery builders, in line with all other German manufacturers, have found it advisable to report fixed capital as low as possible, and in spite of great enlargements made during the war, statements of fixed capital are almost the same now as in 1913. Legal and other reserves, as well as long term obligations, have practically disappeared from balance sheets. Although the average profit on invested capital in 1925 was only 1.4 per cent, earnings were much better in 1927. Concentration of industry has also been actively forced, first as a result of inflation and later because of competition. This consolidation movement has been much more evident in the basic raw material field than in the finished manufacturing lines.

This stabilizing corporate activity would not have been possible, in view of the shortage of working capital, had it not been for generous loans made to Germany by foreign countries. The last two years have also shown marked progress in the negotiation of foreign trade treaties in which the machinery industry has taken a large part. It has also declared itself in favor of a gradual reduction in the German tariff on machinery in order to encourage corresponding reductions by other countries. An increasing amount

Comparison of Machinery Industries in Germany and the United States in 1925

	Germany	United States
Number of factories engaged in machinery building	15,965	8,154
Total annual machinery producing capacity, 1925, German estimate	$1,200,000,000	$4,050,000,000
Total number of employees	612,165	481,212
Average number of employees per factory	38	59
Percentage of salaried employees to total employees	17.2	18.5
Total horsepower in use	635,000	1,424,259
Horsepower per employee	1.04	3.38
Value of production	$690,000,000	$2,232,985,974
Value of production per employee	$1,090	$4,640
Value exported in 1925	$175,000.000	$149,379.000
Value exported in 1927	$207,000,000	$180,167,000
Percentage of production going to export	39	6.7

of German machinery is also coming into the world's markets as "satisfaction for war indemnity."

Government Support

Government support to the German machinery industry embraces: Reduction of 50 per cent in inland freight rates covering export shipments, Government export credit insurance, a Government guarantee of export credits granted to various purchasers, Government ownership or controlling interest in a number of machinery factories, furnishing special banks with funds at rates below the regular market which are made available to finance export shipments, support of standardization and simplification programs, countenancing of cartels, trusts and other price-regulating organizations and permitting sales abroad at lower prices than in the protected domestic market.

Stable Labor Conditions and Low Wages

Labor conditions, the fourth factor in the recovery of the German machinery industry, seem to have become stable. Although the trend is upward, it is not believed that any rapid increase in wages is likely. Efficiency and output are rapidly increasing by the use of greater power and the adoption of American production methods. Although the legal working day is now 8 hr. in Germany there is no difficulty in obtaining workmen for overtime at the regular hourly wage. The matter of "hours" in Germany is less a matter of law than of unfilled orders in the shops.

Germany's Share in World Production

According to a monograph on the world's engineering industries published at the International Economic Conference at Geneva in 1927, Germany claims to have built about 21 per cent of the total world output of machinery in 1913, compared on a basis of value, while Great Britain built 12 per cent; and the United States, 50 per cent. Reducing 1925 values to pre-war levels, Germany claims that in that year she built only about 13 per cent of the world's output of machinery, with Great Britain and the United States building 14 and 58 per cent respectively.

Germany claimed in 1925 to have manufacturing capacity sufficient to turn out $1,200,000,000 worth of machinery annually and that its factories were about 70 per cent active. These German statistics gave the United States capacity at $4,000,000,000 and set Great Britain at $825,000,000 annually, with the capacity of the entire world at $7,000,000,000. Of the world's exports of machinery in 1913 Germany supplied 29 per cent, Great Britain 28 per cent and the United States 27 per cent, according to the monograph. Based on pre-war values, the United States supplied 34 per cent, Great Britain, 24 per cent, and Germany, 21 per cent of the total world exports in 1925.

German and American Industries Compared

As shown in the accompanying table, Germany employs 21 per cent more persons in its machinery factories than does the United States, but each man has only 1.04 hp. furnished to him, as compared with 3.38 hp. per employee in the United States. Largely for this reason, the American workman produces $4,640 worth of machinery per year, or over four times that of his German colleague.

The relative importance of export markets to the United States and to Germany is shown by the fact that foreign shipments represented only 6.7 per cent of American production as compared with 39 per cent for Germany. The machinery trade from and to Germany in 1926 gave an excess of exports over imports amounting to 706,000,000 marks, which is one-eighth of the total excess exports of that year for all important manufactured commodities which showed an export surplus. Furthermore, it is one-eighth of the total net importation of foodstuffs and raw materials which Germany brought in.

Power Transmission Association Holds First Regional Meeting

The first of a series of regional meetings of the Power Transmission Association was held at the Poor Richard Club, Philadelphia, Feb. 3. The attendance was in excess of 100 and included manufacturers, distributers, engineers and salesmen of mechanical power transmission equipment.

W. H. Fisher, vice-president of the T. B. Woods Sons Co., Chambersburg, Pa., and president of the association, presided at the meeting. The general object of these regional conferences, the next of which will be held in Chicago, is to acquaint members of the industry with the purposes and scope of the association, which aims to promote the most efficient and economical distribution of power. It is planned to collect and disseminate data that will be helpful to representatives of the industry in cooperating with the users of power transmission equipment in selecting the most efficient method of drive. It was explained that the association is committed to "the right drive in the right place."

T. E. Hazell, vice-president of the William H. Taylor Co., Allentown, Pa., and member of the association's dealer relations committee, in an address following that of Mr. Wood, pointed out that the association would fill a long-felt want in providing the necessary supplementary consulting engineering and technical service for distributers and dealers. The association would provide a place to which salesmen could refer special problems and secure the experience of users and the recommendations of engineers, he said.

At the annual meeting of the association in New York, Dec. 7, an advertising program to acquaint the users of power equipment with the purposes of the association was suggested, the advertising space to be appropriated for the association from the member's schedules. Roy C. Moore, Charles A. Schieren Co., New York, chairman of the advertising committee, explained the progress made and predicted that the program adopted would prove to be an outstanding example of coordinated and cooperative advertising, of high value to the association and to each member company contributing use of its space.

Charles E. Carpenter, E. F. Houghton & Co., Philadelphia, emphasized the value of the opportunity afforded by the association in showing the place of the products of its members in the equipment of programs of plants throughout the country. Other speakers included L. H. Shingle, Shingle-Gibb Leather Co., Philadelphia; W. A. Staniar, engineer of the Du Pont companies, Wilmington, Del., and chairman of the association's board of advisory engineers, and W. S. Hays, executive secretary of the association.

At a meeting of the executive committee nine regional chairmen or team captains were named to head an "every member get a member" drive. Edward H. Ball, president, Chicago Belting Co., Chicago, is general chairman. The regional chairmen are: H. E. Whiting, Whiting Leather & Belting Co., Long Island City, N. Y.; Charles M. Murray, Transmission Ball Bearing Co., Buffalo; Stiles C. Smith, Smith Power Transmission Co., Cleveland; D. I. Wheeler, Whitney Mfg. Co., Hartford; F. H. Willard, Graton & Knight Co., Worcester; A. G. Snider, Hide Leather & Belting Co., Indianapolis; H. J. Heasley, G. W. Sadler Belting Co., Montreal, Canada; J. E. Henry, Medart Co., St. Louis, and H. P. Degen, H. P. Degen Belting Co., San Francisco.

Employment Off During January in Illinois—Improvement Looked For

Employment in Illinois dropped 2.1 per cent during January and reached the lowest level since the war, according to a report recently issued by the State Department of Labor. Immediate prospects in metal and wood industries, as well as in other industries, notably iron foundries and printing trades, indicate a general industrial improvement in February, according to the report. Automobile establishments reported a gain of 2.6 per cent. In sheet-metal and electrical products establishments the course of employment was downward during January.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY
DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Current Statistical Data, Considered Independently of Trade Opinion, Indicate That:

Steel ingot output (adjusted) increased with unusual sharpness in January and probably will continue upward for a time.

Unfilled orders showed a smaller increase than in December, and less than the gain in ingot production.

Pig iron production advanced to normal, making a smaller gain than ingot output and early price recovery may be expected.

Finished steel prices, still too low for a proper relation with their raw materials, advanced during the month to a better position.

IN general, the impression to be gained from an examination of the steel statistics this month is that of the "scared bull." The trend is favorable, as we had anticipated it would be at this time. But conditions are not altogether conducive to a sustained improvement in the industry. Production appears to be well up with requirements, and is large enough to arouse doubts as to any large advance in prices. The question is being asked, are the consumers not taking more steel than they actually require?

This is at least a reasonable question, in view of the fact that ingot production is in excess of theoretical normal requirements and the further fact that prices have been suspiciously slow in advancing when compared with the sharp gains in unfilled orders and in the volume of production. It may well be asked why prices are so low. And the answer must be that either the supply, including stocks, is large, or the demand is small, or both conditions are true. Consumers have thus far merely shown a willingness to take a large quantity—at a low price.

Ingot Output Jumps Above Normal

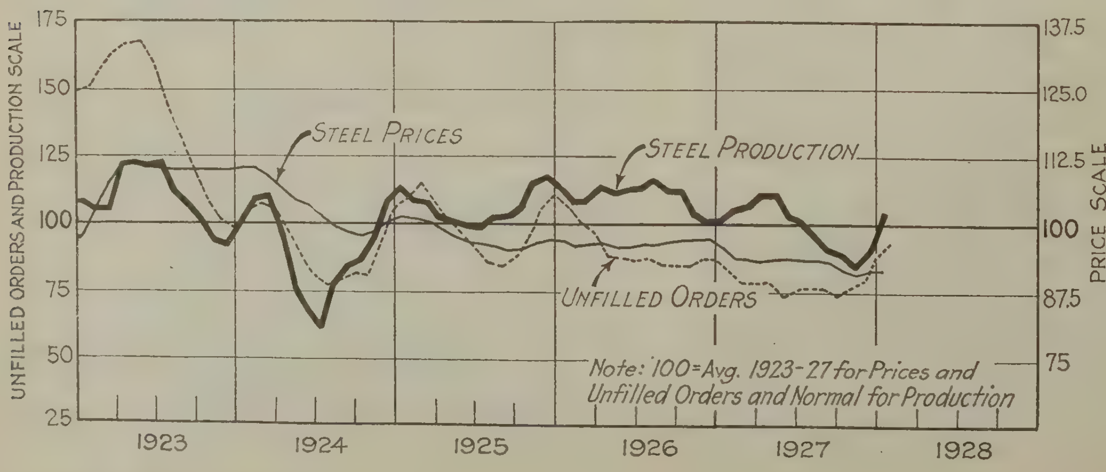
STEEL ingot production was sharply upward in January. Not only did it rise more than usual for the season, but enough to carry the average daily production from 10 per cent below normal to nearly 5 per cent above normal. The only comparable gains in recent years have been in August, 1924, and April, 1923. Nothing approaching it has appeared in January.

Our adjusted index of ingot production, allowing for normal growth and for seasonal variation, is 104.7 per cent of normal, against 89.8 per cent in December and 101.5 per cent in January, 1927. It is thus not only higher than a year ago, but represents the highest annual rate of ingot production that has existed since last May. Such expansion rarely occurs except under one or two circumstances: (1) at the beginning of a period of sustained recovery (as in 1922 and 1924), or (2) near the end of a recovery (as in April, 1923, December, 1924, and November, 1925).

It is significant as to the present case that the expansion starts from a sub-normal point, as to both steel production and activity in most of the chief consuming industries, notably in the automobile, railroad and mining branches. Naturally, this suggests that the recovery is not a mere final spasm at the peak of a business boom. On the other hand, it carries production in one leap above normal and, as shown last week in this department, above the indicated level of the potential requirements of the chief consuming industries. Accordingly, some doubt may well exist as to the continuance of the upward movement for any prolonged period.

Some light on the question might be expected from the condition of unfilled orders. If unfilled orders were large and continually rising, production might easily continue to expand. Unfilled orders are rising (or have been rising), but they are not yet large, and the January increase was less than that which occurred in December. The production curve gained on the unfilled orders curve. Thus we are left in doubt.

The price situation is the result of demand and supply conditions, and as we know something about supply we may infer something about demand. The price trend is slightly upward. At this writing THE IRON AGE index of finished steel prices is 2.364c. The average for January was 2.32c., which compares with 2.31c. in December and 2.30c. in November. The January average is 91.6 per cent of the average for the five years 1923-1927. This appears to be but a halting response to the rise in the unfilled orders. Moreover,



Note: 100=Avg. 1923-27 for Prices and Unfilled Orders and Normal for Production

Fig. 1—Steel Production Increased More Sharply in January Than in Some Years. Prices, after sagging for months, have turned upward. Unfilled orders have made two substantial monthly gains

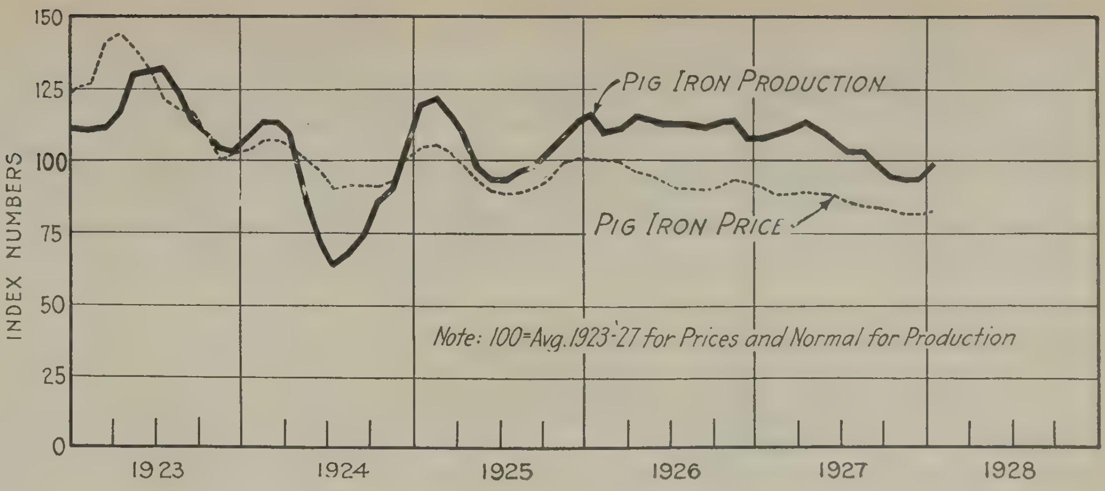


Fig. 2—Good Recovery in Output of Pig Iron May Presage an Approaching Advancement in Prices. But weakness in fuel and scrap may retard the recovery

it shows that producers are willing to expand production in spite of a low price level. There is no indication of much gain in the intensity of demand. Again we are left in doubt.

Normal Output of Pig Iron

PIG iron production increased approximately to the normal level last month. After falling to 93.2 per cent of normal in November, it rose to 99.7 per cent in January. These figures allow for both seasonal variation and a conservatively determined factor of normal growth. Thus it may be noted that, in spite of a considerable recession in industry, the pig iron output was reduced only to 7 per cent below estimated normal, and continued below normal only four months.

As usual, the price of pig iron has rather closely followed the direction of the production curve. At this writing, THE IRON AGE composite is $17.75. The average for January was $17.65, which compares with $17.54 in December, the low month. The January average was 82.5 per cent of the average for the five years 1923-1927. It will be remembered that finished steel prices were 91.6 per cent of the five-year average. (Also, steel production was more sharply curtailed than was the pig iron output, and it fell further below normal.)

Thus it can be said that pig iron has suffered more over-production and greater price weakness than has steel. But it can also be said that pig iron production expanded less rapidly than steel production in January. In fact, the ratio of pig iron production to steel production fell with unusual sharpness in that month. Considering the trend of the steel markets, this circumstance is favorable to higher pig iron prices. And it seems likely that, in spite of some unfavorable conditions, prices will move higher during the next month or two. The advance, however, will certainly be moderated by the weakness in fuel and in steel scrap.

One might *guess* that the average daily production of pig iron may run up to about 105,000 tons in February, and possibly to around 111,000 tons in March, attended by moderately stronger prices, but it would be too daring to try to look beyond that point.

Finished Steel Prices Slightly Higher

THE outstanding change in the iron and steel price structure during January was the higher level of finished steel. Sheets, nails and bars were all higher, as appears in the third chart. The fact appears to be that prevailing prices at the end of 1927 were much too low, and that they have been marked up a little on this account rather than through the urgency of demand. They are still by no means high and are probably not high enough to give an adequate profit to the average manufacturer.

Almost equally notable are the continued stability in the price of semi-finished steel, the inability of scrap to make progress on the upside, and the weakness of fuel.

A third fact is the existence of some independent strength in the pig iron market, which is advancing much as we had forecast. The gain here is apparently due chiefly to the relatively great expansion in steelmaking requirements, which obviously tends to reduce the supply in the merchant markets. Several large melters, including a leading radiator company, have

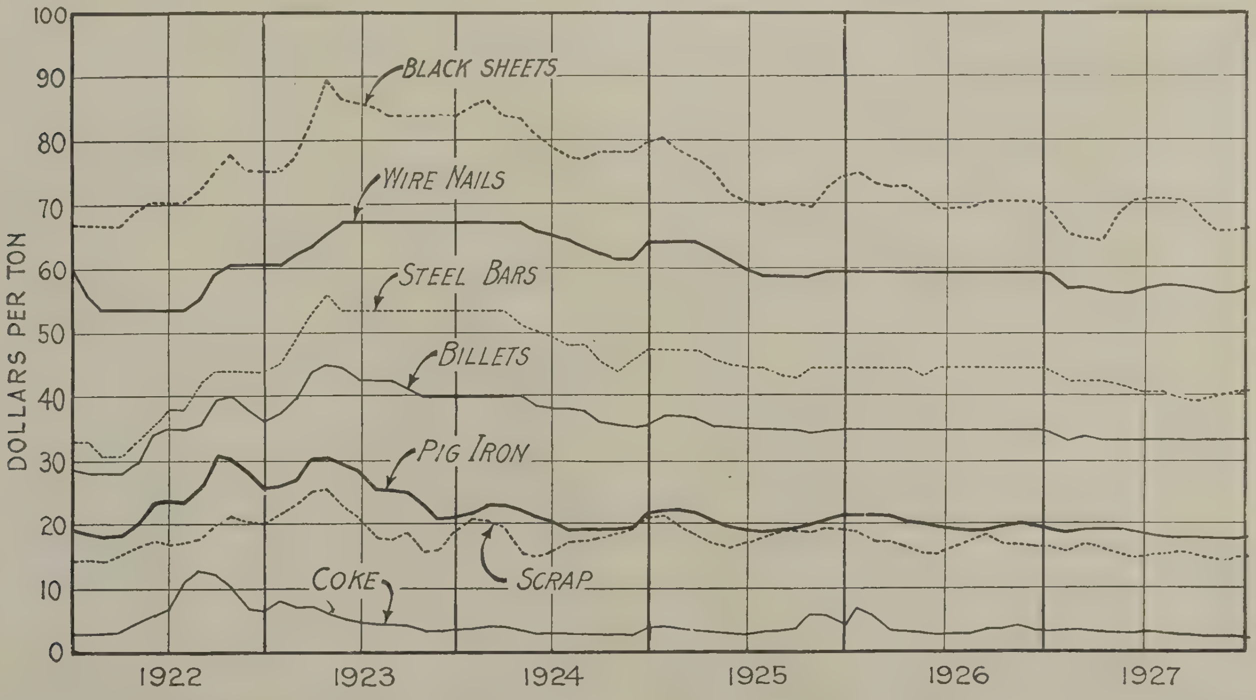

Fig. 3—Finished Steel Prices (in Particular, Sheets, Nails and Bars) Made an Advance, Putting Them into Better Position with Regard to Semi-Finished and Raw Materials. Readjustment of the price structure may be sustained if it stands the test of second-quarter buying

therefore covered their requirements for the second quarter. This at least shows that there is fair activity in the radiator, pipe and foundry business.

Our general impressions are that there is a certain lack of spontaneity in the prices of finished steel. Ingot production has been rapidly expanded and is above normal, while the price of steel shows no particular strength. Fuel is abundant and cheap. The same may be said of steel scrap. In recognition of the fact that pig iron prices could be forced no lower, and that no declines were to be expected in the first quarter, the pig iron markets have shown some strength.

It seems that finished steel prices have been pushed up from beneath, as the result of low margins of profit and some reduction in the resistance by consumers. Not until finished steel prices stand the test of second-quarter buying, however, can we be sure that a sustained recovery is in process. We find unusual difficulty in arriving at any conclusion, aside from the opinion that pig iron will probably show further advances.

ATTACKS CARTEL IDEA

Assistant to Attorney General Commends Anti-Trust Laws—Cites Existing Check on Foreign Competition

WASHINGTON, Feb. 20.—The policy of American law as it relates to industrial combinations is based upon the principle of competition, including equal opportunity, maintenance of individual initiative, freedom from Government regulations and absence of power to control prices or allot territory or customers, and differs sharply from the Continental European theory, Col. William J. Donovan, assistant to the attorney general, told the American Chemical Industry conference here on Thursday of last week. Speaking on "Foreign Cartels and American Industry," Colonel Donovan entirely discouraged the idea of those who, he said, have been urging amendment of the anti-trust laws so that American combinations similar to European combinations may be developed in order to meet more effectively threatened competition from abroad.

"It would seem that those who urge such amendments to our laws—amendments permitting combinations in industry resulting in monopoly—forget the historical, inevitable result of such a tendency," it was declared. "It would mean that the people of this country would not permit monopolistic power to go unregulated. If your industry is permitted to attain that extent of combination which results in elimination of competition, the people of the country, for their own protection, would insist that there should be greater Governmental supervision and control. So that those among you who, because of fear of foreign competition, grow panicky and urge what is in effect a surrender to the Continental principle of trade ought to pause and consider whether or not there is not greater opportunity for more effective and unhampered development of your industry under our existing laws."

Colonel Donovan then explained the means this Government has to protect American industry against a foreign monopoly which comes into this country and by collusion with citizens of the United States enters into agreements for the restraint of trade and enhancement of prices. The basis for his contention is found in the anti-trust provisions of the Wilson tariff act of 1894, which was never invoked until two years ago and was not passed on by the Supreme Court until last year, he said. The act provides that every contract between two or more persons or corporations, either of whom is engaged in importing, is illegal and void if it is intended to operate in restraint of trade or designed to increase the market prices in the United States of any article imported or intended to be imported. This act was held by Colonel Donovan to constitute a measure of protection against the illegal activities of foreign trusts in American jurisdiction.

Legalization of Combinations to Buy Foreign Raw Materials Proposed

Touching on affirmative measures to foster American foreign trade, he mentioned the Webb-Pomerene act permitting consolidations of domestic interests for exportation of their products and he also mentioned the proposed amendment to that act which would permit similar combinations for purposes of importing raw materials. He declared that it is quite clear that Congress contemplates the enactment of constructive legislation, not only to protect American industry from unwarranted attacks from abroad, but to enable American industry to have a fair opportunity of meeting foreign competition in neutral markets.

"But all statutes and all the aid that Governmental departments may give are of no avail unless there is an intelligent conduct of business itself," said Colonel Donovan. "There are those who believe that the principle of competition means that a premium is placed on drastic and destructive competition; but the law itself has recognized that destructive competition is of no benefit, even to the consumer. Cooperation in industry is not forbidden. It has been pointed out by the Supreme Court that the Sherman law did not intend to place a penalty upon intelligence in business. A manufacturer is entitled to exercise the business virtues which are based upon a knowledge of actual conditions."

Scope of Trade Association Activity Defined

Pointing out that the true course of conduct for trade associations has been laid down by certain decisions of the Supreme Court, Colonel Donovan explained that it is clear under those decisions that associations of competitors in any particular line of commerce which have solely for their purpose the collection and dissemination of statistical information as to the exact existing conditions and past transactions do not violate the anti-trust laws.

"It is only where the collection and dissemination of information and its subsequent discussion leads to agreements as to prices, customers or allocation of territory that the entire combination falls within the provisions of the Sherman law," it was declared, "and such conduct is forbidden for the very reason that persons and concerns agreeing to the imposition of arbitrary conditions must always submit themselves to the will of others."

Better Distribution Essential to Prosperity—Dr. Julius Klein

In speaking on "Factors in Profitable Prosperity," Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, declared that two factors essential to prosperity are the most rigorous scrutiny of the costs and wastes of distribution and the fullest exploitation of foreign markets. The matter of better distribution, he stated, in spite of the increasing publicity that has been given to the problem, is still evidently in need of much further analysis and exploitation.

He cited different examples showing progress made in waste elimination and production and pointed out that the value of American manufactured products increased from 1923 to 1925 by not less than $2,500,000,000 and that meanwhile there was a decrease of some 400,000 employees. He said this fact has created some alarm lest there would be a great amount of unemployment, but explained that those leaving the manufacturing lines as the result of greater output per man due to improved machinery, increased efficiency, etc., have gone into non-manufacturing pursuits. He said that the net increase of employment and servicing functions, which, after all, are the direct and immediate outcome of greater production, has more than taken up the slack created by any curtailment in manufacturing payrolls.

One means of eliminating waste in distribution urged by Doctor Klein was a better understanding of markets with a view to concentrating upon them rather than trying to spread out to sparse markets, with high costs of delivery and other obstacles to efficiency and profits in industry.

Blast Furnace Practice in Europe

Outstanding Paper Before Furnace and Coke Association—Round Table Discussions on Other Topics Bring Out Sharp Differences

MEETINGS of the Eastern States Blast Furnace and Coke Oven Association usually are productive of interesting discussions of matters pertaining to blast furnace and coke oven operations, and it rarely happens that something of outstanding interest fails to get before these assemblages. At the fall meeting of the association, held at the Shannopin Country Club, Ben Avon, Pa., it was an intimate picture of a blast furnace capable of producing 1000 tons daily and which, in a run of 45 days, actually averaged 903 tons daily.

At the mid-winter meeting held Feb. 17 at the William Penn Hotel, Pittsburgh, it was a paper on "Blast Furnace Practice in Europe," by F. H. Willcox, vice-president Freyn Engineering Co., Chicago. In detailing his personal observations, on an extended tour of blast furnaces and steel works in Germany, France and Luxemburg, Mr. Willcox touched upon a subject that has been freely discussed when blast furnace men have met. For several months word has been coming from Germany of the wonderful production records of blast furnaces there. It has been said that, in furnaces of what would be called small hearth diameters on this side of the water, there have been daily outputs of 800 to 900 tons, while in 16-ft. hearth furnaces as much as 1100 and 1200 tons daily has been made.

How the Germans Obtain High Output

Mr. Willcox, whose paper will be published later, gave the details of the ore mixtures and other reasons making these performances possible. The German iron makers are favored by being able to draw upon a wide variety of ores. By sintering fine ores and carefully charging coarse and fine ores in layers, they obtain an open burden which is easily reduced without recourse to high blast pressure or excessive use of coke. He said that there is a close similarity between the ore practice of German furnaces and those in the eastern part of the United States. Coke is not so carefully prepared as on this side of the water, and is not of such good quality, as Ruhr coal does not make a good coke, but it is strong in structure and does not break up. Scrap is not heavily used.

Touching on construction of the furnaces and the bin systems, Mr. Willcox noted that in many respects the German furnaces are heavier than American stacks, but lighter in others, while on account of the distance from receiving ports, the bins are large enough to carry stocks sufficient for several months. The bins are used for storage purposes, there being a complete absence of ore storage yards served by ore bridges. Charging is done by three or four men and there usually are four or five scale-car tracks. There has been considerable grief in the use of two stoves for the hot blast, although the stoves have considerably larger heating surfaces than American stoves.

He said that German success cannot be ascribed to any single cause, but rather is traceable to a combination of causes. He argued that American furnace men, doing their own thinking and not being too greatly influenced by German practices, can accomplish as great success in getting out tonnage as has been achieved abroad. Mr. Willcox said that in England the effect of the coal strike of a year ago has not worn off and that, accordingly, blast furnace and industrial progress is less marked there than on the Continent.

Round-Table Discussions Animated

Following out the plan inaugurated at the fall meeting, the program for the mid-winter meeting was divided into separate round-table discussions of blast furnace and coke oven subjects during the morning, with a joint meeting in the afternoon. For scope of discussions, the meeting set new high standards. Haakon A. Berg, vice-president A. G. McKee Co., Cleveland, presided at the blast furnace meeting, and H. P. Zeller, vice-president Donner-Hanna Coke Corporation, Buffalo, was chairman of the coke oven meeting. E. T. McCleary, vice-president Youngstown Sheet & Tube Co., Youngstown, was in charge of the afternoon session. C. R. Meissner, superintendent coke plant, Weirton Steel Co., Weirton, W. Va., and president of the association, presided at the dinner in the evening. There was a registration of 175.

Recent developments in gas cleaning; use of high blast temperature; relation between size of large bell and stock line diameter and its bearing on flue dust losses and what there was in pig iron, not revealed by present methods of analysis, that causes trouble in steel plants were freely discussed at the blast furnace meeting. At the joint session in the afternoon, which proved an exceedingly interesting one, coal, coke and refractories came in for a major part of the discussion. Whether zinc in refractories is a cause of their disintegration was the occasion of a real debate, with William A. Haven, superintendent northern furnaces, Republic Iron & Steel Co., taking the affirmative, and Dr. John S. Unger, Carnegie Steel Co., Pittsburgh, the negative.

Dry Cleaning of Gas Desirable

There was much discussion at the blast furnace round table of the vortex eliminator and dust catcher, which was said to be capable of taking 90 per cent of the dust out of gas running 26 grains per cubic foot of raw gas. H. S. Braman, Youngstown Sheet & Tube Co., Youngstown, gave the figures on gas cleaning at two furnaces at the Campbell works, using Kennedy whirlers as the activating units. On one furnace, 65.23 per cent of the dust was caught in the catcher, 26.11 per cent in the whirlers and 8.64 per cent in the washer and delivered to the sump. In the second furnace, on a month's observation, 70.1 per cent was caught in the catchers, 28.5 per cent in the whirlers and 1.3 per cent taken out by the washer. Dry cleaning of gas was generally admitted as desirable, because the higher percentage of dust removed dry made the washer correspondingly more efficient.

Discussion of high blast temperature brought out some difference of opinion. While several reported success with present day burdens at 1400, 1500 and 1600 deg. Fahr., it was also indicated that best success would come only when the burdens could be opened up. Eastern furnace men indicated particular success with high blasts through the use of sintered magnetic ores.

Speakers held that the small bell was too extensively blamed for some of the troubles of other years, and that now the trend is back to the small bell and to an enlarging of the stock line. A bell with a 2-ft. clearance, and the keeping of the fine ores against the brickwork, are now considered standard.

Coal and Refractory Topics

Dry cleaning of coal was described and compared with wet washing, by Mr. Affelder, Hillman Coal & Coke Co., at the joint afternoon meeting. Discussion of the melting point of coke brought out that the best coke usually results from coals of closely similar melting points. The question of the qualities of coke required for foundry and mill iron was pretty well answered by Mr. Affelder, who said that it would have to be a coke which would offset the impurities of the furnace lining, correct the ores and fluxes, offset the weather and climatic conditions, which would be flexible in cell structure and porosity and would produce a ton of pig iron on a smaller amount than, it is alleged, is being used.

This Issue in Brief

Production control board tells at a glance the amount of work before every production machine for months in advance. Length of colored planning card indicates the number of hours the job will take.—Page 521.

Cuts costs 25 per cent by handling materials on roller and belt conveyors. Moderate-sized plant discovers it can utilize to excellent advantage mechanical handling methods employed by large mass production shops.—Page 525.

Foundry solves problem of handling molds in limited space by mounting a swinging jib crane on a pipe column erected in place of a wooden building column. The crane swings in a complete circle, serving one-half of two bays and handling molds from two machines.—Page 530.

Production delays due to tardiness in making tool set-ups are avoided by having department foreman furnish tool room, at least three hours ahead of time, with a control card showing just what set-up will be required. Tools are delivered to the department in a metal basket at least one hour before needed.—Page 522.

You can have too many shop rules. Attempting to govern the conduct of workmen in petty and inconsequential matters has an effect opposite to that desired. It is well to avoid unnecessary limitations on the freedom or initiative of the employee.—Page 552.

Pig iron price advance during the next month or two seems likely, says Dr. Haney. However, the advance will certainly be moderated by the weakness in fuel and steel scrap, he indicates.—Page 545.

Foremen are kept on important supervisory work by being relieved of the necessity of following up jobs going through department. Each foreman has a set of machine schedule cards showing just what is scheduled for each machine for two weeks in advance. These cards are checked by a clerk from the production control office, who reports delays and investigates their cause.—Page 524.

Departure from one-price policy inevitably leads to failure, says association head. Price-cutting is contrary to the interest of the buyer, for the ultimate result is inferior quality and inadequate service.—Page 531.

Fatigue failure of metals is promoted by non-metallic inclusions. Boundary between the inclusion and the metal is the path often followed by the fatigue crack, metallurgist declares.—Page 533.

Magnet steel can be reduced two-thirds in weight, without reducing the coercive force, by using a steel containing cobalt. But the high cost of this steel restricts its use to special applications.—Page 534.

High skill is required in molding chrome iron castings. Operations must be adjusted so that the alloy will not burn or cut into the sand.—Page 535.

Germans obtain high iron output from relatively moderate-size blast furnaces. As much as 1100 to 1200 tons daily is produced from a 16-ft. hearth furnace. Ability to draw upon a wide variety of ores is partly the reason.—Page 547.

Predicts wide use of nitrification to provide a superior degree of corrosion resistance to ordinary carbon steels. Metallurgist also declares that alloy steels, covered with mill scale, may be given a hard and useful case by nitrogen.—Page 538.

Cut your selling costs by confining your efforts to profitable markets. Spreading out into sparse territory promotes waste in distribution, says Dr. Klein. —Page 546.

Discourages idea of American cartels to meet threatened foreign competition. Monopoly would only result in greater Government supervision and control, says assistant to Attorney General.—Page 546.

Ammonia-hardening produces a superior case in aluminum steel containing about one-quarter per cent molybdenum, and low chromium. Brittleness at moderate temperatures is avoided, and the steel shows high resistance to abrasion.—Page 538.

Trade associations will not fall afoul of the Sherman law if they confine themselves to collecting and disseminating statistical information as to "exact existing conditions and past transactions," says Government official. They violate the law only when discussion leads to agreements as to prices, customers or allocation of territory.—Page 546.

Is instalment buying contributing heavily to the high cost of distribution? With the common citizen paying 27 per cent for money borrowed from a finance corporation, the present system of instalment buying seems wasteful.—Page 550.

Cost of Instalment Selling

PROF. EDWIN R. A. SELIGMAN of Columbia University has written a pair of persuasive books on instalment selling, and in common phrase "gives it a clean bill of health." That is, except for a few minor and correctable abuses. On the whole, he feels that the instalment buyer gets value received for the premium he pays over the cash price, while the credit extended, both in nature and in volume, does not constitute a menace to our present banking and business system.

One hesitates to dispute so eminent an authority, but there is one aspect of instalment selling which seems so distinctly uneconomic that it is worthy of more detailed consideration. We refer to the great spread in cost of money to the commercial bank and to the instalment buyer. When John, Jerry or Henry deposits his money, the bank pays him 3 to 4 per cent for it. When John, Jerry or Henry borrows money from a finance corporation, which borrows it from a bank, he pays 27 per cent for it. In other words, the common citizen pays 24 per cent for the privilege of using his own money!

This statement may be thought to require a deal of qualification, but is it not essentially sound? The finance corporation which advances the money covering the unpaid balance on a purchase, which in turn enables the dealer to pay for his cars or refrigerators or oil burners or radios promptly, and thereby enables the maker to manufacture some more for a new wave of instalment purchases—that finance company must get the money somewhere. It has some capital stock paid in, and can get direct loans from banks on its own credit to about five times that sum, but this is nowhere near enough. It replenishes its coffers by discounting its receivables (that is, the promises to pay future instalments signed by John, Jerry and Henry) with friendly banks direct, or with a bank through some middleman, such as a larger finance company, a broker or a bonding company. When this does not procure all the money required, or the cost mounts too high, the finance company turns over its receivables (promises to pay signed by John, Jerry and Henry) to a trust, and the trust sells short time notes, based on a constantly recurring supply of such receivables, to a bank or to the public at margins varying from 1 to 20 per cent.

This outline of the financial story emphasizes one thing: that in general the only assets which a finance company can pledge are the notes signed by the purchaser on instalments—that is, by citizens generally. The only way the finance company can get money for these assets is to sell them back to the public, either direct or through the banks (which are the depositories of that self-same public's funds and credit).

In other words, a highly complex and expensive organization has been set up to enable the common citizen to borrow his own money, and to insure him against his own recklessness either in buying or using a modish luxury, convenience or necessity.

To the extent that such an expensive intermediary may be replaced by a simpler and more direct method of financing consumers' goods, the present system of instalment buying is wasteful. The suspicion will not down that this waste, this expensive step in distribution, is taking too great a share, or relieving the citizen (for a price) of common responsibility and caution in his spending or using.

Automobile vs. Steel Profits

COMPARISONS of the large profits of some of the automobile companies with the relatively small earnings of the steel companies have been commonly made during the past year. Now comes the annual report for 1927 of the General Motors Corporation, showing profits of $235,104,826 available for dividends as against $87,845,456 made last year by the United States Steel Corporation, whose capital structure is comparable in size with that of General Motors.

It has often been said that many of the steel companies have given away profits in the form of price concessions on purchases of steel by automobile companies, but this in no wise explains the enormous profits of the General Motors Corporation. Last year the automobile industry as a whole is credited with consuming nearly three and a half million tons of finished steel. If we assume that the General Motors Corporation not only paid an average of $5 a ton more for its steel than it actually paid (which perhaps would have been a profitable level for the steel companies) and an additional sum equal to $5 a ton for every ton of steel bought by other automobile companies, the total to be deducted from its profits would have been less than $17,500,000. Thus more than $200,000,000 of its profits would still have to be accounted for in other ways.

Of course, the above statement does not adequately measure the cost to the steel industry of its concessions on automobile steel, if it be assumed that a low general level of selling prices on steel is brought about in many instances by the pressure that automobile companies are able to exert by reason of their large requirements.

Fluctuating Commodity Prices

THE Bureau of Labor's index number of commodity prices at wholesale is announced at 96.3 for January, against 96.8 for December and 96.2 for January, 1927. The outstanding feature of the showing is not the steadiness in prices, which will be loosely referred to in many quarters, but the serious dangers lurking in averages. From January, 1927, to January, 1928, there is a decrease of only three-tenths of one per cent in the "average." This is an index carefully weighted according to production shown by the last census, and it is quite up to date, as all figures have been recomputed with 1926 prices as base or 100, the old system, with 1913 as base, having been abandoned after August, 1927. There is no doubt that when the general index number is unchanged the general purchasing power of the dollar is not materially changed, and that for a given volume of commodity turnover the dollar turnover is not materially changed.

But various producers have good reason to ask: "What do we get out of that?" Among such producers are those whose products are listed below, with the percentage decrease that occurred from one January to the next, computed from the Bureau of Labor's own figures:

	Per Cent Decrease
Bituminous coal	6.7
Coke	11.8
Petroleum products	29.4
Iron and steel	5.3
Non-ferrous metals	3.3
Building materials	6.9

It is the reverse of comfort to these producers to learn that others are securing higher prices for their goods. They cannot nourish any hope that because other things cost more the public will buy more of their goods now that they are cheaper.

An unevenly divided prosperity does few people much good, perhaps none in the long run. Certainly it is vastly inferior to a uniformly distributed prosperity. There has been much talk about sustained buying power. The total buying power is the thing and if it is impaired in big spots something is not right.

This showing furnishes food for thought. We must not be deluded by averages. The laborer is worthy of his hire and conditions should be sought which will assist all producers to secure decent prices.

Group Progress and the Business Press

INDIVIDUALISM in industry is steadily giving way to group effort. Time was when every manufacturer regarded competitors with suspicion and jealously guarded his secrets from prying eyes. In his self esteem he did not credit others with the ability to develop equally good ideas. Today the same self-confidence helps to explain a radical change in attitude. A keen foreign observer recently quoted an American foundryman as follows: "Why shouldn't I let a competitor visit my plant? If I do not learn more from him than he gets from me, I am to blame."

The old saying that "two heads are better than one" finally is being taken seriously. There is a constant pooling of ideas both in informal conferences and in the meetings of organized associations. It is realized that there are mutual advantages in a policy of give and take; it is clearly seen that progress is expedited if many minds work collectively for the solution of business problems. Yet it is only beginning to dawn on some that the group mind of an industry functions most effectively in the business paper.

Such a publication is not merely a newspaper. It collects the diverse ideas of many individuals, and sifts, assembles and organizes them, returning them to industry in the most usable form.

There may be journals that lead an industry and others that follow it, but the trade publication is of greatest value as the best available means for collective expression. An industry serves the common welfare and thus justifies its existence only as it learns more, and makes practical use of what it learns, about its technical and economic problems. The business paper, in both its advertising and editorial pages, is a stimulus to all to contribute to, as well as to partake of, the latest, best conceived and most useful ideas of their industry.

The Short-Term Buying Regime

MARKET factors now appear to be at work that are leading away from the extremely close-range buying which for so long has been the policy of manufacturing consumers of steel. For the most part the change may be attributed to the advancing tendency of the market, due to the emphasis the producers are putting upon the folly of cutting prices to increase operation.

There have also been some efforts to discourage small-lot business by increasing quantity extras, as on hot-rolled and cold-finished bars, or by establishing separate higher base prices for smaller lots, as in the case of cold-rolled strip steel. But, as a general thing, mills have adjusted their operative organizations to a regime of many small orders and specifications and they are not releasing their hold on a business gained and held through special efforts to give the service demanded. Although order books are well filled and specifications entered at some mills indicate delivery periods running into weeks, the small-tonnage buyer obtains and can still expect deliveries from mills that compare favorably with those of six months or a year ago.

If, in the early days of close-range buying, railroads were charged with failure in the matter of delivery, it was due in large measure to two factors: lack of cooperation among carriers entering competitive territory, and the slowness and uncertainty of package freight delivery due to the desire to concentrate on carload shipments, which net the largest return in revenue. It remained for agencies outside of buyer, seller or railroads to bring about cooperation so that package freight, and for that matter consignments by express, move to the principal centers of distribution with few transfers and with a minimum of delay.

This work has been undertaken by commerce associations in many of the large production centers. As an example, there are now moving daily out of Chicago 3000 merchandise freight cars, sealed and routed to 1800 points of distribution. The associations offer assistance to shippers in routing consignments and they invite the cooperation of railroads in competitive territory by distributing merchandise cars to the several carriers entering a given center.

Service rendered is the keynote of the situation. Railroad transportation facilities and methods are vastly improved. Hard roads have extended movement by trucks. Small orders, on which unusual dispatch is required, are now forwarded by air transport. In fact, all agencies interested have made such a thorough job of meeting market conditions as they have existed in the last few years that it would take a prolonged upward movement in prices to cause any considerable departure from the policy of short-time buying.

Coal Stocks and Consumption

A CURIOUS outcome of the failure of the bituminous coal strike of last April is that stocks at the beginning of this year were unusually large. Coal in the open market was so cheap during the months expected to constitute the strike period that holders of stocks were loath to draw upon them, feeling that they had best take advantage of the bargains continually offered.

The Bureau of Mines in a report dated Feb. 9 gives the stocks at the beginning of this year, with the usual comparisons. For a total of forty-eight dates in the past thirteen years the figures represent the stocks, either ascertained or estimated, in the hands of commercial consumers. Stocks on Jan. 1 for each recent year except 1925, are as follows:

Jan. 1	Stocks of Bituminous Coal, Net Tons
1922	48,000,000
1923	36,000,000
1924	62,000,000
1926	49,000,000
1927	55,000,000
1928	55,500,000

Even three months before the strike of April 1, 1922, there were rather large stocks and these increased to 63,000,000 tons, as a minimum estimate, on the strike date. Although resumption came late in August the stocks at the end of the year were down by 27,000,000 tons to 36,000,000 tons.

Preparation for the 1927 strike came earlier, there being 7,000,000 tons more stock on Jan. 1, 1927, than on Jan. 1, 1922, and only the accumulation of the first three months of 1927 was liquidated during the remainder of the year. The bare figures show a half-million ton increase in the year as a whole. The April 1, 1927, stocks are given at 75,000,000 tons.

The Bureau of Mines estimate of consumption during the last three months of last year is remarkably low. The estimates are based upon production, with allowances for imports, exports and changes in stocks. Apparent consumption is given as follows:

Weekly Consumption, Last Three Months of Year, Net Tons

1923	10,080,000
1926	11,200,000
1927	9,912,000

Thus consumption in the last quarter is made 11½ per cent less than in the quarter a year previous and even a trifle under consumption in the last quarter of 1923. In a four-year interval one may count upon increasing efficiency in using coal to cover an increase in trade activity without more coal being needed, but some may doubt the decrease shown from 1926 to 1927.

Production of coal since the first of this year has been well under that in the same period of any recent year. Clearly there is no chance of demand being such as to relieve the coal industry from its present deplorable condition. The proposed Senate investigation will meet a very big subject.

How to Get Zest in Work

THE intangibles in industrial relations are frequently overlooked. This is not surprising in view of what has been accomplished through the mechanization of industry and the adoption of mechanistic systems of management. Good results are obviously obtainable from various applications of the principles of scientific management, but there is too little recognition of the human phase of the plant operation. The human side of industrial relations, however, does not mean maudlin expressions of good will toward employees or excessive outlays for "welfare" work. It implies, rather, a knowledge of human nature and the possibilities of capitalizing that knowledge.

A certain amount of discipline is essential in every plant. Improved ways of performing different operations, as disclosed by time and motion studies, are cheerfully accepted by workmen when tactfully approached. Even highly specialized tasks are regarded as unavoidable in shops engaged in mass production. But the average employee resents unnecessary limitations on his freedom or initiative.

In plants where rules govern the conduct of workmen even in petty and inconsequential matters, and where the management takes the view that eternal vigilance and constant driving are the price of satisfactory production, there can be no zest or spirit in workmanship and no pride of accomplishment. "When zest departs," said Owen D. Young in a Harvard address last year, "labor becomes drudgery. . . . Zest is partly a matter of physical condition, but it is also largely influenced by mental reactions."

Zest in workmanship is primarily dependent on the general atmosphere in a given plant. While it may be encouraged by better foremanship, it depends mainly on the attitude of the managing heads of the organization. A slave driver gets the production of slaves. Management that recognizes the psychology of freedom-loving men and women reaps its reward in the intelligence and zest with which they perform their tasks.

To Organize Pressed Metal Association According to Group Interests

Preliminary steps toward the organization of an association of pressed metal manufacturers were taken at a recent meeting at Cleveland. A meeting to consider the adoption of a permanent form of organization will be held at the Cleveland Athletic Club, Cleveland, on Feb. 28, as reported in THE IRON AGE of Feb. 16. Those who were present at the preliminary conference were:

F. H. Seither, treasurer Defiance Pressed Steel Co., Defiance, Ohio.
G. F. Conway, vice-president and treasurer Lansing Stamping Co., Lansing, Mich.
J. Bingham, president, and W. H. Schomburg, vice-president Bingham Stamping Co., Toledo, Ohio.
H. C. Nelson, Globe Machine & Stamping Co., Cleveland.
F. J. Flach, president Metal Specialty Co., Cincinnati.
E. R. Wagner, E. R. Wagner Mfg. Co., North Milwaukee, Wis.
Robert C. Yates, Transue & Williams S. F. Corporation, Alliance, Ohio.
H. F. Millman, Geuder, Paeschke & Frey Co., Milwaukee.
H. S. Johnson and R. R. Braggins, Bossert Corporation, Utica, N. Y.
E. I. Dail, Dail Steel Products Co., Lansing, Mich.
George W. Schreck, Kales Stamping Co., Detroit.
George F. Sparks, Truscon Steel Co., Youngstown.
Lee O. Benner, Motor Wheel Corporation, Lansing, Mich.
H. B. Ranney, Bettcher Stamping & Mfg. Co., Cleveland.
W. W. Galbreath, president Youngstown Pressed Steel Co., Warren, Ohio.
E. W. Hamlin, Akron-Selle Co., Akron, Ohio.

At the preliminary meeting W. W. Galbreath, president Youngstown Pressed Steel Co., was elected temporary chairman. There was a discussion of the general condition of the industry, of the problems which face it and of the possibility of solving some of these problems through cooperative effort and discussion. Every person present took part in the discussion. The sentiment in favor of the organization of a pressed metal association was unanimous.

The general opinion seemed to be that much could be accomplished if it were possible to group the different plants, so that those having common interest could meet at regular intervals where most convenient. The organization committee (Messrs. Baird, Benner, Bingham, Flach, Galbreath and Johnson) was appointed to work in the problem of the proper grouping of the different plants, so that an association could be formed built up on these groups, rather than on a general association, which naturally could discuss only general problems.

In view of the large number of stamping manufacturers in the United States, and their great variety of products, it is obviously impossible to reach all in the short time before the organization meeting. Many have been reached, but the organization committee extends a cordial invitation to any pressed metal manufacturer to attend the Feb. 28 meeting in Cleveland. Malcomb Baird, 232 Delaware Avenue, Buffalo, is serving as secretary.

The Columbia Steel Corporation recently started a new battery of 23 Koppers-Becker by-products coke ovens at Provo, Utah. The work was completed in exactly 29 weeks from the day of the arrival on the job of the superintendent of construction. An addition to the by-product recovery plant also was made. The new battery gives the company a total of 56 ovens, capable of producing 400,000 tons of metallurgical coke annually.

Industry's Problems to Be Discussed at Conference in Cincinnati

Vital economic problems affecting American industry will be discussed at a round table conference in Cincinnati March 1 and 2 under the joint auspices of the Cincinnati branch of the National Metal Trades Association and the National Industrial Conference Board. The relation between wages and prices, the agricultural problem and an approach to its solution, and public expenditures and their bearing upon taxation are among the subjects to be discussed. The conference will be conducted by Magnus W. Alexander, president of the National Industrial Conference Board. Speakers will include Virgil Jordan, chief economist of the board; William J. Shultz, financial economist; Charles Nagel of St. Louis, J. A. Morford, industrial relations expert of the board, and Mr. Alexander. The conference will open with a luncheon meeting, and the Cincinnati branch of the National Metal Trades Association will hold its annual business session and election of officers at 5 p. m. A dinner will follow at which E. A. Muller, president King Machine Tool Co. and president of the Cincinnati branch, will preside.

Purchasing Agent's Committee on Iron and Steel Appointed

The National Association of Purchasing Agents has appointed an enlarged iron and steel committee representing five regions, of which Canada is one, which shall have the following for its objects: To further the use of standard specifications in the buying and selling of iron and steel scrap and to work with scrap dealers and producers to perfect these specifications; to urge producers and distributers of pig iron in perfecting and endorsing the pig iron contract, and to cooperate with the Department of Commerce and trade associations in improving conditions in the iron and steel field. The personnel of the new committee is as follows:

National chairman—C. R. Ramage, Diamond Chain & Mfg. Co., Indianapolis.

Pacific Coast Region—Malcolm McPhee, Pacific Coast Coal Co., Seattle (chairman); H. W. Christensen, Llewellyn Iron Works, Los Angeles; J. S. Gabriel, Denver & Rio Grande Western R.R., Salt Lake City; R. H. Petillon, Western Pipe & Steel Co., San Francisco.

Southern Region—E. B. Corbett, Harrisburg Pipe & Pipe Bending Co., Houston, Tex. (chairman); P. J. Oliver, Mexican Gulf Oil Co., Tampico, Mex.; Charles T. Doerr, Alabama Power Co., Birmingham.

North Central Region—A. J. Copeland, Industrial Brownhoist Corporation, Bay City, Mich. (chairman); Walter Wenzel, Vilter Mfg. Co., Milwaukee; L. E. Jones, Heywood-Wakefield Co., Chicago; E. H. Cordes, Stacey Mfg. Co., Cincinnati; H. C. Wickline, Union Steel Casting Co., Pittsburgh; J. A. Dwyer, C. G. Spring & Bumper Co., Detroit.

Eastern Region—B. C. Sawyer, Bethlehem Fabricators, Inc., Bethlehem, Pa. (chairman); F. M. Roos, Consolidated Car Heating Co., Albany, N. Y.; A. P. Hickcox, Scovill Mfg. Co., Waterbury, Conn.; M. G. L. Harris, Standard Gas Equipment Corp., Jersey City, N. J.

Canadian Region—T. G. Elliott, Babcock-Wilcox & Goldie McCulloch, Galt., Ontario (chairman); J. R. Hoyle, Canadian Vickers, Ltd., Montreal; M. K. McGuffie, Sheet Metal Products Co., Toronto.

Western Malleables, Inc., 332 South Michigan Avenue, Chicago, has been incorporated and has purchased all the properties, good-will and equipment of the Western Malleables Co., whose plant is at Beaver Dam, Wis. The foundry has a daily capacity of 75 tons of finished castings. The property covers 16 acres and buildings provide 300,000 sq. ft. of floor space. Officers are: A. D. Johnson, president; C. A. Starkweather, vice-president; H. L. Kirsh, vice-president and general manager, and R. J. Klatts, secretary and treasurer.

Iron and Steel Markets

Specifications Balance Output

Mill Bookings Gain Little Except at Chicago—Prices Await Test of Second Quarter Buying—Pig Iron More Active—Mixed Situation in Scrap

STEEL production is holding its recent gains and is perhaps a shade higher than a week ago. In most districts output and shipping orders are virtually on a parity, so that mill backlogs have ceased to expand. Operating schedules of Steel Corporation plants are unchanged at about 90 per cent of capacity, but some of the independent mills, notably at Youngstown, have increased production. Operations in the Pittsburgh-Youngstown area now average fully 80 per cent, as compared with 75 per cent at the close of January.

Consumers are specifying liberally against contracts placed at prices below those now quoted. There continues to be some concern lest buyers take shipments in excess of consumption and carry stocks of material well into the second quarter. At Cleveland, however, pressure for prompt deliveries indicates that specifications are in close step with current needs, and that supplies are not being accumulated. At Chicago there is not only a good volume of specifications against past obligations, but also considerable fresh buying, sales during the week having been exceeded only twice since Jan. 1. A further growth of mill backlogs there is reflected by extending deliveries.

From Chicago also come the first signs of interest in second quarter requirements, particularly in sheets, contracts for which have been placed at prevailing prices. In other markets present mill quotations remain largely untested. Some of the motor car builders have tried to obtain concessions from the recently advanced price on automobile body sheets, and one large company, failing to get a better quotation on its second quarter requirements, bought for the month of April only. On the other hand, irregular prices on galvanized sheets for early shipment are reported from Cleveland and the South. Prices on plates, shapes and bars are firm at 1.85c., Pittsburgh, on such new business as is being placed, and buyers are confident that they will be given an opportunity to cover their second quarter needs before any further advance is made.

Automobile consumption of steel continues to increase, but at a gradual rate. Motor car manufacturers have taken heavy orders from dealers, but it will be some time before the extent of demand from car users will be disclosed.

Fresh demand for structural steel is large, but recent bookings were not well distributed, fabricators in some districts being short of sizable work while others with large contracts, notably in the Chicago district, lack small tonnages to round out their schedules. New inquiries call for 44,000 tons. In addition, three large buildings to be erected in New York, taking a total of 50,000 tons, will soon be in the market. At Pittsburgh, 10,000 tons of plates and shapes will be needed for 66 barges. Projects closed in the week totaled 20,000 tons.

Rail mills have enough tonnage booked to keep them engaged for several months. There is still fair demand for track accessories, purchases from Chicago mills amounting to 6000 tons.

Railroad equipment buying has not developed to the extent that the steel trade had looked for. The week's principal orders were 2000 box car bodies for the Baltimore & Ohio and 500 flat cars for the Union Pacific. Bids have gone in on 2000 refrigerator cars for the Pacific Fruit Express.

Overproduction of oil is adversely affecting business in drill and drive pipe, but a fair tonnage of plates for storage tanks continues to be bought for Southwestern fields. An inquiry for 100,000 tons of pipe for a gas line from Amarillo, Tex., to Kansas City, Mo., is now before the mills.

Tin plate demand has been enlivened by inquiries for 100,000 boxes from a domestic oil producer and for 60,000 boxes from a Japanese oil company.

Pig iron business is active in Chicago, Cleveland, St. Louis and the South, but is exceedingly quiet at Pittsburgh, in the Valleys and in eastern Pennsylvania. Cleveland sales were 53,000 tons, 11,000 tons was taken by a St. Louis district producer, and one interest in Alabama has booked 25,000 tons. Two New England consumers of basic iron have taken a total of about 15,000 tons. Shipments of iron by Chicago merchant furnaces are in excess of production and yard stocks are being reduced. A Cleveland producer has advanced its price 50c. a ton, but in other districts there is no upward movement.

Steel mill grades of scrap are 50c. a ton higher at Chicago on sales of 15,000 tons, but in general the scrap market has not reflected the recent increase in steel production.

Orders for fabricated structural steel in January are computed at 213,750 tons, or 57 per cent of capacity, representing a sharp drop from 258,750 tons (69 per cent) in December and making the smallest month since January, 1927. Total orders for the year 1927 are placed at 3,060,000 tons, the largest for any year on record.

Both of THE IRON AGE composite prices are unchanged this week, that for pig iron remaining for a second week at $17.75 a ton and that for finished steel for a second week at 2.364c. a lb. The finished steel composite is almost precisely the same as the 2.367c. of one year ago, but pig iron is $1.21 below the $18.96 of a year ago.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Buyers Taking Shipments Freely—Ingot Output Averages 80 Per Cent

PITTSBURGH, Feb. 20.—From the standpoint of steel works and rolling mill operations and demand as typified by specifications against contracts, the steel situation leaves little to be desired. As a result of some increase in the operations of the Youngstown district, the general average of the Greater Pittsburgh district in steel ingot production is now easily 80 per cent of capacity. The freedom with which consumers are taking shipments against their orders suggests no immediate recession from that rate, especially as invoice prices on present shipments are generally below those manufacturers are now quoting. The unfavorable feature of the situation at the moment is that consumers are placing most of their dependence upon the steel they have on order and are not yet showing much interest in second quarter requirements. Views as to prospects are more moderate in some quarters than they were in January.

With the possible exception of pipe, steel makers have good-sized order books in all products. Evidence is still lacking that outside of the motor car industry there has been as much of a gain in consumption among the industries drawing on Pittsburgh for their steel as was indicated in some of the forecasts made in December and in the early weeks of this year.

Railroad car builders in this territory do not appear to have fared as well as those in the Central West. Structural steel business also has been better for mills outside rather than in the Pittsburgh district. The oil industry, a recovery in which would mean much to Pittsburgh in pipe business, is yet to make real headway in correcting the over-supply situation. Conditions generally are much more favorable in the Chicago district, but, on the other hand, the East, according to local advices, is not doing so well as Pittsburgh.

Automobile companies have been trying to get concessions from the recently announced price on body sheets, but do not seem to have had success, although it is rather significant that one large company, which failed to get a lower price on its entire requirements for the second quarter, decided to order only for April.

Primary materials are very dull, with steel works scrap showing some tendency toward weakness. Coke and coal are quotable at unchanged prices, but are weaker.

Pig Iron.—Merchant pig iron producers have little reason to feel cheerful about the market. While consumers are taking shipments against old orders fairly freely, their fresh requirements are few and small. The trade has before it the inquiry of the Westinghouse Electric & Mfg. Co., which may reach fair-sized proportions, though no specific tonnage is mentioned. Otherwise, inquiries are entirely for carloads. The Edgewater Steel Co. was a recent buyer of about 5000 tons of basic iron at a price below what it would have had to pay if the iron had come from a Valley furnace. The iron was sold by a steel works having a much lower freight rate. The Carnegie Steel Co. recently added a blast furnace at Mingo, Ohio, and one at New Castle, Pa., to its active list, making a total of 10 stacks this company has put on since Jan. 1, and giving it

32 in production of a total of 51. The Stewart Furnace Co., Sharon, Pa., is about to blow out its furnace.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	$17.25 to 17.50
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—Ferromanganese is moving a little more freely on contracts. Consumers appear to have pretty well reduced their stocks and the increased rate of steel production means a larger consumption. Spiegeleisen continues to move well on old orders, but new business amounts to little. Consumers are specifying well for high-grade ferrosilicon, although tonnages moving to the Youngstown district show some recession as compared with those of January. Prices are unchanged.

Semi-Finished Steel.—Chicago interests recently were seeking prices on 10,000 tons each of 4-in. and 1¾-in. billets for shipment to the Chicago district, but prices quoted here were too high to take the business away from Chicago district producers. Otherwise open market activity in semi-finished steel has been limited, but there continues to be a fairly good movement on specifications to sheet, tin plate and strip makers from their regular sources of supply. The Chicago inquiry developed a waiver of the size extra on small billets by some makers, but in general prices are holding well, and on wire rods all local producers now are quoting $44, base Pittsburgh or Cleveland. Sales at that price are few and small, because there was such extensive covering of consumers for this quarter at prices $2 to $4 a ton less.

Bars, Plates and Shapes.—Approximately 5000 tons of structural steel is pending in Pittsburgh district building projects and 10,000 tons of plates and small shapes will be needed in 66 barges now before fabricators for bids. Fabricated steel lettings of the past week show some increase in number, but tonnages run small, and complaint again is heard of sharp price competition. There continues to be steady specifying against old orders for plates and shapes, but strictly new business is not yet of sizable proportions. The mills are firm at 1.85c., base, for shapes and plates, and small lot sales are fairly numerous at that price. Specifications for bars continue to flow in steadily and in good volume. On new bar orders makers are holding firmly to 1.85c., base. Reinforcing bars wait on open weather for activity.

Rails and Track Supplies.—Standard-section rail bookings are sufficient to keep the mills busy for several months, provided the roads do not revise original estimates of their requirements. Light-section rails are not doing much on account of the curtailment of coal mining operations. Only a fair demand is noted for spikes and other track accessories. Prices are unchanged.

Wire Products.—All makers are quoting nails at $2.65 per keg, base Pittsburgh, plain wire at $2.50 per 100 lb., base, and other wire products at the higher prices announced on Jan. 25 last, and on such new business there is, no deviation from that schedule is observed. There is not much new business, however, since buyers were covered pretty fully for this quarter prior to the advance; they are specifying so steadily against those coverages that there is some concern that mill shipments are in excess of actual consumption and that stocks in second hands may be sufficient to lighten orders for the second quarter. Jobbers are known to have pretty heavy stocks of nails.

Tubular Goods.—Pipe makers are well satisfied with the movement of buttwelded pipe, but still report a slow movement of lapwelded, which does not appear to be sharing in the demand for drill and drive pipe and casing from California, where oil well drilling is more active at present than in any of the other producing fields. The oil situation is not improving rapidly enough to encourage hopefulness over the prospect for well pipe. The line pipe outlook, however, still is promising. All makers having mills large enough now have the inquiry for the gas line to run from Amarillo, Tex., to Kansas City, Mo. There are 400 miles of main line calling for 20-in., 22-in. and 24-in. pipe, and approximately 300 miles of smaller sizes for feeder and distributing lines, and the steel will amount to about 100,000 tons. Formal inquiry for the Monroe, La.-St. Louis gas line is yet to be made. Pipe prices continue to show some irregularity despite efforts to stabilize them. Fairly good demand is noted for locomotive tubes. Mechanical tubing is going out very steadily.

Tin Plate.—Container manufacturers, most of whom have contracted for their requirements for the first half of the year, are specifying steadily and mill operations continue at around 80 per cent of capacity. There is little business outside of contract obligations.

Cold-Finished Steel Bars and Shafting.—Consumers continue to take shipments against first quarter contracts, but demands otherwise are few and small, and no second quarter tonnages yet are under negotiation. Most of the shipments carry a price of 2.20c., base, Pittsburgh or Chicago, with occasional small lots going at 2.30c., which makers probably will name on second quarter contracts.

Hot-Rolled Flats.—There has been almost general adoption of the price schedule announced a week ago, but not much business is being done at the new prices, which, while effective immediately, were primarily intended to rule on second quarter business. Consumers generally are covered against their needs for this quarter and are taking shipments very steadily.

Cold-Rolled Strips.—Good movement against contracts for this quarter still is noted. The higher base price announced Jan. 25 has not yet had a serious test, as buyers were previously well covered for this quarter and they are not yet showing much interest in their needs for the second quarter.

20-lb. coating I.C.	15.30	40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. Pittsburgh, Chicago or Ohio Mill)

S. A. E. Series Numbers		*Base Per* 100 *Lb.*
2100*	(½% Nickel, 0.10% to 0.20% Carbon)	$2.90 to $3.00
2300	(3½% Nickel)	4.00 to 4.10
2500	(5% Nickel)	5.00 to 5.25
3100	(Nickel Chromium)	3.00 to 3.10
3200	(Nickel Chromium)	4.75 to 5.00
3300	(Nickel Chromium)	6.75 to 7.00
3400	(Nickel Chromium)	6.00 to 6.25
5100	(Chromium Steel)	3.00 to 3.10
5200*	(Chromium Steel)	7.00 to 7.50
6100	(Chrom. Vanadium bars)	4.00 to 4.15
6100	(Chrom. Vanad. spring steel)	3.50 to 3.75
9250	(Silicon Manganese spring steel)	3.00 to 3.15
Carbon Vanadium (0.45% to 0.55% Carbon, 0.15% Vanad.)		4.10 to 4.20
Nickel Chrom Vanadium (0.60 Nickel, 0.50 Chrom., 0.15 Vanad.)		4.05 to 4.20
Chromium Molybdenum bars (0.80—1.10 Chrom., 0.25—0.40 Molyb.)		4.00 to 4.25
Chromium Molybdenum bars (0.50—0.70 Chrom., 0.15—0.25 Molyb.)		3.05 to 3.10
Chromium Molybdenum spring steel (1 — 1.25 Chrom., 0.30 — 0.50 Molybdenum)		4.50 to 4.75

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

---

*Not S. A. E. specification, but numbered by manufacturers to conform to S. A. E. system.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 *Lb.*
Spikes, $\frac{9}{16}$ in. and larger	$2.70 to $2.80
Spikes, ½ in. and smaller	2.70 to 2.80
Spikes, boat and barge	2.90 to 3.00
Tie plates, steel	2.25
Angle, bars	2.75
Track bolts, to steam railroads	3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count,	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel			*Iron*		
Inches	Black	Galv.	Inches	Black	Galv.
⅛	45	19½	¼ to ⅜	+11	+39

3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Old Material.—Business is very slow and such changes as there have been in prices have not been uniform. Heavy melting steel now is quotable at $14.50 to $15; there have been no sales to consumers at less than the higher figure, but dealers are able to buy against short sales at one point in the district at $14.50, and $15 is as high as they will go on purchases for other points where there are uncovered sales at higher prices. On the other hand, No. 2 wrought, which ordinarily sells at the same level as heavy melting steel, now is at a premium because of bids by dealers who are short against sales made a few weeks ago. Dealers are keeping up the market on scrap rails by purchases against short sales. Cast iron wheels are stronger and heavy breakable cast scrap has been sold at a slight advance over recent prices. Machine shop turnings have been sold into consumption at $11.25. The recent advance in compressed and bundled sheets has not held.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$14.50 to $15.00
Scrap rails	14.50
Compressed sheet steel	14.00 to 14.25
Bundled sheets, sides and ends	13.00 to 13.25
Cast iron carwheels	14.50 to 15.00
Sheet bar crops, ordinary	15.00 to 15.50
Heavy breakable cast	13.50 to 14.00
No. 2 railroad wrought	15.00 to 15.50
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	11.00 to 11.25
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	16.75 to 17.00
Railroad coil and leaf springs	16.75 to 17.00
Rolled steel wheels	16.75 to 17.00
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.00 to 11.50
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	10.00 to 10.25
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.00 to 15.25
Malleable Grades:	
Railroad	14.50 to 15.00
Industrial	14.00 to 14.50
Agricultural	13.50 to 14.00

Sheets.—Business conditions still vary. Reports from the Central West indicate a good movement against first quarter contracts and also a willingness to sign up for second quarter, but there does not seem to be the same anxiety for supplies on the part of consumers in other sections of the country. While there is interest in second quarter tonnages on the part of automobile builders and some business in body sheets has been written at the new price of 4.15c., base Pittsburgh, others are resisting that price, which is an advance of $3 a ton over the current invoice price. One large user has bought only for April. Prices indicate a stronger tendency on the part of producers to get prices that will yield a fair profit in preference to full order books at unprofitable prices. It is said that current demands do not warrant more than an 80 per cent operation of the mills, and the general average of mill engagement is at about that rate.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.60c.
Hoops	4.00c. to 4.50c.
Black sheets (No. 24 gage), 25 or more bundles	3.65c.
Galvanized sheets (No. 24 gage), 25 or more bundles	4.50c.
Blue annealed sheets (No. 10 gage), 25 or more sheets	3.10c.
Galvanized corrugated sheets (No. 28 gage), per square	$4,39
Spikes, large	3.30c. to 3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.
Track bolts, all sizes, per 100 count,	62½ per cent off list
Machine bolts, per 100 count	62½ per cent off list
Carriage bolts, per 100 count	62½ per cent off list
Nuts, all styles, per 100 count,	62½ per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft annealed, base per 100 lb.	$3.00 to 3.10
Wire, galvanized soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Bolts, Nuts and Rivets.—Not much change is noted in the character or volume of business. Buyers still are ordering steadily, but not very far ahead of their requirements. Prices are firm.

Coal and Coke.—Standard furnace coke still is held at $2.75 per net ton at ovens, but the market is not overly strong, and sales of some coke of that grade, released through the suspension of shipments by a Valley furnace, have been made at $2.50. This was really a distress sale and the coke went for heating purposes, but it is probable that if there was a demand from furnaces, less than $2.75 could be done. Foundry coke is just about steady. Coal prices though unchanged are weaker as there is too much offered to be readily or easily absorbed.

Detroit Scrap Market Weak

DETROIT, Feb. 20.—Some declines were registered in the scrap market in this district during the past week, notably on heavy melting and shoveling steel and long turnings.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$11.50 to $12.00
Borings and short turnings	8.75 to 9.25
Long turnings	7.50 to 8.00
No. 1 machinery cast	14.50 to 15.50
Automobile cast	18.50 to 20.00
Hydraulic compressed sheets	10.50 to 11.00
Stove plate	11.50 to 12.50
No. 1 busheling	9.50 to 10.00
Sheet clippings	7.50 to 8.00
Flashings	9.75 to 10.25

Shipment of Steel Barrels Better in January, but Still Low

WASHINGTON, Feb. 18.—Steel barrels to the number of 475,906 were manufactured in January, against 444,227 in December, according to reports received by the Department of Commerce from 27 companies owning or operating 31 plants. Except for December, the January total was the smallest for any month in two years. Unfilled orders at the end of January for delivery within 30 days totaled 241,145 barrels, and 1,110,652 more for later delivery. Stocks at the end of the month were 54,353 barrels.

Members of the Steel Barrel Manufacturers Institute shipped 298,480 barrels in January and had on hand orders for 354,552 on Feb. 1. The business reported in January was $927,752. Capacity was engaged to the extent of 45 per cent, being 21 per cent for I.C.C. barrels and 51 per cent for light barrels.

The American Welding Society will hold its annual meeting April 25, 26 and 27 at the Engineering Societies Building, New York. One technical session will be devoted to procedure standardization in welding, including qualifications of welders, inspection and supervision. Discussion of the subject will include procedure standardization relating to structural steel, pressure vessel and pipe welding.

The Lapham-Hickey Co., 518 Buhl Building, Detroit, and 1625 West Pershing Road, Chicago, has been appointed exclusive distributer in Illinois, Indiana, Michigan and Ohio for the Athenia Steel Co., Athenia, N. J., manufacturer of tempered and annealed clock spring steel. A complete stock will be carried at Chicago.

Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Steel Sales Continue at High Rate—Pig Iron Market Active

CHICAGO, Feb. 20.—Consumers of finished steel continue to enter this market at a lively rate and sales for the week are the third largest of any similar period so far this year. Although it may reasonably be assumed that specifications made earlier in the year were in some measure to balance stocks that had run low during the inventory period, it is now rather generally believed that current specifications closely represent consumptive demand. Deliveries are being extended.

The Union Pacific has ordered 500 flat and 25 passenger cars, all of which will be constructed in Central Western shops. Noteworthy among structural awards this week is 4000 tons for the Drake Tower, Chicago, taken by the American Bridge Co. It is probable that a Chicago shop will fabricate the 8000 tons required for a viaduct at Milwaukee.

Sales of billets have been heavy, not less than 20,000 tons having been taken by a producer with mills at Chicago and east of this district.

Evidence is at hand that prices for cast iron pipe are seeking higher levels. Fresh inquiry for that commodity is active.

Heavy melting steel has sold at 50c. a ton higher and other steel mill grades of scrap are correspondingly strong, but foundry specialties and blast furnace grades are weak.

Pig Iron.—Business continues active, particularly for second quarter delivery. Four merchant stacks are in blast but this output added to the foundry iron sold by local steel producers totals less than current shipments, affording a further reduction in stocks at Chicago furnaces. Prices for Northern iron are firm at $18.50 and full differentials are being obtained. Quotations by furnaces to the south are steady and local producers are meeting with little difficulty in maintaining the full Chicago schedule in intermediate territory where freight differentials are in favor of the Northern furnaces. Reports that iron to come in by boat from Lake Erie furnaces is being offered are not quieted in spite of the fact that several options against water shipments at the opening of navigation have been cancelled.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	20.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys. — Specifications for ferrosilicon are heavy and carload sales for immediate delivery are at $83.50. Ferromanganese is quiet at $100, seaboard. Spiegeleisen is being offered at $38.76 to $39.76, delivered.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Plates.—Two orders for tank plates for delivery in the Southwest total 4000 tons, about half of which will be rolled in Chicago district mills. This tonnage is for shipment at the earliest convenience of producers. The Chicago Bridge & Iron Works has taken 1000 tons for refinery work for the Standard Oil Co. at El Paso, Tex. The railroad equipment market is almost devoid of fresh inquiries. The Union Pacific has ordered 500 flat cars and bids have been submitted on the 2000 refrigerators to be purchased by the Pacific Fruit Express. It is understood here that about one-fourth of those cars may be built on the Pacific Coast. The Chicago & Eastern Illinois has taken new bids on 500 freight cars. The trade is looking daily for orders from the Burlington for 150 ballast cars. Shipping schedules are being arranged on 45,000 tons of steel required for 4000 cars recently ordered by the St. Louis-San Francisco. Demand for plates from the building industry is active but rolling schedules are easily arranged because of delay between awards to fabricators and the actual beginning of erection. Prices are firm at 1.95c., Chicago, for lots of 100 tons or more.

Mill prices on plates per lb.: 1.95c. to 2.05c., base, Chicago.

Structural Material.—New business in structural material is active but in smaller volume, following heavy lettings of the past three weeks. The Drake Tower, requiring 4000 tons, has been awarded. Local shops are well supplied with heavy tonnage orders but are finding schedules difficult to arrange because of the lack of small fill-in contracts. This condition keeps competition at high pitch and no improvement is noted in prices obtained by fabricators. The Great Lakes Dredge & Dock Co. has been awarded the general contract for the Robey Street viaduct, Chicago. Chicago producers are holding rigidly to 1.95c. for 100 tons or more in a single order and at 2.05c. for smaller lots.

Mill prices on plain material per lb.: 1.95c. to 2.05c., base, Chicago.

Bars.—Sales of mild steel bars for the week are ahead of shipments. Deliveries range four to six weeks, which brings local mill bookings close to the end of the first quarter. Producers say that sales made now are for delivery in the first three months only and that no tonnage will be carried into April. Announcement of second quarter prices may be near at hand. Quotations in Chicago are firm at 1.95c. for lots of 100 tons or more. The iron bar market is quiet both in inquiries and sales. Orders for alloy steel bars are keeping Chicago mills engaged at 85 per cent of capacity. Demand for rail steel bars continues to grow and specifications are heavier than shipments. Barn equipment manufacturers and bed makers are enjoying a better volume of business. Prices are steady at 1.80c., Chicago Heights mills.

Mill prices per lb.: Soft steel bars, 1.95c. to 2.05c., base, Chicago; common bar iron, 1.90c., base, Chicago; rail steel bars, 1.80c., base, Chicago Heights mill.

Cast Iron Pipe.—Taking fresh inquiry as a gage, the cast iron pipe market has shown a marked improvement in the week. New buying is sluggish and is confined to car lot purchases except for several orders, aggregating 2500 tons, from public utility operators. Bids opened at Detroit on 2000 tons of 24-in., class C pipe, disclose that French pipe was priced at $27, Birmingham, while three American foundries, whose bids cover the full requirements of Detroit, were all within a few cents of $30, Birmingham. It appears that delivery is an important factor in the placing of this business and therefore it is not unlikely that the tonnage will be distributed among the American Cast Iron Pipe Co., the National Cast Iron Pipe Co. and James B. Clow & Sons. Chicago will open bids Feb. 29 on 1600 tons of 8 and 12-in. class B pipe, and Akron, Ohio, will receive tenders up to Feb. 21 on 1500 tons of 4 to 16-in. pipe and 100 tons of fittings. Saginaw, Mich., will buy 475 tons of 6 to 24-in. pipe and 30 tons of fittings, and Grosse Point Farms, Mich., has need of 150 tons of 8 and 12-in. pipe. Bids at Detroit and prices quoted locally to contractors show that quotations on 6-in. and larger pipe are at $29.50 to $30.00, Birmingham, or $37.70 to $38.20, delivered Chicago.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $37.70 to $38.20; 4-in., $41.70 to $42.20; Class A and gas pipe, $4 extra.

Wire Products.—The jobbing trade continues to find business brisk and orders to mills are about equal to output, which is a shade above 75 per cent of capacity. Some production departments are fully engaged while others are operating at about 50 per cent, indicating a less balanced condition than prevailed at the beginning of the month. Business in the Middle West and in the South is good, while some improvement is noted in the near Northwest. Specifications from the manufacturing trade are growing slowly. Demand

CARNEGIE LIBRARY

from warehouses is not keeping pace with that from other sources. Plain bright wire is steady at $2.55 per 100 lb., Chicago. Sellers plan to announce second quarter prices on March 1. Prices of wire and wire products are given on page 557.

Rails and Track Supplies.—Chicago district rail mills are operating at capacity and with shipping schedules well arranged there is little complaint on deliveries. New buying is quiet. Several railroads have purchased a total of 6000 tons of track accessories and fresh inquiry has raised the pending list to 15,000 tons. Light rail orders are confined to miscellaneous carlots.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per Lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Sheets.—Following the announcement that present prices will be quoted for second quarter, sales of sheets have grown heavier. First quarter requirements have been well covered. Specifications have expanded and deliveries have been pushed ahead to an average of three weeks. The call for shipments is widespread both as to consuming industries and territory served.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Reinforcing Bars.—Interest in this market centers chiefly around business which will come from recently announced office building construction. Fresh inquiry is not large. Sales consist largely of individual orders of less than 100 tons each. The downward trend in bending shop operations is checked at 40 per cent of capacity but order books are small and the outlook is not reassuring. Recent awards have not served to test billet steel reinforcing bar prices. The hard steel commodity is quotable 1.80c. to 1.95c., Chicago Heights mills.

Bolts, Nuts and Rivets.—Fresh buying of small rivets is sluggish at the new discounts and a test of the market has not been made. Bolt and nut users are taking larger quantities. Large rivets are steady at $2.85 per 100 lb., f.o.b. Chicago.

Hot Rolled Strip.—Demand from automobile frame makers is heavy and March schedules of shipments to that industry indicate that the rate will be sustained. Producers here find that new uses for this commodity are rapidly coming to light and that the general demand is broadening. Prices in the Chicago market are unchanged, though quotations to the east of here are reported to have been advanced.

Coke.—Shipments are steady and prices for by-product foundry coke are unchanged at $9, f.o.b. local ovens, and at $9.50, delivered in the Chicago switching district.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.35c. to 2.75c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb	$3.20
Common wire nails, base per keg	3.00
Cement coated nails, base per keg	2.90

Old Material.—A Chicago mill has purchased close to 15,000 tons of heavy melting steel at $13.50 a gross ton, delivered. This is 50c. a ton higher than prevailed on recent heavy sales. Dealers, pressed to cover on No. 1 heavy melting steel contracts, are offering $13.25. Steel mill operation is placing a heavy drain on the local market especially for the better grades of melting steel. Specialties, mainly the cast grades, are weak and the price of cast iron borings is sagging under pressure of a more than adequate supply and the refusal of many large users to make purchases at prices asked. It is reported that one large buyer is holding out for a delivered price of $10. Malleable foundries are not anxious to take deliveries against recent purchases and are not interested in current offerings. A number of gray iron foundries are declining to take deliveries pending the reduction of stocks on hand.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$13.00 to $13.50
Shoveling steel	13.00 to 13.50
Frogs, switches and guards, cut apart, and miscellaneous rails	14.25 to 14.75
Hydraulic compressed sheets	11.50 to 12.00
Drop forge flashings	9.75 to 10.25
Forged, cast and rolled steel carwheels	15.25 to 15.75
Railroad tires, charging box size	16.50 to 17.00
Railroad leaf springs, cut apart	16.50 to 17.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	14.50 to 15.00
Coil springs	16.50 to 17.00
Electric Furnace Grades:	
Axle turnings	13.00 to 13.50
Low phosphorus punchings	14.25 to 14.75
Low phosphorus plate, 12 in. and under	13.50 to 14.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	10.00 to 10.50
Short shoveling turnings	10.00 to 10.50
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	15.00 to 15.50
Cupola Grades:	
Steel rails less than 3 ft	15.25 to 15.75
Angle bars, steel	14.25 to 14.75
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	13.00 to 13.50
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	14.00 to 14.50
Iron arch bars and transoms	19.25 to 19.75
Iron car axles	21.50 to 22.00
Steel car axles	16.50 to 17.00
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	11.50 to 12.00
No. 1 busheling	9.75 to 10.25
No. 2 busheling	4.25 to 4.75
Locomotive tires, smooth	12.50 to 13.00
Pipes and flues	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.00 to 13.50
No. 1 agricultural cast	13.00 to 13.50
Stove plate	11.25 to 11.75
Grate bars	11.50 to 12.00
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

The Lally Co., Union Trust Building, Pittsburgh, dealer in tubular steel products, has been succeeded by Lally-McKelvy, Inc., which retains the present offices and will maintain its predecessor's connections and represent the Delaware Seamless Tube Co., Auburn, Pa., on sales in western Pennsylvania, western New York and West Virginia.

Changes in business methods necessary to meet new conditions will be the theme of the second annual conference of the Society for the Interchange of Merchandising Ideas which will be held at Nela Park, Cleveland, Feb. 27 and 28. F. J. Nichols, president of the F. J. Nichols Co., Dayton, Ohio, marketing counselor, is adviser to the executive committee of the society, members of which include Bennett Chapple, publicity director, American Rolling Mill Co., Middletown, Ohio.

New York

Pig Iron Sales 10,000 Tons—Three Buildings Will Take 50,000 Tons of Steel

NEW YORK, Feb. 20.—Pig iron buying is at a sustained rate, sales at 10,000 tons being on a par with the total of last week, and inquiry is heavier. Fully 15,000 tons is under negotiation, and it is regarded as significant that several melters who recently bought good-sized tonnages are in the market for additional iron. The largest new inquiry is from the National Radiator Corporation, Johnstown, Pa., and calls for 5000 tons. Abendroth Brothers, Port Chester, N. Y., are in the market for 1000 tons each of No. 2 plain and No. 2X for April and May delivery, and the General Fire Extinguisher Co., Providence, R. I., is inquiring for 1800 tons. Another New England buyer is negotiating for 1500 tons. The only inquiry calling for deliveries beyond the second quarter is from the A. P. Smith Mfg. Co., East Orange, N. J., calling for 600 tons of No. 2 plain and No. 2X for shipment from April through July. Prices show little change except that recent concessions on sizable tonnages have had the effect of making $16.50, base Buffalo, a more open quotation on attractive business. On smaller lots, however, $17 is still being obtained. The recent advance to $20, base furnace, on eastern Pennsylvania foundry iron is still largely untested in this territory.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.41 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 22.52
East. Pa. No. 2 fdy., sil. 2.25 to 2.75	20.89 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 23.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Finished Steel.—Specifications on old contracts are coming in at about the same rate as during the last two weeks, but buyers are so well covered on needs for the present quarter that it will probably be three or four weeks before recently established prices on a number of finished products may be adequately tested. Reflecting the activity of the building industry in this territory, the outlook for shapes seems unusually bright. Three large buildings in New York for which plans are being prepared will probably require a total of 50,000 tons, and engineers and architects are rushing plans for further work in view of an advancing market. On new business shape mills seem to be adhering to 2.14½c., New York. A feature of the market is the reported placing of 2000 box car bodies with a Baltimore car builder by the Baltimore & Ohio. Activity in bars is not pronounced, but specifications are coming in at a fair rate. A large independent oil company is inquiring for 100,000 boxes of tin plate and a Japanese oil company for 60,000 boxes. There is also a growing interest in steel pipe for oil company use, and several municipalities and private corporations are inquiring for fair-sized tonnages of casing and line pipe. Sheet prices have been somewhat weaker in the last few days, and one or two companies apparently have not yet advanced their prices to the recently announced levels. However, small sales are being made at 2.90c., Pittsburgh, for black, 3.75c. for galvanized and 2.10c. and 2.20c. for blue annealed, according to width. There has been some opportunity to test the 2.50c. price for wire, but most consumers are well covered for the quarter. This condition is more pronounced in nails and buying at 2.65c., the new price, is almost entirely lacking.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c.; plates, 2.17½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Warehouse Business.—Purchasing from stock has been rather light in the past week, but there is very little tendency to shade the present schedule of prices. The market on black and galvanized sheets in New York and in local New Jersey still shows a considerable difference with black sheets at 4c. per lb., base, in New York and 4.20c. per lb. in New Jersey and galvanized at 4.70c. in New York and 4.95c. per lb. in New Jersey.

Cast Iron Pipe.—A large Southern maker has advanced the base price on pipe to $29.50 per ton, Birmingham, the increase to apply on all small routine inquiries. This move, however, is not generally reflected in the market, as competition is still keen enough to bring out prices below $28, Birmingham, on comparatively small jobs. Newark, N. J., has placed 1000 tons of 6 to 16-in. cast pipe with the United States Cast Iron Pipe & Foundry Co. and this maker has also closed on 800 tons of 48-in. pipe for New Bedford, Mass. The New Haven Water Co., New Haven, Conn., has placed 2000 tons, presumably with the same foundry.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $37.25 to $38.25; 4-in. and 5-in., $42.25 to $43.25; 3-in., $52.25 to $53.25; Class A and gas pipe, $4 to $5 extra.

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.34c.
Soft steel bars and small shapes	3.24c.
Iron bars	3.24c.
Iron bars, Swedish charcoal	7.00c. to 7.25c.
Cold-finished shafting and screw stock—	
Rounds and hexagons	3.40c.

No. 30	5.60c. to 5.85c.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

Reinforcing Bars.—Inquiry has come out for two large industrial buildings in Manhattan, one of which will require 1000 tons of bars and the other 500 tons. Otherwise the market is without feature, awards having been mostly small tonnages. The mill price is unchanged at 1.95c. per lb., Pittsburgh. Distributers are quoting 2.20c., Youngstown warehouse, or 2.57½c., on cars at New York, and out of New York warehouse the general quotation is 2.80c. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons and 3.24c. for less than 2 tons, all delivered at job.

Coke.—Furnace coke is somewhat easier, but specifications for the foundry grade are coming in at a satisfactory rate. There is very little spot demand. Standard foundry is quoted for prompt shipment at $4 to $4.50 per ton, Connellsville, and standard furnace at from $2.75 to $3 per ton, Connellsville. Delivered prices are: To northern New Jersey, $8.03 to $8.53; to New York or Brooklyn, $8.79 to $9.29; to Newark or Jersey City, $7.91 to $8.41. By-product coke continues at $9 to $9.40 per net ton, delivered Newark or Jersey City.

Old Material.—Except for some sizable purchases of No. 1 heavy melting steel by eastern Pennsylvania consumers, the scrap market has continued rather inactive. A Coatesville, Pa., mill recently closed on about 18,000 tons and a Bethlehem, Pa., consumer purchased a sizable tonnage of No. 1 steel. Yard grade of heavy melting steel is quiet but a fair tonnage is moving to Harrisburg and Pottsville, Pa., mills, for which brokers are paying $11 per ton, delivered. On yard steel shipments to Phoenixville, Pa., only $10.75 per ton, delivered, is being offered by most dealers. Efforts of a Phoenixville consumer of stove plate and machine shop turnings to purchase stove plate at $12.50 and turnings at less than $11 have apparently been unsuccessful thus far, as brokers claim that it is necessary to pay these prices to obtain sufficient tonnage.

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	7.00 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	8.75 to 9.00
Machine shop turnings	6.75 to 7.50
Short shoveling turnings	7.00 to 7.50
Cast borings (blast furnace or steel works)	6.75 to 7.50
Mixed borings and turnings	7.00 to 7.50
Steel car axles	16.00 to 16.50
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. diam., not under 2 ft. long)	8.75
Forge fire	6.75 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought, long	9.00 to 9.50
Rails for rolling	10.50 to 11.00
Cast iron carwheels	11.25 to 11.75
Stove plate (foundry)	8.50 to 9.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.00 to 11.50
Prices per gross ton, delivered local foundries:	
No. 1 machinery cast	$13.75 to $14.25
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.75 to 12.25
No. 2 cast (radiators, cast boilers, etc.)	11.25 to 11.75

Of 53 independent open-hearth furnaces in the Mahoning Valley, 41 are melting this week, against 39 the preceding week, while 108 of 127 sheet mills are under power. Some rolling mill companies, such as the Newton Steel Co. and the Trumbull Steel Co. are operating Sundays to meet demands on certain departments.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.60c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb	$2.90
No. 9 galvanized wire, per 100 lb	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

Cleveland

Demand for Steel Keeping Up—Pig Iron Sales of 53,000 Tons

CLEVELAND, Feb. 20.—Orders for finished steel against contracts are keeping up to the recent good volume, but it is not expected that February business will be quite equal to that in January. While some small-lot business in steel bars, plates and structural material is being taken at present prices, most orders are against lower-priced contracts that extend through the quarter. On new business, 1.85c., Pittsburgh, is being maintained on steel bars, plates and structural material and mills in some cases are able to get 1.95c. for small miscellaneous lots of steel bars. Local mills quote steel bars at 1.85c., Cleveland.

With increased mill operations, the steel output is about on a parity with orders, so that with a few exceptions, mills are not accumulating backlogs. On the other hand, consumers do not appear to be ordering in excess of current needs and are not accumulating stock, this being indicated by requests for prompt shipments. Specifications from the automotive industry continue heavy, but this industry, as well as other consumers, is covered for the present quarter. Some of the automobile manufacturers will increase slightly their output in March. Motor car manufacturers have taken heavy orders from dealers, but it will be some time before the extent of purchases by car users this spring will be known. However, a large amount of business in low-priced cars was held back late last year as buyers were waiting for the appearance of the Ford model and it seems certain that this year's sales of cars of this class will be heavy.

Consumers of steel bars, plates, and structural material are beginning to show an interest in second quarter contracts. The belief is rather general that present prices will prevail for that delivery and that if there is another advance it will not be made until buyers have an opportunity to cover at present quotations. The opening of books for second quarter contracts for sheets and hot and cold-rolled strip steel has not yet brought out any business for that delivery.

The American Steel & Wire Co. will blow in an additional blast furnace in Cleveland about March 1. It is now operating two of its four stacks.

Strip Steel.—Specifications are liberal against contracts for hot and cold-rolled strip taken at lower prices than those now prevailing, but there is very little new business, as most consumers are covered for the quarter. While mills have opened their books for the second quarter at the recently revised prices on hot strip and the current prices on cold strip, no buying has as yet developed for that delivery.

Iron Ore.—The consumption of Lake Superior ore during January amounted to 4,303,132 tons, an increase of 311,033 tons over December. During January last year 4,523,863 tons was consumed. Furnace stocks Feb. 1 amounted to 27,061,994 tons. Ore on hand at furnaces and Lake Erie docks Feb. 1 totaled 33,349,994 tons, as compared with 33,971,030 tons on the same date a year ago. Central district furnaces consumed 2,063,871 tons of ore in January, an increase of 157,530 tons over the previous month. Lake front furnaces consumed 2,060,464 tons, a gain of 177,917 tons; Eastern furnaces used 44,442 tons, a decrease of 19,978 tons, and all rail furnaces consumed 134,355 tons, a decrease of 4436 tons. On Jan. 31 there were 156 furnaces in blast using Lake ore, a gain of 12 for the month.

Pig Iron.—Sales showed a sharp gain the past week, during which Cleveland interests sold 53,000 tons of foundry and malleable iron for delivery through the second quarter. The increase is due in part to the booking of considerable iron in the East to be shipped from Buffalo furnaces. Considerable business was also taken in the Michigan territory. Sales in Ohio were moderate. One producer has advanced its Lake furnace price 50c. a ton to $17.50 for foundry and malleable iron, but others are still quoting $17, which is the ruling price in the Cleveland territory. However, efforts to establish the Lake furnace market at $17 have not been wholly successful as $16.50 has not disappeared as a price for shipment to competitive points. Full silicon differentials are not always being maintained. In Michigan $18 is the ruling price, the market there holding to the recent 50c. advance. Shipping orders continue heavy from the automotive industry and are fair from other sources. However, shipping orders indicate that many consumers overbought late last year and will carry considerable first quarter iron over into the second quarter. Business has improved with radiator manufacturers and some plants in this industry will increase operations.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Reinforcing Bars.—Some shading is reported on round-lot business and warehouse prices are irregular. Rail steel bars are unchanged at 1.75c., mill, but cannot compete in Cleveland at this price with billet steel bars.

Warehouse Business.—Jobbers' sales show a gain and the volume of business is quite satisfactory. The adoption of lump sum extras by mills on hot-rolled steel bars has diverted some business from mills to warehouses. Hardware jobbers have not followed the recent advance on galvanized sheets.

Sheets.—Consumers are showing no interest in second quarter contracts, although mills have opened their books for that delivery. Specifications continue good from the automotive industry and are fair from other consumers, but there is very little current buying. Regular quotations are being well maintained on black and blue annealed sheets, but galvanized sheets, for which the demand is not very brisk, are irregular with concessions reported of as much as $4 a ton from 3.75c., Pittsburgh base. Jobbers placed contracts a few weeks ago at prices that enable them to sell at a profit at lower than present mill prices and they are responsible for some of the present price shading.

Coke.—New demand for foundry coke is limited to car lots. Prices are unchanged at $8, Painesville, for by-product foundry coke, or $9.01, delivered Cleveland; $3.75 to $5.10, ovens, for Connellsville foundry coke and $2.75 for heating coke.

Bolts, Nuts and Rivets.—The demand for bolts and nuts is slow, although it shows a little gain. Rivets continue dull. Practically all orders are specifications against contracts.

Old Material.—Mills are still holding down shipments to very limited quantities and the market is inactive. There is no buying by the mills, and dealers and producers are making little effort to make sales, as there is not much incentive to dispose of material they cannot ship. Dealers having old orders are covered and out of the market. Blast furnace scrap is being rather freely offered at $10.25, a reduction of 25 cents a ton. Other grades are unchanged.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.00 to 11.25
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.25 to 10.50
Mixed borings and short turnings	10.25 to 10.50
No. 2 busheling	10.25 to 10.50
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, $\frac{3}{16}$-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.40c.
Round-edge iron	3.50c.
Round-edge steel, iron finished, 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.35c.
Cold-finished steel, squares and flats	3.85c.
Steel hoops	3.50c.
Steel bands, No. 12 gage to $\frac{3}{16}$-in., inclusive	3.25c.
Spring steel	5.00c.
Black sheets (No. 24)	4.25c.
Galvanized sheets (No. 24)	5.10c.
Blue annealed sheets (No. 10)	3.15c.
Diamond pattern floor plates—	
¼-in.	5.30c.
$\frac{3}{16}$-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

Philadelphia

Further Advance Expected on Plates, Shapes and Bars

PHILADELPHIA, Feb. 20.—Consumers of steel apparently specified sufficient tonnage during January and early February to cover nearby requirements. Consequently, shipments against first quarter contracts have been lighter and new business is extremely limited. It is expected that there will be a further price advance on plates, shapes and bars for second quarter delivery, but consumers will in all probability be given an opportunity to cover at the present level.

Pig Iron.—The market is decidedly inactive and purchasing is confined almost exclusively to occasional carload lots by the larger foundry consumers, who apparently underestimated their requirements when contracting for the present quarter. On the other hand, the smaller jobbing foundries are evidently well supplied with iron and in some instances are inclined to ask for delays in shipments on their contracts. It is estimated that current inquiry in this district is not much more than 1000 tons of foundry iron. Furnaces are maintaining the new price of $20, base, on foundry grades, despite the small volume of present business. Of the three principal basic buyers in eastern Pennsylvania, one has recently bought a tonnage, another is reported to be supplied for the next month to six weeks, and the third is still receiving shipments on an old contract. Business in low phosphorus iron is confined to occasional carload lots.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26
East. Pa. No. 1X	21.76
Basic (delivered eastern Pa.)	$19.50 to 20.00
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to 24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to 24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to 25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to 25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Business is restricted to small lots for prompt shipment, and prices are unchanged at $33 per ton, Pittsburgh, for rerolling billets and at $38 per ton for forging grade. The plate market being quiet, an eastern Pennsylvania plate mill is seeking business in forging billets.

Bars.—Current specifications against contracts are small and there is very little purchasing at the present level of quotations. Sellers seem confident that prices for second quarter will be advanced. The price for prompt shipment is 1.85c. per lb., Pittsburgh.

Shapes.—Fabricated steel projects are not numerous and most of the present business involves small tonnages. Competition among fabricators is keen. While the market on shapes has advanced twice in a comparatively short period, bids on structural projects are still at about the same level as before the advances. Shapes are quoted at 2c. per lb., Bethlehem, 1.975c. per lb., Pottsville, or 2.12c. to 2.13c. per lb., delivered Philadelphia.

Plates.—New business is slow in developing and specifications against contracts are light. Recent locomotive purchases by the railroads, however, are expected to provide some plate business. Prices continue at 2c. per lb., Coatesville, Pa., or 2.10c. per lb., delivered Philadelphia.

Sheets.—Although shading of prices on both black and galvanized sheets is still frequent, concessions are becoming smaller and the tendency of the market is apparently toward greater strength. Black sheets range from 2.75c. to 2.90c. per lb., base Pittsburgh, and galvanized from 3.65c. to 3.75c. per lb., base Pittsburgh. A firmer attitude is evident in blue annealed and strip steel sheets, which show little or no deviation from the basis of 2.10c. per lb., Pittsburgh.

Warehouse Business.—The recently applied quantity differentials on bars and small shapes are being maintained on most business in this district and the territory in which the differentials are quoted has been extended beyond the immediate Philadelphia district. Some jobbers expect that February will prove to be a better month than January.

Imports.—In the week ended Feb. 18, ore imports totaled 3736 gross tons, of which 3180 tons was Cuban chrome ore, 551 tons Portuguese African chrome ore and 5 tons South African manganese ore. Pig iron imports totaled 300 tons of Indian iron. Arrivals of steel consisted of 107 tons of bars from Belgium and 97 tons from France, 164 tons of shapes from Belgium, 44 tons of hoops from Belgium and 9 tons of strip steel from Great Britain. There was also 43 tons of steel scrap from Germany and 11 tons from Great Britain.

Old Material.—Except for some recent purchasing by a large eastern Pennsylvania consumer for several plants, the market is inactive. The total of these purchases was about 60,000 tons of No. 1 heavy melting steel, of which about 25,000 tons was for Sparrows Point, Md., and the remainder for Bethlehem, Steelton and Coatesville, Pa. Prices ranged from $13.50 to $14 per ton, delivered. The same consumer has purchased about 5000 tons of blast furnace scrap at $10.50 per ton, delivered Bethlehem, Pa., and $11 per ton, delivered Sparrows Point, Md.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	15.00 to	15.50
Bundled sheets (for steel works)	10.50 to	11.00
Machine shop turnings (for steel works)		11.00
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast boring (for steel works and rolling mill)		11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars		13.00
Stove plate (for steel works)		13.00
No. 1 low phos., heavy, 0.04 per cent and under	18.00 to	18.50
Couplers and knuckles	16.00 to	16.50
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.00 to	10.50
Machine shop turnings (for rolling mill)		11.00
Wrought iron and soft steel pipes and tubes (new specifications)	12.50 to	13.00
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire	11.00 to	12.00
Steel rails for rolling	15.00 to	15.50
Cast iron carwheels	15.50 to	16.50
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	14.50 to	15.00

MORE STEEL IN RIVER CRAFT

Last Year 506 Hulls Were Launched, Taking 79,200 Tons of Steel—63,776 Tons in Preceding Year

USE of steel in inland waterway barges, boats and other river craft, as measured by the launchings of 1927, registered a substantial increase as compared with 1926. Last year 506 hulls were launched, in the construction of which 79,215 tons of steel was used. This compares with 366 hulls, taking 63,776 tons of steel in 1926 and with 269 hulls, taking 53,710 tons of steel, in 1925.

The steady rise in construction of steel river craft not only reflects the replacement of wood barges and boats by those of steel, but also the increasing use of the inland rivers for the movement of freight. In another year, the canalization of the Ohio River from its source to its junction with the Mississippi at Cairo, Ill., will be completed and this development is expected to be followed by a considerable swelling of the waterborne movement of the products of the Pittsburgh, Wheeling and Cincinnati districts.

Inland points, such as Youngstown, are seeking the assistance that even partial use of the rivers will afford steel manufacturers through lower freight charges. A movement now is under way to get the railroads to grant a proportional rate to some point on the Ohio River, where the Youngstown products can be transferred to river barges and carried to destinations. This is not possible under present conditions, which on any such movement would mean that the railroads would exact the local tariff to the point of river transfer.

The record of 1927 launchings is as follows:

Builder	Location	Number of Hulls	Tonnage of Steel
American Bridge Co.	Ambridge, Pa.	132	19,662
Dravo Contracting Co.	Pittsburgh	113	22,600
Riter-Conley Co.	Leetsdale, Pa.	60	9,000
Midland Barge Co.	Midland, Pa.	42	7,650
Marietta Mfg. Co.	Point Pleasant, W. Va.	49	5,310
Jones & Laughlin Steel Corporation	Pittsburgh	29	4,956
Nashville Bridge Co.	Nashville, Tenn.	25	3,650
Howard Shipyards & Dock Co.	Jeffersonville, Ind.	37	3,580
Charles Ward Engineering Works	Charleston, W. Va.	12	1,835
Alabama Drydock & Shipbuilding Co.	Mobile, Ala.	7	1,014
Total 1927 launchings		506	79,257
Total 1926 launchings		366	63,776
Total 1925 launchings		269	53,710

American Rolling Mill Co. to Redeem 6 Per Cent Gold Notes

The American Rolling Mill Co. has informed holders of its 15-year sinking fund 6 per cent gold notes, due Jan. 1, 1938, that it will redeem on July 1 next the entire outstanding issue at 104½ and accrued interest. Pursuant to this notice, the company has authorized the Guaranty Trust Co. of New York to purchase any of these notes at the redemption price, with accrued interest to July 1, discounted on a 4½ per cent true discount basis figured to the redemption date. The calling of these notes is a part of the purpose of the refinancing plan approved by the company on Dec. 31, when the right to subscribe to one additional share of common stock for each six shares held was given to each stockholder and a $25,000,000 issue of 5 per cent sinking fund gold debentures, callable as a whole or in part at 104 and interest, was marketed.

Orders for 1025 steel boilers in January, with 851,811 sq. ft. of heating surface, were reported to the Department of Commerce by 72 manufacturers. This compares with 1054 boilers and 905,680 sq. ft. in December. Of the January orders 1010 were stationary boilers, with 833,314 sq. ft., and 15 were marine boilers, with 18,497 sq. ft.

Boston

Sizable Tonnage of Basic Iron Sold in New England

BOSTON, Feb. 20.—It is understood a sizable tonnage has been placed by the two largest basic pig iron users in New England, with a larger portion presumably going to a Bridgeport, Conn., consumer. Details are lacking, but it is understood the tonnage runs well into five figures. A slump in foundry iron buying in the past week is reported. Sales did not exceed 3000 tons, of which Buffalo furnaces and furnaces east of Buffalo took practically all. Buffalo iron, silicon 1.75 to 2.25 per cent, is still offered at $16.50 a ton, furnace, but on higher grades full differentials are generally maintained not only by Buffalo furnaces but by those east of Buffalo. Current iron sales are for deliveries straddling first and second quarters or for second quarter only. There are but two sizable inquiries in the market, one for 1000 tons of No. 2 plain and 1000 tons of No. 2X, and the other for 1000 tons of No. 2X and No. 1X.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$21.41 to	$21.91
Buffalo, sil. 2.25 to 2.75	21.41 to	22.41
East. Penn., sil. 1.75 to 2.25	23.15 to	23.65
East. Penn., sil. 2.25 to 2.75	23.65 to	24.15
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Steel Grit.—New England foundries took quite a little steel grit the past week on a basis of $120 a ton for small lots and $100 a ton for large lots.

Bars.—Consumers' takings of steel bars are holding up well, but the average individual specification as well as current new order is small. Reinforcing bar business has fallen rather flat, daily average individual orders being less than 10 tons, with no easing in prices, however. Steel bars are 1.85c. to 1.90c. per lb., base Pittsburgh, generally 1.90c. Reinforcing bars from stock are 2.70c. to 2.75c., base, mostly 2.70c., with mill shipments 1.90c. per lb., base Pittsburgh, or 2.26½c., delivered in New England.

Cold-Rolled Strip.—Mill bookings of cold-rolled strip steel orders in the past week fell off somewhat. Most producers are well sold up into next month. Competition among Atlantic seaboard mills is keen. The Worcester, Mass., mill is holding to 3.30c. per lb., base, on lots of 1 to 3 tons and at 3.05c. on larger lots.

Shapes and Plates.—So far this month there has been a marked falling off in prospective fabricating jobs. At the moment, 123 tons of steel for a Weymouth, Mass., town office building is the largest job up for figures. Even small jobs are lacking. Recent lettings of bridge work in Vermont disclosed keen competition among fabricators for the work, the low bidder being $12 under the second lowest. Plate business is fairly good, but much less than it was a month ago. Standard shapes and plates are firm at 1.85c. per lb., base Pittsburgh.

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.
Structural shapes—	
Angles and beams	3.365c.
Tees	3.365c.
Zees	3.465c.
Soft steel bars and small shapes	3.265c.
Flats, hot-rolled	4.15c.
Reinforcing bars	3.265c. to 3.54c.
Iron bars—	
Refined	3.265c.
Best refined	4.60c.
Norway, rounds	6.60c.
Norway, squares and flats	7.10c.

Crucible	12.00c.
Tire steel	4.50c. to 4.75c.
Bands	4.015c. to 5.00c.
Hoop steel	5.50c. to 6.00c.
Cold rolled steel—	
Rounds and hexagons	*3.45c. to 5.45c.
Squares and flats	*3.95c. to 6.95c.
Toe calk steel	6.00c.
Rivets, structural or boiler	4.50c.
	Per Cent Off List
Machine bolts	50 and 5
Carriage bolts	50 and 5
Lag screws	50 and 5
Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Coke.—Demand for by-product foundry coke is still spotty owing to the low melt of iron. The price remains at $11.50 a ton, delivered within a $3.10 freight rate zone, and there is no indication of a change on March 1. Average weekly shipments by by-product ovens so far this year are a shade better than last year.

Old Material.—Brokers report it is easier to sell scrap, but more difficult to buy it because of the low prices offered by consumers. Purchases against an order for 3500 tons of steel scrap for shipment to Poland is helping the local market. There is practically no market for yard wrought and shippers are mixing it with steel. The market for steel axles is nominal. Long bundled skeleton sells mostly at $6 a ton on cars, and short bundled skeleton at $6.50. The general price on steel mill borings is $6 a ton for blast furnace use. A Norwood, Mass., foundry is buying stove plate at $10.50 a ton, delivered, and the Mystic Iron Works has also taken some on that basis. For shipment to Pennsylvania points, $8 a ton on cars is the general price. New England foundries are buying textile and No. 1 machinery cast a little more freely, but show no interest in No. 2 machinery cast. Some No. 2 is going to Pennsylvania steel mills at $10.50 to $11 a ton, on cars shipping point.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.00 to	$9.10
Scrap T rails	8.75 to	9.00
Scrap girder rails	7.50 to	8.00
No. 1 railroad wrought	10.00 to	10.50
No. 1 yard wrought	8.50 to	9.00
Machine shop turnings	6.00 to	6.25
Cast iron borings (steel works and rolling mill)	6.00 to	6.25
Bundled skeleton, long	6.00 to	6.50
Forge flashings	6.50 to	7.00
Blast furnace borings and turnings	6.00 to	6.25
Forge scrap	6.00 to	6.50
Shafting	13.00 to	13.50
Steel car axles	15.50 to	16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	8.00 to	8.50
Rails for rolling	10.00 to	10.50
Cast iron borings, chemical	10.00 to	10.50

Prices per gross ton delivered consumers' yards:

Textile cast	$14.00 to	$14.50
No. 1 machinery cast	14.50 to	15.00
No. 2 machinery cast	12.50 to	13.00
Stove plate	10.50 to	11.00
Railroad malleable	13.50 to	14.00

St. Louis

Pig Iron Sales 11,000 Tons—Steel Mill Operations at a High Rate

ST. LOUIS, Feb. 20.—With sales of 11,000 tons, the Granite City maker of pig iron enjoyed its best week of the year. Several thousand tons went to radiator manufacturers in the district, a wheel maker took 1000

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, $\frac{7}{16}$-in. and smaller, 100 lb. or more	70
Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

tons, and jobbing foundries bought about 1200 tons. The sales were for shipment during first quarter and into second quarter, the local maker not having made any change in prices. Shipping specifications are holding up well. The melt in the district is increasing, and the situation generally is promising.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—The Granite City mill has announced sheet prices for second quarter in line with those recently named by other mills. Prices on plates, shapes and bars for second quarter have not been announced, although they are being freely inquired for. Specifications against contracts have been liberal. The Granite City interest is operating its sheet and tin plate mills at full capacity and the plate mill at above 75 per cent. Warehouse business continues good in St. Louis because of the demand for structural material, but very light in the surrounding territory.

Coke.—The market for coke remains steady. The demand for domestic grades has been rather light on account of milder weather, while industrial grades are moving more freely because of the increased melt in the district.

Old Material.—The market for old material continues soft, with a few items 25c. to 50c. a ton lower. Consumers in the district have heavy backlogs of orders, but they are well supplied with old material for the present. Shipments in this market have been very heavy and the mills are congested. Railroad lists include: Southern, 7300 tons; Texas & Pacific, 1600 tons; Chicago & Alton, 1400 tons; New Orleans Public Belt, 1100 tons; Louisville, Henderson & St. Louis, 10 miles of 80-lb. relaying rails; Frisco Lines, 25 carloads.

Prices per gross ton f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$11.75 to $12.25
No. 1 locomotive tires	12.75 to 13.25
Heavy shoveling steel	11.75 to 12.25
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	14.00 to 14.50
Railroad springs	14.50 to 14.75
Bundled sheets	8.75 to 9.25
No. 2 railroad wrought	11.75 to 12.25
No. 1 busheling	10.00 to 10.50
Cast iron borings	9.00 to 9.50
Iron rails	13.00 to 13.50
Rails for rolling	14.25 to 14.75
Machine shop turnings	7.50 to 8.00
Steel car axles	19.50 to 20.00
Iron car axles	24.00 to 24.50
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	10.00 to 10.50
Steel rails, less than 3 ft	15.75 to 16.25
Steel angle bars	13.00 to 13.50
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	14.50 to 15.00
Railroad malleable	12.00 to 12.50
No. 1 railroad cast	13.50 to 14.00
Stove plate	13.50 to 14.00
Agricultural malleable	12.00 to 12.50
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Birmingham

Second Quarter Pig Iron Inquiry Developing—Steel Buying Steady

BIRMINGHAM, Feb. 20.—Inquiries for second quarter pig iron, including some of large size, are more numerous and some business is being booked. The spot and March sales of the past week were at about the same level as the preceding several weeks. Shipments continue close to production. The base price of $16 is being maintained on foundry iron. There has been no change in furnace operations, 17 being in blast.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil.	$16.00
No. 1 foundry, 2.25 to 2.75 sil.	16.50
Basic	15.00

Finished Steel.—Demand continues to improve and there is a steady accumulation of new tonnage.

Cast Iron Pipe.—There is a fair amount of new pressure pipe business in small lots and several large orders are expected in the near future. The market is somewhat firmer and the base price on spot business is now $28 to $30.

Coke.—Spot demand for foundry coke continues quiet. Shipments are in satisfactory volume. Price remains at $5.

Old Material.—There is no noticeable change in tonnage or inquiries, both continuing at about the same rate as in recent weeks. Prices are unchanged.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00 to 8.50
Stove plate	13.00 to 14.00
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	15.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Buffalo

Pig Iron Inquiry Still Pending Totals 20,000 Tons

BUFFALO, Feb. 20.—About 20,000 tons of all grades of pig iron, principally foundry iron, remains unclosed. There are several inquiries for foundry grades ranging from 500 to 3000 tons and a couple of foundry inquiries ranging between 3000 and 5000 tons. Most of the pending business is for delivery over the remainder of first half. The Kensington-Davis foundry of Buffalo has not yet closed against its 2000-ton inquiry and the General Electric Co. inquiry for 500 tons of high silicon iron for Pittsburgh is still pending. Prices remain firm at quoted levels in this district, though some of the Buffalo furnaces are shading the silicon differentials on New England business.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2X foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	$17.00 to 17.50
Basic	16.50 to 17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Mill operation is better and more open-hearth steel capacity is being used. The Donner Steel Co. is now maintaining an 80 per cent rate on open-hearth operation. The Bethlehem Steel Co.'s plant at Lackawanna is running 80 per cent or better, and the Seneca Iron & Steel Co. is operating 80 per cent. Demand for bars and shapes is sustained at 1.95c., Buffalo. Sheet demand is very good. Bolt and nut makers report heavy specifying by the automobile companies. Three Batavia schools, plans on which are just out, will require around 200 tons of reinforcing bars.

Old Material.—A few sales are reported of heavy melting steel, hydraulic compressed and No. 1 busheling. The heavy melting steel sold was strictly No. 1 selected and not less than $15.25 is said to have been obtained. The busheling and hydraulic compressed brought around $14. Some sales of drop forge flashings are reported and there has been some strengtening of this grade. A selected small tonnage of billet and bloom crop ends brought $18, but the market is

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

more nearly represented by the $17 to $17.50 quotation. There is a strong demand for iron axles at $22 to $23.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.75 to $15.25
No. 2 heavy melting steel	13.25 to 13.75
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.25 to 13.75
Hand bundled sheets	9.00 to 9.50
Drop forge flashings	12.00 to 12.50
No. 1 busheling	13.25 to 13.75
Heavy steel axle turnings	12.75 to 13.25
Machine shop turnings	9.00 to 9.25
Acid Open-Hearth Grades	
Railroad knuckles and couplers	16.00 to 16.50
Railroad coil and leaf springs	15.50 to 16.00
Rolled steel wheels	15.75 to 16.25
Low phosphorus billet and bloom ends	17.00 to 17.50
Electric Furnace Grades	
Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	11.00 to 11.50
Blast Furnace Grades	
Short shoveling steel turnings	10.75 to 11.00
Short mixed borings and turnings	10.50 to 11.00
Cast iron borings	10.50 to 11.00
No. 2 busheling	9.00 to 9.50

No. 1 machinery cast	14.50 to 15.00
Stove plate	13.00 to 13.25
Locomotive grate bars	11.50 to 12.00
Steel rails, 3 ft. and under	17.00 to 17.25
Cast iron carwheels	13.00 to 13.50
Malleable Grades	
Railroad	15.50
Agricultural	15.50
Industrial	15.50

Canada

Mills Operating at a Higher Rate—Pig Iron Business Improving

TORONTO, ONT., Feb. 20.—The improvement that has featured the Canadian iron and steel industry during the past two months is reflected in higher production among the leading mills. Companies equipped to produce rails have large tonnage orders on their books and have their rail mills running practically to capacity. The Dominion Iron & Steel Co., Sydney, N. S., which has been rolling rails for the Canadian National Railways, has started its rail mill on an order of 12,600 tons of 127-lb. rails for the Michigan Central. These are the heaviest ever turned out in a Canadian rail mill.

Pig Iron.—Inquiries for second quarter delivery are making their appearance and a number of melters appear anxious to cover up to the end of June. The demand for spot iron is strong. Indications are that first quarter spot sales will stand out above those of the first three months of 1927. Melters are entering the market for lots ranging from 50 to 200 tons and occasional orders are appearing for 500 tons. Pig iron production in Canada is increasing and with six blast furnaces blowing figures for this month will surpass those of January. It is understood that the new owners of the British Empire Steel Corporation propose changes in its blast furnaces. Some of those that are now considered more or less obsolete are to be replaced with modern stacks. Pig iron prices are firm in both Toronto and Montreal markets.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	$25.00 to $25.50
No. 2 foundry, sil. 1.75 to 2.25	25.00 to 25.50
Malleable	25.00 to 25.50
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—The general trend of business in this market is on the up-grade, but so far improvement has not been sufficient to warrant the advancing of prices. Consumers are buying sparingly and prefer to hold their purchases to correspond with immediate needs. Prices are unchanged, although a little stronger.

Dealers' buying prices:

	Toronto	Montreal
Per Gross Ton		
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00

San Francisco

Structural Steel Awards 8800 Tons Plate—Jobs Pending Total 9000 Tons

SAN FRANCISCO, Feb. 16 (*By Air Mail*).—Outstanding among a total of 8800 tons of structural shape awards was 6500 tons for the Physicians' Building in San Francisco which went to the McClintic-Marshall Co. Central Works. Other awards included 700 tons for transmission towers for the Southern California Edison Co., Los Angeles, and 850 tons for a church in the same city, the latter project going to McClintic-Marshall Co. and the former to the Pacific Coast Steel Co. Pending business involves over 20,000 tons. Plain material continues firm at 2.35c., c.i.f. Coast ports.

Pig Iron.—Movement of pig iron this week was limited to small lots and little of importance transpired. No change in prices is noted.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Plates.—Awards of plate material this week were confined to lots of less than 100 tons. However, a number of pending projects involve over 9000 tons. Bids will be opened this week in Seattle for a 2000-ton penstock and bids will be taken next week on 650 tons for a pipe line and penstock at Milton, Ore. The Southern California Edison Co. has taken bids on a 1300-ton penstock. Prices are now firm at 2.30c. c.i.f.

Bars.—In the reinforcing bar market the largest award was 210 tons for apartments in Los Angeles placed with an unnamed interest. The majority of the awards lately have been confined to lots ranging from 20 to 30 tons. In the San Francisco district considerable foreign material has been used of late and this has resulted in weak out-of-stock prices, as low as 2.25c. being named.

Cast Iron Pipe.—The only award of over 100 tons this week involved 19 tons of 4 to 8-in. class 150 pipe for Pasadena, Cal., and was secured by the American Cast Iron Pipe Co. Charles Raasche, Los Angeles, was low bidder on 156 tons of 4 to 8-in. class B pipe for the improvement of Pacific Street, Oceanside, Cal. James Young, Sacramento, was low bidder on 145 tons of 4 and 6-in. class B pipe for the State Fair Grounds at Sacramento, Cal. Bids were opened this week on 128 tons of 48-in. class A pipe for the North Oufall sewer

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ³⁄₁₆-in. and over	3.15c.
Small angles, under ³⁄₁₆-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.95c.
Blue annealed sheets (No. 10)	3.90c.
Galvanized sheets (No. 24)	5.50c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.40
Cement coated nails, 100-lb. keg	3.40

in Los Angeles. Bids were also opened on 222 tons of 4 to 8-in. class B pipe for Armona, Cal. B. Nicoll & Co. were low bidders on 1964 tons of 6 and 8-in. class 350 pipe for Los Angeles. George C. DeGolyer, Oakland, was low bidder on 526 tons of 4 to 8-in. class B pipe for the East Palo Alto Waterworks District at Redwood City, Cal. Bids will be opened on Feb. 20 for 426 tons of 4 to 12-in. pipe for the improvement of Saturn Avenue, Huntington Park, Cal., and on Feb. 21 for 136 tons of 18-in. pipe for San Diego, Cal.

Standard Pipe.—The Grinnell Co. of the Pacific was awarded 950 tons of 6-in. welded pipe and 285 tons of 6-in. wrought iron pipe for Los Angeles. E. W. Redman, Fresno, Cal., was low bidder on 150 tons of 2 to 8-in. Matheson joint pipe for the East Palo Alto Waterworks District at Redwood City, Cal. No action has yet been taken on the inquiry of the Petroleum Securities Co. for 650 tons of 3½-in. to 16-in. plain-end line pipe for its new Richmond, Cal., plant.

Cincinnati

Pig Iron Shipments Increase—Steel Specifications Lagging

CINCINNATI, Feb. 20.—There has been a further increase in the foundry melt in this district, with the result that pig iron shipments are going forward at a better rate. In many cases, however, specifications for first quarter deliveries are lagging and it will be well into the second quarter before buyers have taken all of the tonnages called for on current contracts. Sales are inconsequential in the aggregate and inquiries are scarce. The Favorite Stove & Range Co., Piqua, Ohio, has bought 600 tons of foundry iron from a Lake Erie furnace, while another company in this territory has purchased 1000 tons of malleable. Prices are unchanged with Ironton makers asking $19 at the furnace and northern Ohio producers quoting from $16.50 to $17, base Cleveland. In the South, Alabama and Tennessee sellers are firm at $16, base Birmingham. The Marting Iron & Steel Co. is reported to be preparing to blow in one of its Ironton furnaces late in March. At present none of the merchant stacks in the Ironton district is operating.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25		$20.89
So. Ohio malleable	$20.14 to	20.89
Alabama fdy., sil. 1.75 to 2.25		19.69
Alabama fdy., sil. 2.25 to 2.75		20.19
Tennessee fdy., sil. 1.75 to 2.25		19.69
Southern Ohio silvery, 8 per cent		26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—There has been a perceptible decline in specifications against first quarter contracts for bars, structural shapes and plates. The decrease is partly attributed to the fact that contract customers in recent weeks have taken out substantial tonnages and therefore are not in immediate need of material in large quantities. Many buyers are awaiting developments on prices before authorizing releases beyond the amounts needed for current requirements. In structural steel an inquiry for 6000 tons for a highway bridge spanning the Ohio River at Maysville, Ky., has been put out, and bids are being submitted on 1700 tons for the new buildings of the L. S. Ayers Co. at Indianapolis. Aside from these two projects, however, pending work in this district is light and fabricators have found it necessary to curtail operations. Demand for wire goods has been fairly well sustained, but deviation from the recently established prices is noted. Common wire nails and plain wire are reported to have been sold at concessions of $2 from the regular schedule of $2.65 per keg and $2.50 per 100 lb., base Ironton or Pittsburgh, respectively. Sheet producers declare that a limited volume of buying for the second quarter has been done, although major activities still center on the tonnages to be shipped in February and March. All consuming lines are contributing substantially to the well-filled order books of sheet manufacturers, who are holding to a production program calling for full capacity output. Prices are firmly maintained on a basis of 2.10c., Pittsburgh, for blue annealed, 2.90c. for black and 4.15c. for automobile body stock. Only in galvanized sheets for roofing purposes is there any shading of quotations, and on this grade cuts of from $1 to $3 a ton have been made in the South.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforcing bars	3.15c.
Rail steel reinforcing bars	3.00c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb.	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb.	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.52 to $9.64; Wise County coke, $7.59 to $8.09; New River coke, $10.09 to $10.59. Freight rates, $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Reinforcing Bars.—Bids are being taken on 100 tons of bars for a warehouse of the Union Gas & Electric Co., this city, and on 150 tons for a building at Dayton, Ohio, for the Young Women's Christian Association. New billet bars are selling at 1.85c., base Pittsburgh, for sizable tonnages and at 1.95c. for small lots. Makers of rail steel bars continue to quote 1.80c., base mill, and only on especially desirable jobs will they go below that figure. Reports are current that producers will try to get from $1 to $2 a ton above present prices for second quarter orders, although no business for delivery beyond March 31 has been booked by district mills.

Warehouse Business.—While there has been a slight upward trend in the volume of sales and February tonnage will be better than that in January, business of local jobbers is running approximately 10 per cent behind that of 1927. Prices in all commodities are firm and unchanged.

Coke.—The betterment in foundry production is reflected in an increase of approximately 20 per cent in the shipments of by-product foundry coke in the first 20 days of February, as compared with January. By-product domestic grades, on the other hand, are about on a par in shipments with those of last month. The Portsmouth By-Product Coke Co. has announced that beginning March 1, it will permanently double its output of foundry coke, setting aside for this purpose a number of ovens which have been used recently in making furnace coke.

Old Material.—Steel plants in this district are authorizing the release of a fair amount of material on current contracts, and foundry grades are the most active in many weeks. However, the demand from consumers has not increased to the extent that dealers had anticipated and consequently prices have failed to advance; in fact, in certain grades a downward trend is perceived.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.50 to	$12.00
Scrap rails for melting	12.25 to	12.75
Loose sheet clippings	9.00 to	9.50
Bundled sheets	9.50 to	10.00
Cast iron borings	8.50 to	9.00
Machine shop turnings	8.00 to	8.50
No. 1 busheling	10.50 to	11.00
No. 2 busheling	7.50 to	8.00
Rails for rolling	13.00 to	13.50
No. 1 locomotive tires	13.50 to	14.00
No. 1 railroad wrought	11.00 to	11.50
Short rails	16.50 to	17.00
Cast iron carwheels	12.75 to	13.25
No. 1 machinery cast	16.00 to	17.00
No. 1 railroad cast	13.50 to	14.00
Burnt cast	8.00 to	8.50
Stove plate	9.00 to	9.50
Brake shoes	10.00 to	10.75
Railroad malleable	12.75 to	13.25
Agricultural malleable	12.25 to	12.75

EMPLOYEE STOCK PLAN

Purchases, Under Careful Safeguarding of Interests, May Be on Monthly Payments

An interesting example of the tendency of manufacturers to encourage habits of thrift and systematic saving among their employees is shown in a stock subscription plan originated by the Mueller Brass Co., Port Huron, Mich. Principal among the provisions of the plan are:

1. All employees who had been in the service of the company one year, at the time the plan went into effect, receive as a gift one share of 7 per cent cumulative preferred stock.
2. The company will offer each employee who qualifies as to service the right to buy additional stock in amounts not to exceed 10 per cent of his annual earnings, exclusive of bonus payments.
3. Such stock may be purchased by the employee outright, or on monthly payments to be deducted from his pay.
4. The company will deposit each year, from 1929 to 1933, a percentage of its profits in the form of a trust fund, which will be distributed pro rata in January, 1933, to all employee stockholders who have remained in continuous employ of the company, and who at the date of the disbursement still own their stock.
5. The company agrees to repurchase at par value, upon 10 days' notice, any stock thus sold previous to the division of the participating trust fund
6. Suitable provision will be made to protect employees' stock investment in the event of temporary unemployment, sickness or death.

The stock that is being sold under this plan is preferred and cumulative, having preference over all other classes of the company's stock with respect to assets and dividends. Paid up stock, deposited with the company, will entitle any employee to a company loan not to exceed 90 per cent of the par value. All dividends on gift and purchased shares are payable quarterly at the rate of 1¾ per cent each quarter.

Subscriptions may be canceled at any time through filing a written request with the secretary of the company. Within 10 days from the date of notification an employee making such a request will be paid the full amount he has paid in, plus all dividends due, less any amounts due the company. Such withdrawal automatically cancels that employee's rights to participation in the trust fund distribution.

Any purchaser who is laid off because of the temporary closing of the company's plant, or a reduction in its operating schedule, and who subsequently resumes his service, will not be deprived of any of the benefits of the plan, even though he may have found it necessary to find employment elsewhere during such suspension. The benefits of the plan are extended to all employees of the company and its subsidiaries, with the exception of company officers, and sales representatives or agents operating exclusively on a commission basis.

Sheet & Tube Stockholders to Meet March 15 to Ratify Merger

The Youngstown Sheet & Tube Co., Youngstown, has issued a call for a special stockholders' meeting March 15 at Youngstown to ratify the proposed merger with the Inland Steel Co., Chicago. A letter accompanying the official call, signed by President James A. Campbell, indicates that the transaction represents actual purchase of Inland by the Sheet & Tube company rather than a consolidation of interests. In this connection, it reads: "The officers and diretors of this company believe this purchase will greatly strengthen the position of this company by the addition of the valuable good-will and resources of the Inland Steel Co., and by further diversifying its products, and that the terms of the contract are fair and for the best interests of the company. They recommend that the contract be approved by the stockholders.

"The products of the two companies are largely different and their plants are so located in different districts that there is no substantial competition between them. The plants fit together well and can be operated together to much better advantage than apart. To preserve the valuable good-will of Inland Steel Co., it is recommended that the name of the company be changed to the Youngstown-Inland Steel Co. It is also necessary that the code of regulations of the company be changed and new directors added."

It is proposed to change the Sheet & Tube company's capital structure by changing the present authorized 1,000,000 shares to 2,000,000 shares, so that the holders thereof shall be entitled to two shares in place of every one as now authorized, and authorizing an additional amount of 1,200,000 shares.

Ohio Foundry Operations Unchanged in January

January employment reports from 64 Ohio foundries and machine shops show no change from the low level maintained since November, the index of the number of wage earners, based on an average month in 1923 as 100, standing at 82. This represents a drop of 13 per cent from January, 1927. Cincinnati, with an increase of 14 per cent, was the only city which did not show a decline. Ten steel works and rolling mills reported an improvement in employment in January for the first time since May, 1927. While the number of workmen was 7 per cent greater than in December, there was a loss of 11 per cent compared with January last year.

Statistics from 24 automobile and automobile parts manufacturers in Ohio showed that employment in January was 5 per cent ahead of December and 2 per cent better than in the corresponding month of 1927. In fact, January was the first month in the past 12 in which the number of wage earners exceeded those in the same month of the preceding year. In the Ohio construction industry, employment in January was 12 per cent less than in December and 13 per cent below January, 1927. The reports are gathered monthly by the bureau of business research of Ohio State University for publication in its bulletin.

Small Decrease in Wholesale Prices in January

Wholesale prices in January were slightly lower than in December and correspondingly lower than in January, 1927, according to the United States Bureau of Labor Statistics. The index (based on 1926) was 96.3 last month, against 96.8 in the preceding month and 96.6 in January, 1927. Changes during the month included increases in prices of farm products, hides and leather, and building materials, and decreases in prices of foods, textiles, fuel and lighting, metals and metal products, chemicals and drugs and house-furnishing goods.

Metals are listed at 98.1, compared with 98.4 in the preceding month and with 98.8 in January, 1927. This group is made up of five principal subdivisions, which are respectively iron and steel, non-ferrous metals, agricultural implements, automobiles, other metal products. There was in January a slight rise in iron and steel, from 93.7 to 93.9, compared with 99.2 a year earlier.

Fewer Mechanical Stokers Sold

Mechanical stokers sold in January are reported by the Department of Commerce at 75 units, aggregating 26,572 hp. This compares with 32,202 hp. in December and with 40,467 hp. in January, 1927. With two exceptions, the latest report shows the smallest rating for any month in more than two years.

Recommendation for the adoption of intermediate grade as the single standard for new billet reinforcing steel is contained in Commercial Standard No. 1, a bulletin recently issued by the Department of Commerce. Results of a number of conferences held by the Department in an effort to establish this standard are contained.

NON-FERROUS METAL MARKETS

The Week's Prices

Cents per Pound for Early Delivery

	Feb. 20	Feb. 18	Feb. 17	Feb. 16	Feb. 15
Lake copper, New York	14.25	14.25	14.25	14.25	14.25
Electrolytic copper, N. Y.*	13.82½	13.82½	13.82½	13.82½	13.82½
Straits tin, spot, N. Y.	51.50	....	52.00	51.62½	51.25
Lead, New York	6.32½	6.32½	6.32½	6.35	6.35
Lead, St. Louis	6.07½	6.07½	6.07½	6.12½	6.12½
Zinc, New York	5.82½	5.85	5.85	5.90	5.95
Zinc, St. Louis	5.47½	5.50	5.50	5.55	5.60

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, Feb. 20.—Further weakness in tin and zinc has developed, prices the lowest in over five years having been reached in the latter. Extreme dullness still persists in copper, with a little shading here and there. The lead market is somewhat easier.

Copper.—Featureless and sluggish is the characterization of this market in all quarters. There has been almost no buying of electrolytic copper by either domestic or foreign consumers in the past week. The small purchases which American melters have made have been at a concession from the 14.12½c. price maintained by all large producers—as low as 14c., delivered in the Connecticut Valley, in one or two instances. There has been hardly enough business to establish a market, but the metal has been available at concessions anywhere from 14c. to 14.07½c. Copper Exporters, Inc., continues its official quotation at 14.50c., c.i.f. usual European ports, with almost no business done. The dullness is explained by some as due to an expectation by consumers of lower prices based on weakness in other metals. Lake copper is firm but quiet at 14.25c. delivered.

Tin.—Prices of tin continue to hover around the levels which were established in April, 1925, and the value of tin at present is the lowest since that period. Sales continue fairly liberal, the total for last week having been about 1050 tons. There are plenty of sellers, and buyers are able to buy all they want. Friday, Feb. 17, the situation in spot tin became acute, with sales at 51.62½c. and 52.25c. bid. This was due to the temporary shortage in supplies. Saturday the acuteness softened and the situation was still more relieved today. The spread between spot and futures has again reached the normal of about ¼c. Today the market has been very dull, with spot Straits tin quoted at 51.50c. Prices in London today were again a little lower than a week ago, with spot standard quoted at £230, future standard at £233 and spot Straits also at £233. The Singapore price today was £237 5s. Arrivals thus far this month have been 3015 tons, with 6280 tons reported afloat.

Lead.—Declines in the London market have caused the market here to be somewhat easier. It is stated that the metal can be bought at New York about 5 points under the contract quotation of the leading interest, which is 6.35c., New York. In the West, it is reported that some metal sold last week as low as 6c., St. Louis, but the prevailing quotation averaged about 6.07½c. A fair amount of business in small lots for prompt shipment is reported.

Zinc.—New low prices for prime Western zinc have been established. The metal reached 5.47½c., St. Louis, today, which is the lowest price since July 6, 1922. The market is extremely weak and it is stated that 5.45c., St. Louis, was possible today. On the rather rapid decline in the last week there has been a fairly large amount of forward buying, but the spot situation is not so easy as to supplies. Prime Western today is quoted at 5.47½c., St. Louis, or 5.82½c., New York, for nearby delivery. Ore at Joplin was again easier last week with some sales at $35 per ton, as against $36 a week ago. The production was again around 3000 to 4000 tons in excess of sales.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—The market is a little easier, but quiet, with Chinese metal for spot delivery quoted at 10.87½c., and futures at 11c. New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb. delivered.

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	54.00c. to 55.00c.
Tin, bar	56.00c. to 57.00c.
Copper, Lake	15.25c.
Copper, electrolytic	15.00c.
Copper, casting	14.25c.
Zinc, slab	7.00c. to 7.50c.
Lead, American pig	7.50c. to 8.50c.
Lead, bar	9.90c. to 10.90c.
Antimony, Asiatic	12.75c. to 13.25c.
Aluminum No. 1 ingot for remelting (guaranteed over 99 per cent pure)	27.00c. to 28.00c.
Aluminum ingots, No. 12 alloy	26.00c. to 27.00c.
Babbitt metal, commercial grade	30.00c. to 40.00c.
Solder, ½ and ½	35.00c. to 36.00c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	59.00c.
Tin, bar	61.00c.
Copper, Lake	15.25c.
Copper, electrolytic	15.25c.
Copper, casting	14.50c.
Zinc, slab	7.75c.
Lead, American pig	7.10c.
Antimony, Asiatic	16.00c.
Lead, bar	9.50c.
Babbitt metal, medium grade	19.75c.
Babbitt metal, high grade	64.00c.
Solder, ½ and ½	35.25c.

Rolled Metals from New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—	
High brass	18.50c. to 19.25c.
Copper, hot rolled	22.75c. to 23.75c.
Copper, cold rolled, 14 oz. and heavier,	25.25c. to 26.25c.
Seamless Tubes—	
Brass	23.37½c. to 24.37½c.
Copper	24.50c. to 25.50c.
Brazed Brass Tubes	26.50c. to 27.50c.
Brass Rods	16.25c. to 17.25c.

From New York Warehouse

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9), casks	10.00c. to 10.50c.
Zinc sheets, open	10.50c. to 11.00c.

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products have not changed since early December, and there have been no revisions in the quotations on zinc sheets and lead full sheets.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Zinc	10.00c.
Lead (full sheets)	10.00c. to 10.25c.
Seamless Tubes—

Copper	24.50c.
Rods—	
High brass	16.50c.
Naval brass	19.25c.
Wire—	
Copper	15.75c.
High brass	19.25c.
Copper in Rolls	21.75c.
Brazed Brass Tubing	26.75c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also allowed to St. Louis on shipments to destinations west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Rolled Metals, f.o.b. Chicago Warehouse

(Prices Cover Trucking to Consumers' Doors in City Limits)

	Base per Lb.
Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Copper, cold rolled, 14 oz. and heavier	25.00c.
Zinc	11.00c.
Lead, wide	9.75c.
Seamless Tubes—	
Brass	25.12½c.
Copper	26.00c.
Brazed Brass Tubes	26.75c.
Brass Rods	16.50c.

Non-Ferrous Metals at Chicago

FEB. 20.—There is practically no change in this market from a week ago. Prices are fairly steady and new buying is in moderate volume. The old metal market is without feature.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 54c.; lead, 6.30c.; zinc, 5.75c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10c.; copper bottoms, 9c.; red brass, 9c.; yellow brass, 6.75c.; lead pipe, 5c.; zinc, 3.25c.; pewter, No. 1, 34c.; tin foil, 40c.; block tin, 50c.; aluminum, 12.50c.; all being dealers' prices for less-than-carload lots.

NICKEL-CHROME STEEL RIVETS

Develop High Strengths and Impact Resistance When Driven in Cold Plates and Cooled Normally

LIGHT armor has been attached to tanks, gun carriages, and aircraft with ordinary rivets and bolts, which on occasion have been broken and penetrated by opposing bullets. Consequently an effort has been made to find a rivet which will drive readily, harden on slow cooling, and remain tight when cold, yet not so tight as to cause the heads to pop off when hit by a small-caliber armor-piercing bullet. Results of these studies are contained in Technologic Paper of the Bureau of Standards, No. 358, by Harry K. Herschman, entitled "Air-Hardening Rivet Steels."

Satisfactory armor has a Rockwell diamond cone hardness of 40 to 45 (Brinell 375 to 450), and a group of steels which on air cooling develop this hardness was studied. It was found that the microstructure should be fully martensitic; correct hardness could be had by steels which had more or less troostite or austenite in addition to the martensite, but the relative amount of each constituent varied widely with normal variations in cooling rates, and with corresponding wide variations in the physical properties when cold. Furthermore, it was discovered that some rivets which were driven tight when hot were loose when cold. These all had low Ar" transformation points where austenite in the hot rivet changed into the martensite of the cold rivet. This transformation causes the rivet shank to elongate, and if it occurs at too low a temperature, subsequent normal contraction on cooling will not retighten the grip. This consideration fixed a moderate limit on the carbon content. Low carbon also gave good ductility, resistance to impact, and shear strength.

Best results were had in a steel containing 0.23 per cent carbon, 0.33 manganese, 1.5 chromium and 3.75 nickel. It is somewhat cheaper than a similar steel with nickel up to 4.5 per cent, which is second choice. When driven as ½-in. rivets, joining ½-in. armor, they cooled to 415 Brinell hardness. They passed the standard hot flattening and hot bending tests satisfactorily, drove readily and remained tight when cold. Microstructure in this condition was entirely angular needle form, looking like martensite (although the authors call it "pseudo-martensite" and think that it is a mixture of true martensite and ferrite). Tensile tests on air-hardened 0.505-in. bars gave the following results:

Steel	Tensile Strength	Yield Point	Elongation in 2 In.	Reduction
3.75 Ni-Cr	200,000	170,000	10	15
4.5 Ni-Cr	170,000	170,000	0	0

One-half-in. rivets, driven in a testing fixture and cooled more rapidly by contact with the cold metal, developed higher ultimate strengths. In double shear, ½ and ¾-in. rivets failed at about 170,000 lb. per square inch stress. Only a small piece would be torn off the head of a rivet driven in armor plate, when hit directly by 0.30 caliber armor-piercing bullets flying at almost 2650 ft. per sec.

Other less extensive tests indicate that lower nickel and chromium will give satisfactory results if the action is intensified by adding a little tungsten or molybdenum.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	10.00c.	11.25c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.75c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	4.25c.	4.75c.
Zinc	3.75c.	4.25c.
Sheet aluminum	12.75c.	14.50c.
Cast aluminum	12.75c.	14.50c.

REINFORCING STEEL

Awards of About 5000 Tons and New Projects Amount to About 2700 Tons

TOTAL awards of reinforcing bars were a little more than 5000 tons. The largest was 2000 tons for a power plant at Penns Grove, N. J. Inquiries totaling about 2700 tons included 1000 tons for a loft building in New York.

BOSTON, 500 tons, Post Office garage, to Concrete Steel Co.

SCARSDALE, N. Y., 100 tons, school, to Republic Fireproofing Co.

NEW ROCHELLE, N. Y., 100 tons, bridge between Glen Island and New Rochelle for Westchester County Park Commission, to Concrete Steel Co.

PENNS GROVE, N. J., 2000 tons, power house, to Concrete Steel Co.

GREENSBORO, N. C., 180 tons, Presbyterian Church, to Truscon Steel Co.

CLEVELAND, 200 tons, Marine Hospital, to Truscon Steel Co.

DETROIT, 900 tons, building for Sears, Roebuck & Co., to Gabriel Steel Co.

CHICAGO, 220 tons of rail steel bars, apartment building at Wilson Avenue and Beacon Street, to Concrete Engineering Co.

CHICAGO, 110 tons, Women's Athletic Club, to Jones & Laughlin Steel Corporation.

CHICAGO, 700 tons, Passavant Hospital, to unnamed bidder.

LOS ANGELES, 210 tons, office building, Seventh Street and Wilshire Boulevard, to unnamed interest.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 1000 tons, loft building for V. Green Co. at Canal and Hudson Streets; Turner Construction Co., general contractor.

NEW YORK, 500 tons, building for Eleto Co.; Waite Construction Co., general contractor.

CINCINNATI, 100 tons, warehouse for Union Gas & Electric Co.

DAYTON, OHIO, 150 tons, building for Young Women's Christian Association.

CHICAGO, 200 tons, Sheridan Towers apartment building.

CHICAGO, 500 tons, Civic Opera Building; Graham, Anderson, Probst & White, architects.

ST. LOUIS, 300 tons, warehouse for Atlantic & Pacific Stores Co., Fourteenth and Poplar Streets; Austin Brothers, Chicago, general contractors.

FABRICATED STRUCTURAL STEEL

New Business Good With 44,000 Tons Pending —Awards Only 20,000 Tons

AWARDS of less than 20,000 tons registered the lowest level for a week's business since the first of the year. This total, however, consisted of a large number of small tonnage projects, the only purchases of more than 1000 tons being 6500 tons for the Physicians' Building in San Francisco and 4000 tons for the Drake Tower in Chicago. Pending business was enlarged by inquiries for about 44,000 tons. Outstanding was 6000 tons for a bridge at Maysville, Ky., 5900 tons for Mississippi River barges and 4000 tons for a hotel in New York.

East Barnet-Passumpsic, Vt., 139 tons, two bridges, to Berlin Construction Co.

Brookline-Newfane, Vt., 105 tons, bridge, to Berlin Construction Co.

North Royalton, Vt., 100 tons, bridge, to Albany Bridge Construction Co.

Johnson, Vt., 100 tons, bridge, to Ring Construction Co.

Westchester County, N. Y., 400 tons, bridge connecting Glen Island and New Rochelle, to Bethlehem Steel Co.

New York, 250 tons, shoring beams and splice plates for subway work for Arthur A. Johnson Corporation, to Bethlehem Steel Co.

Little Neck, N. Y., 375 tons, Lakeville School, to an unnamed fabricator.

Ithaca, N. Y., 700 tons, residential buildings for women, to an unnamed fabricator.

Philadelphia, 250 tons, Uptown Theater and office building, to Bethlehem Fabricators, Inc.

Philadelphia, 150 tons, bank and office building at Sixteenth and Locust Streets, to Bethlehem Fabricators, Inc.

Pittsburgh, 515 tons, building for National Biscuit Co., to Fort Pitt Bridge Works.

Philadelphia, 200 tons, substation for Philadelphia Electric Co., to Belmont Iron Works.

Philadelphia, 125 tons, bridge over Carpenter Street, to McClintic-Marshall Co.

Philadelphia, 265 tons, George W. Childs Public School, to McClintic-Marshall Co.

Connellsville, Pa., 100 tons, Capstan Glass Co. addition, to Pittsburgh Bridge & Iron Co.

Pittsburgh, 200 tons, Kuhn recreation building, to Guibert Steel Co., Pittsburgh.

Pittsburgh, 500 tons, Ambassador Apartments, to McClintic-Marshall Co.

Mayview, Pa., 510 tons, Pittsburgh Municipal Hospital, 300 tons of standard sections to John Eichleay, Jr. Co. and 210 Junior beams to Jones & Laughlin Steel Corporation.

Toronto, Ont., 200 tons, Junior beams for 28-story tower, *Toronto Star*, to Jones & Laughlin Steel Corporation.

Cleveland, 100 tons, laboratory for American Gas Association, to Wellman-Seaver-Morgan Co.

Chicago, 100 tons, transformer station for Commonwealth Edison Co., to Vierling Steel Works, local.

Chicago, 100 tons, railroad bridge and turn-table repairs, to Vierling Steel Works.

Chicago, 600 tons, building for Campbell Soup Co., to Hansell-Elcock Co., local.

Chicago, 4000 tons, Drake Tower, to American Bridge Co.

El Paso, Tex., 1000 tons, refinery for Standard Oil Co., to Chicago Bridge & Iron Co.

St. Louis, 100 tons, repairs to Famous & Barr Co. store, to Mississippi Valley Structural Steel Co.

Los Angeles, 700 tons, transmission line, Southern California Edison Co., to Pacific Coast Steel Co.

Los Angeles, 850 tons, synagogue, Wilshire and Hobart Boulevards, to McClintic-Marshall Co.

San Francisco, 6500 tons, Physicians Building on Sutter Street, to McClintic-Marshall Co.

San Francisco, 130 tons, apartment building, Sixteenth Avenue and Lincoln Way, to Judson-Pacific Co.

Oakland, Cal., 300 tons, telephone building, Forty-fifth Street and Telegraph Avenue to Judson-Pacific Co.

Oakland, 100 tons, warehouse, Twenty-fourth and Peralta Streets, to Pacific Coast Engineering Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

Weymouth, Mass., 123 tons, town office building.

Burlington, Vt., 500 tons, bridge over Winooski River; bids March 1.

New York, 4000 tons, Governor Clinton Hotel at Seventh Avenue and Thirty-first Street.

Brooklyn, 900 tons, theater for Allied Owners' Corporation.

Philadelphia, 1800 tons, building for Integrity Trust Co., Sixteenth and Walnut Streets; Levgar Structural Co., New York, reported low bidder.

Delaware, Lackawanna & Western Railroad, 900 tons, bridge work.

Pennsylvania Railroad, 800 tons, bridges.

Cumberland, Md., 3000 tons, building for Celanese Corporation of America.

Wheeling, W. Va., 2400 tons, six covered and 10 coal barges for Wheeling Steel Corporation.

Creighton, Pa., 1000 tons, plant for Pittsburgh Safety Glass Co.

Pittsburgh, 3000 tons, C. B. Connelley Trade School.

Pittsburgh, 750 tons, Stanley-Clark theater.

Pittsburgh, 1600 tons, nine cargo barges for Union Barge Line Corporation.

Memphis, Tenn., 5900 tons, 39 barges for Mississippi River Commission; bids to be opened March 3.

Maysville, Ky., 6000 tons, highway bridge across Ohio River; bids close March 24.

Vicksburg, Miss., 300 tons, two barges for United States Engineers.

Indianapolis, 1700 tons, building for L. S. Ayers Co.

Columbus, Ohio, 350 tons, power house at Ohio State University.

Pekin, Ill., 300 tons, bridge for Chicago & Illinois Midland.

Petersburg, Ill., 300 tons, bridge for Chicago & Illinois Midland.

Chicago, 825 tons, north approach to the LaSalle Street bridge; R. H. Simpson, low bidder.

Chicago, 3000 tons, Robey Street viaduct and approach, Great Lakes Dredge & Dock Co. general contractors.

Shreveport, La., 450 tons, viaduct.

Amarillo, Tex., 1800 tons, office building for Atchison, Topeka & Santa Fe Railroad.

Corpus Christi, Tex., 1200 tons, warehouse for Planters & Shippers Compress Co.

St. Louis, 100 tons, warehouse for J. C. Penney Co.

San Francisco, 100 tons, bridge over Colorado River, Grand Canyon National Park; bids Feb. 20 by United States Bureau of Public Roads.

Milton, Ore., 650 tons plates, 48 in. penstock; bids in.

Redwood City, Cal., 100 tons, pipe line for East Palo Alto Waterworks District; bids opened.

Seattle, Wash., 2000 tons plates, penstock for city; bids opened.

Olympia, Wash., 235 tons, Wind River bridge; general contract to Gilpin Construction Co., Portland, Ore.

RAILROAD EQUIPMENT

Only 650 Cars Ordered and 200 Under Inquiry —31 Locomotives Bought

CAR awards included 500 flat cars by the Union Pacific and 150 ballast cars by the Chicago, Burlington & Quincy. The Minneapolis, St. Paul & Saulte Ste. Marie is in the market for 200 box cars and the Berwind-White Coal Mining Co. is inquiring for 1200 mine cars. Locomotive purchases included 30 industrial engines by the Russian Railway Commission.

Union Pacific has ordered 500 flat cars from Bettendorf Co.

Baltimore & Ohio is reported to have placed 2000 steel box car bodies with Standard Steel Car Co.

Chicago, Burlington & Quincy has ordered 150 ballast cars from Rodger Ballast Car Co.

Minneapolis, St. Paul & Sault Ste. Marie has placed eight baggage and smoking cars with Pullman Car & Mfg. Corporation and is inquiring for 200 box cars.

Berwind-White Coal Mining Co. has made inquiry for 1200 mine cars.

Central Railway of Brazil has purchased 12 passenger cars from American Car & Foundry Co.

Nashville, Chattanooga & St. Louis has ordered 500 center constructions from Tennessee Coal, Iron & Railroad Co.

Sinclair Refining Co. is inquiring for five coke cars.

Russian Railway Commission has ordered 30 industrial locomotives from George D. Whitcomb Co., Rochelle, Ill.

Union Pacific has ordered 15 passenger and 10 dining cars from Pullman Car & Mfg. Corporation.

Alabama Stock Dock has ordered one locomotive from American Locomotive Co.

PERSONAL

Louis Wiard has been elected president of the Wiard Plow Co., Batavia, N. Y., returning to the organization after an absence of 13 years. He first became associated with the company in 1898, and 10 years later became superintendent of the plant. He left the company in 1915 to become State industrial commissioner of New York, retaining, however, his interest in the company and retaining the title of vice-president. Mr. Wiard succeeds Arthur G. Hough, who has been president of the company since 1914 and treasurer since 1902. He became interested in the plow company at the same time as Mr. Wiard, and will continue as a director and vice-president.

R. L. Balzer, for 11 years general manager of the Clyde Equipment Co., Portland, Ore., has organized the Balzer Machinery Co., with offices at 267½ Oak Street, Portland, and will represent several lines of contractors' and loggers' machinery, including that of the Ohio Locomotive Crane Co., Bucyrus, Ohio. His territory will include Oregon and southwestern Washington.

Paul S. Seck, formerly in the Chicago branch of the Columbia Tool Steel Co., Chicago Heights, Ill., has resigned to become associated with the Ziv Steel & Wire Co., 2945 West Harrison Street, Chicago.

W. B. Arbuckle has been placed in charge of a new sales office which has been opened at 1006 Washington Avenue, Houston, Tex., by the Wagner Electric Corporation, St. Louis. He has been associated with the company for 12 years, most recently as manager of the Kansas City, Mo., service station. Previously he served in a similar capacity at Omaha, Neb., and before that was employed in the production, ignition test, research and engineering departments of the corporation at its factory.

Earl R. Nichols, formerly with the Service Steel Co., Detroit, has joined the Peter Smith Heater & Mfg. Co., Fordson, Mich., and will devote his time to developing pressed steel stamping business for that company.

Francis O. Carfer has been appointed metal sales manager of the Republic Metalware Co., Buffalo, succeeding the late W. F. Hopkins. He entered the sheet metal business 17 years ago as representative in Ohio, Indiana and Michigan for the Tiffin Art Metal Co., Tiffin, Ohio. Later he served as sales manager for the Kanneberg Roofing & Ceiling Co., Canton, Ohio, going from that company to the J. M. & L. A. Osborn Co., Cleveland, for which he later served as Buffalo branch manager. He joined the Republic company last year.

O. C. Ferens and R. C. Nelson have been appointed managers of the New York and Chicago offices, respectively, of the Keasbey & Mattison Co., Ambler, Pa., manufacturer of insulating materials.

R. B. Vessey, for several years general superintendent of the tool room and automatic department of the AC Spark Plug Co., Flint, Mich., has been made assistant to the management of the company. Before going with the AC organization he was engaged in the development of experimental machines for the Buick Motor Co. Louis B. Berge, who has been associated with the AC company for 12 years, most recently as general superintendent of plants Nos. 1, 2 and 3, has been appointed manager of manufacturing. George Mann., Jr., recently assistant comptroller, has been advanced to assistant secretary-treasurer and has been succeeded by Walter J. Langdon, formerly supervisor of the tabulating and payroll department.

Myron A. Wick, who has been vice-president of Steel & Tubes, Inc., Cleveland, has been elected president of that company, succeeding his brother, Hugh B. Wick, who has been made chairman of the board. The new president has been associated for 14 years with the company and its predecessor, the Elyria Iron & Steel Co. J. L. Sussman has been elected first vice-president in charge of the Brooklyn plant. Lyman Bartlett has succeeded Harris Sussman as a director.

Earle F. Heffley has been appointed sales manager of the Morse-Rogers Steel Co., Cleveland, steel jobber. A. J. Decker has been named assistant sales manager. Mr. Heffley had been connected for some time with the Betz-Pierce Co., Cleveland.

J. W. Collins, superintendent of the Detroit foundry of the Aluminum Co. of America, addressed the Quad-City Foundrymen's Association on Feb. 20 at the Leclaire Hotel, Moline, Ill.

John E. Frederick, general manager of the Kokomo Steel & Wire Co., Kokomo, Ind., has announced his candidacy for the governorship of Indiana.

Ralph E. Frey and J. E. Ledeboer have been elected vice-presidents of the Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa. Mr. Frey, who has been secretary and sales manager, will continue in charge of the company's products. H. R. Weaver has been elected secretary.

James H. McGraw, president McGraw-Hill Publishing Co., New York, was awarded the Harvard Gold Medal for distinguished service to advertising at a dinner held Feb. 17 at the Faculty Club, Boston. The medal is one of the 10 awards established in 1923 by Edward Bok.

O. D. Fries has been placed in charge of consumer motor sales in the Detroit territory for the Lincoln Electric Co., Cleveland. He is a graduate of the Glasgow Royal Technical College and Glasgow University, Glasgow, Scotland, and has had varied experience in practical and theoretical engineering and sales work.

J. H. Mull has retired as president of the William Cramp & Sons Ship & Engine Building Co., Philadelphia, and has been succeeded by H. Birchard Taylor, who is also president of the Cramp-Morris Industrials, Inc., which was formed to take over some of the departments and subsidiary properties of the Cramp company when liquidation was undertaken about a year ago.

E. C. Brandt, recently works manager at the Homewood works of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., and F. J. Shiring, who has been superintendent of motor apparatus, have been appointed assistant works managers of the company. J. E. Webster, formerly engineer of works for the Westinghouse organization, has been made chief plant engineer. A. E. Kaiser, who has been assistant works manager, East Pittsburgh works, has been made director of production for all works, and S. C. Hoey, since 1926 superintendent of the manufacturing engineering department, has become works manager of the Homewood renewal parts works.

George F. Davie, vice-president and treasurer of the Interstate Iron & Steel Co., Chicago, left this week for a vacation trip through northern Africa, Greece, Italy and France.

Oscar Egan, an assistant engineer with the Minneapolis Steel & Machinery Co., Minneapolis, has resigned to become chief engineer for the Hart-Parr Co., Charles City, Iowa.

W. S. Peddie has been appointed treasurer of the Minneapolis Steel & Machinery Co., Minneapolis. He will also continue as comptroller and succeeds as treasurer E. A. Merrill, who has retired after 25 years of service with the company.

H. C. Camp has been appointed receiver of the H. D. Smith Co., Southington, Conn., maker of drop forgings, by the United States District Court, Hartford, Conn.

George P. Aborn, formerly manager Blake & Knowles Works, Worthington Pump & Machinery Corporation, Cambridge, Mass., has become associated with the industrial department of the Harvard Trust Co., Cambridge

George W. Thurston, vice-president American Screw Co., Providence, R. I., has been made general manager of the company. Paul C. Nickerson, a director, has been made a vice-president.

George J. Green, of the Pittsburgh Welding Corporation, Pittsburgh, is to be the speaker at the regular monthly meeting of the Pittsburgh section, American Welding Society, at the William Penn Hotel on Wednesday evening, Feb. 29. His subject is to be "Miscellaneous Welding and Repair Work."

G. Burki, formerly salesman with the E. L. Essley Machinery Co., Chicago, has joined the Chicago sales force of Manning, Maxwell & Moore, Inc., 27 North Jefferson Street, machinery dealer.

Dr. Colin G. Fink, professor of electrochemistry Columbia University, New York, lectured recently to the graduate students of Yale University on "Corrosion, Its Cause and Prevention." He emphasized in particular the modern electrolytic method for the prevention of corrosion of boilers, which method likewise does away with the formation of boiler scale. He also referred to the new development in electroplating of chromium on steel, a process for which Doctor Fink's laboratory has been responsible.

Alexander Dow, head of the Detroit Edison Co. and president of the American Society of Mechanical Engineers, was the guest of honor at the monthly dinner meeting of the Engineers' Society of Milwaukee on Feb. 15 and spoke on "Detroit Edison Power Plant Problems." The session was under the auspices of the Milwaukee section of the American Society of Mechanical Engineers. Mr. Dow was a guest of Gen. Otto H. Falk, president Allis-Chalmers Mfg. Co., during his stay in Milwaukee.

H. A. Sedgwick, superintendent of the Cutler-Hammer Mfg. Co., Milwaukee, manufacturer of electrical controlling devices, has been made manager of operations, A. E. Rauch has been appointed assistant superintendent.

C. I. Auten, M. T. Clark and C. D. Loveland have been made vice-presidents of the Truscon Steel Co., Youngstown, Ohio. Mr. Auten has been with the company 17 years and will be in charge of the standard building division. Mr. Clark, with the company nine years, was formerly an architect in California; he will supervise the steel window department. Mr. Loveland has been in charge of sales for the company in the Pittsburgh district and in his new capacity will have charge of sales in New Jersey, with headquarters in Newark.

Pacific Northwest Iron and Steel Leaders to Hold Conference

Expansion of Pacific Northwest business, development of markets and correction of trade abuses are to be considered at a conference of iron and steel industry leaders in the Pacific Northwest at the Winthrop Hotel, Tacoma, Wash., Feb. 27. The conference will be the first of its kind in that territory and is expected to result in the formation of the Northwest Iron and Steel Conference. Problems common to the manufacturer, the fabricator, the foundry operator and the distributer of steel products will be considered as a whole and will be followed by trade group meetings for considering individual problems relating to each division of the industry.

The Gartshore, Thompson Pipe & Foundry Co., Hamilton, Ont., is completing erection of a new plant for manufacture of cast iron pipe by the centrifugal process.

Benjamin Talbot New President of Iron and Steel Institute

BENJAMIN TALBOT

The annual meeting of the Iron and Steel Institute will be held Thursday and Friday, May 3 and 4, at the House of the Institution of Civil Engineers, Great George Street, London, England. At this meeting Benjamin Talbot will assume office as the president for the year 1928-1929, and the meeting will take place under his presidency. Mr. Talbot is the inventor of the continuous process for making steel which bears his name. Born in 1864, he went to the United States in 1890. His first work here was the management of a steel works at Chattanooga, Tenn. In 1893 he went to what is now the Pencoyd Works of the American Bridge Co. at Philadelphia, as manager. Returning to England in 1900 he introduced the continuous process which he had meanwhile invented. He also originated a mechanical gas producer and is credited with several improvements in open-hearth and reheating furnaces.

The autumn meeting of the institute is announced as scheduled to be held in Bilbao, Spain, and the neighboring mining districts, Sept. 24 to Oct. 2.

Philadelphia Steel Club Holds Its Tenth Annual Dinner

The Steel Club of Philadelphia, an organization of steel company sales managers, held its tenth annual dinner at the Manufacturers' Club, Philadelphia, Friday evening, Feb. 17. It was attended by more than a hundred purchasing officials of Eastern companies as guests of the 35 members of the club. The dinner was followed by an elaborate vaudeville entertainment which had been arranged by the club's entertainment committee consisting of W. H. Dickson, chairman; R. H. McCracken and W. W. Deal. Officers of the club are: J. B. De Wolf, Trumbull Steel Co., president; W. S. Haring, Alan Wood Iron & Steel Co., vice-president; F. J. Krouse, Bethlehem Steel Co., secretary and treasurer.

Foundrymen Nominate New Officers

At a meeting of the nominating committee of the American Foundrymen's Association, in Cleveland, Feb. 6, the following were nominated as officers and directors of the association:

For president to serve for one year:
    S. T. Johnston, vice-president and general manager, S. Obermayer Co., Chicago.
For vice-president to serve for one year:
    Fred Erb, president Erb-Joyce Foundry Co., Detroit.
For directors to serve three-year terms each:
    S. W. Utley, vice-president, Detroit Steel Casting Co., Detroit.
    L. W. Olson, works manager, Ohio Brass Co., Mansfield, Ohio.
    B. H. Johnson, works manager, Cresson-Morris Co., Philadelphia.
    Peter J. Krentz, vice-president and works manager, Buffalo Foundry & Machine Co., Buffalo.
    C. E. Hoyt, executive secretary, Chicago.

Massey-Harris Co., Ltd., Toronto, has purchased the J. I. Case Plow Works, Racine, Wis. The Massey-Harris Co., large manufacturer of farming implements exercised an option dated Feb. 14, 1924, it is said, and purchased all of the plow company's assets and good will.

OBITUARY

Thomas DeVenny, manager of lines of the Portsmouth By-Product Coke Co., Portsmouth, Ohio, died Feb. 13, following an operation at University Hospital, Philadelphia. He was well known in the eastern Kentucky coal fields, having made his home at Freeburn, Ky. In addition to his duties with the Portsmouth company, he was president of the Williamson Coal Co., Edgarton, W. Va. He was 39 years of age.

James W. Nelson, for many years manager of Richard Dudgeon, Inc., New York, and actively engaged in that time in designing and developing hydrostatic apparatus, died Feb. 16 at Altadena, Cal., where he had gone a few years ago for his health. He was born in Cambridge, Ohio, 60 years ago, and received his early education in Lawrence, Kan. He was a member of the Sons of the Revolution, the American Society of Mechanical Engineers, the American Society of Civil Engineers and the Brooklyn Engineers' Club, serving as president of the last named organization.

Charles W. Hessler, manager of the Gloucester, N. J., plant of the American Radiator Co., died on Feb. 14 at his home in Haddonfield, N. J., aged 38 years. Before going with the radiator company he was identified with the Buffalo plant of the Austin-Arcola Co. and previously had been associated with his brother, the late George Hessler, in the Hessler Foundry & Mfg. Co., Oswego, N. Y.

Joseph Farris, for many years identified with the Farris Furnace Co., Springfield, Ill., died on Feb. 7.

Fay B. Zopf, vice-president of the Youngstown Boiler & Tank Co., Youngstown, Ohio, died Feb. 15 at his home in Youngstown, aged 47 years. He had been connected with the Youngstown company for four years, and for 23 years previously had been associated with the Riter-Conley Co., Pittsburgh, for a number of years as sales manager.

Albert Claude Ludlum, president New York Engineering Co., New York, died on Feb. 15 at the Fifth Avenue Hospital in that city. He was born in Brooklyn in 1867 and in 1889 went to Denver, where he entered the employ of the Kennedy & Pierce Mfg. Co., maker of mining machinery. He returned to New York in 1895 to become sales engineer and manager of James Beggs & Co., machinery dealers. He left that company in 1906 to organize the New York Engineering Co., with plant at Yonkers, N. Y., to manufacture mining and dredging machinery and equipment. He was a member of many engineering societies and clubs.

M. Cochrane Armour, for many years a partner in Rogers, Brown & Co., now Rogers Brown & Crocker Brothers, Inc., died Feb. 15 at his home in Pasadena, Cal. He was born at Auburn, N. Y., and went to Chicago in 1895, managing the local office of Rogers, Brown & Co. from that date until 1916. He was a director of the Chicago Short Line Railway, vice-president of the Rogers Iron Mining Co., president of the Iroquois Iron Co. and a director of the Rogers-Brown Ore Co. and the Lake Superior Iron & Chemical Co.

Robert Livingston Ireland, formerly a member of the firm of M. A. Hanna & Co., Cleveland, died in his apartment at the Hotel Seymour in New York, Feb. 17, aged 60 years. He was born in Stratford, Conn., and after graduation from Yale University in 1890 he located in Cleveland, where he was employed by the Cleveland Hardware Co. In 1899 he took an active part in consolidating some of the shipbuilding interests of the Great Lakes into the American Shipbuilding Co., of which he was vice-president until 1903. He became a member of M. A. Hanna & Co. in 1904, having previously married a daughter of the late H. M. Hanna. He was very active in all the affairs of that firm, although he devoted particular attention to its finances. He retired from the Hanna firm in 1918 and since then has made his home in New York. During his active business career he was associated with two Cleveland banks and with several Eastern corporations.

Era of Individualism Passing

(*Concluded from page* 531)

edy is equally obvious. Owen B. Young, chairman of the board of the General Electric Co., has said that the solution of business problems lies in group action. Charles M. Schwab has made the statement that cordial cooperation among the various elements of the steel industry would be worth more than a billion dollars.

"James A. Farrell, president of the United States Steel Corporation, has always advocated a general adoption of the principle of cooperation in the place of ruinous competition, as a means of bringing about more stable conditions and better profits in the steel industry. Close and mutually helpful relations between the producing mills and their intermediate industries constitute an essential step in achieving such cooperation.

"The mills have a well defined responsibility in the movement of their products to the ultimate consumer. Intermediate industries, otherwise designated as distributers, are in most instances essential to efficient distribution. Public interest demands service based upon the most economical system of distribution, and responsibility for such service rests equally upon producer and distributer. It continues until the public's requirements have been adequately met.

"Structural steel, steel pipe, tanks, boilers and other steel products have suffered a drastic shrinkage in their markets, due largely to lack of cooperation in the past between the producing mills and the distributing industries. I believe, however, that this state of affairs is destined to show marked improvement in the not distant future.

Volume Should Not Be the Chief Aim

"In a number of our key industries there is actually severe trade depression due largely to methods that have obliterated all semblance of salesmanship. If the tendency in this direction continues at its present rate it threatens to develop into trade prostration of the worst kind. In my opinion, the best hope of checking this trend lies in convincing our executives that volume is not the sole aim of business.

"We must learn that fair volume coupled with fair profit is far more desirable than maximum volume coupled with minimum profit or no profit at all. We must learn that a million times nothing is still nothing.

"Price-cutting is a direct result of unreasonable greed for business, and rancorous, cut-throat competition is a direct result of price-cutting."

Republic-Trumbull Merger to Become Effective May 1

Merger of the Trumbull Steel Co. and the Republic Iron & Steel Co., approved last week by about 94 per cent of the outstanding preferred and common stock of the Trumbull company, following a previous approval by Republic shareholders, is expected to become effective as of May 1. Headquarters will be in Youngstown, and the Trumbull properties will be known as the Trumbull division of the Republic company.

The Interstate Commerce Commission has suspended until Sept. 15 proposed increased rates on railroad car material in carloads between points in Illinois Classification Territory. The schedules would increase from 17.5c. to 22c. per 100 lb. the rates from Chicago to Mount Vernon, Ill., and East St. Louis, Ill.; 15½c. to 17c. to Moline, Ill., from Mount Vernon and Chicago and from 9½c. to 12c. from Mount Vernon to Belleville, Ill.

BOOK REVIEWS

Economics of Instalment Selling. By Prof. Edwin R. A. Seligman, Columbia University. A Study in Consumers' Credit, With Special Reference to the Automobile. Vol. I, 357 pages; Vol. II, 623 pages; with numerous charts and tables in the text. Harper & Brothers, New York. Price, $8.00.

These books contain the results of a year's investigation, undertaken for General Motors Corporation, in which the author had the help of several colleagues and assistants. Volume I contains a brief statement of the facts which are known about instalment selling, and an outline of the course of reasoning pursued to reach the general conclusion that instalment selling of durable goods to responsible consumers is a healthy development in modern trade. Volume II contains a series of appendices, giving in considerable detail the results of special studies undertaken to get the more essential facts, which were missing.

These volumes are to be heartily commended for several reasons. They contain an orderly analysis of a distinctly modern problem by a leading economist. They are very readable. The appendices will prove a mine of information on such things as the amount and variety of goods now being bought on instalments, the selling methods, the financing of motor car retailers, the used car problem and the defaults which occurred during the anthracite strike in 1926.

It is reported that the study was undertaken to give one of the leading automobile producers an answer to the very practical question, "Is it good public policy to encourage purchasing on the instalment plan?" Professor Seligman states that in 1925, out of an estimated total retail sales of all commodities of 38 billion dollars, no less than 5 billion dollars was negotiated on instalments, and the average amount of instalment paper outstanding was 2.2 billion dollars. Toward the end of the discussion, the author reaches the view that this paper is essentially the same as any other credit since it rests on the character of the borrower, that it does not involve utilization before payment (because the utilities of the motor car, piano or other purchase last much longer than the payment period), that it is just as liquid as the more conventional producers' credit, and that the total volume of instalment credit, even though growing, is inconsiderable in relation to the total credit of all kinds. Consequently he holds that instalment selling contains no special hazard to the banking system. Furthermore, in times of business depression, when producer's credit is overexpanded, instalment paper can be sharply curtailed, and therefore would not intensify industrial stagnation. On the contrary, Professor Seligman says it may even be distinctly beneficial in the recovery period, by starting the flow of commerce from producer to consumer more quickly than if the consumer had to wait until all his losses were repaired and his savings reestablished to the point where he could purchase the more expensive articles.

Professor Seligman attacks the distinction ordinarily made between production and consumption, and by a process of reasoning which to the reviewer does not seem entirely convincing comes almost to the conclusion that consumption is production. It goes something like this: Production is defined as the creation of wealth and of the productive efficiency which renders future wealth more easy of attainment. Consumption is defined as the utilization of wealth for the satisfaction of the personal wants of the user. Wise consumption increases the ability of the consumer to produce wealth. If you follow thus far, you then agree that "utilization of wealth that we call production is from one point of view not to be distinguished from utilization of wealth that we call consumption." These mental exercises are apparently necessary in order to remove the economic stigma which seems to attach to consumers and consumption (from which production is free), and apparently growing out of the economists' premise that the greatest good is reached where the greatest surplus of wealth is being produced. In passing, it may be remarked that this premise may be doubted, indeed has been doubted among others by a Philosopher who was brought up at Nazareth and whose teachings are still widely respected.

Considerable space is given to the question whether instalment selling increases wasteful luxury. It is concluded that the automobile is not a reprehensible luxury because its consumption is neither wasteful nor destructive of material wealth nor of economic welfare; in fact, in all but a small percentage of instances, it creates a surplus of material or psychical utilities, or at least is neutral—neither creative nor wasteful. Few people would condemn the automobile unreservedly; the balance of good it has brought far outweighs the preventable abuses and misuses.

All, however, is not rosy. Attention is called to serious abuses which have appeared in the method of selling and the surcharge for the convenience. It has been said by critics of instalment selling that it changes the buyer into a virtual slave of the usurer, and involves a long train of baleful influences. If the added price of instalment buying is figured as interest on money payments deferred, it will work out to 27 per cent per annum, or more, but it is pointed out that the "finance charge" must cover more than mere interest on the deferred payments; it includes such items as credit analysis, collections, losses by occasional default, insurance, and readiness to serve. Whether this costs more than it is worth can only be determined by asking the consumer, a thing which has yet been done only once. In the State of Oregon a questionnaire was answered by 2105 people who had bought various articles on the instalment plan. About 60 per cent believed that the method was not of advantage to them. Professor Seligman dismisses this, the only real information on the point, rather cavalierly with the observation that the conclusions "are partial and fragmentary . . . of relatively minor importance." While it is not so stated, the reader gathers that the author believes that the large growth of instalment selling is evidence enough that the buyer does not object—that he feels he is getting his money's worth. Yet growth of instalment selling could as well result from intensive salesmanship, or from an overextension of instalment purchases, to the point where a great number of consumers never are out of debt.

That these alternative suggestions are of some bearing may be concluded from what appears to be the creed of the General Motors Acceptance Corporation: "Largest possible down payment; shortest time for balance." Such a plan reduces the risk and increases the profit of the finance corporation, and simultaneously cures many of the admitted evils growing out of reckless use of other people's property by irresponsible persons. Such a policy, combined with careful analysis of the credit of prospective purchasers, has enabled the General Motors Acceptance Corporation to keep its percentage of losses in 1926 from delinquencies to 0.035 per cent of the volume of total retail paper purchased. Compare this with 1.75 per cent, an average for many other finance companies in 1925; or with 0.10 per cent losses of the Morris Plan banks; or with 0.20 per cent losses on producers' credit advanced by commercial banks; or 25 per cent when selling furniture on instalments in poorer districts.

With all these considerations in view, Professor Seligman's conclusion is obvious: that when instalment selling is good, it is very good. When instalment selling is bad (that is, not restricted to what loan brokers call "prime names," or utilized for other than durable goods, or extended in large amounts and for long times), it is bad from abuses which may be corrected, and in part are self-correcting. E. E. T.

Bounties and Rebates Feature Markets

British and German Schemes to Augment Exports Are Active—Price Trends Uneven

(By Cablegram)

LONDON, ENGLAND, Feb. 20.

CLEVELAND pig iron is active and producers are well sold, but they complain that prices are insufficiently remunerative, as costs are increasing. Export demand is improving, but so far actual sales are still meager. Hematite prices are easy.

Foreign ore is strong, due to the Swedish strike, but British consumers already have bought most of their needs.

Finished steel, generally, is quiet as regards export, but the domestic demand is improving. The Steelmakers' Association has advanced its prices of plates, angles and sections, to domestic users, by 5s. ($1.22) a ton, increasing by a similar amount the rebate to users who are participating in the rebate scheme. It is hoped thereby to attract other users.

Tin plate inquiry is good, but business is irregular, as buyers are hoping to secure their supplies at the schedule price. Some mills are accepting this figure, but most of them are holding out for 18s. ($4.39) or upward, basis, IC, f.o.b. works port, as their order books are filled for some months in advance.

Galvanized sheets are active and makers of the heavy gages are now well placed. There is moderate demand for black sheets to Japanese specifications, both thick and thin gages.

On the Continent of Europe

Continental iron and steel markets are strong, based on good demand and a reluctance on the part of the works to accept offered orders, especially on semi-finished steel and joists (beams). British sheet rollers have paid 96s. ($23.39) a ton f.o.b., for sheet bars.

German pig iron production in January is now placed at 1,180,000 (metric) tons.

GERMAN PRICE RISE OPPOSED

Consumers Protest That They Cannot Pass on Higher Cost and Ask Investigation

BERLIN, GERMANY, Feb. 1.—The recent advance in prices by the Ingot Steel Syndicate has brought protests from consuming industries. The new level of steel prices has forced manufacturers, such as the machinery builders, to make slight advances in their prices and the machinery industry points out that even a small increase gives an advantage to importers of foreign machines, particularly American. As a result of the rise in prices, the export bounties have been correspondingly increased, but German manufacturers complain that while they will lose nothing in their export trade by the price revision, German consumers will not accept higher domestic prices.

The bounties being offered to exporting manufacturers at present are: Steel ingots and blooms, 24m. ($5.72) per ton; slabs, 27m. ($6.44); structural shapes, 35m. ($8.35); steel bars, 36m. ($8.59); wire rods, 21.50c. ($6.13); heavy gage sheets, 24m. ($5.72); and boiler tubes, 80m. ($19.08).

Consumers are protesting to the Government against the revision of prices, pointing out that since the foundation of the International Steel Cartel the difference between the domestic and world market prices has been increased, although the cartel was expected to bring about higher export prices. Consumers believe that members of the steel syndicate are exploiting their home market, and there is a demand for anti-syndicate legislation, similar to American anti-trust laws. Although supporters of the steel syndicate in the Reichstag argue that the Government has not sufficient cause for applying existing legislation regulating cartels, the Minister of Industry, Dr. Curtius, has acted under the section of the law which requires producing cartels to

Germany	6 1		1.34	

(a) Nominal.

submit to him all decisions and agreements on prices before they become effective. In addition, the entire price situation is to be investigated by the Government.

Since the price advance on many products by the syndicate, finished materials have advanced. Apparently, as a result of the agitation caused by these increases, the syndicate has abstained from further advances. The Pig Iron Syndicate has announced unchanged pig iron prices for February. Although unemployment continues to increase, demand for iron and steel continues heavy.

Annual reports of such large companies as the Central German Steel Works, the United Steel Works, the General Electricity Co. and the Linke-Hofmann Corporation all reflected prosperity in 1927. The electrical industry did particularly well and expects some large orders if the French Government carries out its reported plan of accepting reparations payments in electrification of French railroads, ports, canals and colonial projects.

German Steel Mill Reports on Its Operations

HAMBURG, GERMANY, Feb. 4.—The United Steel Works has begun publishing quarterly reports of production and unfilled tonnage. The first of these statistics, covering the final quarter of last year, shows an output of 1,750,000 metric tons of pig iron, compared with 1,660,000 tons in the last quarter of 1926; 1,830,000 tons of steel ingots, compared with 1,780,000 tons in 1926; 6,670,000 tons of coal, compared with 6,550,000 tons in 1926; and 2,300,000 tons of coke, compared with 2,140,000 tons in 1926.

The total number of employees in the last quarter of 1927 was 183,179, of which 5173 were in the coal mines and the rest in the iron and steel departments. The number of employees was about 1.25 per cent greater than in the same quarter of 1926. By the end of January, 1928, the total of unfilled orders was 1,490,000 metric tons of steel, about 34 per cent more than in January, 1927, and about 99 per cent greater than in January, 1926.

Italian Company Books Foreign Locomotive Order

HAMBURG, GERMANY, Feb. 4.—Considerable interest has been aroused among German locomotive builders by the report that an Italian company, the Societa Italiana Ernesto Bredo at Milan, had received an order for 10 of a total of 39 locomotives purchased by the South African railroads. This is said to be the first export order taken by an Italian locomotive builder since the war. The remaining 29 locomotives on the list went to the North British Locomotive Co. German builders expect that Italy will continue as a competitor for overseas business in locomotives.

Germany Increases Imports of Tin Plate

HAMBURG, GERMANY, Feb. 4.—There was an increase of about 300 per cent in Germany's imports of tin plate in 1927 compared with 1926. German tin plate production is only about 100,000 tons a year, while consumption is about 150,000 tons annually. Of the total imports last year Welsh mills supplied 26,212 tons, compared with only about 5838 tons in 1926. The remaining tonnage came from Belgium and France, with a few small lots from the United States. German consumers evidently like the quality of American tin plate, and increased sales might be possible if the market were properly cultivated.

Exports of copper from the United States in 1927 are reported by the Bureau of Foreign and Domestic Commerce at 538,403 net tons, with a value of $150,163,302. This value is double the figure given for steel mill manufactures, which aggregated $73,871,825. It is within 6½ per cent of the total of finished and semifinished iron and steel, which was $160,631,441.

French Iron and Steel Output and Exports in 1927

PARIS, FRANCE, Feb. 2.—The total production of steel in France in 1927 was 8,275,000 metric tons, compared with 8,386,000 tons in 1926. Of this total, 5,858,000 tons was basic Bessemer, 2,251,000 tons open-hearth, 91,900 tons electric furnace steel, 59,900 tons acid Bessemer and 11,200 tons crucible steel.

The total pig iron output for 1927 was 9,293,000 tons, compared with 9,393,000 tons in 1926. Of this total, 7,162,000 metric tons was basic, 1,200,000 tons foundry, 38,000 tons phosphoric forge iron, 373,000 tons foundry grade hematite and 304,000 tons hematite, foundry and Bessemer iron.

Iron and steel imports totaled 97,194 metric tons, compared with 129,640 metric tons in 1926. Exports totaled 4,715,142 metric tons, compared with 3,471,258 tons in 1926. Of the total exports of 835,703 metric tons of pig iron in 1927, the United States received 3484 tons. This compares with 23,977 metric tons of pig iron shipped to the United States in 1926 out of total exports of 702,537 tons. The United States received 43,200 tons of blooms, billets, beams, bars and similar material, compared with 36,051 tons in 1926, and 41,537 tons of castings, compared with 38,592 tons in 1926. Exports of rails totaled 388,048 tons, compared with 322,217 tons in 1926. Of the 1927 total, Germany received the largest amount, taking 72,502 tons compared with 44,647 tons in 1926. Japan received 31,376 tons of rails, compared with 12,282 tons in 1926. The United States took 2694 tons in 1927 and 3768 tons in 1926.

British Iron and Steel Exports Lower; Imports Higher

WASHINGTON, Feb. 20.—Imports of iron and steel products into the United Kingdom increased to 283,921 gross tons in January from 280,520 tons in December, while exports declined to 332,185 tons from 351,795 tons, despite the tendency toward increased output, particularly of raw steel, according to a radiogram received by the Department of Commerce from Commercial Attaché William L. Cooper, London.

Production of pig iron in January was 560,500 tons, compared with 559,100 tons in December, while steel production totaled 626,200 tons and 604,900 tons, respectively. At the end of January there were 148 blast furnaces and 272 open-hearth furnaces in operation.

The principal gains in imports in January were in structural steel and plates and sheets. The most marked declines in exports in January were made in pig iron and ferroalloys, galvanized sheets and rails, while there were gains in such lines as structural steel and tin plate and in railroad material other than rails.

Structural Steel Orders Lower in January; 1927 Was Record Year

WASHINGTON, Feb. 20.—Orders for structural steel in January totaled 165,017 tons, representing 57 per cent of capacity, according to reports received by the Department of Commerce from 195 firms with a monthly capacity of 291,290 tons. Computed bookings amounted to 213,750 tons. Shipments were computed at 210,000 tons. Orders in December, reported by 221 firms with a capacity of 302,195 tons, were 209,429 tons or 69 per cent of capacity. Computed bookings amounted to 258,750 tons and computed shipments were 240,000 tons.

Orders for structural steel in 1927, computed at 3,060,000 tons, representing 68 per cent of capacity, were the highest in the history of the industry, though the greatest rate of operation, 72 per cent, was made in 1925, when computed orders were 2,998,080 tons. The lowest year since 1913, both in orders and rate of production, was 1921, when orders were computed at 1,188,600 tons and output rated at 35 per cent of capacity.

Monthly capacity reached its highest point in 1927, with 363,770 tons, as reported by 435 firms, and the total is estimated at 375,000 tons. There has been a continuous increase in capacity since 1913, when the 435 firms reported 214,200 tons.

Machinery Markets and News of the Works

BUYING IS LESS ACTIVE

February Machine Tool Business May Not Equal That of Last Month

Considerable Inquiry Is Pending but Prospective Buyers Are Somewhat Slower in Placing Orders

MACHINE tool buying has been moderately active in some of the principal buying centers during the past week, but sales are not in keeping with the promise held out by the fairly large inquiry of the past several weeks, and indications are that February business may not equal that of January. A considerable volume of business on which quotations went in last month is still pending, and the disposition to defer purchases is more apparent among various classes of buyers. The railroads in particular are doing little while the demands from the automobile industry have subsided now that 1928 production schedules are well under way.

Operations of machine tool plants are poorly balanced for the reason that some companies have a fair amount of unfilled business on their books, while others have comparatively little. Builders of high production tools have been getting the bulk of recent orders.

In the Cleveland and Detroit districts manufacturers of automobile parts are among the most active buyers. The chief inquiry from an automobile company is for 20 to 30 centrifugal grinding machines for the Ford plant. The Chicago trade is awaiting the placing of orders against the recent large inquiry of the Santa Fe Railroad. In the East the principal buyers are the General Electric Co. and the Wright Aeronautical Corporation.

The United States Navy will shortly purchase 18 lathes for scout cruisers.

New York

NEW YORK, Feb. 20.

INDUSTRIAL users of machine tools continue moderately active in purchasing, but no business is being closed with the railroads in this district. The General Electric Co., Schenectady, has closed against a number of tools on a list of 12 to 15 pieces of equipment, but still has some large machines to buy. The Wright Aeronautical Corporation, Paterson, N. J., has ordered a number of tools in the past 10 days including several milling machines, two turret lathes and some radial drills.

The New York Central Railroad has a number of outstanding inquiries but has not yet taken any action toward making purchases. The list of the Delaware, Lackawanna & Western Railroad is still open. The other railroads which buy in this district continue inactive.

Recent purchases of tools have included nine 5-in. production hand milling machines by a Detroit motor company, a 16 x 36-in. lathe by a Massachusetts construction company, a No. 1 Sigourney drill by a New Jersey manufacturer, a 13 x 48-in. lathe by a Milwaukee manufacturer, a 20-in. x 12-ft. Boye & Emmes lathe by an Indiana company, a 22-in. x 14-ft. Morris lathe by a Pittsburgh manufacturer, a 13 x 48-in. lathe by a Milwaukee company, a 6-in. vertical shaper by a Chicago machinery company, a 13 x 30-in. lathe by a Connecticut manufacturer, two No. 13 profiling machines by a typewriter maker, a 12-in. vertical shaper by a Cincinnati machine tool builder. A manufacturer in Pennsylvania has closed on the following used machine tools: A 26-in. x 17-ft. Pond lathe and a 30 x 30-in. x 12-ft. Pond planer, a 15-in. Bement slotter and a 2 x 26-in. Pratt & Whitney turret lathe.

Contract has been let by Ward Leonard Electric Co., South Street, Mount Vernon, N. Y., manufacturer of controllers and other electrical apparatus, to John W. Ferguson Co., Paterson, N. J., for a one-story addition, 115 x 116 ft., to cost upward of $75,000 with equipment.

E. M. Adelsohn, 26 Court Street, Brooklyn, architect, is preparing plans for a three-story automobile service, repair and garage building to cost $125,000 with equipment.

Mansfield Iron Works, 878 East Forty-third Street, Brooklyn, has acquired property on East Mill Basin, Jamaica Bay section, for establishment of a new plant.

Tillary Chemical & Perfume Laboratories, Inc., 16 Tillary Street, Brooklyn, manufacturer of chemicals and chemical by-products, is reported planning to rebuild four-story factory recently destroyed by fire, with loss estimated at more than $50,000 with equipment.

Franz Wolfgang, 535 East Tremont Avenue, New York, architect, has plans for a two-story automobile service, repair and garage building on White Plains Avenue, to cost close to $100,000 with equipment.

Department of Docks, Municipal Building, New York, will soon begin work on a municipal airport in Mill Basin-Barren Island district, Jamaica Bay, to cost $500,000, in which amount funds have been approved. Four hangars, each 120 x 140 ft., will be built, with capacity of 50 airplanes; repair and reconditioning shops, fuel storage and distributing plant, and other structures will also be built. Facilities will be provided on Jamaica Bay for seaplanes. It is expected to complete project in the fall. T. F. Keller is chief engineer.

Sanitary Postage Service Corporation, 285 Madison Avenue, New York, manufacturer of stamp vending machines, is disposing of preferred stock issue of $252,000, portion of proceeds to be used for expansion.

Joseph L. Steinman, 46 West Forty-sixth Street, New York, architect, has filed plans for a six-story automobile service, repair and garage building, 75 x 75 ft., to cost about $225,000 with equipment.

Board of Education, Great Neck, L. I., contemplates installation of manual training equipment in a proposed high school to cost about $800,000. Guilbert & Betelle, 24 Branford Place, Newark, are architects.

R. H. Macy, Inc., New York, has awarded general contract to Barney-Ahlers Construction Co., Metropolitan Avenue, Brooklyn, for a seven-story storage and distributing plant, 140 x 200 ft., at Long Island City. Installation will include elevating, conveying and other material-handling equipment. Project is estimated to cost $650,000.

Wright Aeronautical Corporation, Paterson, N. J., has work under way on a one-story assembling plant, 70 x 100 ft., for which general contract recently was let to John W. Ferguson Co., to cost about $65,000 with equipment.

Mapes & Sprowl Steel Co., 227 High Street, Newark, manufacturer of metal sheets and kindred products, has leased portion of a new one-story building on Empire Street, totaling about 15,000 sq. ft. of floor space, and will remove to that location.

G. W. Carnrick Co., 421 Canal Street, New York, manufacturer of chemicals, has awarded general contract to Enstice Corporation, 111 Academy Street, Newark, for a three-story factory at Newark, to cost more than $70,000 with equipment. Russell G. Cory, 30 Church Street, New York, is architect and engineer.

Laskey Body Co., 337 Halsey Street, Newark, recently formed to succeed to plant and business of J. B. Laskey, manufacturer of automobile bodies, has leased building at 243-45 Central Avenue and will remodel for a branch plant, to include departments for production of automobile tops and frames, body repair work, etc.

Kennedy-Van Saun Mfg. & Engineering Corporation, recently at 50 Church Street, New York, is now located at 2 Park Avenue.

Stronach Corporation, 2850 Grand Central Terminal, New York, recently formed to own manufacturing rights of Stronach non-splitting nails, has sold rights to manufacture under existing patents to Stronach Nail Co., Pittsburgh.

Petty & Wherry, Inc., 50 Church Street, New York, distributer of factory, garage, mill and contractors' equipment, has taken over distribution in New York territory of products of Dodge Mfg. Corporation, Mishawaka, Ind.

Kneuer Tail Board Co., Inc., 126 Van Buren Street, Newark, has been organized to manufacture patented spaceless tail board for commercial automobile trucks. Company is interested in purchasing iron-working machinery, such as heavy power brakes, shears, millers, power hack saws and power punches, and will also purchase iron and steel pipe 1 to 2 in. in diameter, 3/16-in. plates, 13 to 16 in. wide in lengths up to 8 ft., and 3/16-in. steel bands, 2 in. wide in lengths up to 20 ft.

Philadelphia

PHILADELPHIA, Feb. 20.

PLANS have been filed by Quaker City Iron Works, Ontario Street and Aramingo Avenue, Philadelphia, for a one-story addition, 140 x 150 ft., to cost about $40,000 with equipment.

Edward H. Reuss, Jr., Thirtieth and Race Streets, Philadelphia, manufacturer of pipe, heating equipment, etc., is having plans drawn for a one-story pipe-bending and fabricating plant, to cost in excess of $150,000 with equipment. Philip H. Johnson, Widener Building, is architect.

Philadelphia Suburban-Counties Gas & Electric Co., 712 Locust Street, Philadelphia, is arranging an expansion and improvement program for 1928 to cost more than $6,000,000, of which amount $3,954,000 will be used for electric division, and $2,355,000 for gas department. Work will include an addition to power plant on Barbadoes Island in Schuylkill River, with installation of additional equipment, new transmission lines, substations and miscellaneous construction; extensions will be made in gas properties in Newtown Square and West Manayunk, including installation of compressing equipment, pumping machinery, purifying and other apparatus, with pipe lines. H. H. Ganser is vice-president and general manager.

Silverman & Levy, 313 South Smedley Street, Philadelphia, architects, have plans ready for bids on a four-story automobile service, repair and garage building, 94 x 110 ft., with extension, 20 x 65 ft., to cost close to $150,000 with equipment.

Bureau of Supplies and Accounts, Navy Department, Washington, is asking bids until Feb. 28 for a quantity of gages and reamers for Philadelphia Navy Yard, schedule 8533; also for quantity of tool steel, schedule 8521.

LeRoy B. Rothschild, Heymann Building, Philadelphia, architect, is preparing plans for a two-story motor bus service, repair and terminal building at Thirteenth and Filbert Streets, for Association of Motorbus Owners of Philadelphia and Vicinity, and Del-Bridge Bus Association, both represented by Harold S. Shertz, Liberty Building, attorney, to cost close to $1,000,000 with equipment.

Brown Instrument Co., Roberts and Wayne Avenues, Philadelphia, manufacturer of pyrometers and other measuring instruments, has plans for a two-story addition, with foundations to provide for an additional floor later, to cost close to $45,000. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Philadelphia Rapid Transit Co., 810 Dauphin Street, Philadelphia, has concluded arrangements for purchase of property at 1420-26 Locust Street, through its affiliated company, Motor Real Estate Co., and will have plans drawn for a multi-story motor bus service, repair and terminal building, to cost close to $1,000,000 with equipment.

John A. Roebling's Sons Co., Roebling, Trenton, N. J., manufacturer of wire and cables, etc., has plans for a one-story rod mill to cost close to $700,000 with equipment.

Allentown, Pa., M. W. Gross, mayor, is asking bids until March 13 for electrical distribution and control equipment for Kline's Island sewage disposal plant, contract 3, as per plans at office of city engineer.

Bellanca Aircraft Corporation, Arlington, Staten Island, N. Y., will soon ask bids on general contract for initial units of its new plant near New Castle, Del., to cost close to $100,000 with equipment. Price & Price, Wilmington, engineers, will make surveys.

A steam power house, 24 x 44 ft., will be built by Phoenixville Hosiery Co., Phoenixville, Pa., in connection with a new mill unit, entire project to cost more than $60,000 with equipment. Clarence Wunder, 1520 Locust Street, Philadelphia, is architect.

Audubon Wire Cloth Co., Audubon, N. J., has asked bids on general contract for a two-story addition, 55 x 94 ft., to cost close to $20,000 with equipment. Robert Korb is president.

Bridesburg Foundry Co., Bridesburg, Philadelphia, manufacturer of brass, bronze and aluminum castings, has been reincorporated under Pennsylvania laws, but plans no change in management or operations. Statement appearing in these pages on Feb. 9 that company would manufacture iron castings, dies and kindred products was incorrect.

Chicago

CHICAGO, Feb. 21.

THE volume of sales has reacted only slightly from the dip of last week. In the absence of large lists, the Santa Fe inquiry being an exception, dealers are forced to concentrate on small and widely scattered business. Fresh requests for prices are more numerous, but sluggish, and give no indications of closing. The Santa Fe has added a driving wheel lathe, two grinders, a 24-in. lathe and a cold saw to its list. A Milwaukee road machinery manufacturer will soon come into the market and other plants making similar equipment are showing more interest. The International Harvester Co. continues to issue requisitions for miscellaneous items. Production equipment is being sought by the Nash Motors Co. for its Kenosha, Racine and Milwaukee plants.

Interstate Rivet Co., 7850 South Chicago Avenue, Chicago, has been organized to take over small rivet business of Interstate Iron & Steel Co., Chicago. New company will operate under lease small rivet department of Grand Crossing works of Interstate company.

Sangamo Electric Co., Springfield, Ill., will build an addition, 75 x 200 ft., to cost $75,000.

American Ventilating Co., 228 North LaSalle Street, Chicago, will build an addition, 70 x 103 ft., to cost $30,000.

Johnson Sheet Metal & Furnace Works, 712 West Seventy-ninth Street, Chicago, will build a one-story shop, 37 x 121 ft. to cost $12,000.

Elgin Stove & Oven Co., Elgin, Ill., has plans for an addition, 50 x 135 ft., to be completed this spring. Company manufactures complete steel kitchen units, wall cabinets, stoves and refrigerators, and has recently added metal clothes hangers and metal furniture to its lines.

Richardson Rod & Reel Co., 536 Lake Shore Drive, Chicago, manufacturer of steel fishing rods, tackle, etc., has awarded general contract to G. A. Schillinger Construction Co., 2339 North Hoyne Avenue, for a two-story and basement plant, 62 x 120 ft., to cost about $50,000 with equipment. Van Gunten & Van Gunten, 26 East Huron Street, are architects.

Reliance Die & Stamping Co., 501 North La Salle Street, Chicago, will soon begin erection of three-story plant to cost close to $125,000 with machinery. A. A. Wickland, 5 South Wabash Avenue, is architect.

H. J. Mapp, 6739 South Western Avenue, Chicago, is considering erection of one-story machine shop, 50 x 100 ft.

Power Engineering Co., Metropolitan Life Building, Minneapolis, Minn., engineer, will take bids in spring for extensions and improvements in municipal power plant at Stoughton, Wis., to include installation of generator, exciter, switchboard, transformers and other equipment.

West End Scrap Iron & Metal Co., 1920 West Michigan Street, Duluth, Minn., is having plans drawn for new works to cost $20,000 with equipment. Thomas J. Shefchik, Glencoe Building, is architect.

Interstate Power Co., Decorah, Iowa, has plans for new hydroelectric power station, including improvements in power dam and extensions to transmission line, to cost upward of $200,000. Management & Engineering Corporation, 327 South La Salle Street, Chicago, is engineer.

Denver, Rio Grande & Western Railroad Co., Denver, Colo., is planning extensions and improvements in its locomotive shops at Salida, Colo., including installation of additional equipment.

Produce Terminal Cold Storage Co., Chicago, care of Henschin & McLaren, 1637 Prairie Avenue, architects, will take bids for an eleven-story cold storage warehouse and produce terminal at Fifteenth Place and Throop Street, to cost close to $1,000,000 with equipment.

Bellefourche Implement Co., Bellefourche, S. D., manufacturer of agricultural implements, etc., is considering erection of a new plant, to cost about $20,000 with equipment. John Boland, Rapid City, S. D., heads company.

Ford Motor Co., Detroit, is reported planning new assembling works at Pueblo, Colo., to cost in excess of $150,000 with equipment.

C. W. Olson Mfg. Co., 1300 Quincy Street, N. E., St. Paul, Minn., operating an ornamental iron and steel plant, will rebuild portion of works destroyed by fire Feb. 12, with loss reported at $30,000 including equipment.

Chicago, Rock Island & Pacific Railroad Co., 179 West Jackson Boulevard, Chicago, is arranging an appropriation of $1,651,000 for new construction and repair shops, and engine facilities, and $1,085,000 for new yard facilities.

Pittsburgh

PITTSBURGH, Feb. 20.

THERE is a steady flow of single orders for machine tools and most dealers appear fairly satisfied with the amount of business done for the year to date. New inquiries are quite numerous and dealers also are uncovering other needs on visits among buyers. In the heavier equipment there is a good amount of prospective business in cranes. A local builder recently took an order for several mills for the Timken Roller Bearing Co.

Arrangements have been made by Duquesne Steel Foundry Co., Union Bank Building, Pittsburgh, for purchase of complete foundry and steel roll equipment of Tioga Steel & Iron Co., Philadelphia, for removal to its Pittsburgh works, which will be extended for increased capacity. Purchase concludes liquidation of equipment of Tioga plant, which will be closed, company concentrating production at its plants at Easton, Pa., and High Bridge, N. J.

J. F. Bontempo, 423 Franklin Avenue, Woodlawn, Pa., architect, has plans for a two-story automobile service, repair and garage building, to cost about $90,000 with equipment, and will ask bids before close of month on general contract.

Kennilworth Tile Co., Newell, W. Va., has approved an expansion and betterment program to cost about $75,000, including installation of tunnel kiln and equipment to double present capacity.

Bailey-Farrell Mfg. Co., Twentieth and Sidney Streets, Pittsburgh, manufacturer of plumbing equipment and supplies, is considering rebuilding portion of its branch plant at Second Avenue and Ninth Street, Huntington, W. Va., recently destroyed by fire, with loss close to $70,000 including equipment.

United States Engineer, Keenan Building, Pittsburgh, is asking bids until Feb. 28 for one duplex plunger type valve pot pump, circular 285, and until March 9 for two hydraulic turbines, circular 274.

Appalachian Electric Power Co., Bluefield, W. Va., is planning construction of a power substation at Madison, W. Va., and extensions and improvements in transmission line from Yolyn and Lundale, W. Va., to cost more than $60,000.

United States Engineer, Huntington, W. Va., is asking bids until Feb. 29, for one portable vertical capstan, with gasoline engine and necessary clutch, gears, housing, frame, etc., circular 148.

School District of Altoona, Pa., has engaged H. O. Swoboda, Inc., engineer, 3400 Forbes Street, Pittsburgh, for increasing capacity of its central light, heat and power plant, made necessary by an addition to senior high school now under construction.

W. H. Nicholson & Co., Wilkes-Barre, Pa., manufacturer of expanding mandrels, arbor presses, flexible and compression couplings and steam specialties, have opened sales office at 1669 Montpelier Street, Dormont, Pittsburgh, to serve western Pennsylvania, eastern Ohio and West Virginia. Ralph A. Comstock is in charge.

Fawell Engineering Co., First National Bank Building, Pittsburgh, has been appointed exclusive representative in Pittsburgh district for Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa., designer and builder of rolling mills, rolling mill machinery, hydraulic equipment and special machinery.

Buffalo

BUFFALO, Feb. 20.

PLANS are being arranged by American Radiator Co., Buffalo, for early operation of its new plant at Gloucester, N. J., for production of iron castings for radiators and assembling.

H. R. Emerick, 28 Telegraph Street, Binghamton, N. Y., is planning installation of equipment for marble and slate production, including electrically-operated machinery for drilling slabs.

Edward A. Stone, 42 Canfield Place, Rochester, N. Y., and associates have formed E. A. Stone Cutlery Co., capitalized at $100,000, and plan early operation of a local factory to manufacture cutlery. George T. Stone, 310 West Ninety-seventh Street, New York, is interested in new organization.

Malone Light & Power Co., Malone, N. Y., is disposing of a block of preferred stock, portion of proceeds to be used for expansion in plant and system, including transmission line construction.

Board of Education, Malone, N. Y., plans installation of manual equipment in a new high school to cost $600,000, for which plans will be drawn by Fuller & Robinson, 95 State Street, Albany, N. Y., architects.

Pierce, Butler, Pierce Mfg. Co., Syracuse, N. Y., manufacturer of heaters, boilers, etc., is said to have plans for a one-story addition to be equipped as a core department.

Houde Engineering Co., 237 Winchester Avenue, Buffalo, manufacturer of automobile shock absorbers, etc., will soon begin work on a two-story addition, 210 x 225 ft., to cost close to $200,000 with equipment. G. Morton Wolfe, 1377 Main Street, is architect.

Cincinnati

CINCINNATI, Feb. 20.

WHILE machine tool buyers are somewhat hesitant about placing orders for equipment, and a large volume of pending business is being temporarily held in abeyance, bookings this month are expected to be considerably better than in February, 1927, although not equal to the record set in January. The bulk of sales made recently has been outside the automotive industry, this development being significant of a healthier condition in the general industrial field.

Operations continue to be poorly balanced among machine tool builders and it is those with high production tools which are getting most of the business. A local manufacturer has sold six engine lathes to an Eastern company. The United States Government probably in the next 10 days will purchase 18 engine lathes for naval scout cruisers. Aside from a transaction calling for the shipment of seven special automatic lathes to Germany, foreign orders have been negligible.

Plans are being arranged by Cincinnati-Oakland Motor Co., 1026 Gilbert Avenue, Cincinnati, representative for Oakland automobile, for a one and two-story service, repair and sales building to cost $125,000 with equipment.

Gosite Air Machine Co., 413 West Fifth Street, Dayton, Ohio, has plans for one-story factory to cost about $50,000 with equipment. Building on site is being razed and new superstructure will soon begin.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is taking bids until Feb. 28 for 26 electric trigger solenoid control assemblies and 26 gun camera mount assemblies, circular 230; also for 1400 tow target assemblies, circular 232; until March 1 for a quantity of aluminum alloy tubing and aluminum sheets, circular 235, and until Feb. 29, for 28,000 lb. sheet iron, schedule 236.

Union Battery Co., 2717 South Troy Street, Memphis, Tenn., has leased property at 305 Trigg Street, for establishment of new plant for manufacture and distribution of automobile batteries.

Peter Fox Sons' Co., Fulton Market, Chicago, food products, is reported planning construction of an ice-manufacturing and cold storage plant on First Avenue, Nashville, Tenn., to cost more than $250,000 with equipment.

Newport Finance Corporation, Newport National Bank Building, Newport, Ky., Lorimer Scott, secretary, is head of a project to construct a four-story automobile service, repair and garage building at Cincinnati, to cost $200,000 with equipment.

Chaney Mfg. Co., Pleasant Street, Springfield, Ohio, manufacturer of thermometers and kindred instruments, contemplates an addition and improvements in present factory.

Meehanite Metal Engineering Corporation, 907 Chamber of Commerce Building, Cincinnati, has been organized to manufacture Meehanite metal, a pearlitic iron made in cupola or air furnaces which is said to combine qualities of cast iron and cast steel. At present company is licensing manufacturers to use Meehanite in their own products and is prepared to supply companies which cannot make product in their own foundries.

St. Louis

ST. LOUIS, Feb. 20.

PLANS are being completed by B. F. Mahoney & Co., San Diego, manufacturer of airplanes and parts, care of McDonald & Condie, 502 North Taylor Avenue, St. Louis, architects, for a new plant at Anglum, near St. Louis, consisting of four one-story units, 75 x 260 ft., 30 x 40 ft., 40 x 60 ft., and power house, 18 x 35 ft., to cost about $75,000 with equipment.

General Brake Service Corporation, 2727 Locust Street, St. Louis, manufacturer of automobile brakes, has plans for expansion to double present capacity.

Western Products Corporation, Kansas City, Mo., care of Henry E. Dean, Kansas City, Kan., attorney, recently formed with a capital of $100,000, will operate a new plant in Fairfax industrial district for manufacture of special hard rubber goods, including flooring, paving expansion joints, etc. Company is headed by Charles Ora and W. W. Rose.

United Motor Service Co., Twenty-seventh and Warwick Streets, Kansas City, Mo., has leased a two-story and basement building, 100 x 120 ft., to be erected by Scarritt Estate, to cost $100,000, with equipment. R. H. Sanneman, Lee Building, is architect.

Central Arkansas Public Service Corporation, Hot Springs, Ark., is disposing of a bond issue of $2,700,000, a portion of fund to be used for extensions and improvements, including transmission lines.

Board of Education, Stillwater, Okla., is arranging fund for a new manual training school, for which plans will be drawn by Philip A. Wilber, Oklahoma Agricultural and Mechanical College, Stillwater, architect.

Paxton-Mitchell Co., 2614 Martha Street, Omaha, Neb., manufacturer of iron castings, has plans for a one and two-story foundry to cost more than $100,000 with equipment. Austin Co., Euclid Avenue, Cleveland, is engineer.

Schneider Red Granite Co., 1224 Central National Bank Building, St. Louis, is arranging bond issue of $200,000, a portion of fund to be used for expansion and improvements at plant at Graniteville, Mo., including additional equipment.

Waters Auto Parts Co., 1711 Joplin Street, Joplin, Mo., has plans for a one-story addition, 25 x 35 ft., for which foundations will soon be laid.

Price Box & Basket Co., Neosho, Mo., has work under way on a new one-story mill and plans early purchase of equipment, including crane for unloading and handling logs, shingle machinery, basket machines and auxiliary equipment.

South Atlantic States

BALTIMORE, Feb. 20.

PLANS for second unit of expansion program of Bethlehem Shipbuilding Corporation, Baltimore, are nearing completion and bids will soon be asked on general contract. Structures will be one and two-stories, and with first unit will cost approximately $1,000,000 including equipment. H. B. Bisbee, Fore River plant, Quincy, Mass., is architect and engineer. J. M. Willis is local manager.

Board of Commissioners, District Building, Washington, is asking bids until March 5 for metal cabinets.

Art Furniture Mfg. Co., Macon, Ga., care of Frank R. Happ, Fourth National Bank Building, architect, recently formed with a capital of $40,000, has plans for a new one and two-story factory, 50 x 200 ft. and 50 x 165 ft., to cost about $35,000 with equipment.

Columbus Iron Works Co., Columbus, Ga., manufacturer of stoves and parts, plans installation of grinding machines and other equipment. Company will also purchase stove trimmings from outside plants. C. D. Cabaniss is vice-president.

Chesapeake Mfg. Co., Sharp and Barre Streets, Baltimore, manufacturer of furniture, will soon take bids for a two-story addition to cost about $35,000 with equipment. David Harrison, 1322 North Central Avenue, is architect.

General Supply Committee, United States Government and District of Columbia, Washington, is asking bids until March 2 for annual supplies for executive departments, including tools, dies, trucks, wire, abrasives, iron, steel, lead, babbitt metal, brass, surveying instruments, castings, electrical equipment and supplies, etc.

Motor Storage Corporation, Charlotte, N. C., has filed plans for a five-story service, repair and garage building to cost $175,000 with equipment.

Potomac Electric Power Co., Washington, has approved plans for enlargement of its steam-operated electric power house at Bennings to increase capacity by 30,000 kw. Extensions will be made in transmission lines. Entire project will cost upward of $750,000.

Georgia Portland Cement Corporation, Augusta, Ga., J. L. Hankinson, president, is reported completing plans for construction of first unit of new mill at Sandersville, Ga., to cost close to $1,000,000 with machinery. Another mill is also being projected on Savannah River, near Augusta.

Central Chevrolet Co., 1233 Hampton Avenue, Columbia, S. C., local representative for Chevrolet automobile, has plans for a three-story and basement service, repair and sales building, 65 x 210 ft., to cost close to $100,000 with equipment.

Bureau of Supplies and Accounts, Navy Department, Washington, is asking bids until Feb. 28 for two ball bearing testing machines for Annapolis Navy Yard, schedule 8496; also for starting motors, generators, distributors, magnetos and spares for motor boat gasoline engines for Hampton Roads Yard, schedule 8508; bench lathes and grinders for Newport Navy Yard, schedule 8523; three fluid pressure scales for same yard, schedule 8524; die castings for Washington Yard, schedule 8532, and until March 6 for steel bars for Eastern and Western yards, schedule 8507.

Savannah River Electric Co., operated by Southeastern Power Co., Birmingham, has secured a Federal permit for a hydroelectric power development on Savannah River, near Greenwood, S. C., entire project to cost in excess of $20,000,000 with transmission lines.

Detroit

DETROIT, Feb. 20.

A THREE-STORY addition, a portion to be used for storage and distributing service, will be erected by Lieberman & Gittlen Metal Co., 322 Front Street, S. W., Grand Rapids, Mich., to cost more than $30,000. D. R. McEachron, Associates of Commerce Building, is architect and engineer.

National Utilities Co., Grand Haven, Mich., will dispose of bonds in amount of $812,500, and 1000 shares of stock, no par value, portion of fund to be used for expansion and betterments, including transmission line construction.

Detroit Edison Co., 2000 Second Avenue, Detroit, is arranging a construction and improvement program to cost $30,000,000, including increase in capacity at Trenton Channel power plant of 50,000 kw., construction of Delray plant No. 3 and expansion in generating station at Marysville; construction of 120,000-volt steel tower transmission line from Trenton Channel station to Detroit, and similar single steel tower line from Marysville power plant to Northeast substation, Detroit, and other power lines; construction of four new power substations and additions to present substations, and miscellaneous work.

Chevrolet Motor Co., Flint, Mich., is reported to be contemplating a new assembling plant for Southwestern district in vicinity of Dallas, Tex., to cost in excess of $500,000 with equipment.

Board of Education, Battle Creek, Mich., is considering installation of manual training equipment in high school in east side district to cost $500,000, for which plans will be drawn by William B. Ittner, 911 Locust Street, St. Louis, architect.

Koestlin Tool & Die Co., 3601 Humboldt Avenue, Detroit, is said to be planning early purchase of a traveling crane and other equipment for installation in a shop addition.

Chrysler Motor Car Co., Highland Park, Detroit, is completing plans for an addition to cost close to $100,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects and engineers.

United States Radiator Corporation, 133 East Grand River Boulevard, Detroit, is concluding arrangements for purchase of Pacific Steel Boiler Co., Waukegan, Ill., manufacturer of electrically-welded steel heating boilers, and will operate as a division.

Board of Education, Pontiac, Mich., is having plans completed for a one-story manual arts building at high school, to cost $100,000 with equipment. Childs & Smith, 720 North Michigan Avenue, Chicago, are architects.

Niles Aircraft Corporation, Niles, Mich., has been organized to manufacture special type of monoplane. Demonstration plane has been constructed and company expects to go into mass production shortly. James R. Williams, designer of plane, is president.

Rich Steel Products Co., Battle Creek, Mich., has awarded a contract to Reniger Construction Co., Lansing, Mich., for a branch plant at Marshall, Mich., to cost $120,000.

The Crane Market

THERE has been a better volume of inquiry for overhead and locomotive cranes during the past week or ten days, but purchasing has been light. The inquiry of the Amtorg Trading Corporation, 165 Broadway, New York, previously reported as calling for 40-ton locomotive cranes for export to Russia, is for five 15-ton, kerosene operated crawl-tread cranes, one 15-ton and one 25-ton standard locomotive cranes. The Phoenix Utility Co., 71 Broadway, New York, is about to close on a 60-ton electric crane. The Reading Railroad, Reading, Pa., has not yet closed on two 250-ton, double trolley overhead cranes.

Among recent purchases are:

Humble Oil Refining Co., Austin, Tex., 10-ton, 40-ft. span and 3-ton, 25-ft. span electric cranes for Pyote, Tex., from Box Crane & Hoist Corporation.

California Edison Co., Los Angeles, two 5-ton, 31-ft. span, 3-motor, overhead cranes from Box Crane & Hoist Corporation.

Fagan Iron Works, Jersey City, N. J., one used 10-ton, 75-ft. span and two used 5-ton, 30-ft. span overhead cranes from McCabe Equipment Co., Philadelphia.

Wallingford Steel Co., Wallingford, Conn., 5-ton, 50-ft. span, 3-motor, overhead crane from Niles Crane Corporation.

Tidewater Structural Material Co., 271 Madison Avenue, New York, 1-ton hand power crane with electric hoist from Reading Chain & Block Corporation.

Otis Elevator Co., Yonkers, N. Y., a 2-ton electric hoist from unnamed maker.

Griscom-Russell Co., Massillon, Ohio, three 2-ton, 20-ft. span, 3-motor overhead cranes and one 2-ton, 2-motor, monorail hoist, reported purchased.

International Harvester Co., Chicago, 3-ton, 45-ft. span hand power crane through Page Sales Service, from H. D. Conkey & Co.

B. B. Buffaloe & Co., Monroe, La., 3-ton, 36-ft. span hand power crane from H. D. Conkey & Co.

J. J. Normoyle Co., Moline, Ill., 1-ton, 16-ft. span push crane from H. D. Conkey & Co.

Clinton Bridge Works, Clinton, Iowa, ten 2-ton push cranes from H. D. Conkey & Co.

Northern Pacific Railroad, Brainerd, Minn., mast type jib crane from H. D. Conkey & Co.

Mundie Mfg. Co., Peru, Ill., 8-ton, under-brace, jib crane from H. D. Conkey & Co.

Uxbridge Worsted Co., Uxbridge, Mass., 1-ton, 38-ft. span, 3-motor crane from H. D. Conkey & Co.

Indiana

INDIANAPOLIS, Feb. 20.

PLANS have been approved by Auburn Automobile Co., Auburn, Ind., for a five-story factory branch at Los Angeles, for service, repair and sales, to cost more than $250,000, with equipment. E. L. Cord is president.

Interstate Public Service Co., Indianapolis, has applied for permission to acquire plant and system of Dillsboro Electric Co., Dillsboro, Ind., with transmission line from that place to Aurora, Ind., and plans expansion, including transmission line extensions.

Bishop-Knowlton-Carson Co., 312 North Meridian Street, Indianapolis, architect, will soon begin construction of a three-story automobile service, repair and garage building, 100 x 165 ft., to cost $180,000 with equipment.

Duesenberg Motors Co., 1511 West Washington Street, Indianapolis, is making improvements and alterations in its plant for increased production of custom automobiles, including machinery replacements, installation of equipment, etc.

Cleveland

CLEVELAND, Feb. 20.

THE lull reported in the machine tool market a week ago is still in evidence and applies both to sales and inquiries. There is no demand for round lots of machines for equipping new plants or for extensions and few orders are being taken for more than single machines. Business at present is coming largely from manufacturers of automobile parts. Automatic screw machinery is moving fairly well in orders for one or two machines. Following the placing of some good orders by Michigan automobile companies, buying appears to have subsided in the Detroit territory. The Ford Motor Co. is still buying equipment and is figuring at present on 20 to 30 centrifugal grinding machines.

Plans are being completed by Willys-Overland Co., Toledo, Ohio, manufacturer of Overland and Willys-Knight motor cars, for new plant units to cost more than $500,000 with machinery.

Car-Van Steel Products Co., Fifth Street, S. W., Canton, Ohio, manufacturer of punches, reamers, wrenches and other tools, contemplates a one, two and three-story addition, to cost more than $50,000 with equipment.

Liberty Paper Board Co., Steubenville, Ohio, is completing extensions and improvements in former mill of Hartje Paper Co., and will provide equipment for large increase in output.

Serugo Rubber Co., 172 Cole Avenue, Akron, Ohio, is reported planning new mill at Atwater, Ohio, to cost more than $60,000 with machinery. John Hadfield is president.

Toledo Edison Co., Toledo, Ohio, is arranging an expansion and improvement program to cost about $2,000,000, of which approximately one-half will be used for an addition to steam-operated electric power plant, with installation of fourth turbo-generating unit and accessories. Transmission line will be built from Toledo to Sandusky, Ohio. C. L. Proctor is vice-president and general manager.

Packard Motor Car Co., Detroit, has awarded a general contract to Sam W. Emerson Co., 1836 Euclid Avenue, Cleveland, for a two-story service, repair and sales building at Carnegie Avenue and East Ninety-third Street.

Gulf States

BIRMINGHAM, Feb. 20.

PLANS are being completed by John E. Mitchell Co., 600 South Sixth Street, St. Louis, manufacturer of cotton ginning and flour mill machinery, for a new plant at East Dallas, Tex., primarily for manufacture of parts for ginning machines, to cost $90,000.

Board of Education, Beaumont, Tex., plans installation of manual training equipment in a new senior high school to cost $1,000,000. A special election has been called in April to approve a bond issue. An architect is being selected to prepare plans.

Long-Lewis Hardware Co., 2014 Second Avenue, Bessemer, Ala., will take bids early in March for a two-story storage and distributing plant in Smith Park section, Birmingham, to cost close to $40,000. Denham, Van Keuren & Denham, Comer Building, Birmingham, are architects.

Alabama Power Co., Birmingham, is disposing of a preferred stock issue to total about $1,950,000, a portion of proceeds to be used for expansion, including hydroelectric power plant and transmission line construction.

Mason Brown Ice & Coal Co., Huntsville, Ala., has purchased property at Decatur, Ala., and plans erection of one-story electrically-operated ice-manufacturing plant, to cost $65,000 with equipment.

Port Compress Co., Laredo Street, Corpus Christi, Tex., plans extensions and improvements in cotton compress plant, including installation of high-density press, boilers, and other equipment, material-handling and conveying machinery, to cost more than $250,000.

S. R. Morgan & Co., Rector Building, Little Rock, Ark., has acquired property at Aberdeen, Miss., as site for new ice-manufacturing plant to cost about $90,000 with equipment.

Ovens, power equipment, conveying and other machinery will be installed in a new plant at East Dallas, Tex., to be erected by Mrs. Baird's Bread Co., Fort Worth, Tex., two-stories and basement, to cost $200,000 with equipment.

Amarillo Producers' & Refiners' Corporation, Amarillo, Tex., is planning the early rebuilding of portion of oil refining plant, recently destroyed by fire with loss reported in excess of $50,000, including equipment. New structure will have a capacity of 1500 bbl. per day. W. S. Roberts is secretary.

Dixie Gas & Utilities Co., Port Arthur, Tex., is disposing of bond issue of $3,000,000 and note issue of $1,500,000, portion of proceeds to be used for extensions and improvements in natural gas properties, including pipe line construction.

Florida Babbitt Corporation, 42 North Twenty-first Street, Miami, Fla., will erect one-story plant for manufacture of recently patented babbitting machine and parts, to cost close to $40,000.

Wagner Electric Corporation, St. Louis, has opened sales office at 1006 Washington Avenue, Houston, Tex. Warehouse stocks are now carried by company at both Houston and San Antonio, Tex.

New England

BOSTON, Feb. 20.

SALES of machine tools in this territory the past week increased perceptibly. The Pittsfield plant of the General Electric Co. is reported to have purchased at least a dozen tools valued approximately at $30,000, including two special purpose radial drills; the Lynn plant also has purchased several pieces of equipment. The Maine Central Railroad is reported to have bought a medium sized lathe, a planer, slotter, drill grinder and a plate machine; a Cambridge, Mass., shop has taken a large compressor; a Worcester shop has bought a 16-in. lathe. A Worcester dealer has sold radial drills, lathes and about 14 miscellaneous tools, all of the foregoing new equipment.

For a new trade school the city of Boston has closed bids on two 14-in. Hendey lathes, five 12-in. tool-room lathes, one 20-in. shaper, one single-spindle sensitive drill and one two-spindle drill, 14-in. American geared head lathe, a Monarch 14-in. cone head lathe, No. 2A Brown & Sharpe milling machine, and No. 13B Brown & Sharpe tool grinder, 23 sheet metal-working tools, and a number of wood-working tools. In used tools, two 8-in. lathes, a duplex milling machine, two upright drills, and a shaper went outside of Boston. Other used tools sold included a power press to a Boston shop, about eight miscellaneous drills, a cutting-off machine and about eight items of grinding equipment. It was by far the best week this year.

New England industrial conditions are improving. It is anticipated that Ford Motor Co. will reopen its Somerville, Mass., assembling plant about March 5. Material has been started there from Detroit. National Acme Co. and Cone Automatic Machine Co., Windsor, Vt., are operating night and day shifts. English & Mersick Co., New Haven, Conn., automobile equipment, is operating at better than 60 per cent with only a moderate stock of goods on hand. Foster Merriam Co., Meriden, Conn., iron and brass castings, is operating at 80 per cent of capacity with finished and raw stocks low. Millers Falls Co., Millers Falls, Mass., tools, is running at 65 to 70 per cent of capacity. William L. Gilbert Clock Co., Winsted, Conn., is operating at capacity; Atlas Tack Co., Fairhaven, Mass., at slightly better than 70 per cent of capacity, and Geometric Tool Co., New Haven, Conn., is doing better than in the closing days of 1927.

Pratt & Whitney Aircraft Co., Hartford, Conn., has received additional Government orders for 96 Hornet and 50 Wasp engines to cost $1,510,000, bringing the value of orders on books to approximately $6,000,000.

Bantam Ball Bearing Co., Bantam, Conn., has authorized construction of a new plant at South Bend, Ind., and upon completion company will move from Connecticut. W. S. Rogers is president and W. W. Gager, vice-president.

C. Hammond & Son, 179 North Water Street, New Bedford, Mass., have completed plans for several vocational school units at that city, including a machine shop, electrical shop and other improvements.

Gardner Airport, Inc., Gardner, Mass., is erecting a hangar and one-story, 60 x 150 ft., office and machine shop on Brock farm, between Gardner and Templeton, Mass. Charles H. Hartshorn, 562 Main Street, Gardner, is president.

Worcester Gas Light Co., subsidiary of New England Gas & Electric Association, is preparing plans for either a coal gas or a water gas plant to cost from $1,500,000 to $2,000,000. F. H. Golding is manager of New England properties.

Machine shop and the pipe shop of Beacon Oil Co., Everett, Mass., were recently totally destroyed by an explosion and fire. Plans are under way for new and larger shops.

Bids are being received by Royal Typewriter Co., Hartford, Conn., for one-story addition, 35 x 120 ft., to cost about $50,000 with equipment. Greenwood & Noerr, 847 Main Street, are architects and engineers. Headquarters of company are at 316 Broadway, New York.

Electric Boat Co., 11 Pine Street, New York, manufacturer of submarines, motor boats, etc., with plants at Groton, Conn., and Bayonne, N. J., is completing arrangements for merger with New London Ship & Engine Co., New London, Conn., in which it has heretofore held a substantial interest. New London shipyard will be continued in service.

Charles Street Garage Corporation, Boston, is having plans drawn for a one and two-story addition to its service, repair and garage building at 252 Cambridge Street, to cost close to $100,000 with equipment. Lockwood, Greene & Co., 24 Federal Street, are architects and engineers.

Cleveland Burial Case Co., 2274 St. Clair Avenue, Cleveland, has acquired the six-story building at 867 Boylston Street, Boston, heretofore held by B. F. Goodrich Co., and will occupy for a new factory branch and distributing plant.

Western Electric Co., 80 John Street, New Haven, Conn., has plans for a two-story factory branch and distributing plant at West Haven, Conn., totaling about 38,000 sq. ft. of floor space, to cost about $70,000. Engineering department at company headquarters, 195 Broadway, New York, is in charge.

Public Service Co. of New Hampshire, Manchester, has purchased Utilities Power Co., with hydroelectric power station on the Pennigawassett River, vicinity of Laconia, N. H., and will consolidate with its organization. Company has also acquired Ossipee Electric Co., Center Ossipee, N. H., with properties near Conway Electric Co., recently purchased by Public Service Co. Extensions will be made in transmission lines and substation facilities.

Brockton Ice & Coal Co., Lawrence Street, Brockton, Mass., has begun excavations for a one-story ice-manufacturing plant, 100 x 150 ft., to cost about $100,000 with machinery.

Essex Tire & Supply Co., 118 Central Avenue, Lynn, Mass., has asked bids on general contract for a new two-story and basement works, 60 x 100 ft., to cost about $50,000 with equipment. G. A. Cornet, 10 Central Avenue, is architect.

Mechanical Devices, Inc., 260 Tremont Street, Boston, has purchased Strathmore mill in Concord, formerly occupied by American Woolen Co., and expects to begin manufacture of cotter pins, nuts, screws, etc., within a few weeks. It was recently stated company would use part of Victory plant at Squantum, Quincy, but owing to limitation of lease that plan was abandoned and mill at Concord was purchased. Watson Hartley is president and general manager.

Milwaukee

MILWAUKEE, Feb. 20.

ORDERS for machine-tools continue at a relatively satisfactory rate, and the volume of business so far this month is generally reported at a higher level than a year ago. There still is, however, a hesitancy on the part of prospective buyers to take action on inquiries, but in comparison with recent months activity is measureably improved. Prospects are excellent and a speeding up of buying is believed to be at hand. Automotive industries are regarded as of best promise, judging by the character and source of current inquiry.

Aluminum Goods Mfg. Co., general offices, Manitowoc, Wis., is deferring for about six months construction of a $450,000 addition to its branch stamping and drawing plant at Two Rivers, Wis., designed by Lockwood, Greene & Co., consulting engineers, Chicago.

Chicago, Milwaukee & Pacific Railway Co., Chicago, has placed general contract with Henry Danischefsky, 1484 Humboldt Avenue, Milwaukee, for construction of a new freight depot at Milwaukee to cost $500,000. C. F. Loweth is chief engineer.

Combination Door Mfg. Co., Fifty-seventh Avenue and Mitchell Street, West Allis, Milwaukee, has started work on erection of a one-story addition, 64 x 100 ft., and is in market for miscellaneous wood and metal-working equipment.

Wisconsin Veneer Co., Rhinelander, Wis., has started work on a new mill and plywood factory providing 45,000 sq. ft., and replacing the plant wrecked by fire several months ago. New equipment will be installed throughout. F. A. Marshall is secretary and general manager.

Kurz-Root Co., Appleton, Wis., manufacturer of electrical equipment, is preparing to reestablish its plant recently wrecked by fire, with loss estimated at $25,000.

J. E. Burke, Fond du Lac, Wis., manufacturer of metal weather strip and other metal building specialties, has incorporated as J. E. Burke Co., capital stock $250,000. A new plant is about to be established in Milwaukee, but present plant in Fond du Lac will be retained also as a production unit.

Standard Sheet Metal Works, 1411 Thirtieth Street, Milwaukee, is preparing to enlarge its plant and has increased its capitalization from $30,000 to $50,000 to accommodate expansion of output and business.

Stanley F. Parker, 963 Mitchell Street, Milwaukee, has taken over factory of former Loewenbach Shoe Co., Cedarburg, Wis., and will equip it for manufacture of a sugar beet harvesting machine and other agricultural machinery. A corporation is in process of organization to carry on operation.

Board of Education, South Milwaukee, Wis., is taking bids until March 8 for construction of a new junior high school and vocational training institute, 152 x 178 ft., part three stories and basement, and estimated to cost $250,000. Architects are Parkinson & Dockendorff, LaCrosse, Wis. H. Daehling is secretary of board.

The Atlas Engineering Co., Milwaukee, which recently sold its plaster and mortar mixer business to Chain Belt Co., Milwaukee, has acquired Topp-Stewart Tractor Co., Clintonville, Wis., and will take over plant March 1. Atlas company will continue manufacture of Topp-Stewart four-wheel drive tractor and its own lines of conveyors, loaders and unloaders. Milwaukee plant at Thirty-first and Galena Streets will be retained as a branch office and warehouse. H. W. Zimmermann is president and general manager.

Board of Education, Neenah, Wis., is preparing to take bids on revised plans for new $400,000 senior high school which also will accommodate present vocational training institute. John D. Chubb, Chicago, is architect. H. V. Zemlock is secretary of board.

Pacific Coast

San Francisco, Feb. 15.

APPLICATION has been made by Red River Lumber Co., Westwood, Cal., for permission to construct and operate a hydroelectric power plant on Ash Creek, a tributary of Pit River, to cost $250,000 with transmission line.

Chain Belt Co., 82 Natoma Street, San Francisco, has leased a one-story factory to be erected at Fifth and Harrison Streets, for a factory branch and distributing plant. Headquarters are at Milwaukee.

United Verde Copper Co., Clarkdale, Ariz., has plans for a one-story foundry, 80 x 120 ft., for production of electric steel castings, to cost more than $80,000. Headquarters are at 111 Broadway, New York.

Doheny-Stone Drill Corporation, Los Angeles, manufacturer of oil drilling equipment, tools, etc., has awarded general contract to C. L. Peck, H. W. Hellman Building, for a one-story unit, 60 x 90 ft., at its new plant to be located at Torrance. It will be equipped as a change building. Entire plant will cost about $225,000. Hamm, Grant & Bruner, Ferguson Building, are architects.

Southern California Edison Co., Los Angeles, is planning construction of a steel tower transmission line from Saticoy to Castaic, Cal., about 44 miles, to cost $400,000.

Keenan Machine Works, 2925-29 First Avenue South, Seattle, has awarded contract to H. D. Stewart, 2702 First Avenue South, for a one-story machine shop addition, 60 x 75 ft., to cost about $20,000 with equipment.

Queen City Improvement Co., Seattle, has filed plans for a six-story automobile service, repair and garage building, 90 x 110 ft., to cost about $160,000 with equipment.

Signal Gas Co., Long Beach, Cal., is planning to rebuild portion of its oil refinery absorption plant destroyed by fire Feb. 10, with loss close to $90,000 with equipment.

Snow Mountain Water & Power Corporation, San Francisco, has secured permission to use waters from South Eel River, Lake County, for a hydroelectric power development with initial capacity of 21,680 hp., to cost $3,200,000, including power transmission lines and power dam.

Orange County Refining Co., Newport Beach, Cal., is planning to rebuild portion of oil refinery recently destroyed by fire, with loss reported more than $100,000 including equipment.

Whitehouse & Price, Hutton Building, Spokane, Wash., architects, have plans for a five-story and basement automobile service, repair and garage building, to cost $450,000 with equipment.

Zellerbach Paper Corporation, Sacramento, Cal., is said to have plans for new pulp and paper mill in Tongass National Forest district, Alaska, to cost in excess of $7,000,000 with equipment.

Associated Supply Co., 724 Pacific Electric Building, Los Angeles, has organized purchasing department under direction of S. A. Joseph, and is receiving all quotations, contracts, discount rates and catalogs at that address. Company was recently purchased by Youngstown Sheet & Tube Co., Youngstown, Ohio, and engages in distribution of oil field equipment.

Royal-Rochester, Inc., has been organized as a service company in California for Robeson-Rochester Corporation, Rochester, N. Y., manufacturer of hardware specialties and cutlery. New company will have office in Los Angeles and will be equipped to replace parts and make repairs on all appliances made by Rochester company.

Isler Metal Works, 109 East Twelfth Street, North, Portland, Ore., is installing new power press for forming sheet metal up to No. 10 gage.

Rose City Ironcraft Shop, Portland, Ore., has moved from 1431 Macadam Road to 1400 Macadam Road. New motors and acetylene welding outfit have been added and company expects to begin manufacture of hand-wrought ornamental iron.

Portland Machinery & Supply Co., Portland, Ore., has moved to 229 Front Street, where warehouse and showrooms have been remodeled.

Canada

Toronto, Feb. 20.

WHILE large lists were absent from the market the past week, machine tool sales maintained the high level of previous weeks this year. A number of companies are increasing their operations and many whose plants had not been fully equipped are now installing new machines. The demand is diversified and comes from practically all parts of the Dominion.

W. Beatty, general manager Beatty Brothers, Ltd., Fergus, Ont., is in market for equipment to manufacture electric washers and other specialties, for installation in a proposed addition.

City Council, Toronto, has purchased site on Queen Street West, for erection of a booster pumping station to cost $200,000, in connection with proposed $14,000,000 duplicate waterworks system.

International Pulp & Paper Co., Ltd., Gatineau, Que., is having plans prepared for erection of a box factory to cost $20,000.

East St. John Dry Dock Co., East St. John, N. B., will build addition to its plant to cost $20,000.

Western Canada

Western Dominion Collieries, Ltd., 305 Trust & Loan Building, Winnipeg, will start work immediately on construction of an addition to its briquetting plant at Taylorton, Sask., to cost $200,000.

Pacific Coast Terminals, Ltd., Vancouver and New Westminster, B. C., contemplates erection of a cold storage plant at New Westminster, of reinforced concrete construction, and to cost $900,000.

Dominion Department of Public Works, Ottawa, Ont., has awarded contract to Parfitt Brothers, Ltd., 1303 Gladstone Avenue, Victoria, B. C., for erection of drydock buildings and Esquimalt, B. C., to cost more than $15,000.

Foreign

A COMPANY at London, England, has plans for a new low-temperature carbonization plant at Askern, near Doncaster, for handling 3000 tons of coal weekly, to cost close to $1,000,000 with machinery. American Consulate, London, William L. Copper, commercial attaché, has information regarding project; also at office of Bureau of Foreign and Domestic Commerce, Washington, reference England No. 2/13/28.

Plans are under way for construction of a flour mill at Dniepropetrovsk, Russia, under Government direction, to use American machinery. Information at office of American-Russian Chamber of Commerce, 143 West Fifty-seventh Street, New York.

Rotterdam-Amsterdam Railroad, Amsterdam, The Netherlands, has plans under way for electrification of its line from Amsterdam to Rotterdam, and other branches; project will be carried out under Government direction. Information at office of American Consulate, Rotterdam, Edward A. Dow, consul.

A company in New South Wales, Australia, is planning construction of a plant to manufacture linseed oil, linseed cake and kindred products. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Australia No. 60714; also at American Consulate, Sydney, Australia, Charles F. Baldwin, assistant trade commissioner.

Bureau of Yards and Docks, Navy Department, Washington, is asking bids (no closing date announced) for a steel-covered structural steel frame hangar, 160 x 330 ft., with lean-tos on both sides, 120 ft. long, 20-40 ft. wide, for Coco Solo, C. Z., specification 5569.

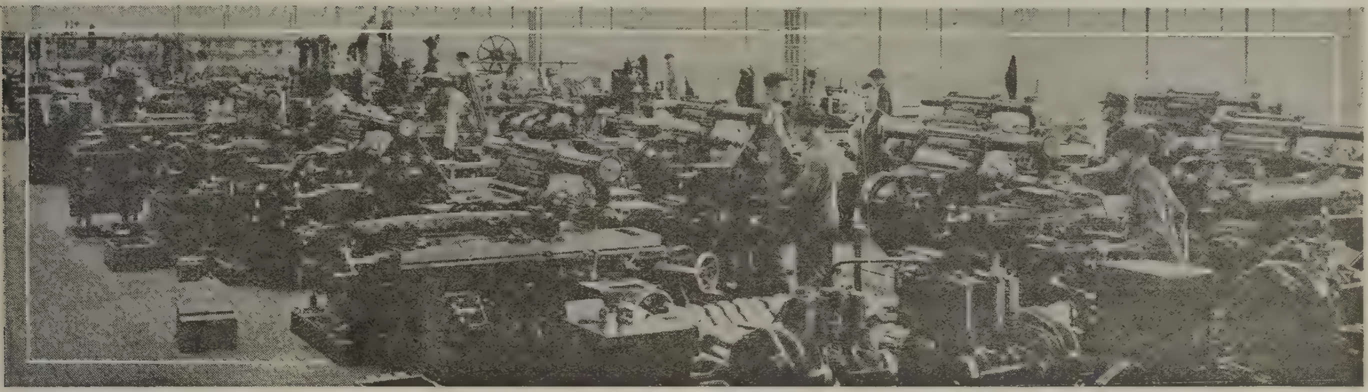
Buenos Aires Great Southern Railway Co., Buenos Aires, Argentina, has begun construction of a new grain elevator at Ingeniero White, near Bahia, Blanca, to cost in excess of $4,500,000. It will have a capacity of 3,000,000 bu. All machinery will be electrically-operated. Construction will be carried out under direction of Henry Simon, Ltd., London, England. Information at American Consulate, Buenos Aires, Dana C. Sycks, consul.

THE IRON AGE

New York, March 1, 1928

ESTABLISHED 1855

VOL. 121, No. 9



"Educational Orders" for Munitions

Plan to Rotate Contracts for War Material Among Private Plants Essential to Industrial Preparedness

BY LIEUT.-COL. TOWNSEND WHELAN*

EXTREMELY unlikely it is that a democratic nation will engage in a war with which the mass of the people is not in sympathy. In any war in which the United States may engage hereafter there will probably be no difficulty in getting all the man-power needed, either by voluntary enlistment or draft. But more than man-power is needed. Material—weapons, ammunition, transportation, clothing, food, supplies—is required also. This material is needed in the shortest time possible because the waging of a successful war is a matter of speed almost as much as of numbers and power. The army which gets there *first* with an equal or greater number of *well armed* men usually wins. The man-power of the United States is unequaled by that of any other nation, and in all probability there will be no difficulty in obtaining it in the amount and at the rate necessary. But when we examine the probability of obtaining the necessary materials of war in the amounts and on the dates required to supply this man-power, the picture is not so encouraging.

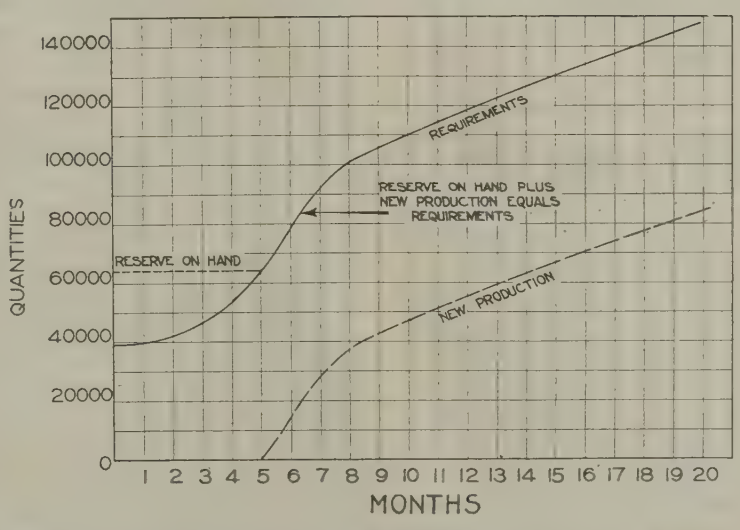


Fig. 1. Curve Showing How War Materials Held in Reserve Supply the Requirements of Mobilization Until New Production Gets Under Way

Reasons for Maintaining Reserves of War Material

No nation can afford to keep on hand a reserve of arms, ammunition and supplies necessary to wage a complete war. The cost of such a reserve and the interest on the investment would be prohibitive. Instead, each modern nation endeavors to maintain a reserve of war material which will last its man-power until such a time as its arsenals and its industrial establishments can take up the burden of manufacture and supply. If our arsenals and our commercial plants can get into small production on a certain type of ammunition five months after declaration of war, and can produce that ammunition in ample quantity after eight months, then the reserve of that ammunition maintained in peace should be that required by all the troops under arms for the first five months and part for the remaining three months.

Fig. 1 shows such an ideal supply curve. But Fig. 2 shows a curve such as this country finds itself confronted with in the case of a number of very vital items of equipment and supplies. Constant study and effort is being made by all concerned with national preparedness to eliminate the shortages illustrated hypothetically by Fig. 2. Such shortage may be eliminated either by increasing the reserve or by expediting production. To increase the reserve is extremely expensive, and of course necessitates the appropriation of funds by Congress. In some cases it must be done—there being no alternative. The reserves of certain essential articles are so small as to be a constant matter of anxiety to the War Department. But the military student endeavors first to see if he cannot eliminate most of the shortage by measures taken to hasten production, as the pre-war cost is very much less. The measures taken to hasten production have been termed "industrial preparedness."

---

*Ordnance department United States Army.

Briefly, industrial preparedness for war in the United States consists in a calculation of all requirements in advance, based on the rate of mobilization of the man-power, the allocating of these requirements to the Government arsenals and to suitable selected industrial plants, and of planning in advance in the matters of power, labor, raw materials and transportation.

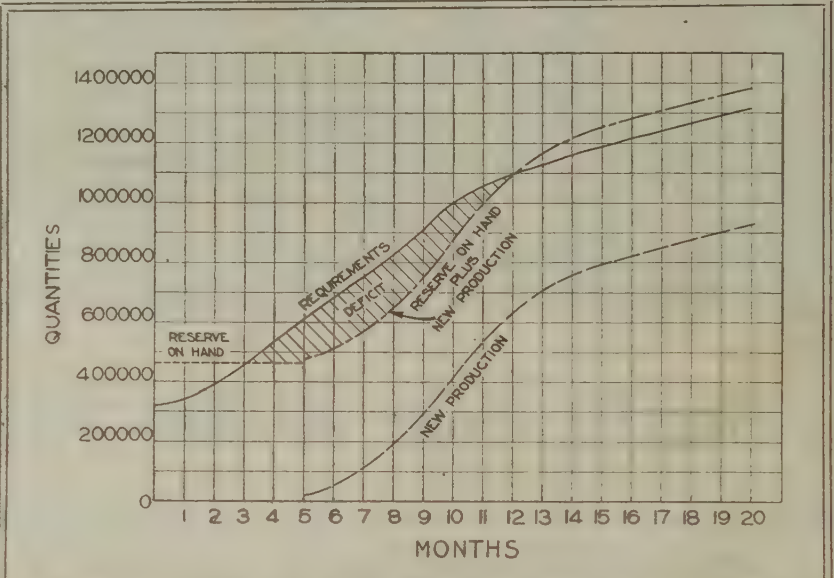

Fig. 2. A Deficit Will Exist Whenever Reserve Is Too Small or New Production Is Tardy

The industrial plant to which a war order for the manufacture of supplies is allocated is provided with detailed specifications and manufacturing information covering the article, and is asked to indicate how soon it can get into production on the article, and how soon it can reach the desired peak of production. It is also asked to draw up a war plan covering new equipment needed, bills of material, route sheets, labor, power, transportation, sub-contracts and any other essential step. When these measures are taken, the getting into production on that article is very greatly facilitated. We now know what is wanted and who will make it. The contractor knows what he is to make, and he has laid many of his plans in advance. We have already reached this stage in our plans.

Munitions Manufacture Now Exclusively in Arsenals

But there is still one weak point in the system, for, in too many cases, particularly as regards rifles, cannon, ammunition, tanks and airplanes, the manufacturer does not know *how* to make the article, nor is his plant more than generally suited in its equipment for that particular class of article. He does not understand the art of manufacture, and he is not equipped with the special machinery needed. Practically all of our manufacturers who made munitions during the World War have made no such articles since then; they have lost the art of manufacture, and the special machinery has been scrapped. A very large amount of time will be necessary to learn the art of manufacture and to design and procure the special machine tools, dies, jigs, fixtures and gages needed before production can be started. Conversely, if we can devise a plan which will teach our manufacturers the art of manufacture in time of peace very much time will be gained, the serious shortages will be greatly or entirely eliminated and very large sums of money will be saved the taxpayer.

The art of manufacture is now kept alive in our Government arsenals, which are equipped to manufacture most of the technical articles needed by our army, and which do manufacture a small amount of such material each year to meet the current needs of the army, and to replace deterioration in our reserves. It is very necessary to keep these arsenals alive to the extent that will preserve the art of manufacture, and retain a nucleus of officers, foremen and workmen familiar with the art. Further maintenance of these arsenals is not necessary, but the preparation and training of the commercial plants is vital, for on them will fall the bulk of production in war, as the arsenals have only sufficient capacity to manufacture from 1 to 5 per cent of the material needed, depending upon the particular article.

Obviously, therefore, the proper procedure would be to allocate only such portion of our peacetime manufacture to our arsenals as will be necessary to maintain the art of manufacture at these plants, and to allocate the balance of it in the form of "educational orders" to those plants which have been selected to make the particular article in event of an emergency. For example, suppose during the next five years it is necessary to manufacture 500,000 rounds of ammunition for the 75-mm. field gun for target practice and to replace deterioration in the war reserve of such ammunition. During the next five years we would then allocate say 250,000 rounds to our arsenals, and each year we would allocate 50,000 rounds to some one selected commercial plant. Thus within five years five commercial plants will have experience in manufacture, and each five years or so each plant will renew its experience. Or it may be possible to place orders annually with each selected manufacturer.

This is an entirely hypothetical example, but if some such plan could be put into effect it would result in a small line of machinery being installed in each plant for the manufacture of the article (which line could be easily duplicated in war), in a nucleus of foremen and workmen familiar with all manufacturing operations, in a perfection of plans for reaching mass production in war, including really practical plans for the necessary raw material, power, facilities, labor and transportation. Such education of our selected munitions plants, and such perfection of their war plans might easily result in advancing the date of mass production by one to three months. This would result in some cases in entirely eliminating shortages, in others of making it unnecessary to maintain such large reserves. The money gain to the taxpayer will be enormous, for it has been estimated that a month saved in getting into production will result in a reduction of the value of the reserve required to be maintained by approximately $150,000,000.

It is undeniable that it will cost more to manufacture supplies by the medium of educational orders placed with commercial plants than if these same supplies were made at a Government arsenal. The Government arsenal has complete facilities and is familiar with the work. The commercial plant will have to tool up for its initial educational order, and the planning cost will be high. Also, taking the above hypothetical case, a commercial plant cannot produce 50,000 of a certain article annually at the same unit cost as an arsenal could produce 100,000 in the same time.

Our selected commercial plants have been consulted relative to this plan for educational orders. They are a unit in stating that, more than anything else, it will result in a perfection of their war plans and in their getting into production in an emergency at a very much earlier date than would be possible without such educational orders. Moreover, they have quite generally indicated in a patriotic manner that they would be willing to undertake such orders on a cost basis. The plants which the ordnance department has selected for its war manufacture are almost all such large industrial concerns that such educational orders as would be placed with them would be a mere fraction of their regular annual commercial production.

The increased cost of educational orders over arsenal orders is a price we should pay for an exceedingly cheap form of insurance against shortages in war and will be money well spent. It should also be understood that the placing of educational orders does not necessarily mean a large increase of the amount of money appropriated annually for munitions supplies. It is in general merely contemplated that the money now appropriated annually for the procurement of current supplies shall be utilized to procure those supplies in a little different manner which, in the end, may be slightly more expensive, but which will add very greatly to our state of preparedness against war.

Present Legal Obstacles

Most unfortunately the law does not now permit the placing of such educational orders with commercial plants. The second paragraph of Section 5a of the National Defense Act now reads:

> * * * He (the Secretary of War) shall cause to be manufactured or produced at the Government arsenals or Government-owned factories of the United States all such supplies or articles needed by the War Department as said arsenals or Government-owned factories are capable of manufacturing or producing upon an economical basis.

As our Government arsenals can produce the vast majority of ordnance material and supplies needed in time of peace upon an economical basis, it follows that it is impossible to place even a small proportion of these orders with commercial plants.

There are also other existing laws which hamper the War Department in this connection, such as Section 3709 R. S., which provides that all contracts shall be made by advertising and in effect awarded to the lowest responsible bidder. Such procedure would defeat the purpose for which orders for ordnance would be placed with commercial plants, for awards in all probability could seldom be made to those well equipped and responsible manufacturers with whom the War Department has allocated orders for the manufacture of supplies in war, and whom it is desired to train in peace for such manufacture. Instead it is very likely that, under the present laws, such contracts would have to be awarded to some manufacturer who was the lowest bidder, because of his desire for work which would carry his overhead over a lean period, or for some other reason, and who might not be equipped or organized in a way that would permit of his producing quickly and in enormous quantities in war. It would be of little benefit from the standpoint of preparedness to have educational orders placed with such firms. They should be distributed among all the plants to whom war orders have been allocated in conformity with the well formulated plans for industrial mobilization.

In order to permit educational orders to be placed in the manner which will best secure the results desired, the War Department recommended introduction of a bill in the last Congress and reintroduction in the present Congress (H R 450, H R 5662 and S 1824), which provides that:

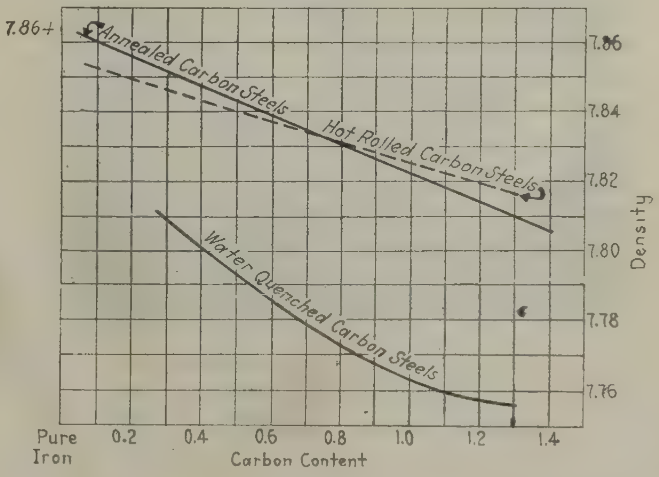
> The Secretary of War may authorize the placing of educational orders for equipment, munitions and accessories needed in the military service with commercial concerns to the degree that is considered by him as being necessary to familiarize commercial factories with munitions manufacture and to advance the industrial war plans of the War Department, and in placing these educational orders the competitive bids which in his opinion best secure these results may be accepted; and he shall make statement of his action under this provision in his annual report.

It is believed that this bill should be enacted into law as soon as practicable. It will place the nation in a far better state of preparedness as to its munitions supply for possible war than it now is. Should it become a law, the resultant training of our commercial plants in the art of manufacturing munitions, together with the other well formulated plans and measures of the War Department looking to industrial mobilization in war, will go a very long way toward insurance against war. What we are interested in is achieving a state of industrial preparedness which will match our unrivaled man-power with adequate munitions-power, so that our country will be secure from attack by any power or combination of powers. We are planning for peace, continued peace, and we think we have hit on a logical way to insure it, not by the mere expression of a pious wish, but by commanding it.

Density of Plain Carbon Steels, As Rolled, and After Heat Treatment

H. C. CROSS and E. E. Hill have studied the "Density of Hot-Rolled and Heat-Treated Carbon Steels," and their results are published in Scientific Paper No. 562 of the Bureau of Standards.

Four samples of the purest commercial and electrolytic irons available closely approximated the average density (7.864 gm. per cu. cm.) despite large difference in previous history. Density of hot rolled commercial steels decrease slightly with increasing carbon content. Annealed steels vary a trifle from these figures. In samples chosen of such size that the structure would be martensitic after water quenching from above Ac_3, the density decreased considerably. Tempering to various increasing temperatures restored the density gradually to the figures for annealed specimens. Principal data are summarized in the diagram shown at the right, adapted from Messrs. Cross and Hill's work.



Whirlwind Engine Parts Receive Careful Handling

Thorough Inspection Made at Every Stage of Manufacture—Cylinders and Cylinder Heads Machined on Production Basis

BY FAY LEONE FAUROTE*

ALMOST within a year, namely, from May 9, 1926, when Commander Byrd and Floyd Bennett flew from King's Bay, Spitzbergen, to the North Pole and return in 15½ hours in a Fokker monoplane equipped with three Wright Whirlwind engines, to July 12, 1927, when Edward A. Stinson in a Stinson Whirlwind-engined monoplane covered more than 4000 miles in the National Air Tour, eight major records, the greatest in aviation history, were made. Six of these were made over oceans and included the splendid flight of Lindbergh, that of Chamberlin and Levine, that of Lieuts. Maitland and Hegenberger across the Pacific, that of Commander Byrd and his three associates, and the flight across the Pacific by Ernest L. Smith and Emory B. Bronte.

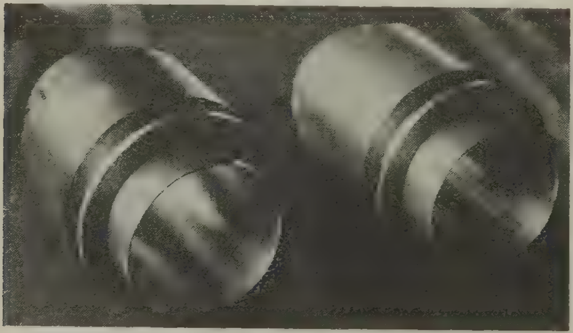
To these spectacular accomplishments has been added the good-will tour of Col. Charles A. Lindbergh in his Ryan monoplane, the Spirit of St. Louis. This tour through Mexico, Central America, a portion of South America, the islands of the West Indies and Cuba, began on Dec. 13, 1927, with a non-stop flight from Washington to Mexico City, the distance covered in this leg of the flight being 2000 miles and the flying time, 27 hours. At the finish of the tour, at St. Louis on Feb. 13, Colonel Lindbergh had spent more than 116 hours in the air and had traveled more than 9000 miles. When such records are remembered, it is hardly to be wondered that the world generally and metal workers in particular are interested in knowing something of how the Wright Whirlwind engine is built.

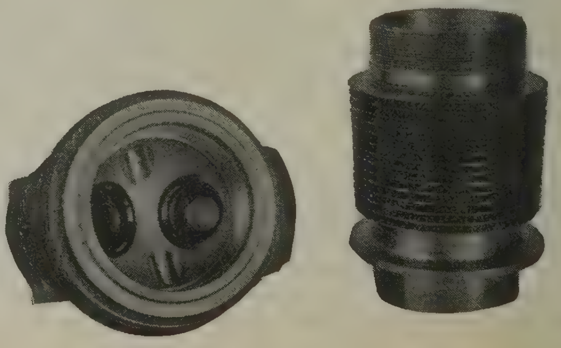
It is the purpose of this and the succeeding article to describe some of the operations performed upon the cylinder, cylinder head, pistons, connecting rod, crankcase and other parts of this famous power plant, as well as to show how some of the major parts are assembled.

At the outset, it should be said that no piece of commercial mechanism that I have seen assembled gets greater care and more careful handling at all stages. I was very much impressed by the manner in which all the parts are protected between operations, the care taken to make sure that the castings are thoroughly cleaned, and parts of metal that might afterward cause failure eliminated, the attention paid to weight, and the sincere seeking after fine workmanship. In general, one had the feeling of being in a tool room rather than in a manufacturing shop. Nor is it to be wondered at when one considers the great responsibility which is actually carried by the workmen themselves in the manufacture of this engine. Only when its motor is in operation is an airplane an airplane; failure of its engine is disastrous—you cannot tow it home. It falls to the earth or sea, a broken thing, a lifeless piece of junk; that is, unless one is within gliding distance of a field. This, of course, usually happens in flight over land but not always over water. There to fall is to perish.

Workmen Realize Their Responsibility

A very intelligent class of men is employed in the Wright shops. Their obvious seriousness and realization of their responsibility, their great willingness to do everything within their power to insure the lives of the daring pilots who will afterward use these power plants, are evidenced throughout. Since operations at the Wright Aeronautical plant are on a quality manufacturing basis, all parts are governed by carefully prepared drawings, operation and instruction sheets and routed through the shops according to a definite schedule. The usual special tools, such as jigs and fixtures which must be used in large





AFTER Annealing, the Cylinder Barrel Is Rough Machined All Over and Put Through a Series of Heat Treatments. The finished cylinder head and barrel are shown at the right

---

*Mechanical engineer, New York, and former editor of the *Aircraft Yearbook*. This is the second of a series of articles on the Wright Whirlwind engine, the first having appeared in THE IRON AGE of Feb. 9, pages 394 to 397.

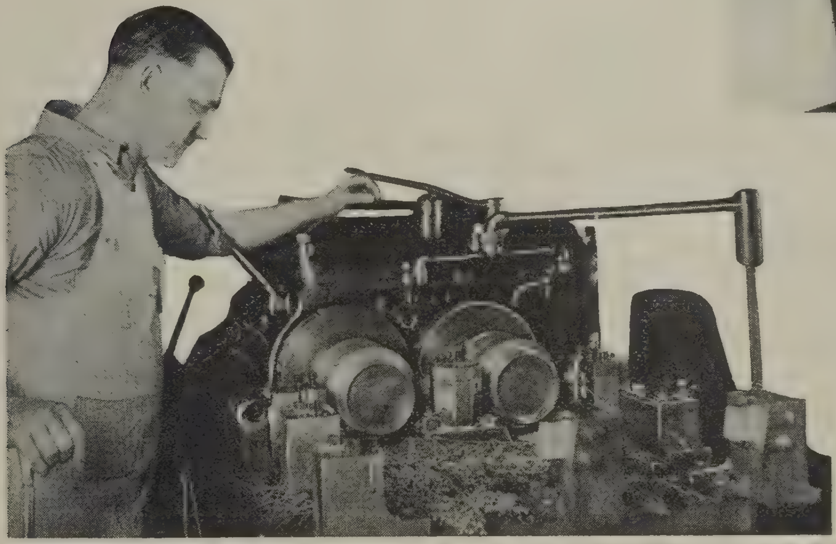
production to assure interchangeability of parts, a point vitally necessary in the manufacture of this power plant, are to be found throughout. Although standard machines are used for most operations, considerable ingenuity has been shown in the manner in which some of these standard tools have been adapted to the work at hand. The output, of course, has not yet reached the point where mass production is possible or desirable. There are no conveyor systems, no overhead trolleys or monorails, no slide ways or rollways. There are a number of assembly jigs mounted on casters, and in general it may be said that for the purposes for which they are used these are ample at the present stage of manufacture.

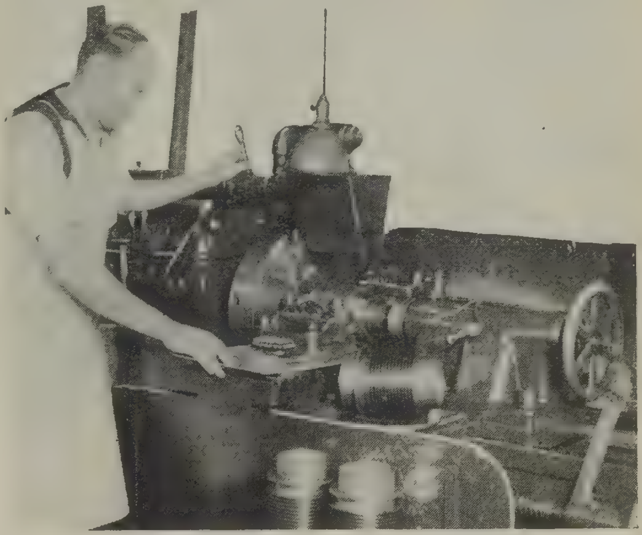
While the company makes its own aluminum-alloy and bronze castings, its steels are bought from outside vendors in rough-finished form according to rigid chemical and physical specifications.

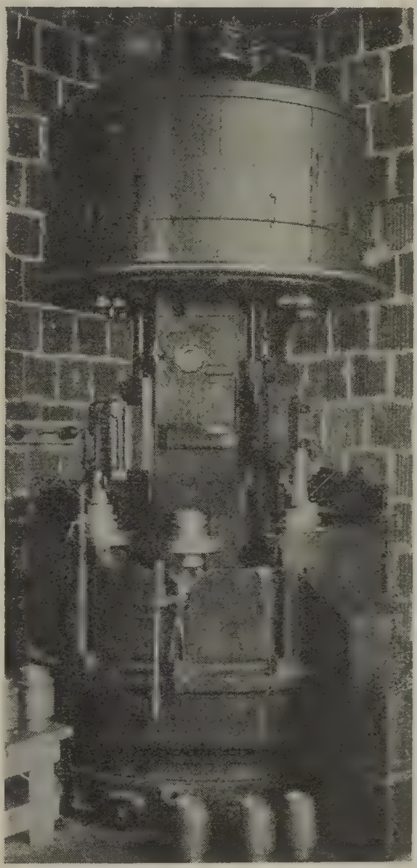
Machining and Assembling of Cylinder Unique

The manner in which the cylinder is machined and assembled is interesting. The resulting product is unique. The cylinder barrel, shown in an accompanying illustration, comes into the shop as a forging of special steel. After being annealed it is rough-machined all over and put through a series of heat treatments. A Brinell hardness tester is used for checking the hardness. The cylinder barrels are then put two at a time on a double-spindle turret lathe where they are bored and faced. The outside diameter is also turned up on a similar lathe, the work being held on an expansion arbor. Following these operations the barrels are placed in a heavy-duty automatic lathe where 14 fins, approximately 13/16-in. deep and 1/64-in. thick at the top, are cut from the solid barrel. The fins are tapered with a separate tool fastened to the top of one of the tool blocks of the same lathe, the taper being from 0.030 to 0.060 in. Two sets of tools, one on each side, operate simultaneously on the work. I was informed that an extra set of tool blocks was being put into condition while the other set was in operation on the work. Operation is continuous, the machine being stopped only when the tools become dull or the work is changed.

A thread miller then cuts the threads on the upper end of the barrels which are cut 0.013 in. oversize to take care of the shrink fit in the cylinder head. Minor operations on this part are the facing of the end to a close dimension from the flange, and the forming of the back of the flange.



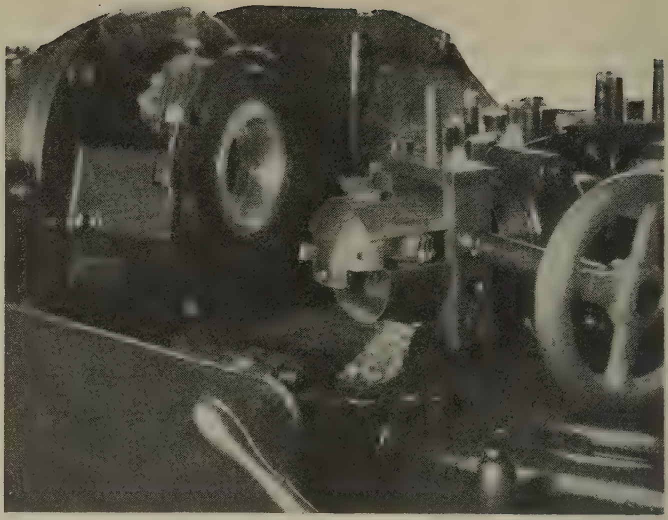




CYLINDER Barrels Are Turned on the Double-Spindle Turret Lathe Above, and Cooling Fins Are Formed on the Machine at Upper Right. The Mult-Au-Matic, at lower right, is set up for machining cylinder barrels, and will also be used for cylinder heads

Cylinder Head a Machine-Molded Aluminum-Alloy Casting

The aluminum-alloy casting for the cylinder head is produced in the Wright foundry where molding machines and special chilled cores make rapid production of good quality possible. In this department one is impressed with the liberal-sized sprues used and the excess metal which is included to secure sound castings that will not reveal internal defects after machining is partially done. The aluminum for the cylinder heads and pistons is the Y alloy, the composition of which is approximately as follows: Copper, 4 per cent; nickel, 2 per cent; magnesium, 1.5 per cent; iron, 0.75 per cent; silicon, 0.50 per cent, and aluminum, 91.25 per cent. Each of these castings is thoroughly cleaned and sandblasted, and then subjected to a 70-lb. air pressure test for defects, after which it is heat treated to normalize the interior. The part is then chucked on the inside diameter of the open end and the first fin is turned to a close-dimension diameter. A ⅜-in. hole is then drilled in the dome



MOLDS for Cylinder Head Casting Are Made on Machine at Left. Boring, facing, forming the dome and threading of the head are done on turret lathe above

end of the cylinder head, the object of this small bottom hole being to provide a stop for the boring fixture used on the next machining operation. It also determines the wall thickness and assures a uniform compression chamber in the cylinder. Rough-facing the open end and rough-forming of the dome are now performed on a heavy upright drill using combination tools. Finishing is done on a turret lathe. This operation includes boring and threading of cylinder bore. A Bullard Mult-Au-Matic is now being installed to handle this work, as well as a sequence of operations on the cylinder barrel.

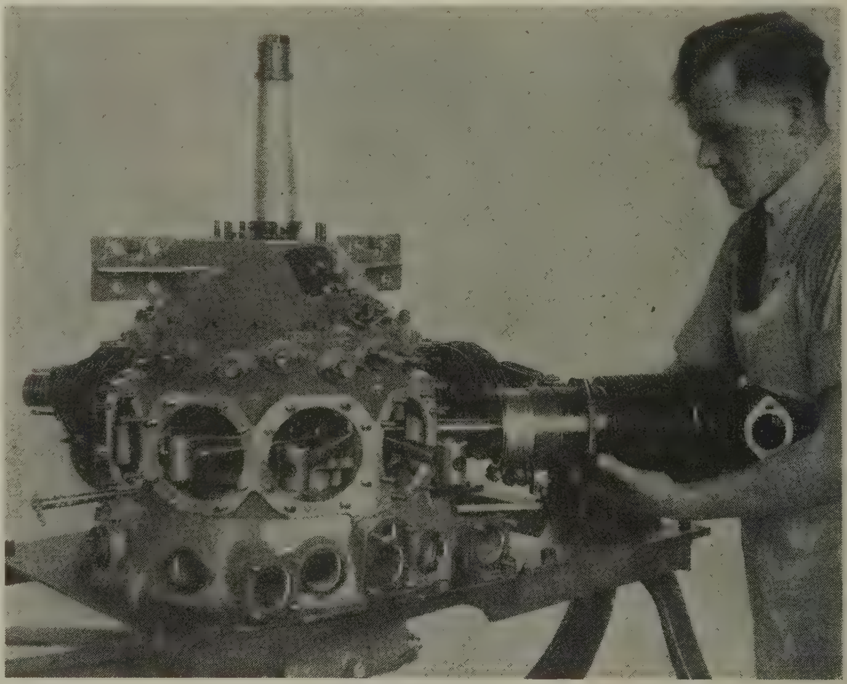
Before any further machine work is done, the cylinder head is subjected to a severe water test. All openings are plugged and water is forced into the cavity by pump until a pressure of 600 lb. per sq. in. is reached. If there is any evidence of leakage, the cylinder head is rejected.

Rough and finish facing and boring of the exhaust port, used as a locating point on future operations, is next in process. An upright drill press fitted with special fixtures and combination boring and facing tools takes care of these operations. Similar boring and facing and tapping operations are then performed on the intake port side, these also being done by an upright drill press. Then comes the drilling and tapping of the two spark-plug insert holes, one on each side of the cylinder. They are counterbored on the inside with special back-facing counterbores. The rocker-box pads are next milled on a vertical milling machine having a special index fixture. Then comes the boring of the valve guide holes and the seats for the valve seat inserts.

The cylinder heads are then placed in a furnace and heated to 650 deg. Fahr. so that the valve seat holes are expanded sufficiently to permit insertion of the bronze valve seats. As soon as this operation is completed and the cylinder heads are cool they are placed in a fixture and the lower part of the valve seat is spun into its anchorage. They are formed to a gage to insure uniform seats. The drilling and tapping of the small holes is done on sensitive drill presses. The part is then carefully inspected and if pronounced fit, is ready for assembly with the cylinder barrel. Before this operation can take place, however, the cylinder head is again heated in a gas furnace to 650 deg. Fahr., after which it is placed on an assembly stand and the cylinder barrel quickly screwed in place. The intake pipe flange is assembled at the same time. The whole job is put through a final pressure test of 600 lb. per sq. in.

Eight holes are drilled in the cylinder barrel flange on a multiple-spindle drill press. The flanges are milled with slotting saws in a gang set-up. The spark plug inserts are screwed and anchored in place and the valve guides pressed into position, after which the whole assembly is spray-enamelled all over and baked in a standard oven.

Internal grinders are used for the next operation which is the grinding of the entire cylinder assembly. A perfect, polished bearing surface is secured by a honing operation which follows the grinding. At this point all cylinders are checked carefully and the percentage of bearing is calculated. All studs are screwed in place, great care being taken that none of them is subjected to torsional stress. Indeed, to make sure



ASSEMBLY of the Cylinder in the Engine Is Preceded by Painstaking Inspection that there is no such stress a straight line is scribed the entire length of the unthreaded portion. If the thread is, therefore, twisted in the least it can be readily detected. As the job is now ready for the engine assembly, it is again painstakingly inspected and placed in individual compartment trays to be forwarded to the assembly section. An inspection of the accompanying illustration of the assembly of the cylinder in the engine will show what a clean workmanlike job this is.

Precautions for Hammer Operators

Simple Safety First Measures Adopted by Drop Forging Institute—Data on Manufacture of Satisfactory Keys

BULLETIN 451 of the United States Bureau of Labor Statistics contains the "Safety Code for Forging and Hot Metal Stamping" recently adopted by the American Drop Forging Institute, National Safety Council and American Engineering Standards Committee. It recommends that the following operating rules be posted prominently and strictly enforced:

Operating Rules

Changing Dies and Repairing.—Always block the hammer, shear or punch substantially, using steel blocks on hydraulic presses. Make sure operating mechanism is closed, locked and protected against accidental opening.

Board Drop Hammers.—When replacing board, keep hands away from ram. When adjusting mechanism, keep hands from under roll-releasing devices or from over the knock-off.

Keys must not project.

Idle equipment at noon and at night should be left with hammer resting on anvil.

Mushroomed tools must be repaired immediately.

Tongs or *forks* must be used in handling metal. Cold metal parts must be handled with tongs or picks long enough to prevent hands from getting between dies.

Quenched forgings for quick inspection should be reheated to draw temper and prevent accidents in further operation.

Goggles must be used by hammer men, heaters, helpers and cold-trim press operators.

Clothing.—Leather or asbestos aprons, gloves with asbestos or leather palms, congress shoes and leggings must be used by men handling hot metal. Wear hand leathers in moving rough cold stock.

Furnaces should be lighted by oily waste placed in front of burners. Open all doors, use long tongs and stand aside to avoid explosion or flare back. Turn on air slowly.

Handling Dies.—Threaded countersunk holes in all dies should be provided at convenient places so rods, screwed in, can be used for handling and adjusting. Minimum sizes follow:

Weight of Dies	Number of Holes	Depth	Diameter
200 to 500 lb.	2	2 in.	¾ in.
500 to 1000 lb.	2	2 in.	⅞ in.
1000 lb. or more....	4	3 in.	1 in.

Transfer Boards Prohibited.—To move dies from bench to machine use transfer truck and chain block.

Other Safety Precautions

The code recommends that aisles should be at least 4 ft. 6 in. wide, properly marked, kept clear of everything except moving traffic. Machines should be so arranged that operators stand between them, clear of the aisles.

Many items of safety equipment are noted, such as gear guards, valve locks and fan screens. Steam hammers should have springs to prevent piston (not piston rod) striking upper cylinder head. Hot steam pipes should be guarded. In mechanical hammers, where the work is so small it can be held in a one-hand tong, the machine should be operated by hand lever, rather than foot treadle. If the work is placed in the lower die and not held by hand, a guard should descend before the hammer falls, or else the operation should depend on two hand levers. Substantial pulley keepers should be installed to prevent pulley or flywheel from falling should the shaft break. Board hammers should have inclosures so that a broken board will not topple down on the operator; railed platforms should be provided for adjusting the overhead mechanisms.

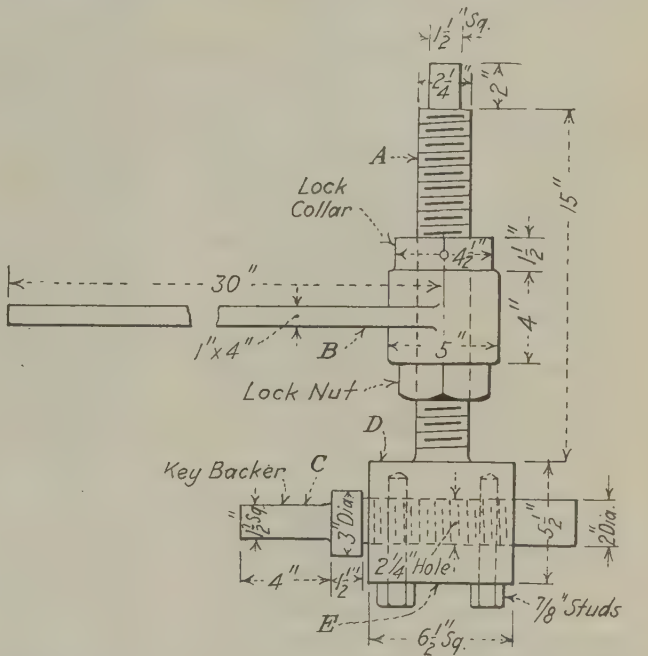
Shears should have their maximum capacity in temper and size prominently placarded, thus: "Limit, 0.30 to 0.40 per cent carbon, 3½ in. square, 4 in. round, 1½ by 8 in. flat."

Manufacture of Keys

Loose fitting, bruised or protruding keys have been the cause of so many accidents that the code gives these definite recommendations on key manufacture:

Hammer die keys shall be of material that will not crack or splinter or fly off, and shall not project so as to endanger workmen.

Note.—It is suggested that hammer die keys be made of open-hearth material (manganese, 0.40 to 0.50 per cent; carbon, 0.50 to 0.60 per cent); that they be machined accurately to fit notches, and that the ends be tempered to prevent spreading, upsetting, or breaking. The ends of keys should be redressed when necessary. For backing out keys a "key backer" held by a fixture is recommended, such as the one illustrated.



Holder for Key Backer. Part "A" is a threaded round bar enlarged to a square end "D." This end has a cap "E" with a round hole in which part "C" moves freely. Part "B" is a flat piece that screws up and down on bar "A." To operate it, part "B" is placed on the lower die and so adjusted that the left-hand end of part "C" is opposite the die key. The hammer is then lowered on top of part "B" to hold it firmly between the upper and lower dies, and part "C" is struck with a ram to drive out the key

Another method which has been found satisfactory is to use softer keys (carbon, 0.37 to 0.50 per cent), heat treated by quenching in oil until black and then cooling in the air. These keys upset before they split. This necessitates frequent dressing but is reported to be much better than using hard keys. If the small end of the key upsets before it starts out of the die, the key is driven up as far as possible, then the end is burned off with an acetylene torch and the key driven out.

Wheelock, Lovejoy & Co., Inc., distributer of alloy and tool steels, has removed its Chicago office from 5 North LaSalle Street to the Pure Oil Building, 35 East Wacker Drive.

Blast Furnace and Open-Hearth Topics Feature Technical Meetings

Mining and Metallurgical Engineers Hold Large Convention—Railroad and Other Steels Discussed —Secretary Hoover Signally Honored

SOME excellent papers on blast furnace, open-hearth and other steel problems and an ovation to Secretary Hoover were features of the 136th general meeting of the American Institute of Mining and Metallurgical Engineers in New York, Feb. 20 to 24. With an attendance of about 2000 members and guests, the convention was one of the largest ever held by the institute.

The tribute to Herbert Hoover, a past-president of the institute, was made when the Saunders medal was conferred on him at the largest banquet in the organization's history. Other prominent metallurgists were also honored. The chief features of the technical papers, delivered at five sessions, are reviewed in the following columns.

Modern Blast Furnace Problems Reviewed

SEVERAL valuable papers were presented at the session on blast furnaces, but unfortunately the attendance was very small. The character of the papers was such that a larger attendance and a broader discussion were merited. George P. Hansen, American Rolling Mill Co., Ashland, Ky., acted as chairman in place of Ralph H. Sweetser, who was confined to his home because of illness.

Blast Furnace Life Prolonged

Some important new developments in blast furnace construction were offered by J. P. Dovel, vice-president Sloss-Sheffield Steel & Iron Co., Birmingham, Ala., in a paper entitled "Improvements in Blast Furnace Construction," pointing out that the expense of replacement and relining of a blast furnace may consume all the profits made while it is in operation. The author described various steps taken in altering the construction so as to make it permanent. It has been possible to install a permanent hearth in one of his company's furnaces by making it of heavy cast iron sections with machined and lap joints, bound together with wrought iron bands which can be repaired from the outside without blowing out. The whole bosh is incased in metal and does not depend upon its brick work to any extent. The author reports that the oldest structure of this type has been in service 11 years and as it is still in perfect condition a longer service will be needed to establish its permanency.

Frequent and early failures in the inwall section above the mantel were dealt with by inserting a series of rows of bronze cooling plates from the outside, attached to and supported by the shell, which after five years' service is still in good condition. Permanency of the top has been accomplished by discarding the brick in the top section and substituting a heavy cast steel jacket lined with cast iron blocks which withstand the wear and make a permanent stock-line. Flue dust production is claimed to be reduced, as well as coke consumption, at the same time increasing the capacity of the furnace.

Discussion

C. A. Meissner, United States Steel Corporation, New York, in commenting on the paper, said that Mr. Dovel has blazed the way in making it possible to increase the stock-line and other parts of the furnaces, at the same time reducing flue dust production. Conditions, however, in the South are much different from those in the North in blast furnace operation. In the North flue dust production is very heavy, involving a large loss of ore already paid for. This flue dust runs as high as 49 to 50 per cent iron, while in the South the dust contains not more than 30 to 35 per cent of iron. The adoption of Mr. Dovel's devices in the North depends a good deal on the extent to which they will reduce flue dust production, said Mr. Meissner.

Studies Metallurgy of Lime and Dolomite

A valuable contribution to the metallurgical problems involved in the use of limestone and dolomite

GEORGE OTIS SMITH

Institute's New President Is Mr. Smith, Director of the United States Geological Survey. Mr. Hibbard was the Howe Memorial Lecturer for 1928

HENRY D. HIBBARD

was offered by Oliver Bowles, supervising engineer Non-Metallic Minerals Experiment Station, United States Bureau of Mines, New Brunswick, N. J., in a paper entitled "Utilization Problems of Metallurgical Limestone and Dolomite." Mr. Bowles points out that relatively little study has been given to the nearly 24,000,000 tons of limestone and dolomite used each year metallurgically. His paper is based on an extensive review of metallurgical literature, and consists of an exposition of some of the facts based thereon. He discusses blast furnace flux, its action in the furnace, the effect of impurities on fluxing stone and offers a formula for calculating the relative values of different grades of flux. The slagging effect of magnesia and its function as a remover of sulphur, as well as its effect on slag viscosity, are gone into. The size of stone for blast furnace flux is also reviewed, as well as the use of impure fluxing material. Basic open-hearth flux is discussed along similar lines, concluding with an analysis of the problems in the use of dolomite as a furnace lining.

Discussion

In the discussion George C. Stone, chief metallurgist New Jersey Zinc Co., said that, in making spiegeleisen, magnesia is much more effective than calcium, and J. T. McKenzie, chief chemist American Cast Iron Pipe Co., Birmingham, Ala., described the use of dolomite for slagging in the cupola. He had found that less dolomite than limestone was necessary and that better results were obtained by using ½-in. to 1-in. stone instead of larger sizes. The question of the use of limestone or burnt lime in open-hearth practice was touched on by L. F. Reinartz, American Rolling Mill Co., Middletown, Ohio, who said that burnt lime gives faster heat, but limestone, because of the larger boil, produces cleaner metal.

Coal Cleaning Methods Reviewed

A paper that was considered valuable to blast furnace men in general was one entitled "Cleaning Bituminous Coal," by J. R. Campbell, American Rheolaveur Corporation, Scottdale, Pa. The author discusses various methods of cleaning coal, both wet and dry. Curves were thrown on the screen, illustrating results in ash and sulphur removal by the use of various methods on different grades of coal. In general the author emphasized the following fundamentals in the mechanical cleaning of bituminous coal: Necessity of washability studies, type of plant adaptable to the coal studied, plant control in performance, and all factors in the cost of washing.

SECRETARY HOOVER
Awarded Saunders Medal

Discussion

The wisdom of putting this paper in a blast furnace session was commended by C. A. Meissner, who said that clean coal means clean coke, a very important consideration in making good pig iron. Commending the paper for its thoroughness, Mr. Meissner said he prefers the dry method of cleaning, and stated that we need more coal cleaned. While the quality of coke has been improved, a uniform pig iron is insured by the use of uniform coke, which can be made more certain by proper cleaning of the coal.

Gas Washing Methods Contrasted

A comparison of American and German methods of washing blast furnace gas was contributed in a paper by Arthur J. Boynton, vice-president H. A. Brassert & Co., Chicago, entitled "Gas Washing." The author states that the logical order in the use of blast furnace gas is as follows: In hot blast stoves, in gas engines where such engines exist, in open-hearth and mill heating, in coke oven underfiring, and under boilers. After discussing the wet cleaning method and its various phases, Mr. Boynton goes into some detail discussing the Halberger-Beth system in Germany, and then devotes some space to the newest method of gas purification and one which is exciting considerable interest on the part of all German iron and steel men, the electrical precipitation system. Some of the results obtained from this in the United States and Germany, as well as the costs of various systems, are dwelt upon. "The reduction in the cost of steel possible through the proper application of washed blast furnace gas remains the most important single unrealized means of reducing the cost of American steel." In the meantime, says the author, wet cleaning by the disintegrator method remains the simplest, cheapest and most flexible of the thoroughly tried systems developed by Continental experiments.

Other Papers

The subject of high alumina slags in blast furnace operation was covered in a paper entitled "Production of High Alumina Slags in the Blast Furnace," by T. L. Joseph, S. P. Kinney and C. E. Wood of the Bureau of Mines. A paper on the program which was not presented was entitled "Operation of the Blast Furnace Plant, Columbia Steel Corporation, Ironton, Utah," by W. R. Phibbs, general superintendent Columbia Steel Corporation, Provo, Utah.

Open-Hearth Session Features Metallurgical Topics

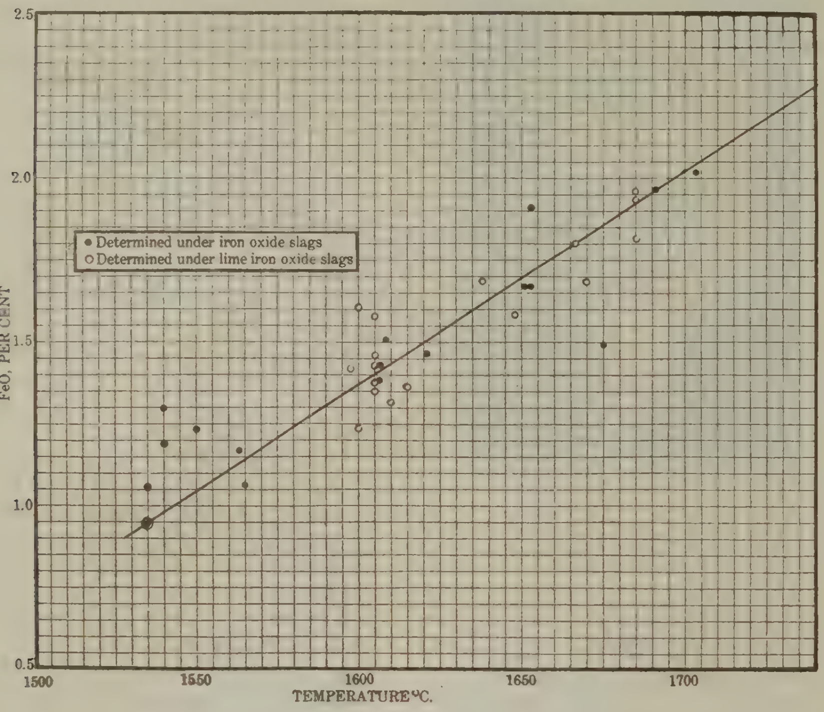
FIVE papers were scheduled for the session of the open-hearth committee, Tuesday afternoon. Leo F. Reinartz, assistant general superintendent American Rolling Mill Co., Middletown, Ohio, presided. Brief abstracts of two of the papers, which were summarized by their authors, are given in the following paragraphs, together with the main features of the discussions which followed each paper. A third paper, describing a 1-ton open-hearth furnace and telling of results of its operation, will be published, in abstract, separately. The two other papers were not heard, as the authors were not present and the papers had not been preprinted.

Elimination of Carbon

Rate of elimination of carbon largely controls the time required to make a heat of steel by the basic open-hearth process and to an important degree determines the cost of refining, according to Alexander L. Feild, metallurgist Union Carbide and Carbon Research Laboratories, Inc., Long Island City, N. Y., in a paper entitled "Rate of Carbon Elimination and Degree of Oxidation of the Metal Bath in Basic Open-Hearth Practice." Practical experience has led to the generally accepted belief that the use of slags relatively high in iron oxide, such as are required to bring about rapid refining, leads to a certain sacrifice of quality in the product. As a consequence, a compromise must be made between the exceedingly slow rate of carbon drop which would correspond to the ideal case and the rapid rate which would best satisfy the condition of minimum cost.

An increase in rate of refining necessarily implies an increase in the concentration of iron oxide dissolved in the metal. However, even for the infinitely slow rate that corresponds to slag-metal equilibrium, the metal would contain a certain definite concentration of dissolved iron oxide. It is a matter of great practical importance, therefore, to determine the quantitative relation between the minimum or equilibrium concentration of iron oxide in the metal and the higher concentrations which must actually obtain in practice.

The slag comprises the immediate oxidizing agent. It is, for practical purposes, insoluble in molten iron and actual removal of the oxidizable elements from the latter must be accomplished by diffusion or transfer of iron oxide from the slag to the metal across the slag-metal interface. Since FeO is soluble in molten iron and since Fe_2O_3 is converted into FeO upon coming into contact with molten iron, the above-mentioned transfer from slag to metal is a transfer of FeO alone.



Effect of Temperature on Solubility of FeO in Iron

Oxidation of carbon proceeds by virtue of the reaction

$$C + FeO = CO + Fe.$$

The dissolved CO, a product of the above reaction, saturates the metal and thereafter escapes as gaseous CO at a pressure equal to the mean or effective hydrostatic pressure. Unless outward diffusion of CO is considered to be too slow to be of practical importance, there can be no such thing as equilibrium between carbon and FeO in the metal bath, excepting the hypothetical equilibrium at extremely low CO pressures, where dissolved CO would by thermal dissociation be in equilibrium with the oxygen pressure of dissociated FeO at the slag-metal interface.

When carbon elimination ceases measurably to progress, the carbon and FeO dissolved in the metal are substantially in equilibrium with CO at a pressure of 1 atmosphere. Hence, for any given temperature, the product of carbon and FeO is equal to a constant—the equilibrium constant for the above-mentioned reaction.

Diffusion Equations Developed

Equations which express the relation between rate of carbon drop, FeO content of the metal, and various other factors have been developed.

Assuming that the data used in the calculation are accurate enough for practical purposes, it becomes possible to calculate how the FeO content of the metal varies with rate of carbon drop for the particular operating temperature. The proportional increase in FeO due to rate of carbon drop, over and above the equilibrium value, is an inverse measure of the degree to which furnace practice approaches the ideal.

The first conclusion is that there is no conflict between theory and practice, and that the commonly accepted beliefs and ideas, so far as they go, contain the germ of truth, in most cases at least. However, the next conclusion, which inevitably follows from a careful consideration of the complexity of the physico-chemical process which comprises basic open-hearth refining, is that it can be only through the application of a perfectly elaborated theory of the process, confirmed by and based upon accurate experimental measurements, that the metallurgical and economic factors involved will be brought within intelligent understanding. The ability of a science to predict quantitatively is a measure of its degree of perfection, and prediction requires an adequate theory and the necessary fundamental data.

Solubility of Iron Oxide

Iron oxide (FeO) plays an extremely important part in the manufacture of steel, according to C. H. Herty, Jr., and J. M. Gaines, Jr., physical chemist and assistant physical chemist, respectively, Pittsburgh Experiment Station, United States Bureau of Mines, in a paper entitled "Effect of Temperature on the Solubility of Iron Oxide in Iron." In the open-hearth furnace and the Bessemer converter it is the chemically predominant compound and controls to a large extent both the operation of the furnaces and the composition and quality of their products. Almost all of the refining action is carried out through the medium of FeO, which oxidizes carbon, manganese, silicon and phosphorus.

At the end of any open-hearth or Bessemer heat the steel contains dissolved iron oxide, which must be wholly or partly eliminated. The type of deoxidation product depends on the amount of dissolved iron oxide and on the deoxidizer used. After the heat has been deoxidized and while it is being teemed, iron oxide diffuses from the ladle slag into the metal, causing losses of deoxidizer and increase in iron oxide content of the steel.

It is generally believed that non-metallic inclusions are responsible for a great many failures of steel in service and for decreased yield of steel during rolling. The basis of most non-metallic inclusions is dissolved iron oxide. This investigation was undertaken to determine the amount of iron oxide that will dissolve in iron under various conditions. Steel-making slags are complex and it has been thought best to determine solubility under simple slags as a first step. The study is being continued under slags whose compositions approach those of operating slags.

Experimental Method

In making determinations on the solubility of iron oxide in iron, a 50-kw. Ajax-Northrup furnace was used. This was equipped with a magnesia-lined graphite crucible in which 50 lb. of electrolytic iron was melted and held at the required temperature. When the metal was melted, the desired slag—either iron oxide or a mixture of lime and iron oxide—was added in sufficient quantity to give a liquid ring on the surface of the metal. Temperature readings were taken at frequent intervals and when the temperature had been constant for 15 min., samples of slag and metal were taken. The slag was analyzed by the usual laboratory methods for FeO, Fe_2O_3, SiO_2, MgO and CaO. One or two samples of metal from each heat were analyzed for the usual constituents, carbon, manganese, phosphorus, etc., and all samples were run by the modified Ledebur method for oxygen content.

The fact that increasing amounts of oxygen are found in the metal with increasing temperature indicates that oxygen dissolved in the metal is present as a compound and not as a gas. Gas dissolved in liquids shows decreasing solubility with increasing temperature.

Solubility of FeO in Iron Under Operating Slags

The exact amount of FeO in the metal in equilibrium with a finishing open-hearth or Bessemer slag cannot be predicted until data are obtained on the compounds present in such slags. The initial steps toward a knowledge of solubility of FeO in iron under commercial slags are determinations of solubility under slags consisting of FeO and SiO_2, and FeO, CaO and SiO_2.

Furthermore, in open-hearth operation, equilibrium between slag and metal is seldom reached, because carbon elimination is proceeding at all times, preventing the metal from taking up iron oxide to its equilibrium value. Under open-hearth conditions the amount of dissolved iron oxide depends on the carbon content of the metal and the temperature, unless, of course, deoxidation with some other metalloid has taken place.

The rate at which carbon is eliminated is controlled primarily by the rate of diffusion of iron oxide from the slag into the metal and this to a large extent depends on the saturation value of FeO in the metal under the slag in question.

Discussion

Running discussion followed the presentation of the three papers on open-hearth subjects. Among the principal points brought out were the following:

Slag analyses to determine FeO are available to the practical open-hearth man and can be reported by the laboratory sooner than the carbon determination comes back. If these samples are taken an hour before tapping they will be a great help in controlling the ore additions and finishing the heat.

Dissolved FeO in the bath affects the rate of carbon drop. In contrast, however, inclusions of iron silicates have no effect upon the rate of carbon drop.

A suggestion was made for obtaining the temperature of the bath of metal by means other than those depending largely upon the consideration of the temperature of the slag. This involves the use of a definite weight of platinum, which would be immersed in the bath in a refractory receptable and held there long enough to acquire the bath temperature. It then would be put into a mercury calorimeter and an accurate determination of the bath temperature would thus become available. It was hinted that a thermocouple for this purpose is now in process of experimentation in a prominent laboratory, and that announcement may be expected shortly as to its characteristics and utility.

Deep baths require a higher percentage of FeO in the slag than do shallow baths, to give an equivalent removal of carbon from the bath by the ordinary reaction $FeO + C = CO + Fe$. This is due to the fact that, with equal FeO in the slag, the rate of removal is about proportional to the area of the contact plane between slag and bath. With a deep bath (and more tons of it) there is a larger amount of carbon to be removed from the bath than with a shallow bath of equal plane.

Some Steels Used by Railroads

MEETINGS considering the properties of various steels were held on Monday, Feb. 20. The morning was given over to the more scientific aspects of alloy systems and results of laboratory study. During the afternoon several papers on the utility of steels were read, and the Howe Memorial Lecture was delivered by Henry D. Hibbard.

Rail Steel Made in Germany

More discussion was accorded C. W. Gennet's paper on "The Manufacture of Some Foreign Rails" than any other. This has already been printed in full abstract in THE IRON AGE, Feb. 9, page 405.

C. B. Bronson of the New York Central Lines dwelt chiefly on the comparative value of the roller straightener and the gag press. He said there were six debatable points, of which the first is most important: (1) Does the roller straightener, in severely kneading the entire rail end to end, do less damage than a few separate blows by the gag press? (2) Will the more costly roller straightener do the work cheaper? On this point he recognized that the tendency toward longer and heavier rails (two-thirds of them now weigh more than 100 lb. per yard) is making the straightener's and helper's job very exhausting. (3) Will it require expensive changes in layout at the finishing end of the rail mill? (4) Can it handle satisfactorily all reasonable variations in line and surface in the rails from the hot bed? (5) Can a second handling at a gag press to remove kinks at the very end be avoided? (6) Does roller straightening iron out and cover up surface defects?

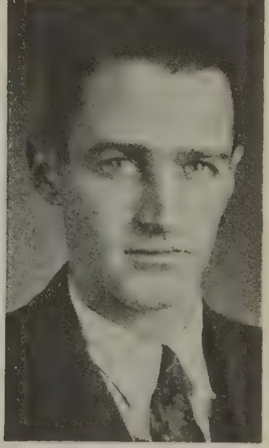
George F. Comstock, consulting metallurgical engineer, Niagara Falls, N. Y., was of the opinion that the reduced piping observed in the Krupp rails was due to the slow rate of pouring a group of ingots rather than the fact that they were bottom cast. Segregation is a more important defect than piping, and unfortunately the available data are insufficient to determine whether the foreign rails are any better in this respect than American rails. He suggested that the method of making the drop test may not have revealed the true story as to segregation.

Henry D. Hibbard, consulting engineer, Plainfield, N. J., described the mechanism whereby slow bottom pour reduced the pipe even

THREE Metallurgists on Whom Awards Were Bestowed at the Banquet. Mr. Blaylock, the James Douglas medal; Doctor Mathews, the Hunt medal and Doctor Herty, the Hunt prize

S. G. BLAYLOCK

DR. J. A. MATHEWS



C. H. HERTY, JR.

though the mold were small end up. The metal, being in the bottom of the mold for a much longer time, chills a thick wall. At the end of the pour this chill is progressively thinner toward the top, thus inclosing a liquid core which has a greater cross section at the top than lower down—in effect a big-end-up condition.

George B. Waterhouse, professor of metallurgy, Massachusetts Institute of Technology, Cambridge, Mass., emphasized the fact that the raw material used for these rails was very carefully selected low-phosphorus scrap and pig, thus enabling carbon to be caught on the way down. He inspected the rails on delivery and found them to be remarkably straight. After 18 months in the track, they appear to be in as good shape as the average American rails after similar service.

Railroad Steels Are Meeting More Severe Duty

Robert Job, vice-president Milton Hershey Co., Ltd., Montreal, Canada, discussed "Types of Steel Used by Railroads, Past and Present." His general remarks on the development of axles and forgings were on ground already covered by E. J. Edwards in "Steels for Locomotive Forgings," printed in The Iron Age, Jan. 26, page 255. Discussing boilers, he noted the abandonment of wrought iron for carbon steels, and more lately a mis-named "silicon steel," and nickel steels. The relative advantages of these stronger steels is a matter which only extended experience in service can determine. Typical analyses are given in the table.

Properties of Boiler Steels

	Carbon Steel	"Silicon Steel"	Annealed Nickel Steel(a)
Chemical Analysis:			
Carbon, per cent	0.20	0.28(b)	0.16
Manganese, per cent	0.40	0.80(b)	0.56
Silicon, per cent	0.20	0.21	0.20
Phosphorus, per cent	0.02	0.03	0.02
Sulphur, per cent	0.03	0.03	0.03
Nickel, per cent	...	...	3.0
Physical Properties:			
Ultimate strength, lb. per sq. in.	60,000	80,000	78,000
Yield point, lb. per sq. in.	35,000	48,500	47,500
Elongation in 8 in., per cent	29.0	26.0	26.0
Reduction in area, per cent	...	49.0	54.0

(a) Average of 385 tests. See The Iron Age, Feb. 23, p. 537.

(b) Obviously the enhanced properties are due not to silicon but to increased carbon and manganese.

Locomotive frames have been discussed by W. A. Newman and C. F. Pascoe in The Iron Age, March 10, 1927, and alloy steel staybolts on Dec. 29, 1927, page 1785. Steel staybolts are practically standard for Canadian railroads. Locomotive tires have also been improved; the following are indicative of the requirements of Canadian roads: ultimate strength 150,000; minimum yield point 85,000 lb. per sq. in.; elongation 2 in., 10 per cent, reduction in area, 20 per cent, Brinell hardness 245 minimum. In order to get such physicals in a plain steel having both carbon and manganese between 0.67 to 0.77, heat treatment at the discretion of the manufacturer is necessary. Competition of forged steel wheels, and cast wheels with steel tires, has forced the makers of chilled iron wheels to study and improve their product. As a result a much better average wheel is now in use. The principal defect of the forged steel wheel is that when the hardened surface of the rim is worn through, further wear is rapid. Deeper hardening is difficult on account of the mass of the tread.

Blast Furnace Practice and Quality of Iron Castings

ONE afternoon session was devoted to a joint round-table conference on blast furnace operations and the character of pig iron and castings. Those partaking in the conference, which was held under the auspices of the iron and steel committee of the institute, were representatives of the American Foundrymen's Association, the American Pig Iron Association, the American Society for Testing Materials, the United States Bureau of Mines, the United States Bureau of Standards and various large pig iron consumers.

The conference last week was really a continuation of two previous conferences of a similar nature held a year ago by the mining engineers and reported in The Iron Age, Feb. 24, 1927, and another one under the auspices of the American Foundrymen's Association held in Chicago last June and reviewed in The Iron Age, June 16, 1927. At the latter conference a resolution was passed to the effect that a cooperative study of the effects of varying blast furnace operations on the character of pig iron made under changing blast furnace conditions and on the castings made therefrom be conducted under the supervision of the Department of Commerce, with an advisory committee consisting of representatives of the national technical associations.

The object of the conference this year was further to consider the situation and the conditions surrounding such a possible investigation and to come to some conclusion, if possible. In the absence of R. H. Sweetser, who was chairman of the Chicago conference and who was to have been chairman of the meeting last week but was unable to be present because of illness, Dr. Richard Moldenke conducted the meeting. Among those who took part in the general discussion of the subject, including the chairman, were Hyman Bornstein, Deere & Co., Moline, Ill., representing the committee on gray iron of the foundrymen's association; J. T. MacKenzie, American Cast Iron Pipe Co., Birmingham, Ala., representing the American Society for Testing Materials; Dr. C. H. Herty, Jr., United States Bureau of Mines, Pittsburgh; Dr. H. W. Gillett of the United States Bureau of Standards; J. A. Capp, engineer of tests General Electric Co., Schenectady, N. Y.; J. W. Bolton, chief metallurgist Lunkenheimer Co., Cincinnati; A. L. Feild, Union Carbide and Carbon Research Department, New York; and R. E. Kennedy, technical secretary of the foundrymen's association.

It was evident from the general discussion that there is no agreement as to just what constitutes bad castings, nor as to just what the real cause is of the various troubles which have been complained of. It was the general opinion that no progress can be made in an investigation, nor can any investigation be justified, until facts are established as to just what constitutes bad iron. One commentator was convinced that the proper way to approach the subject was from the foundry end and not from the blast furnace end, and another stated that until we try to establish the really useful, as well as the bad, properties, and then have some means of measuring them, we cannot get very far.

The committee on gray iron of the American Foundrymen's Association held a meeting previous to the round-table conference, and after a thorough discussion of the whole subject adopted the following statement, which was presented by R. E. Kennedy, technical secretary of the association, as an expression of the committee's opinion:

> The gray iron foundry industry is confronted with many difficulties owing to the complexity of its products. Not the least of these difficulties is the lack of definition of the difficulties themselves. The A. F. A. committee, having come to the realization of the necessity for definition of the various elements of the problem, has reached the conclusion that progress may be expected only after these definitions have been arrived at. Therefore, the committee proposes to attempt the formulation of a series of specific problems, the answers to which will at least assist in the establish-

ment of means of measuring qualities which determine the usefulness of the product, cast iron. When these means of measuring qualities have been determined, there is the immediate opportunity to determine the influence of variables in raw material and practice upon the output. We have every confidence that when the problem has been thus defined there will be found the active sympathetic cooperation among the interests involved in the prosecution of the research.

The round-table discussion was brought to a close by the adoption of a motion that the matter be referred to the committee on gray iron of the A. F. A. and that Dr. C. H. Herty, Jr., of the Bureau of Mines, Dr. H. W. Gillett of the Bureau of Standards, and Ralph H. Sweetser of the mining engineers cooperate and work with this committee to formulate some definite suggestions as to the advisability and scope of research in this field.

Secretary Hoover Signally Honored—Other Awards

HIGH tribute to Secretary Hoover was the feature of the annual banquet, which was held Tuesday evening. The dinner was the largest one ever held by the institute, and the 1100 guests taxed the capacity of the Waldorf-Astoria banquet hall.

To Herbert Hoover, Secretary of Commerce and a past-president of the institute, the second award of the Saunders medal for achievement in mining was the occasion of a demonstration which will long be remembered by the recipient and by those present. The formal speech of presentation was made by Cornelius F. Kelley, president Anaconda Copper Mining Co., New York. Referring to Mr. Hoover's work for refugees in the World War as "the greatest self-imposed task undertaken in the history of mankind and successfully accomplished," Mr. Kelley declared that both in war and in peace "the name of Hoover has become a synonym of helpful, intelligent, instructive, unselfish service."

Mr. Hoover's brief speech of acceptance was a review of the great advance in the engineering profession during the last 40 years, and a tribute to the work of American engineers, past, present and future. "The exchange of engineering experience and scientific discovery between nations," said Mr. Hoover, "is one form of internationalism that is beyond any reservation. More and more engineers are administrators of great industries, instead of being responsible solely for the application of their technology. A greater America for our children will in large degree depend upon the engineering profession."

For achievement in non-ferrous metallurgy the James Douglas medal is awarded each year and the occasion this year was the seventh presentation. The recipient was Selwyn G. Blaylock, general manager Consolidated Mining & Smelting Co. of Canada, Trail, B. C., Canada. The medal was presented by Scott Turner, director of the United States Bureau of Mines, who emphasized many points in Mr. Blaylock's career, particularly his acquisition of the Sullivan mine for his company and the development of the large refining plant at Trail.

For achievement in ferrous metallurgy the Robert W. Hunt medal this year was conferred upon Dr. John A. Mathews, vice-president Crucible Steel Co. of America. The award was presented by J. V. W. Reynders, a past-president of the institute, and was in recognition of Dr. Mathews' Howe lecture on "Austenitic Steels" last year.

For distinguished work in ferrous metallurgy the Hunt prize was awarded to Dr. C. H. Herty, Jr., of the United States Bureau of Mines, and for distinguished work on blast furnace problems the J. E. Johnson, Jr. award was made to P. H. Royster of the Fixed Nitrogen Research Laboratory, Washington. The award to Doctor Herty was based on his papers on the physical chemistry of steel making.

The post-prandial program was brought to a close by the introduction of the new president, George Otis Smith, director United States Geological Survey, who graciously presented his greetings to the members in assuming his new office.

Iron and Steel Committee's New Officers

The iron and steel committee of the institute, at its usual luncheon, adopted a resolution recommending to the board of directors of the institute that the iron and steel activities of the organization be recognized by establishing an iron and steel division similar to that of the institute of metals division instead of the present arrangement confined to the work of a single committee.

New officers for the coming year were elected as follows: Ralph A. Sweetser, American Rolling Mill Co., Columbus, Ohio, was made chairman. Dr. F. C. Langenberg, vice-president Climax Molybdenum Co., New York, and W. J. Priestley, vice-president Electro Metallurgical Sales Corporation, were named as vice-chairmen. Mr. Sweetser had been a vice-chairman for some time and has been very active in the work of the committee in the last few years.

New Officers

AT the annual meeting of the institute, George Otis Smith, director United States Geological Survey, Washington, was elected president. Two vice-presidents were elected, namely, George D. Barron, consulting engineer, New York, and William H. Basset, American Brass Co., Waterbury, Conn. As new directors, Herman C. Bellinger, vice-president Chile Exploration Co., New York; H. G. Moulton, consulting mining engineer, New York, and Robert E. Tally, general manager United Verde Copper Co., Jerome, Ariz., were named.

As president of the women's auxiliary of the institute, Mrs. Herbert Hoover was unanimously elected.

Merger with the Rocky Mountain Club

An important decision was reached in the consummation of the merger of the Rocky Mountain Club of New York with the institute. This club, which was started in 1907 and which at one time was an active and prominent organization, with John Hayes Hammond as its president, during the war accumulated a fund of about $115,000 with which to build a club house. This project was never brought to a head. Those interested both in the club and in the institute were convinced that, if a merger of the two could be achieved, mutual benefit would result. A way was found by which this could be consummated and the final steps in the proceeding were taken last week. Members of the Rocky Mountain Club, who are not members of the institute, will automatically become members and the fund accumulated by the club will add decidedly to the resources of mining engineers.

Other Events

An abstract of the Howe memorial lecture and an account of the meetings of the Institute of Metals division will be published next week.

Henry D. Hibbard, who delivered the memorial lecture, is a consulting engineer, Plainfield, N. J., who has written frequently for THE IRON AGE. His subject was "Significance of the Simple Steel Analysis."

The Institute of Metals Division of the institute held a very successful series of technical sessions. The annual lecture was delivered by Dr. C. H. Mathewson, professor of metallurgy, Yale University, New Haven, Conn., on the subject "Significance of the Twinned Structure in Wrought Metals." The attendance at the sessions and the lecture was large. The usual dinner was held at the University Club on Wednesday.

Powdered Coal for Malleable Iron

Advantages Reported Are Numerous—Better Control, Lower Costs, More Uniform Operation and Quality, Quicker Heat and Hotter Metal

ALL five plants of the Eastern Malleable Iron Co. were changed over from hand-fired operation within a period of 12 months to the use of powdered coal as a fuel for air furnaces. Previously raw coal was used, shoveled in by hand labor and accompanied with the usual amount of smudge and noxious gases. The first pulverized coal unit was placed in operation on Oct. 19, 1925, in the plant at Naugatuck, Conn., and the last unit was in a year later.

Briefly stated, the advantages which are reported include getting away from the fumes and smoke previously encountered, a more uniform heating operation resulting in some quickening of the heat, a saving in furnace labor costs, a slight saving in refractory costs not yet completely evaluated and ability to run heats on a more definite schedule. The gain in refractories comes mainly from the fact that the furnace fire box and front bridge wall are now no longer needed. Whether there is an accompanying gain in increased life of refractories along the side walls and bungs is not yet definitely determined. There is less cutting along the slag line. Taken altogether, these advantages record considerable improvement over what was previously possible.

An incidental gain comes from the character of the coal used. This now consists of what is known as ¾-in. slack gas coal, which is cheaper than the ¾-in. lump gas coal previously employed. The coal handling is done mechanically, coal being brought in from storage in buckets holding 1 cu. yd. and carried on trailers hauled by a tractor. These buckets are dumped into a 6-ton hopper above the pulverizer by use of a crane.

First to Dispense With a Drier

The first unit installed at Naugatuck is said to be the second case of unit pulverizing of coal for this purpose, and the first successful case where the operation dispenses with the use of a drier for the coal. Coal is stored both indoors and outdoors, the outdoor storage having no roof. In a stretch of dry weather coal is taken from the outdoor storage and put through the process without any treatment whatever. In wet weather, or when there is snow, coal from the indoor storage is used.

Coal is fed through the bottom of the hopper by means of an adjustable gate upon a short horizontal belt which operates at a predetermined speed. This belt runs over a magnetized pulley, which gets rid of most of the "tramp iron" which may come in with the coal. From the belt the coal drops through a short diagonal chute to a rapidly revolving plate in the pulverizer proper.

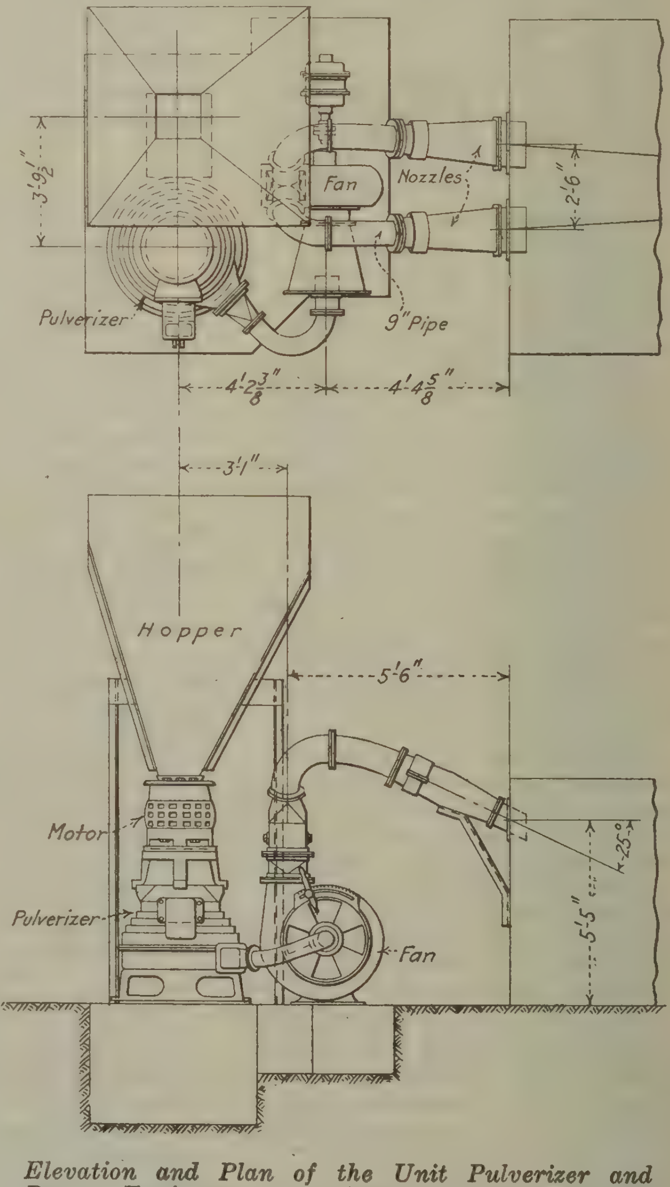
Centrifugal force throws the coal to the periphery of the plate, whence it is cascaded down through a series of pulverizing elements consisting of beaters or hammers fastened on sets of plates. These crush the coal against an inner corrugated lining of the pulverizer housing. Successive lower stages, there being five steps, are of greater diameter as the coal drops lower and gets finer. As high as 75 per cent of the coal thus pulverized will pass through a 200-mesh sieve.

Putting the Coal Into the Furnace

This coal, forced under the pressure of a fan through two burners opening into the furnace, takes the place of the former raw coal, burned on a grate with a form of stoker arrangement for spreading the coal over the grate. One man operates the furnace, having a helper only at time of tapping, in place of the previous two to three men, working much harder and engaged mainly in shoveling coal.

The two jets of flame from the burners are so directed that their center lines converge about 15 ft. inside the furnace. They are directed downward, however, so that the flame actually hits the bath at about half this distance. This bath measures 32 ft. in length in this furnace rated at 25 tons, while the width is from 6½ to 7 ft. The depth of bath when fully melted is about 9 in. at the lower tap hole (nearest the burners) and 3 in. at the farther end.

Charges of sprue, runners and risers (50 to 60 per cent) and pig iron, malleable and steel scrap (40 to 50 per cent) fill the furnace to the roof. One advantage of having the flame directed downward into the charge



Elevation and Plan of the Unit Pulverizer and Burner Equipment. The feeding gate from hopper to pulverizer is adjustable. The air supply to the fan is adjustable, also, and is worked on a definite schedule throughout the period of a heat, as determined by experiment and experience lies in the fact that this forces the flame through the charge and thoroughly heats it before melting begins. The upper parts then gradually sink into the molten pool below. Thus, molten metal does not run down over relatively cold material and partially solidify again.

Coal is blown into the furnace by a fan operated by a 15-hp. motor. This fan provides suction from the pulverizer and at the same time forced draft for the furnace. The motor operating the pulverizer proper is of 40 hp. All of the equipment, from hopper to burner, is from the designs of the Grindle Fuel Equipment Co. (subsidiary of Whiting Corporation), Harvey, Ill. Except for the hopper, beaters, motors, fan and magnetic separator, all this equipment was made by the Grindle company.

As much of the work of this plant consists of small castings, many no larger than a man's finger, it is necessary to pour the iron at a high temperature. It is almost always above 2800 deg. Fahr. This requirement of high temperature makes it inexpedient to use a bull ladle. Hence all the iron is drawn off in hand ladles and carried quickly to the pouring floors. These floors are located on both sides of the furnace.

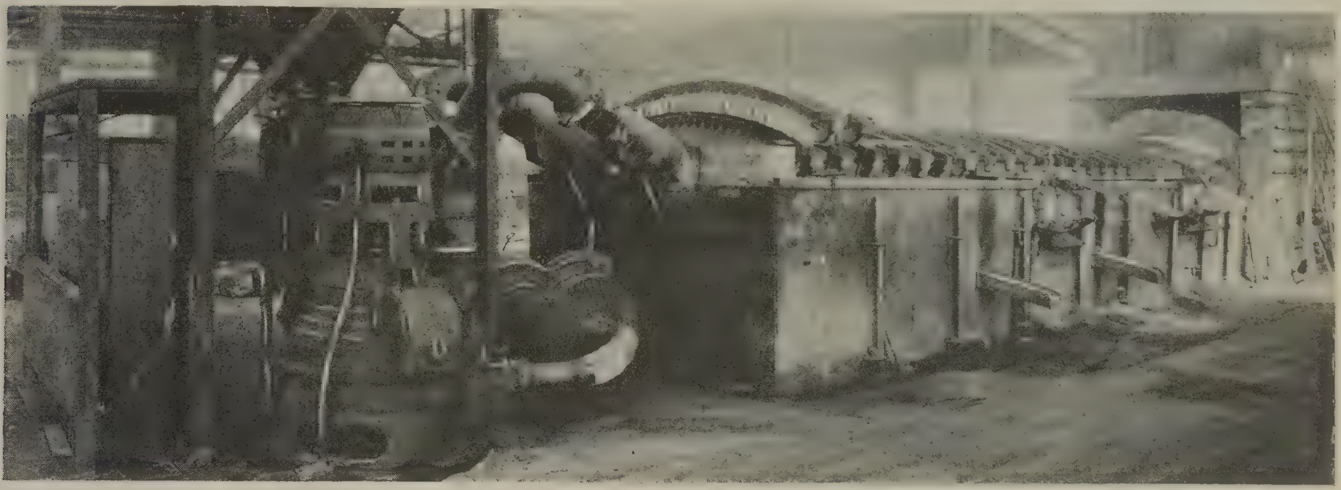
Incidental Advantages Noted

Safety is reported as an important feature of the system. If either motor stops, the interconnecting electric equipment stops the other. This means that there is no storage whatever of pulverized coal anywhere in the system. As pulverized coal is naturally explosive, the importance of this factor will be realized. When closing down the furnace, the operator shuts off the coal first. The blast of air continues for a few minutes longer, thus cleaning out of the system any coal particles which may have lodged in it. When the air goes off, the pipes are entirely empty.

Maintenance is reported as not a serious problem thus far. This covers both the coal preparation plant and the furnace. The beater sections are arranged so that they can be operated in one direction one week and in the opposite direction the next week, thus equalizing wear. Extra corrugated liners, beaters and the plates over which the coal passes are carried in stock. Thus it is easy to handle any repair or adjustment which may be necessary during the time the furnace is not operating. There is only one heat taken each day, and the repair gang can get into the furnace if necessary in the morning, before the heat is started. Or it can work on the pulverizer after a heat is out.

In construction the furnace rests on a concrete slab which supports the furnace walls and sand bottom. The top layer of sand, to a depth of 8 or 10 in., is a highly refractory variety. The surface of the bottom after the first heat is so hard that it will withstand the ordinary bumping it receives when the charge is dumped upon it. Fire clay brick of the highest quality is required for the side walls and bungs. Silica brick would not do, because of its tendency to spall under the alternate heating and cooling of the furnace.

What the new operating method means in lowered unit cost of castings was not disclosed. Many of the items of savings are not readily measurable—the more definite operating schedule and the elimination of sooty smoke, for example. But the effect upon morale is not the least of the benefits which have been noted. Working conditions have been improved not only for those having charge of the furnace but for the much larger number of molders in its vicinity. And the direct savings, which can be measured, have no uncertain bearing upon the high utility of the methods employed.



General View of the Whole Installation, from Coal Hopper (Bottom Shown) to Stack. The adjustable coal feeding gate appears at bottom of hopper; adjustable air inlet below where the two burners enter the furnace. Pulverizer is in left foreground and blower or fan just back of air inlet

To Install Foundry Handling Equipment without Shut-Down

Stephens-Adamson Mfg. Co., Aurora, Ill., is designing and furnishing a new installation of conveying and sand-handling equipment for the Melrose Park plant of the American Brake Shoe & Foundry Co., Chicago. The equipment will include a long roller conveyor, upon which continuous molding, pouring, cooling and shaking out will take place. The installation will include also apron and belt conveyors to sand-preparing machinery, screens, mixers, aerator, bucket elevator, distributing conveyor to overhead storage bins and feeders to molding machines. The new machinery is to be installed without interfering with regular foundry production.

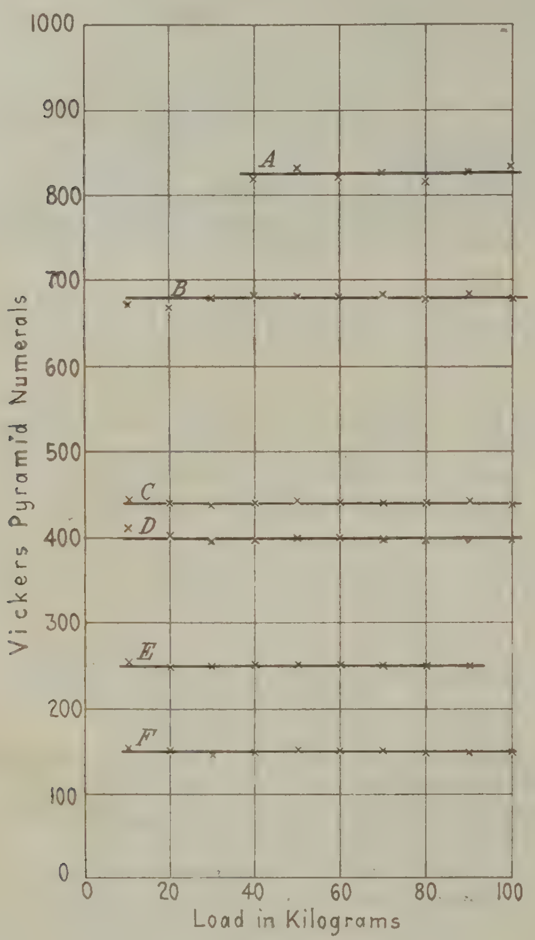
The Federal Compress & Warehouse Co., Memphis, Tenn., has filed a motion with the Interstate Commerce Commission asking the inclusion of castings and forgings and parts of compresses, each piece weighing 2000 lb. or over, in the iron and steel list in the Consolidated Southwestern Cases. The motion points out that the railroads propose to give castings and forgings Class A rating instead of a commodity rating, and that the effect would be to increase rates on these products from 46 to 64 per cent.

Loading of revenue freight for the week ended Feb. 4 totaled 926,204 cars, according to reports by the Car Service Division, American Railway Association. This was an increase of 23,372 cars over the preceding week, but a decrease of 39,460 cars under the same week in 1927.

An Improved Hardness Tester

Accurate and Proportional Brinell Numerals Claimed for British Machine—Diamond Pyramid Used as the Indenter

A NOVEL testing machine, developed by Vickers, Ltd., Erith, England, was exhibited at the Detroit exposition of the American Society for Steel Treating. It utilizes the Brinell principle, but with a diamond indenter pressed into the work under low load and at an automatically controlled rate. Thus it is said to be superior for metals of great hardness, and to be applicable to finished work and very thin sheets.



Hardness Tests on Various Metals Using Different Loads on Pyramid

A: 0.6 per cent carbon steel, water hardened
B: High-speed steel, hardened 1280 deg. C., tempered 630 deg. C.
C: 0.6 per cent carbon steel, oil hardened, tempered 450 deg. C.
D: Hadfield's manganese steel
E: 0.6 per cent carbon steel, oil hardened, tempered 650 deg. C.
F: 0.25 per cent carbon steel, oil hardened, tempered 700 deg. C.

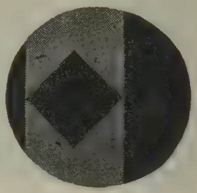
The indenter is a diamond accurately cut and polished to the form of a square-based pyramid. The impressions are therefore square. The load is light, varying from 10 to 50 kg., according to requirements; the hardness numerals obtained by the new apparatus are corrected Brinell numerals, which are strictly proportional whether the material tested is lead or the hardest steel.

The diamond pyramid was adopted in preference to the steel ball or steel cone for the following reasons:

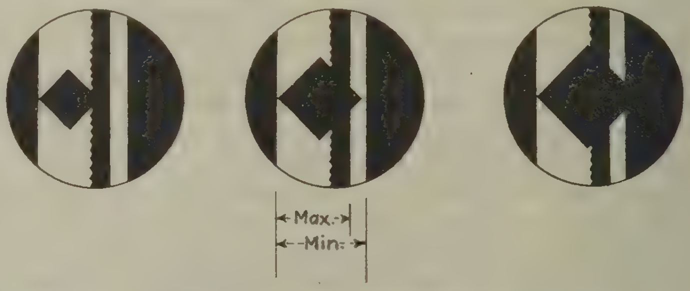
1. The square surface impression is well defined and can be measured with accuracy across the diagonal corners.
2. The impressions are always geometrically similar, irrespective of size.
3. The deformation of the indenter is practically zero, owing to its enormous hardness, even when compared with the hardest of steels.

The diagram shows how the hardness numerals obtained with a diamond pyramid at various loads on several different homogeneous materials are unaffected by variation in load. In full appreciation of the popularity of the Brinell test, the angularity of the Vickers pyramid is based on that of a ball impression of the ideal size, i.e. 0.375 times the diameter of the ball. This angle is 136 deg. It has been found, from a very large number of tests, that the numerals obtained are identical to those resulting from the ball test when the load on the Brinell machine has been adjusted to produce an impression which is 0.375 times the diameter of the ball. This similarity in hardness numerals obtains, however, only in the lower regions of hardness—that is, where the steel ball does not undergo any appreciable deformation. Between 500 and 600 Brinell hardness this deformation begins to make itself manifest by yielding slightly lower readings than the diamond pyramid, and this tendency, of course, increases with increasing hardness, until it becomes very pronounced. It should also be noted that unavoidable differences in the hardness of different steel balls will affect the numerals obtained, particularly in the higher regions.

View of Indentation as It Appears Through Measuring Microscope, Illustrating Precision with Which Knife Edges Can Gage the Size



The machine designed for use with this indenter is illustrated in the drawing and photograph. A main frame *A* of U section, carries the stage *B* and a simple lever *C* of 20 to 1 ratio, which applies the load through a thrust rod *D* to a tube *E*, which is free to reciprocate vertically and carries the indenter *F* at its lower end.



Setting of Knife Edges in Micrometer Eyepiece for Checking Maximum and Minimum Hardness. Left is impression on material which is too hard, right on too soft, and center on material which falls within the specification

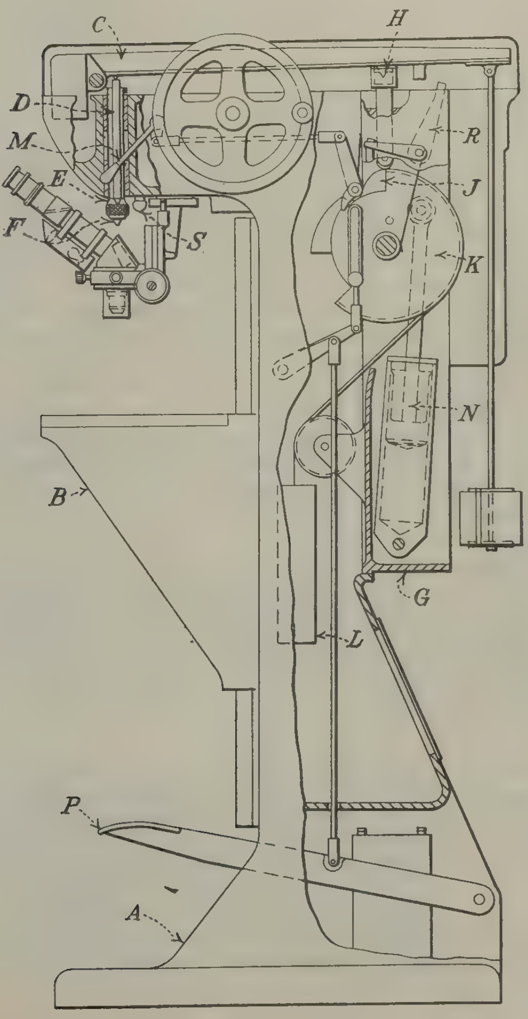
Attached to the main frame is a smaller frame *G*, which contains all the control mechanism. The plunger *H* reciprocates vertically under the influence of a rotating cam *J*, its purpose being to apply and remove the test load. The cam is mounted on drum *K* and the whole is rotated by a weight *L* attached to a flexible wire, after the starting handle *M* has been depressed. The speed of rotation is controlled by an oil dash pot *N* and is regulated by an adjustable control valve. The plunger *H* carries a rubber pad at its upper end, which engages with a cone mounted in the beam, thereby insuring a very slow and diminishing rate of application of the last part of the load. Since the cam both lowers and raises the plunger in the course of its movement, it will be seen that uniformity of loading and duration of load is attained, errors due to inertia or premature removal of the load being eliminated.

Depression of the foot pedal *P* returns cam, drum and weight to their original positions. A tripping piece *R* supports the beam during this latter operation, and drops out as soon as the plunger *H* returns to its top position.

The measuring microscope is capable of measuring to 0.001 mm. As shown in the photograph, it is mounted on a hinged bracket, arranged so it may be swung to a position immediately over the impression. It follows, therefore, that it is only necessary to lower the main stage *B* by the handwheel (upon which rests the operator's hand) and swing the microscope around. The operator leans slightly forward and makes the observation. A considerable saving of time is thereby effected. The impression is illuminated by a vertical beam of light obtained from a lamp, condenser and vertical illuminator, all of which are mounted on the microscope. The light is switched off automatically in swinging the microscope out of position.

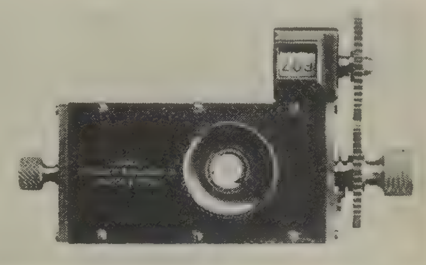
Instead of the usual scale or eye-piece micrometer, a specially designed micrometer ocular is provided. The impressions are read to knife edges, thus avoiding eyestrain, and readings are taken from a digit counter, mounted on the side of the ocular.

In order to make a test, the foot pedal is first depressed and the microscope swung out of position. The area to be tested should be smooth and clean. The work having been placed on the stage, the latter is raised until the surface to be tested just clears the point of the diamond. The small lamp *S* may be switched on if necessary to facilitate this adjustment. The starting handle *M* is then pressed to release the mechanism, when the test proceeds automatically and terminates with a click. If, for any reason, the work has not been elevated to clear the diamond within reasonable limits, the test cannot proceed satisfactorily, and in order to warn the operator of these conditions a small buzzer comes into operation.



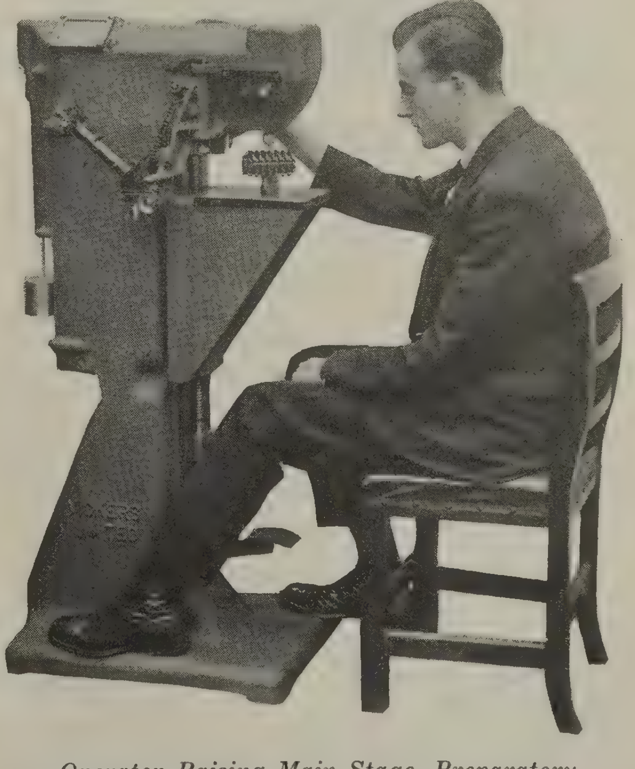
After the test has been properly completed the stage is lowered and the microscope swung over. In focussing the impression, coarse adjustment is obtained by movement of the stage, the fine adjustment being provided on the microscope itself. The measurements are made across the diagonal corners of the square impression. One of the knife edges in the eyepiece is fixed and is set by means of centering screws at the left hand corner of the impression, as it appears through the microscope. A second knife edge controlled by a micrometer screw and geared to the digit indicator is then adjusted to correspond with the right-hand corner of the impression. The reading is taken from the digit indicator at the side of the eyepiece and converted, by means of a table for the particular load impressed, direct to Brinell hardness numerals.

Digit Indicator on Eyepiece to Give Measured Distance Across Impression



Where the work has to fall within specified maximum and minimum limits of hardness, a third knife edge is brought into use. This third knife edge is set to correspond with the smaller dimension, i.e., the maximum limit of hardness, the micrometer knife edge then being adjusted to correspond with the larger dimension, i.e., the minimum limit of hardness. It is only necessary when reading to set the fixed knife edge to the left-hand corner of the impression in the ordinary way, and the right-hand corner must fall within the open strip representing the tolerance.

The time taken in the application and duration of the load can be adjusted by the oil control valve of the dashpot within wide limits. For purposes of research work it is generally desirable to set the valve so that this period is 30 sec., but for most practical purposes a 10-sec. setting will be found satisfactory. It is said that accurate tests have been made at a speed of 200 per hour.



Operator Raising Main Stage, Preparatory to Testing Hardness of Hob; Measuring Microscope Swung Aside

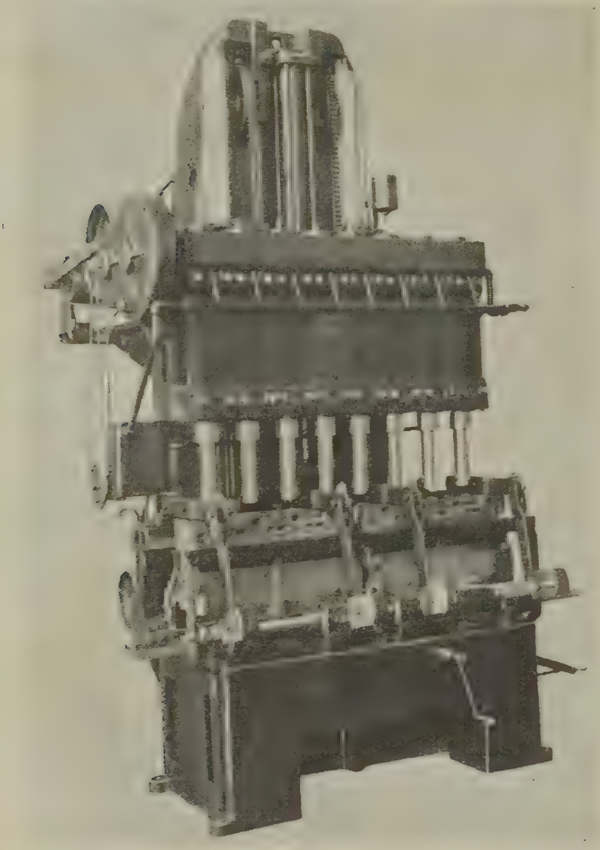
(At Left) Sectional Diagram of Mechanism

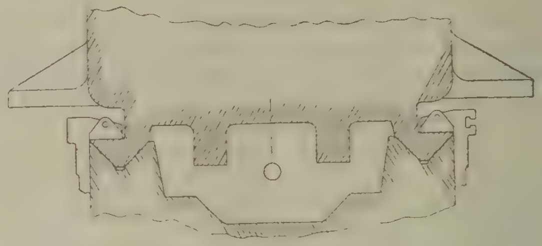
CYLINDER BORING MACHINES

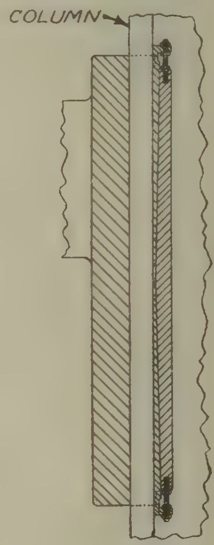
Hydraulic Feed and Double-V Guides Are Features of Redesigned Line of Equipment

THE Moline Tool Co., Moline, Ill., has redesigned its line of multiple-spindle cylinder boring machines, two sizes of which are designated as the No. 13 and No. 10-D respectively.

Both machines have hydraulic feed, using Oilgear equipment, and employ double-V guides, the arrangement of the latter being shown in the accompanying illustrations. Mounting of the hydraulic feed cylinder, between the two guides, is emphasized as eliminating the possibility of weaving of the slide during a heavy cut. The slide is held securely against the V-guides by four taper gibs, as shown in the second sectional view. The latter feature, which is claimed to be new in machine tool construction, is emphasized as facilitating adjustment. Anti-friction bearings are used on all drive shafts.







CYLINDER Borer With Hydraulic Feed, Roller Bearing Heads, and Fixture for Boring an Eight-Cylinder Motor. The cross section view above shows the type of column and slide used. The view at right is a section through the slide and gib

The machine illustrated, the No. 13, is recommended for heavy roughing operations. The rigidity of the construction is said to make it unnecessary to pilot the boring bars either at the top or bottom, although this can be done if desired. The column or housing is of box section and extends down to the floor, the base being bolted to the face of the column. Counterbalancing weights are on the inside of the column. The main drive may be either direct by motor or from a countershaft. From the main drive shaft the power is transmitted to a shaft with hardened spiral gears and through hardened spur gears.

The sides of the spindle housings or heads are accurately scraped and furnished with the necessary spacers so that all the heads can be bolted together to the desired spacing. Spindles are mounted in Timken tapered roller bearings which may be adjusted for wear simply by adjusting the nut on the end of the spindle. Special bronze spiral gears mounted on the spindles mesh with the main driving spiral gear, and by means of force feed lubricating system the entire assembly is flooded with oil. Provision is made against oil leakage around the spindles.

Spindle drive is from the same motor that drives the Oilgear pump. The cylinder is 3⅞ in. in diameter, 36-in. stroke. The entire control of the feed cycle is automatic. Upon moving the starting lever, the rail on which the spindles are mounted is brought down rapidly to the cutting position, whereupon the lever shifts to the slow feed. Upon completion of the boring operation the lever again shifts automatically to the reverse position, giving a rapid return to the rail unit. When the cycle has been completed the feed is thrown out until the operator again engages it. The rate of feed is changed by adjusting a conveniently located valve on the pump unit. If desired the oil circuit can be arranged to give two slow feeds forward.

The machine here illustrated is tooled up for an eight-cylinder motor. The fixture clears the face of the column and is bolted to the wings at the side of the column. Adjacent spindles bore alternate holes in the block, this being necessary because the spacing of the cylinder bores is too close to permit use of a construction having roller bearings. One cylinder is completed at each cycle of the machine. The castings are brought to the machine on a conveyor and pulled into the fixture by means of the latch mounted on a rack, which is operated by a crank at the front of machine. Each time a new block is pulled into the fixture the completed block is forced out at the right-hand side of the machine. The blocks are brought to their approximate location in this manner, and then permanently located by dropping the lever at the right-hand side of base, which raises the locating pins into the locating holes in the pan rail. Then by means of another lever the weights are dropped, clamping the two castings securely.

The smaller machine, the 10-D, is similar except that spindle units having tapered bronze bearings are used in place of roller bearings, permitting closer center distances to be used. This machine is recommended where the boring bars are piloted at the top and bottom of the fixture.

Specifications of the No. 13 and 10-D cylinder borers are respectively: Center distance between the two V-guides, 27½ in. and 21½ in.; floor space required, 7 ft. 8 in. by 6 ft. 4 in. and 7 ft. 2 in. by 5 ft. 4 in.; and approximate shipping weight, with fixtures, 22,925 lb. and 16,500 lb.

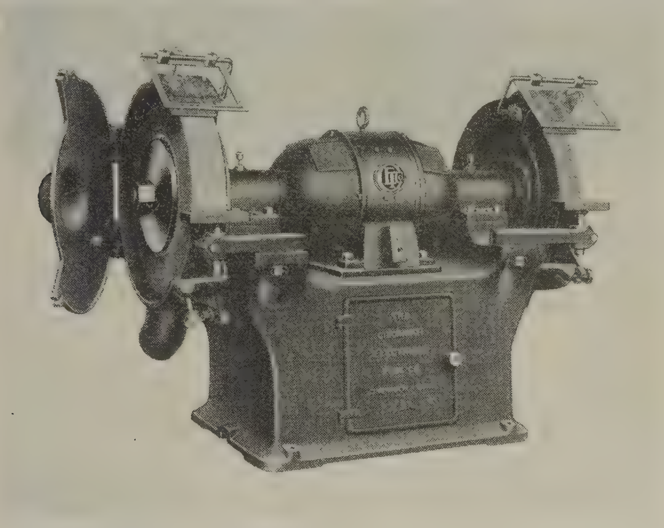
Wood pattern shop No. 2 of the Commonwealth Steel Co., Granite City, Ill., on Feb. 2 completed a safety record of 1000 days without a lost-time accident. About 100 men are employed in the department.

Interstate Iron & Steel Co., Chicago, had net profit of $409,784 in the year ended Dec. 31, 1927. This compares with $900,278 in the previous year.

Heavy-Duty Grinders for Foundry and Steel Mill Service

For heavy-duty work in foundries, steel mills, forge and other shops, the Cincinnati Electrical Tool Co., a subsidiary of the R. K. Le Blond Machine Tool Co., Cincinnati, is offering a new line of 5-, 7½- and 10-hp. floor grinders.

Motors are fully inclosed and the spindle is mounted on four Timken tapered roller bearings, which run in oil. Provision has been made for excluding grit and dust from the bearings and wear between the cup and the cone of the bearings can be taken up conveniently by means of an adjusting nut. Wheel guards are of cast steel. They are equipped with exhaust connections and have a 4-in. adjustment for wear of the wheels. Hinged covers entirely inclose the sides of the wheels, flanges and nuts. Non-breakable adjustable eye shields as well as chip breakers are provided over each grinding wheel. The grinding rests are adjustable and can be removed entirely.



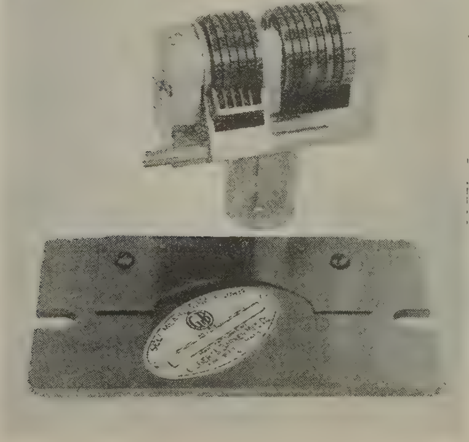
The Spindle Is Mounted on Four Tapered Roller Bearings Which Run in Oil

The spindle is of nickel alloy steel, of one piece, and is turned and accurately ground to size. Wheel flanges and nuts are machined to be in balance with the spindle, thus minimizing vibration. The grinding wheels have a 12-in. bore, which is emphasized as permitting a saving in the initial cost of the wheels and as minimizing the discarded wheel losses. The starter is of the safety type, fully inclosed, with both overload and under voltage protection, and is mounted in the base. Push-button control station is mounted on the motor frame. The machines can be equipped for alternating current, 220-440 or 550 volts, 2 or 3 phase, and for direct current of 115 or 230 volts.

Special Double Numbering Head

A special double numbering head, designed to reduce the cost of marking name-plates shown in the accompanying illustration, has been furnished recently by the Noble & Westbrook Mfg. Co., Hartford, Conn.

There are two groups of wheels. The six wheels at the left operate automatically for serial numbering, while the wheels at the right mark such information as catalog number, model number, date, etc. The latter are changed by hand as required. Between the two groups of wheels there is a star design segment stamp which is inserted directly into the support. The center support serves to strengthen the entire device.

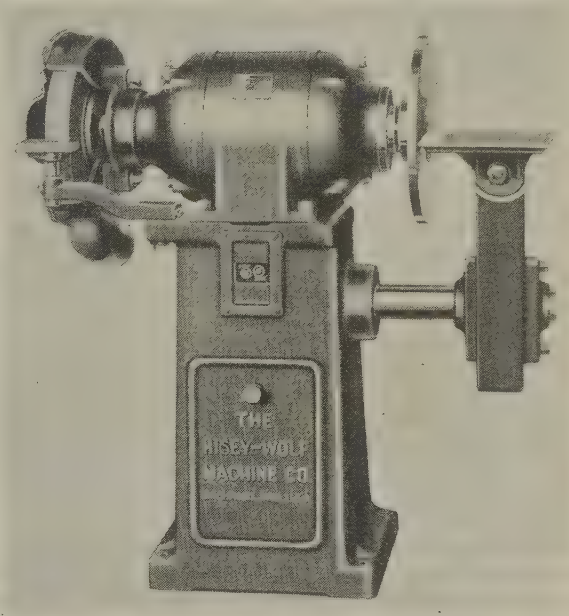


The Six Wheels at the Left Operate Automatically for Serial Numbering

Combination Disk and Floor Stand Grinder

The Hisey-Wolf Machine Co., Cincinnati, has placed on the market the 3½-hp. combination disk and floor stand grinder here illustrated. The spindle of the machine is of steel and of heavy construction to assure permanent concentricity of the disk. It is mounted on two annular ball bearings which take the radial load, end thrust being taken on a double-acting, self-alining thrust bearing. A plain work-table measuring 8¼ x 9½ in. is standard equipment, but a universal lever feed table 6½ x 13 in. is available as an extra. Other standard equipment includes a 15-in. diameter steel disk, a full safety combination wheel guard, and automatic safety motor starter. The grinding wheel, 14 in. in diameter and 2½-in. face, is furnished to order only.

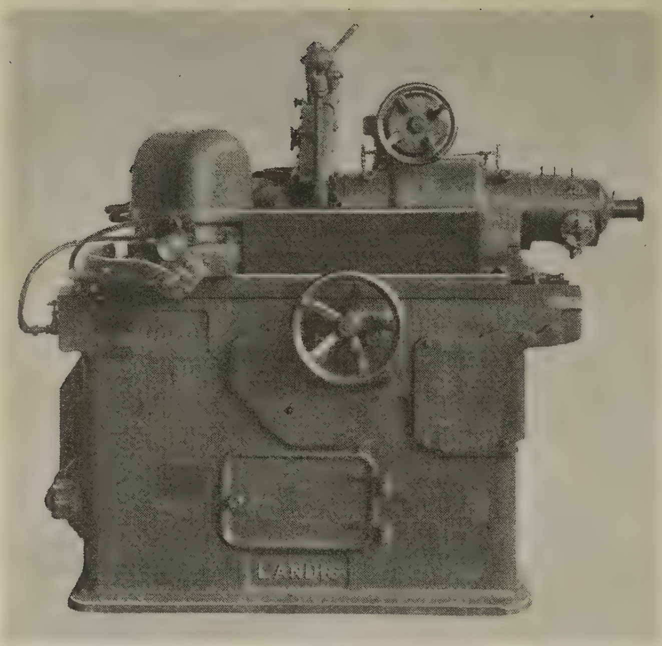
The machine is driven by a 60-cycle, 220- or 440-volt, 3-phase, 1725-r.p.m. alternating current motor, or a 115- or 230-volt, 1725-r.p.m. direct current motor. The grinders may be furnished special for 2 phase, also for 50 cycle at 1425 r.p.m.; 40 cycles at 1125 r.p.m., and 25 cycles at 1425 r.p.m. They can also be equipped for special voltage from 110 to 550 volts and for single phase service with improved repulsion-induction motors. The d.c. machines can be supplied for special voltages up to 250 volts.

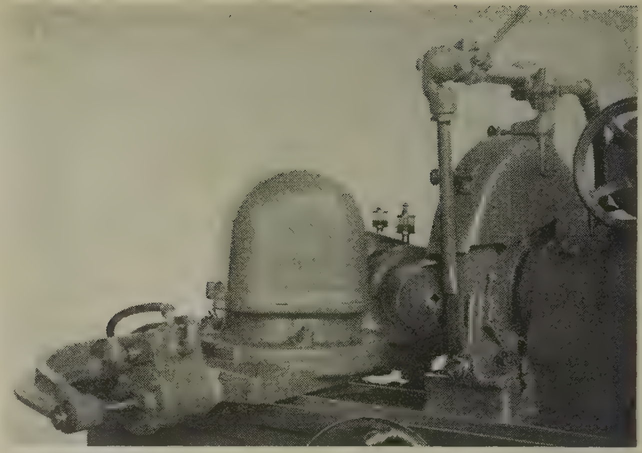


A 14-In. Grinding Wheel Is Employed. The steel disk is 15 in. in diameter

River shipments of iron and steel products in January were 330 net tons on the Allegheny, 78,069 tons on the Monongahela, and 69,750 tons on the Ohio River, according to the Pittsburgh office of the United States Engineers. In December the tonnages were 900, 65,922 and 68,472 tons, respectively. In January, 1927, there were no shipments on the Allegheny, 27,900 tons on the Monongahela and 26,409 tons on the Ohio.

The annual banquet of the Traffic Club of Pittsburgh, which includes most of the traffic officials of the iron and steel companies of the Pittsburgh district, is to be held at the William Penn Hotel, Pittsburgh, Thursday evening, March 8. Former Governor E. P. Morrow of Kentucky is to be the principal speaker. There is also to be a demonstration of the televocal system by R. J. Wensley, Westinghouse Electric & Mfg. Co.





CHANGE From One Type or Size of Valve Involves Only Change of Work-Holding Fixture. Arrangement of the work-head, wheel-head and diamond holder may be noted from view above

Semi-Automatic Hydraulic Machine for Grinding of Valve Faces

ALTHOUGH designed primarily for the grinding of similar parts in large quantities, the semi-automatic hydraulic valve face grinder here illustrated is adapted for the grinding of valves of various types and sizes. Change from one type or size to another merely involves changing to a suitable work-holding fixture.

The machine is a recent addition to the line of the Landis Tool Co., Waynesboro, Pa. It incorporates the bed, wheel-base, rear drive, oil and water service units of the company's 6-in. plain hydraulic grinder, but the work carriage, work-head and cross-slide have been designed particularly for valve face grinding operations.

The work-head is mounted at an angle of 45 deg. on a cross-slide which moves at right angles to the axis of the grinding wheel spindle. Hydraulic power, operating through a piston at the rear of the head, moves the cross-slide to and from the wheel. A ½-hp. constant-speed motor mounted on the head drives the work-spindle through silent chain and sprockets. Movement of the head automatically regulates the rotation of the spindle, a limit switch on the underside of the slide making the electrical contact. A single lever at the front of the slide controls this movement through a reversing valve.

Positive and accurate holding of the work is a feature emphasized. The work-holding fixture, which is air-operated from a cylinder at the rear of the work-spindle, consists of a clamping block on which the valve stem is placed; a clamping arm which carries the clamping shoe; and a locator which positions the valve so that the face will be properly presented to the wheel. Movement of the work-head automatically regulates the clamping and releasing of the clamping shoe.

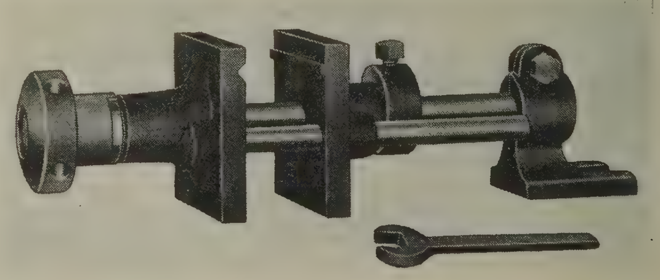
When the work-head is in the back position, the work-clamping shoe is released and rotation is stopped. In this position a valve is placed in the work holder. When the control lever is moved, the work-head moves toward the grinding wheel, the work is clamped, electrical contact is made and the work starts to rotate. The work-head continues to move rapidly toward the grinding wheel until contact is made between the wheel and the work, when it slows down automatically to a predetermined grinding feed and continues to move in until it comes against a positive sizing stop. After the work has made several revolutions, to allow the wheel to cut out, the control lever is reversed, which causes the work-head to move back rapidly. As the head approaches the extreme back position, the electrical connection is broken and the work stops rotating; at the same time the work clamping shoe is released automatically.

The grinding wheel head is massive and is equipped with an alloy steel spindle, which runs in bronze cap bearings lubricated under pressure. A 24 x 1 x 8-in. wheel is used. A reciprocating-type wheel spindle is furnished, and on this particular work the lateral movement is ½ in. Except to compensate for wheel wear or when the wheel is dressed, the grinding wheel-head is not moved. The company's standard plain hand feed is provided. The wheel-truing fixture is clamped to a pad on the top of the special work carriage, and because of its position need not be removed when not in use.

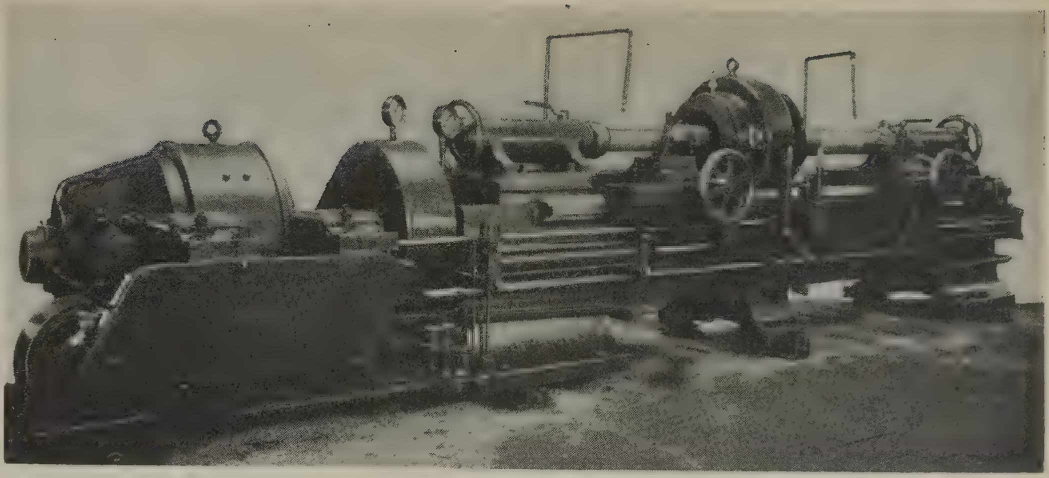
Power for the work-head feed is furnished by a geared oil pump driven from the rear drive shaft, a portion of the base of the machine being utilized as a container for the oil. The work carriage is traversed by hand, a back gear arrangement giving a slow speed for truing the grinding wheel. The machine may be arranged either for lineshaft or direct motor drive, but in either case an electrical work drive motor is required. A 5-hp. 1150-r.p.m. main drive motor is employed.

Offers New Drill Press Vise

MILLER & CROWNINGSHIELD, Greenfield, Mass., are marketing the vise illustrated, which is designed for use on drilling machines. The jaws of the device measure 3½ x 3½ in., and open 6 in. They are square on all sides so that the entire vise may be turned any side up. Round, square or hexagon rods can be held in the jaws and drilled either in the end or on the side. By loosening the clamp screw in the collar the rear jaw may be quickly slid to any position and clamped. The small shoulder on the rear jaw is intended to provide a convenient stop or rest for locating small pieces to be drilled. The work is held by tightening the clamp knob on the front jaw. The guide bars form a base on which to rest the work while drilling. The angular casting at the rear can be bolted to the drill press table to prevent turning of the vise if the drill should catch in the work. The weight of the device, which is designated as the No. 1 drill press vise, is 10 lb.



Feeding Pressure Is Applied to Each Tool by Oil Cylinders Attached to the Under Side of Each Carriage. Feeds from 0 to ½ in. per revolution are instantly available



Center-Drive Axle Lathe Equipped with Hydraulic Carriage Feed

HEAVY-DUTY center-driven axle lathes with hydraulically actuated carriages, using Oilgear equipment, have been brought out by the Consolidated Machine Tool Corporation of America, Rochester, N. Y. The use of this type of feed mechanism eliminates the usual feed gearing, and in addition to reducing manual effort on the part of the operator, is said to speed up production.

Positive feeding pressure is applied to each tool by means of oil cylinders attached to the under side of each carriage at front and back of the machine. This application of feed pressure directly under the tool and held rigidly in balance is emphasized as permitting heavier cuts and feeds than usual. Each carriage is provided with adjustable automatic stops, and the control levers for setting the rate of feed and for power traversing the carriages are located at the center of machine within easy reach of the operator. Any feed from 0 to ½ in. per revolution is immediately available; power traverse is at the rate of 6 ft. per min.

The main drive may be by adjustable-speed motor through a single train of gears or by constant-speed motor through a three-speed gear box. The center driving head is equipped with Sykes herringbone gears. The two Oilgear pumps are driven by one 3-hp. constant-speed motor. The machine illustrated is equipped with 35-hp. adjustable-speed motor for especially heavy duty, but usually a 25-hp. motor is employed.

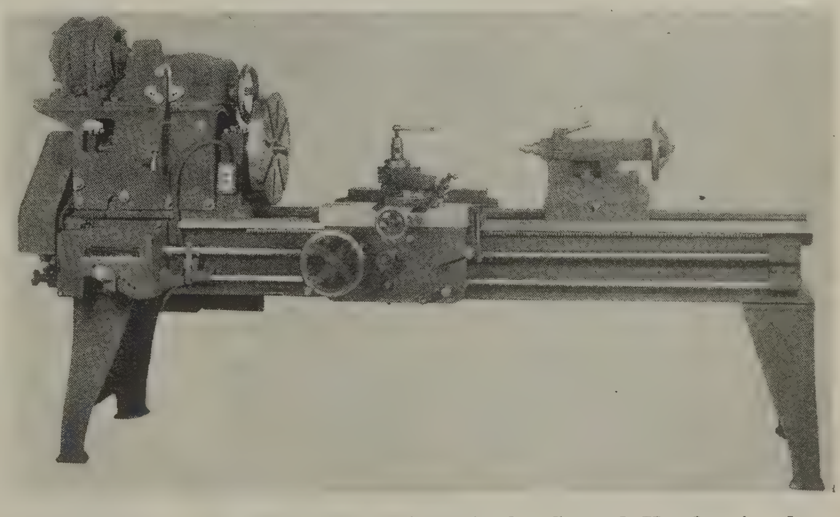
New Line of Engine Lathes

ENGINE lathes designated as the LN series, and available in three-step cone, double back geared, and all-geared head models, 16- and 18-in. sizes, have been added to the line of the Rahn-Larmon Co., 2935 Spring Grove Avenue, Cincinnati.

The bed is heavy and of hard, close-grained iron that will not, it is said, wear hollow. The spindle is of forged steel and has a hole 1 5/16 in. in diameter. The front spindle bearing is 2⅝ in. in diameter and 5 in. long, and the rear bearing 1⅞ in. in diameter, 3½ in. long. These bearings are oil grooved and supplied with oil from a reservoir.

Both carriage and apron are large and heavy, the carriage being carefully scraped and having a 24-in. bearing on the bed. Feed reverse and interlocking device, to prevent engagement of the feed rod and lead screw at the same time are provided. The back of the carriage is arranged for the application of a taper attachment. The quick-change gear box, of new design, is arranged to cut from 2 to 40, including 11½, threads per inch. Thirty-six feeds ranging from 0.0116 to 0.232 are obtainable. The tailstock is graduated for set-over work. The diameter of the tailstock spindle is 1 15/16 in. and the traverse 7½ in. The compound rest has wide bearing surface and is gibbed throughout; dial swivel and cross-feed dial are accurately graduated. The countershaft, supplied as regular equipment, is of double friction type, with self-oiling journals.

The swing of the 16-in. and 18-in. lathes, respectively, is: Over the Vees, 17 in. and 19 in.; over the carriage, 11 in. and 13 in.; and over the compound rest, 10 in. and 11½ in. The machines are available with beds 6 ft. 6 in. in length and up, in even 2-ft. lengths. The weight of the 18-in. x 10-ft. three-step cone, double back geared lathe with quick-change gears is 2050 lb. The machine illustrated is an 18 in. x 10 ft., geared-head unit with nine speeds and 2-hp. motor drive.



Nine Speeds Are Obtainable Through the Geared Head. A 2-hp. motor is employed

Forecasts End of Overproduction

GENERAL distribution of employment and conservation of production will be accepted within 10 years as the only true measure of prosperity, according to an article by James J. Davis, Secretary of Labor, in the February number of the *Monthly Labor Review*, Washington. He is of the opinion that the real object to be sought in the future is the manufacture of just enough to satisfy the national demand and foreign orders.

"Then we shall see at last some real conservation," he points out. "Economics will then live up to its name. We shall have real economy in the conservation of our natural resources, our raw materials, our national energies and, above all, a saving in our man power. We shall not wear out our workers, but rather lengthen their lives and usefulness at the same time that we lighten their labors." The economy of time that will result is held to be most important of all. Every ounce of production above capacity to consume is declared to be only a waste."

May Form Western Steel Institute

Conference at Del Monte, Cal., Decides to Consider Plan to Group Eleven Pacific and Mountain States — Minimizing of Foreign Steel Competition One Object—F. J. Koster Reelected Chairman

A PLAN to form a Western States Iron and Steel Institute, taking in 11 Pacific Coast and Rocky Mountain States, received consideration at the fourth annual conference of the Iron, Steel and Allied Industries of California at Del Monte on Feb. 17 and 18. A resolution was adopted referring the matter to a committee, which will submit a report at the next meeting of the association's executive committee.

About 200 steel men, representing Eastern and Western mills, structural steel fabricators, merchant steel and reinforcing steel jobbers and manufacturers who use steel in various forms, were present at the conference, perhaps the largest convention of its kind ever held on the Pacific Coast.

Among the speakers were Ray M. Hudson, assistant director of commercial standards, Department of Commerce, Washington; Charles J. Graham, president Bolt, Nut and Rivet Manufacturers' Association, Pittsburgh, and Charles F. Abbott, executive director American Institute of Steel Construction, New York.

Frederick J. Koster, president California Barrel Co., San Francisco, was reelected chairman of the conference.

The following objectives for the coming year were adopted by resolution: Centralized leadership, standard specifications and practices, uniform building code, support of California payrolls, extension of marketing territory in Western States, and publicity.

Before the opening of the conference, special group and committee meetings, representing foundries, general manufacturers, steel mills, merchant and reinforcing steel jobbers and fabricators, were held on Feb. 16 to discuss trade practices and general problems pertinent to each of the groups.

Reinforcing Steel Institute Elects Officers

The annual election of officers of the California Reinforcing Steel Institute was held on that day and resulted as follows: J. E. Heber, Pacific Coast manager Truscon Steel Co., Los Angeles, president; Charles M. Gunn, president Gunn, Carl & Co., San Francisco, vice-president; N. E. Dawson, Soule Steel Co., Los Angeles, treasurer. The following directors were elected: E. L. Soule, president Soule Steel Co., Los Angeles and San Francisco; W. S. Wetenhall, president W. S. Wetenhall Co., San Francisco; R. G. Falk, vice-president Badt-Falk Co., San Francisco and Los Angeles, and T. M. Davidson, Badt-Falk Co., Los Angeles.

Among the prominent visitors at the conference were William G. Clyde, president Carnegie Steel Co., Pittsburgh; G. Kahn, vice-president Truscon Steel Co., Youngstown; E. O. Shreve, manager industrial department General Electric Co., Schenectady, N. Y., and A. T. DeForest, vice-president United States Steel Products Co., San Francisco.

The general session of the conference was opened by Frederick J. Koster, who outlined what had been accomplished during the past year, saying that among the outstanding achievements were those of extending the market territory for California producers, the establishing of better purchasing policies and the putting into effect of standard practices. He also pointed out that much had already been done toward establishing a standard analysis for castings which ultimately would result in more uniform castings and in effecting savings for the foundryman and the user of castings as well as for the producer of pig iron.

M. A. Beeman, secretary Concrete Reinforcing Steel Institute, Chicago, emphasized the importance of cooperative effort as against individual effort. Mr. Beeman recounted what the institute he represents had achieved in a relatively brief time to secure for its members larger markets, better prices and more satisfactory methods of doing business in the face of domestic and foreign mill competition and low prices.

In speaking on the subject of standardization, he said: "Working in conjunction with the Department of Commerce, the steel mills and other interested parties, the reinforcing steel industry has succeeded in reducing the number of cross-sectional areas of steel reinforcing bars from 40 to 11 sizes. The result has been a tremendous saving to the steel producer and to our member jobbers through the elimination of heavy charges that were formerly necessary by virtue of carrying in stock many sizes seldom called for, and by increasing the facilities for handling steel."

Advantages Derived from Simplification

Ray M. Hudson, of the Department of Commerce, in his address on "Standardization and Its Relation to the Iron and Steel Industry on the Pacific Coast," said that thousands of American business men have come to recognize simplification and standardization as fundamental forces in modern business.

He said: "When the Hoover committee made its survey of waste in industry, it found wastes ranging from 29 per cent in the metal trades to 64 per cent in the manufacture of men's ready-made clothing. Fifty per cent of the responsibility for this waste was found to be chargeable to management and 25 per cent to labor; the remainder to conditions beyond the control of either labor or management.

"The Department of Commerce has helped to bring about simplification in many lines, and a few of the completed simplifications of interest to the iron and steel industry have resulted in the reducing of solid section steel windows from 42,877 sizes to 2244 sizes, and sheet steel (jobbers' sheets) from 1819 to 263 sizes. In the latter instance the sheet steel committee estimates that this simplification has saved the industry about $4 a ton or $2,400,000 annually.

"Pacific Coast manufacturers will find it to their advantage to concentrate their production and sales efforts on these simplified lines, for they are always in demand and will therefore move out to the trade in due season. Distributers will find these simplified lines easy to buy and sell, thus giving them a quicker turnover."

Mr. Hudson said, in speaking of foreign competition: "The greatest bulwark against invasion of our domestic iron and steel markets by foreign producers is American inventive genius and American executive capacity for organization. The bogey of foreign competition is bound to recede as we mobilize our resources and our collective energies for the best interests of our industries and the public whom they serve. Simplification, standardization and research are three formidable allies in any industry."

Radical Changes Necessary to Insure Prosperity

Charles J. Graham spoke on "Cooperation, the Essential Factor in American Prosperity." He said that close students of business conditions realize that some very radical changes are necessary if a condition is to be brought about which will assure a continuance of the prosperity enjoyed during the past three years and "to take the word profitless out of the picture."

Mr. Graham said: "There is no argument against the uneconomic unsoundness of one-half of our business institutions doing business at a loss, as no doubt will be shown when all returns are in for 1927. The correction of this condition is our greatest national problem and must be solved if we are to stabilize and perpetuate present labor conditions, as satisfactory labor conditions and present high wages are responsible for the degree of prosperity we have had. Any underlying condition which would affect in any way our ability to keep up the present rate of employment or of wages paid would have the effect of cutting down buying power, and the inevitable result would be a long period of depression.

"The subject of paramount importance to the Pacific Coast," he said, "is that of the rapidly growing importation of foreign materials, such as steel, window glass and various other materials. Ways should be found immediately to correct this situation which, if permitted to continue at its present rate of increase, will eventually react and do more to break down what you are endeavoring to build up than any other single factor or group of factors you are in contact with."

Another series of group meetings was held on the afternoon of Feb. 17, and the chairmen of the various groups reported in a general way at the closing session on the following morning, more detailed reports to be submitted to the executive committee at a later date.

Those who addressed the closing meeting were John B. Leonard, structural engineer, San Francisco, who spoke on "The New Uniform Building Code and Its Relation to the Iron and Steel Industry of California"; Frank C. Mortimer, vice-president Citizens National Bank, Los Angeles, and Charles F. Abbott, American Institute of Steel Construction, whose address was given in part in THE IRON AGE of Feb. 23, page 531.

Steel Trade Should Become "Profit-Minded"

Executives in control of policies of steel companies should become "profit-minded" with a view to putting their net income in line with less important businesses, was the advice given by Mr. Mortimer, banker. "There is no law against making good profits," Mr. Mortimer said. "Understandings among those engaged in specific lines of business which help to make fair profits should not be looked upon as reprehensible."

Mr. Mortimer said that if he were asked to write a prescription for the steel business he would make the following suggestions:

- Continue research and educational work. Find new uses for steel and inform the public how to apply them.
- Watch costs more carefully. Reduce overhead and distribution expense where possible.
- Manufacture or contract in quantities sufficient to supply the requirements of regular customers and such additional quantities as can be sold at a good profit. Tighten up on execution and enforcement of contracts.
- Consolidate some plants, if economical to do so. Disregard excess plant capacity, and discontinue unprofitable volume.
- Maintain sales volume in proper relation to demand.
- Put a price on products that will permit a continuance of good wages to employees and good returns to stockholders.
- Take or follow the lead in further and more effective moves for closer cooperation and better understandings in the industry.
- Earnestly and sincerely adhere to your present code of ethics, or to such revised practices as may be decided upon for the betterment of conditions.

Officers and Group Committees Named

Frederick J. Koster was unanimously reelected chairman of the executive committee. Walter Taylor, vice-president Llewellyn Iron Works, Los Angeles, vice-chairman from Los Angeles, and E. L. Soule, Soule Steel Co., San Francisco, vice-chairman from San Francisco.

The following group committee men were announced:

MANUFACTURERS OF SOUTHERN CALIFORNIA: George J. Kuhrts, Jr., Standard Boiler & Steel Works, Los Angeles, chairman; H. Riggs, Baasch-Ross Tool Co., Los Angeles; W. Wardman, Alloy Steel & Metal Co., Los Angeles; A. J. Morse, Alloy Steel & Metal Co., Los Angeles; George Koehler, Federal Tank & Steel Works, Los Angeles.

MANUFACTURERS OF NORTHERN CALIFORNIA: H. W. Force, California Corrugated Culvert Co., Berkeley, chairman; R. M. Alvord, General Electric Co., San Francisco; G. A. Bahler, Caterpillar Tractor Co., San Leandro; R. A. Folsom, W. R. Ames Co., San Francisco; H. P. Phillips, Link-Belt, Meese & Gottfried Co., San Francisco.

STRUCTURAL FABRICATORS, SOUTHERN CALIFORNIA: E. H. Gohle, McClintic-Marshall Co., Los Angeles, chairman; Guy C. Boyton, Baker Iron Works, Los Angeles; R. T. Miller, Union Iron Works, Los Angeles; C. Fred Brombacher, Brombacher Iron Works, Los Angeles; G. W. Suarett, Llewellyn Iron Works, Los Angeles.

STRUCTURAL FABRICATORS, NORTHERN CALIFORNIA: H. Mortenson, McClintic-Marshall Co. Central Works, San Francisco, chairman; Paul F. Gillespie, Judson-Pacific Co., San Francisco; S. S. Herrick, Herrick Iron Works, Oakland; Charles E. Spencer, California Steel Co., Oakland; H. Morris, Western Iron Works, San Francisco.

MERCHANT STEEL JOBBERS, SOUTHERN CALIFORNIA: Shannon Crandall, California Hardware Co., Los Angeles, chairman; C. A. Ducommun, Ducommun Corporation, Los Angeles; D. P. N. Little, A. M. Castle Co., Los Angeles; E. Jungquist, Percival Steel & Supply Co., Los Angeles.

MERCHANT STEEL JOBBERS, NORTHERN CALIFORNIA: F. J. Bruzzone, Baker, Hamilton & Pacific Co., San Francisco, chairman; H. D. Simon, Foucar, Ray & Simon, San Francisco; Roy L. Sanford, A. M. Castle Co., San Francisco; C. H. Merrill, Holbrook, Merrill & Stetson, San Francisco; F. F. Thomson, Thomson-Diggs Co., Sacramento.

STEEL MILLS, SOUTHERN CALIFORNIA: Harvey Hewitt, Southern California Iron & Steel Co., Huntington Park, chairman.

STEEL MILLS, NORTHERN CALIFORNIA: S. S. Lawrence, Columbia Steel Co., San Francisco, chairman; E. S. Houdlette, Pacific Coast Steel Co., San Francisco.

REINFORCING STEEL JOBBERS, LOS ANGELES: J. E. Heber, Truscon Steel Co., Los Angeles, chairman; N. E. Dawson, Soule Steel Co., Los Angeles; E. L. Hansen, Blue Diamond Co., Los Angeles; D. N. Folling, Pacific Coast Steel Co., Los Angeles; George Parker, Fenton-Parker Material Co., San Diego.

FOUNDRIES, SOUTHERN CALIFORNIA: Martin Madsen, Madsen Iron Works, Los Angeles, chairman; G. A. Axleson, Axelson Machine Works, Los Angeles; Carroll A. Stilson, Metal Trades Manufacturers Association, Los Angeles; Lloyd D. Kay, Kay-Brunner Steel Casting Co., Los Angeles; Frank M. Burger, Llewellyn Iron Works, Los Angeles.

FOUNDRIES, NORTHERN CALIFORNIA: George A. Gunn, Best Steel Casting Co., San Francisco, chairman; C. E. Williams, Columbia Steel Corporation, San Francisco; D. Guild, Phoenix Iron Works, Oakland; C. M. Henderson, McAulay Foundry Co., Berkeley; A. D. Scoville, Pacific Coast Foundrymen's Association, San Francisco.

The following resolutions were adopted by the conference:

Centralized Leadership. The development of a greater centralized leadership in the iron and steel industry by a more energetic continuation of the coordination work of the Iron, Steel and Allied Industries of California through the annual Del Monte conference and the continuation of the group meetings throughout the year.

Standard Specifications and Practices. Coordination of technical groups of architects, contractors and engineers in connection with standard specifications affecting the iron and steel industry of California.

Uniform Building Code. The active cooperation of the iron and steel industry in the adoption of a uniform building code and its general acceptance and application by the municipalities of California.

Support of California Payrolls. Continuation on a more energetic basis of the work of the Iron, Steel and Allied Industries of California to develop a statewide attitude of appreciation of the value of industrial payrolls in California, for the purpose of reducing foreign importations to the minimum, where such importations seriously interfere with the proper development of iron and steel industries in California.

Extension of Marketing Territory in Western States. Continuation of the traffic program in obtaining rate adjustments that will make it possible for California industries to serve new territories in the Western States that are logically a part of the trade area of California industries.

Publicity. Conduct an active program of publicity through the press and trade magazines of the State for the purpose of expanding existing industries and encouraging new payrolls in the iron and steel industry of California with due regard and protection for existing industries.

Western States Iron and Steel Institute. That a special committee of three be appointed by the executive committee to investigate the problem of formulating a Western States Iron and Steel Institute to comprise the 11 Western States; further, that this committee be requested to attend the Northwestern Iron and Steel Conference at Tacoma, Wash., Feb. 27, and submit a report on it at the next meeting of the executive committee for consideration.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY
DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

GENERAL BUSINESS OUTLOOK

Favorable Factors

1. The continued rise of the P-V line indicates further improvement in the relation between demand and supply.

2. The trend of building activity was upward in January.

3. The automobile industry is expanding.

4. Unfilled orders show an upward trend.

5. Money is easy.

6. Factory employment and payrolls declined less than usual in January.

Unfavorable Factors

1. Retail trade declined sharply in January.
2. Considerable unemployment exists.
3. Purchasing power of farmers has declined again.
4. Profit margins are low in many industries; failures numerous; new enterprises established few.
5. Severe competition and price cutting in the automobile field.
6. Bank credit over-extended for security market operations; brokers' loans excessive.
7. A reaction in the stock market.
8. Unfavorable political situation.

OBVIOUSLY there are several rather heavy drags on the trend toward prosperity, notably political uncertainty, reduced purchasing power of factory laborers and farmers, and the necessity for correcting inflation in the stock market. But the more barometric basic indexes such as the P-V line, building activity and unfilled steel orders still point upward. Even the trend of employment became more favorable in January. Political uncertainty is about offset by prospects of continued easy money. In general it may be said that the unfavorable indications are mostly indexes of the existing semi-depressed condition growing out of past developments, and may well be taken as promises of recovery later on. The favorable factors forecast early improvement.

Continued Expansion Indicated

THERE is no need this month for much discussion of the P-V line (ratio of commodity prices to physical volume of trade) and its relation to ingot production. Briefly stated, the facts are that a continued rise occurred in the P-V line, together with an unusually sharp upturn in ingot production. About the usual time has elapsed between the upturn in the P-V line and that in steel production. In 1921 some seven months intervened between the rise in the barometer line and the upturn in steel. Exactly seven months intervened between the two occurrences last year, the P-V line having risen in May and the ingot curve (adjusted for seasonal variation) moving up in December.

Perhaps there is some interest in speculating as to the future. In our chart the P-V line has been on the up-grade for eight months; steel production has risen during but two months. It might, therefore, be hoped that a further rise in steel production will occur and one might even go so far as to hope that the expansion will last for six months following January, or until July. It could hardly be hoped that the rise would go forward steadily without interruption, but, allowing for seasonal conditions, one might expect the trend to be mostly upward.

Two facts, however, must be noted as moderating such hopes: (1) The rise of the P-V line, after being quite sharp for four months, has been rounding off; (2) steel production spurted so sharply in January that it ran well above normal. Also there are signs indicating that the P-V line may possibly decline in the near future. These facts suggest the possibility that the supply of steel may gain on demand so rapidly that the rise in steel production may not carry through. It must be admitted that the expansion in the steel industry would now be more likely to show a sustained movement had production not been stepped up so rapidly.

All this is highly speculative, and is probably over-

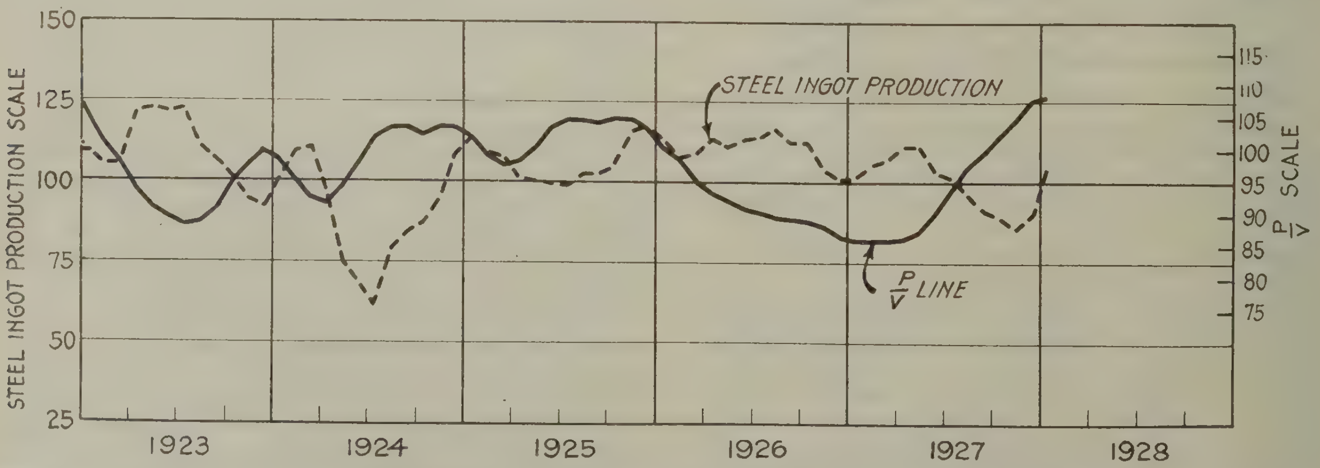


Fig. 1—Upward Movement of the P-V Line (Ratio of Commodity Prices to Physical Volume of Trade) Has Continued for Nine Months. Steel production responded sharply in January and heavy tonnages, with better prices, may be expected for several months

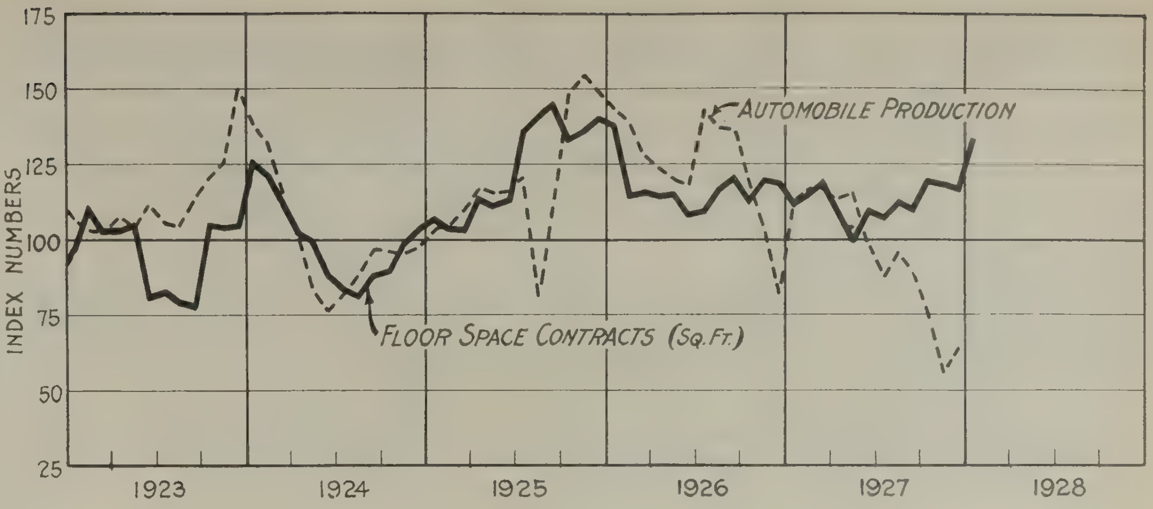
Fig. 2 — Potential Demand for Steel from Construction Activity Has Been Well Sustained. Improvement in the automobile demand for steel is thought to be at hand



working the idea that any general business barometer can be expected to forecast steel production with mechanical accuracy. It can be said, however, that *the prospects for business in general are sufficiently favorable to warrant the anticipation that the steel industry will find support at an above-normal rate of production during a period lasting from four to six months.* For example, the building program is considerable and the automobile industry will not reach the peak of its production much before May.

Buildings and Automobiles Move Upward Together

THE chief reason and justification for the recent expansion in the steel industry is apparent in the second chart. Incidentally, too, there appear some of the reasons for anticipating an early recovery in general business. In January, after making all due allowance for seasonal conditions, the trend of both building activity and automobile production was sharply upward. This is the first time that such a statement could be made since January, 1925.

Floor space in construction contracts awarded, as reported by F. W. Dodge Corporation, actually increased a little in January, in spite of the fact that a decline would have been normal for the month. The adjusted index is 133.6 per cent of the average for 1921-1927, against 117 per cent in December and 111.7 per cent a year ago. This increase is the more impressive in that building permits showed a similar trend. It continues to seem reasonably certain that building activity will hold somewhat above normal, to the great benefit of steel and many other industries, including rail and truck transportation.

Total production of motor cars and trucks in the United States and Canada jumped from 136,600 in December to 233,500 in January, an increase of over 77 per cent in the average daily output. Allowing for seasonal variation, our adjusted index is 103.3 per cent of the average of the last seven years, and compares with 63.6 per cent in December, and with 112.5 per cent in January, 1927. While automobile production is still below a year ago, the trend is sharply upward and at least the usual seasonal gains are probable in February and March. Ford has been slow to get into production, and the total sales of automobiles have not yet shown so great a gain as had been hoped for. But such leading companies as General Motors and Studebaker show large increases in new business. This trend should help steel, glass, non-ferrous metals, textiles and rubber—some of which badly need help.

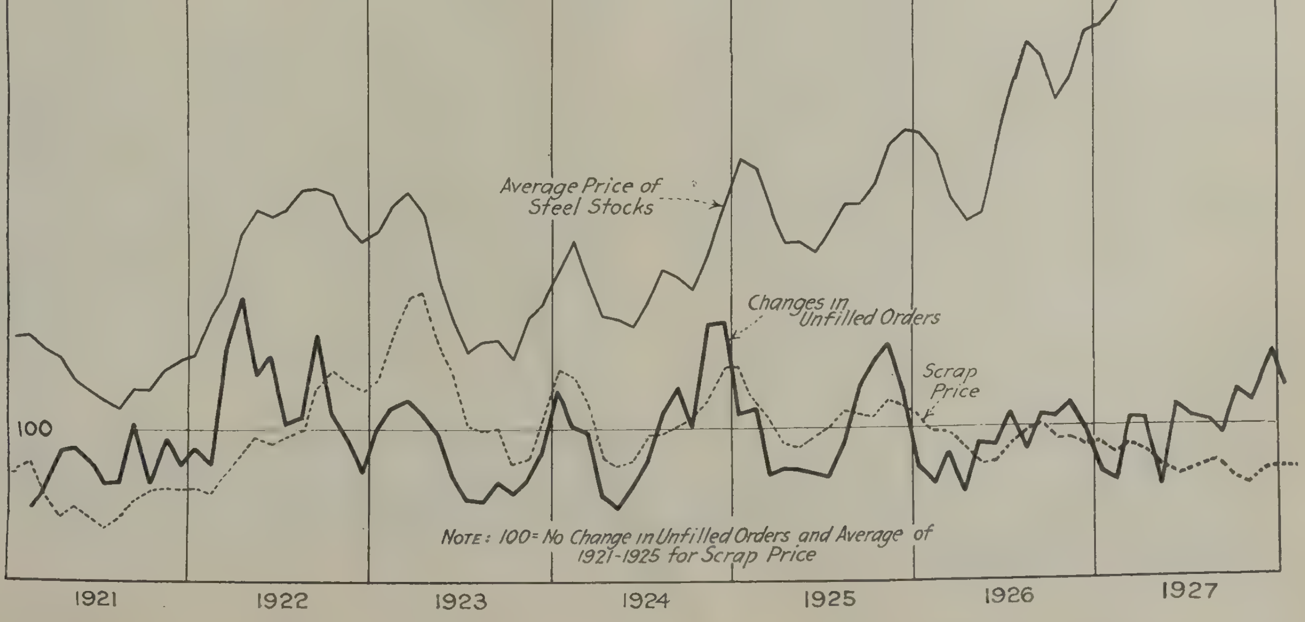
Building activity is an excellent indicator of the business trend. It is, therefore, significant to note that contracts awarded have taken a general upward course since last May.

Some Barometers Point Downward

IN our third chart, however, none of the indexes point upward. The unfilled orders barometer is down; the common stocks of steel companies are down; scrap prices are barely steady. In view of the expansion in the steel industry since January, and the somewhat stronger markets for finished steel, this showing seems paradoxical.

The decline in the unfilled orders barometer is not so bad as it might seem. As long as the curve is

Fig. 3—None of the Three Indexes Points to Higher Operating Conditions. The gain in unfilled orders was less than in December; stock prices are lower and scrap prices weak



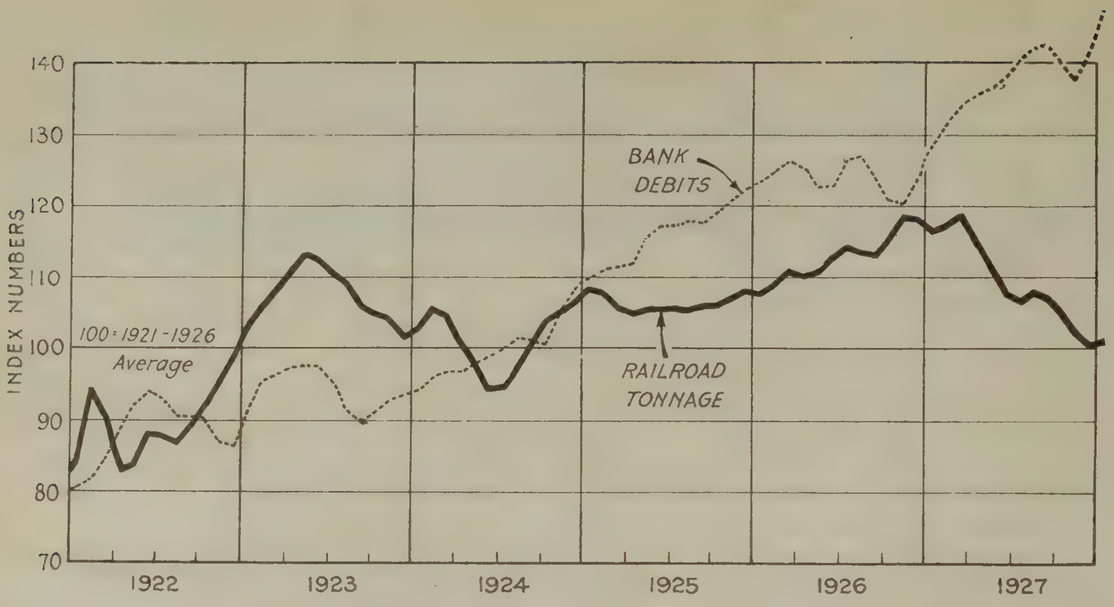


Fig. 4—Freight Traffic Has Reached What May Prove to Be the Low Point. It is nearly 25 per cent below November, 1926. Bank debits, on the other hand, have made the highest record ever known, but it is largely speculative

above the base line in the chart, some increase in unfilled orders is indicated. The decline in the curve in January simply means that the increase in unfilled orders in that month was less than the increase in the preceding month. The same situation existed in January, 1925. The barometer line was headed downward in January, 1926, and January, 1927, but in those months it fell below the base line, indicating an actual decrease in unfilled orders. It must be admitted, however, that the rate of change in unfilled orders is a very sensitive barometer. Usually its decline means a decrease in new orders.

Usually, too, a decline in the unfilled orders barometer has anticipated weakness in steel stocks, one of the very few exceptions having occurred during the inflationary movement at the beginning of 1927. Certainly the present is no exception to the general rule. Already, in February, the average price of nine steel stocks during the first three weeks is as low as the low average of last November. During the period between last September and the present time, the decline which has occurred in steel stocks is the sharpest since the spring break in 1926. It begins to look as if the September peak in the price of steel stocks had fully discounted the present expansion in the industry.

In spite of the increase in steel production, the market for steel scrap shows no strength and the decline in the unfilled orders barometer would indicate further weakness. At the least, the trend of scrap prices leads to no optimistic conclusion.

Freight Tonnage Perhaps at Low Point

THAT business cycles exist, but that they differ widely in nature, is again illustrated by the fourth chart. Railroad freight traffic, after rising in November, 1926, to a point more than 20 per cent above the average for the six years 1921-1926, fell in December, 1927, to a point nearly 2 per cent below that average. These percentages are stated without making any allowance for long-time trend or normal growth in the country's requirements. But the figures, being based on the average for a series of recent years, are probably much the same as they would be if the percentages were calculated with reference to an estimated "normal." This represents a decline of nearly 25 per cent.

It is interesting to note that the decline in freight tonnage that occurred between the peak in May, 1923, and the low point in June, 1924, was only a little less, amounting in that case to about 21 per cent. Freight traffic figures give a very comprehensive picture of industrial activity, and, aside from strike influences, rather faithfully represent the course of the business cycle insofar as this can be done without considering prices and profits. *It is, therefore, of interest to note that we have already had a somewhat greater recession than occurred in the preceding business cycle.*

One difference between the last two cycles lies in the relatively prolonged gradual rise in industrial activity that went on during 1925 and 1926. Instead of rising sharply to a peak, as was the case in 1922-1923, industrial activity held irregularly to a moderately high level, acting almost as though it were being held in restraint by the relative weakness of commodity markets. But the decline during 1927 was similar in degree and in magnitude to that in 1923-1924.

Bank Debits and Securities Speculation

Another difference is found in the performance of bank debits. As shown in the fourth chart, the curve of bank debits was relatively low during the years 1921-1924 and relatively high in the years 1925-1927. This is true, even when allowance is made for a more sharply upward long-time trend in the bank debits. Average weekly bank debits made a new record in December, 1927, when the volume of freight traffic was at the lowest point since 1924. This rise in bank debits was not due to higher commodity prices and payrolls, for the broad trend of commodity prices was about level during the whole period from 1923 through 1927, and payrolls actually declined during 1927.

As we have pointed out before, the largest factor affecting bank debits must be speculation, and notably speculations in securities. In short, *the bank debits curve reflects the inflation in the stock market and gives some idea of the extent to which, after a brief period of liquidation in 1926, that inflation has been carried in* 1927. The wide spread between railroad tonnage and bank debits represents the effect of a lower basis of capitalization, "easy money," large corporate reserves (insuring dividends in spite of a decline in business), and hopefulness as to the future (leading to a willingness to buy and hold securities over a cyclical decline).

One thing is clear: Bank debits and bank clearings do not show the true trend of industrial activity. And, by the same token, the stock market is also not showing the same alinement with business conditions, in the ordinary sense of that term, as it has generally done in the past. This may represent in part a transition to a permanently higher level of security prices and of bank debits. But we are inclined to think that to some extent it represents a maladjustment and that, as the industrial volume expands and carries railroad tonnage higher, the basis of capitalization and money rates will be advanced for a while and stock prices and bank debits will ultimately decline to meet the rising tonnage curve.

Schedule of the next installments of the ***Business Analysis and Forecast,*** *by* ***Dr. Lewis H. Haney,*** *Director New York University Bureau of Business Research, follows:* ***March 15—Activity in Steel Consuming Industries; March 22—Position of Iron and Steel Producers; March 29—General Business Outlook.***

Defines Engineering Trends in Steel

Recent Developments Reviewed by American Metallurgist—Expansion and Effect of Alloy Steels—Suggests Biological Concept of Metallurgy of Steel

A COMPREHENSIVE and valuable lecture on "The Trend of Engineering Developments in Steel" was delivered Friday evening, Feb. 17, by Dr. B. D. Saklatwalla, vice-president Vanadium Corporation of America, before a large assemblage of metallurgists and chemists in the main auditorium of the Chemists' Club, New York. The meeting was held under the auspices of the American section of the Society of Chemical Industry.

Growth of Alloy Steel Industry

Only a few of the outstanding features of Doctor Saklatwalla's broad treatment of this important subject can be touched on here. Phenomenal as the growth of general steel tonnage may seem, said the speaker in the early part of his address, the growth of alloy steels within the last few years has been still more surprising. The statement has been made, based on statistics, that the alloy steel industry has progressed 18 times as rapidly as the general steel industry in the last 15 years. Alloy steels have entered fields where their application could hardly have been prophesied. This development of alloy steel is undoubtedly responsible for our present-day engineering advancement. It is undoubtedly recognized that the advances of modern engineering are closely associated with the wonderful properties of the materials employed. But it may not be generally apparent that these properties are brought about by the effects of heat treatment carried to a high degree in the presence of alloys.

"It has been suggested in the past that the civilization of a nation is measured by the amount of sulphuric acid consumed by it, and again latterly it was suggested that the amount of steel scrap produced by it should be a truer measure," said Doctor Saklatwalla. "It would not be amiss here to set up another criterion, namely, that the civilization of a nation is proportional to the tonnage of metal heat treated by it."

Biological Concept of Steel Metallurgy

A large part of Doctor Saklatwalla's address was taken up with a discussion of the formation and structure of alloy steels, based upon an outline in diagrammatic form, representing the equilibrium changes during the process of solidifying and cooling where the composition in percentages of carbon and temperatures are coordinated. In connection with this outline, Doctor Saklatwalla drew the unique analogy that such an outline might be termed the biological concept of steel metallurgy. He insisted that the analogy is not merely a fantastic one, but a very real one. One area in the diagram he designated as the "prenatal" and another as the "area of adolescence." As in biology so in steel metallurgy, he contended, these prenatal influences have been found to be of tremendous importance. "As in biology, the care and nurture lavished on the steel at these periods is reflected in the ultimate engineering qualities which eventually emerge. Experience bears this out, since defective soaking pit practice or improper period of heating, reheating and quenching, after fabrication, are reflected in weakness and failure during the adult engineering life of the steel."

Effect of Alloys on Steels

Alloying elements in general, with special reference to certain ones in particular, were then fully discussed by the speaker. He emphasized the difference between ordinary scavenging and "molecular scavenging," as illustrated in the use of vanadium in particular, which is an example of the latter. Grain growth was discussed to some extent, as well as the alloying of cast iron. High percentage alloy steels were reviewed quite extensively, with particular emphasis on the important part they will play in the future of engineering, both from a standpoint of resisting corrosion and oxidation at ordinary and high temperatures. Attention was also called to an intermediate grade of steels containing alloy elements in higher percentages than those found in structural alloy steels, though not as high as those found in non-corrosive steels of the stainless type. Some of the developments already made in this field were presented.

Present Status of Testing

The lecturer devoted considerable attention to the question of the value of testing steel, and stated that our ideas as to testing and the values of tests and their correlation to service are becoming greatly modified. The engineering profession has been accustomed to evaluate steel on the basis of standardized physical tests made on regulation test bars. While there could be no argument as to the value of physical test results for certain purposes, especially for comparison between various lots on the same type of steel, they become irrational in comparing divergent and separate types of steel. "The alloy steel industry is now some 20 years old, and if the results of testing and service experience gathered in that time be plotted on probability curves, we would gain a fairly clear picture of the respective merits of the various types of steel for a given service."

Proper Trend in Steel Research

In conclusion, Doctor Saklatwalla said that considerable interest has been aroused recently in the subject of research in steel metallurgy. It is well to bear in mind, he said, that we are concerned with steel more from the engineering standpoint than the mere treatment of steel as a chemical product. "There is a distinct differentiation between the science of metals and the science of applied metallurgy, and the work of the last 20 years or so has been directed mainly to the science of metals. Progress should be directed in the development of correlation of test and service. We have not yet developed a rational abrasion or wire test. Our knowledge of properties of steel at high temperatures is still very limited. We lack a visual representation of how steel actually fails under certain conditions and how failure progresses. The engineer and designer are limited by the materials furnished them by the metallurgist, and consequently the progress of civilization is in no mean measure dependent on him. Our progress should lie along qualitative rather than quantitative lines. As an example of new methods may be cited the development of X-ray analysis. We are not able to study as yet the high temperature changes occurring in steel by means of the hot microscope. We devote too much effort and attention to microscopic and too little to macroscopic investigation. It would certainly pay to investigate trodden fields before exploring new ones.

DISCUSSION

Dr. Ancel St. John, consulting physicist, New York, was the first of those present to discuss Doctor Saklatwalla's lecture. He called attention to the fact that some 10 years ago he had advised the use of X-rays for studying metallurgical problems, and had suggested the possibility of X-ray diffraction analysis. Since that time the methods used in attacking these metallurgical problems have been improved, and it has been demonstrated that valuable information can be obtained by means of the X-ray without changing the metal in any respect. This method of analysis, Doctor St. John claimed, was far ahead of the microscope in the broad scope of the information obtainable. He stated that he had been examining recently sheet, brass, copper and iron up to ⅛ in. in thickness with the X-ray, in the rolled, annealed and strained condition. It had been possible, he said, to investigate practically the same area in each case, and he was glad to report that he felt that he had found out what is going on inside the metal during these various operations. Alluding to the lecturer's suggestion of the "prenatal period" in steel formation, Doctor St. John testified that he considered this very important.

The allusion of the lecturer to the prenatal, the adolescent and other periods in the development of steel was impressive, said Dr. F. N. Becket, vice-president Electro Metallurgical Co., New York. He said that it reminded him of the old saying, "Spare the rod and spoil the child," and he alluded to the possibility that, if steel is "spanked" in the prenatal, in the adolescent and in the later periods of its formation or development, it may be greatly improved. He desired to take issue with one commentator of the evening as to the impossibility of rolling high chromium products. At present, high chromium steels are being rolled down to plates and even sheets.

Complimenting Doctor Saklatwalla on the generous and broad statement which he had presented in his lecture, Dr. Paul D. Merica, director of research, International Nickel Co., New York, in alluding to the question of testing, said that our chief concern should be to give the engineer accurate information, rather than to devote too much time to the development of new products. He referred to the important progress that has been made in our knowledge of the properties of metals at high temperatures and in certain other fields of engineering steel development discussed by the lecturer.

Railroad Proposed to Link Youngstown Mills with Ohio River

Pittsburgh, Lisbon & Western, Owned by Pittsburgh Coal Co., Would Build 40-Mile Track Affording Savings on Coal and Steel Shipments

PITTSBURGH, Feb. 28.—More than ordinary interest is taken by steel manufacturers here and in Youngstown in the filing with the Interstate Commerce Commission by the Pittsburgh, Lisbon & Western Railroad of an application for permission to build 40 miles of trackage and thus provide a direct rail connection between Youngstown and the Ohio River. The Pittsburgh, Lisbon & Western Railroad is owned by the Pittsburgh Coal Co., and while the primary purpose of the proposed addition to the system is to enable the coal company to haul coal partly by water toward Youngstown and adjacent territory and effect a reduction in delivered coal costs through lower freight charges, it could be used for bringing the steel products of the Youngstown district to the river terminal and permit producers to share some of the advantages of river shipments now enjoyed by mills in Pittsburgh, Wheeling and southern Ohio.

The present line of the railroad runs from New Galilee, Pa., about 40 miles northeast of Pittsburgh, west to Lisbon, Ohio. In the construction of the new line, only four miles of the present line would be utilized, the plan calling for a 13-mile section to run from Smith's Ferry, near East Liverpool, Ohio, and Chester, W. Va., to Negley on the present line, thence west to Mill Rock, where the new line would start north 27 miles to a fork, with one branch into Struthers, Ohio, and another to a junction with the Erie Railroad at Austintown, just outside of Youngstown.

There is little doubt that Youngstown district steel companies would welcome this or some similar project that would enable them to reduce their coal costs and put them on more nearly even footing with Pittsburgh district companies able to draw their coal supplies by river. The latter are almost all within the zone where the river rate on coal is 15c. per ton from mine to plant. The present rail freight rate from Pittsburgh to Youngstown is $1.34 per ton and from the Connellsville district it is $1.42 a ton. It is believed that a combination rail and river rate of not more than $1 a ton would be possible through the building of this new line or in the working out of an arrangement whereby the existing railroads would take the coal at some point along the Ohio River and grant a proportional of the Pittsburgh through rate from that point to destination. Operated separately, with the railroad charging the local rate from the river terminal to destination, there would be little or no saving over the all rail rate.

The idea of building a road that would connect Youngstown with the Ohio River is not a new one. Several years ago an attempt was made by Youngstown steel interests to secure a traction line running in a roundabout way from Youngstown to East Liverpool, and converting it into a steam railroad with an idea of partial use of the Ohio River in the inward movement of coal and the outward movement of steel products, but nothing definite ever developed. One of the Youngstown steel companies since has been working on plans for a road that would be more direct from Youngstown to the river and in the past year there have been discussions between Youngstown steel companies and Pittsburgh coal companies having mines on or adjacent to the rivers of a plan which involved the building of a river terminal near Beaver, Pa., to which coal would be conveyed by water and then transferred to the railroads, and which might also be used as a transfer from cars to barges of down river movements of steel products from Youngstown. This plan to be successful would necessitate the cooperation of the railroads through the granting of a rate to and from Youngstown that would be a proportional part of the through rate, instead of the local rate, relatively high because of the short haul.

Shipping Board to Buy Oil Engines for Auxiliary Uses

WASHINGTON, Feb. 28.—The Shipping Board has authorized Commissioner W. S. Benson to negotiate contracts for the purchase from the Nordberg Mfg. Co., Milwaukee, of 12 two-cycle, three-cylinder, 500-bhp., air injection, internal combustion auxiliary engines at a cost not greater than $426,840. Commissioner Benson also has been authorized to negotiate for the purchase of four three-cylinder, four-cycle, 280-bhp., air injection, internal combustion auxiliary engines from the Fulton Iron Works, St. Louis, at a cost not greater than $107,232. These engines are for auxiliary equipment in the eight additional vessels the conversion of which was authorized by a Shipping Board resolution.

Exporters to Hold Convention

The eighth annual convention and dinner of the Export Managers' Club of New York, Inc., will be held March 20 at the Hotel Pennsylvania. Among the topics scheduled for discussion are new export methods, the use of aviation in expanding foreign trade, cables, radio and international telephone communication, budgetary control of export business, export sales quotas and the use of motion pictures in promoting foreign business.

The Export Managers' Club has a membership of more than 400 and the annual convention is open upon registration to anyone interested in foreign trade. The attendance at the convention last year exceeded 750.

Commercial Steel Castings Bookings and Production High in January

Orders for commercial steel castings in January totaled 90,863 tons, or 62 per cent of capacity, against 76,953 tons, or 53 per cent of capacity in December, according to reports received by the Department of Commerce from 129 concerns with a monthly capacity of 145,600 tons. Of the orders in January, 41,276 tons were for railroad specialties, representing 61 per cent of that class of capacity, compared with 39,112 tons, or 59 per cent in December. Orders for miscellaneous castings in January totaled 49,587 tons, or 63 per cent of that class of capacity, comparing with 37,841 tons, or 49 per cent, in December.

Total orders received in January made the largest tonnage since last June.

Production in January amounted to 73,886 tons, or 51 per cent of capacity, against 58,220 tons, or 40 per cent of capacity, in December. Castings for railroad specialties produced in January totaled 28,714 tons, or 43 per cent of that class of capacity, against 19,358 tons, or 29 per cent, in December. Production of miscellaneous castings in January totaled 45,172 tons, or 58 per cent of that class of capacity, as compared with 38,862 tons, or 50 per cent, in December. Total production in January was the highest for any month since last August.

By-Product Coke in January Equals Previous High Record

Production of by-product coke in January totaled 3,880,000 net tons, an increase of 234,000 tons, or 6.4 per cent, over the output in December, according to the Bureau of Mines. With the exception of March, 1927, when the reported production was the same, the January output was the highest on record. Production of beehive coke in January remained practically stationary, the total being estimated at 376,000 tons.

Automobile Production in January Gained 68½ Per Cent Over December

Production of motor vehicles in the United States increased to 225,039 in January, against 133,547 in December, according to reports received by the Department of Commerce from 161 manufacturers, 49 of whom make passenger cars and 130 make trucks, with 18 making both. Of the January output, 199,032 units were passenger cars and 26,007 were trucks, comparing with 106,079 passenger cars and 27,468 trucks in December.

Despite the gain of 68½ per cent from December, the January output was the smallest for any January since 1922. It compares with 238,926 last year, 309,544 in 1926, 240,592 in 1925, 318,526 in 1924 and 244,302 in 1923. Only five months of the preceding five years made lower figures.

Production in Canada in January was 8463 vehicles, of which 6705 were passenger cars and 1758 were trucks. This compares with a total of 3435 vehicles in December, of which 2277 were passenger cars and 1158 were trucks.

Increased Shipments of Malleable Castings

Shipments of malleable castings in January are reported by the Department of Commerce at 47,691 tons. This compares with 42,694 tons in December and 37,986 tons in November. It is, however, substantially below the shipments of January, 1927, at 49,342 tons. Figures are for 133 identical plants, of which five were idle in January.

Production of these same plants in January is given as 54,818 tons. This is the highest monthly figure since last June. It compares with 47,866 tons in December and with 51,492 tons in January, 1927.

Operation in January was at 59.6 per cent of capacity, compared with 47.6 per cent in December and with an average of 50.4 per cent for the 12 months of 1927. Capacity is on a new basis. The formula used is the "average monthly production for the best six consecutive months since Jan. 1, 1919." This places the figure at 92,015 tons, against more than 100,000 tons in each month of 1927. Hence the percentage ratios are no longer comparable.

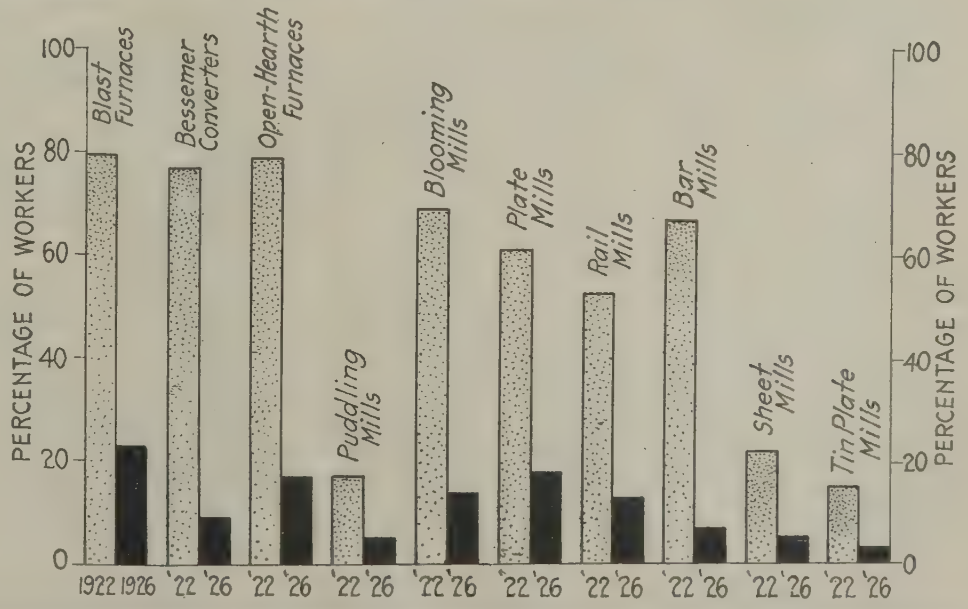
Fabricated Steel Plate Orders Lower

New orders in January for fabricated steel plate are reported by the United States Department of Commerce at 32,810 tons. This represents a drop of 8 per cent from the December figure of 35,648 tons and about the same from the figure for January, 1927, at 35,854 tons. It represented 41.1 per cent of capacity of the 51 firms reporting.

Oil storage tanks accounted in January for 8758 tons, refinery materials and equipment for 2575 tons, tank cars for 2412 tons, gas holders for 2062 tons, blast furnaces for 1225 tons and stacks and miscellaneous uses for 15,778 tons. The latter was the highest figure since last May. Blast furnace requirements made the highest total in more than a year.

Striking Reduction in Long Week in Steel Mills

CHANGES in work-week are shown in the diagram alongside. The solid black areas represent the proportion of the men, in each group designated, whose regular week in 1926 was of more than 60 hr. Contrasted with this is the dotted portion, showing the 1922 proportion on the same basis. It will be noted that there has been a sharp reduction in the long-time week for every group of iron and steel workers represented. Blast furnace operatives working more than 60 hr. have been reduced from 79 to 24 per cent, and others in similar or even greater proportions. Of the tin mill workers only 2 per cent, roughly, were working over 60 hr. in 1926. Figures are from the United States Bureau of Labor Statistics.



European Markets in Better Shape

Higher Prices and Larger Demand, Both Local and for Export —Scrap Prices Weak

(By Cablegram)

LONDON, ENGLAND, Feb. 27.

CLEVELAND pig iron position has been improved as a result of increasing prices of Continental iron. British iron makers are now securing better export orders. Domestic consumers have placed contracts up to June and stocks of iron are decreasing. There is talk of relighting some of the 50 Cleveland blast furnaces now idle. Hematite competition is still strong and, as stocks are still large, there is a possibility of one works closing at the end of this month.

Foreign ore deliveries are good, in spite of the Swedish strike. Hence the ironmasters are not engaging in fresh contracts.

Finished steel demand has improved in the domestic market, but export demand generally is still slow, especially in the plate department. The Admiralty has placed orders for seven destroyers with Scottish and North-East Coast yards. More locomotives have been ordered for use on British railroads.

Tin plate markets are moderately active, with inquiry in excess of actual business. Makers are well sold, on their restricted output, and prices are firm.

Galvanized sheets are active and firm. Japan has bought some parcels of black sheets—thin specifications. Other gages are in less demand and the market is quiet, but prices are higher because of the increasing cost of foreign steel.

On the Continent of Europe

Continental markets are strong. Semi-finished material is almost impossible to secure from the makers. There is good export demand for finished steel, which is being met direct by Continental makers. Hence very little important business is passing through traders' hands in London.

There is to be a meeting in Paris on March 5 of the European Rail Cartel, when, it is expected, prices will be advanced. The Raw Steel Cartel will hold a meeting shortly afterward.

BELGIAN PRICES HIGH

Mills Not Seeking Business—Slight Reaction Expected in Some Quarters

ANTWERP, BELGIUM, Feb. 11.—Recent rapid advances in the iron and steel market have developed a speculative tendency, so that, while it is generally admitted that many mills are well booked with tonnage and able to adopt an independent attitude, some reaction to the present strength would not be unexpected. Such a reaction may be only temporary, as sellers seem to be in a secure position, many either quoting prohibitive prices or refusing to consider further business at present. Since the strike in the Swedish iron mines will probably be settled shortly, this may exercise a slight depressing tendency on prices. With quotations covering a wide range depending upon the tonnage each mill has on its books, determination of the actual market is difficult.

Pig Iron.—Purchases of foundry iron have been large, and prices are very firm. Available supplies at the furnaces are small. Export prices have been advanced to £3 3s. ($15.34) per ton, f.o.b. Antwerp, for foundry grade, and basic iron is quoted at £2 19s. to £3 ($14.38 to $14.61) per ton, f.o.b. Antwerp. Bessemer hematite is quiet at 670 fr. ($18.90) per ton for domestic delivery.

Semi-Finished Material.—Prices have been advanced considerably, and less business is being transacted. Buyers are not inclined to pay the latest quotations of mills, but makers have only small supplies available and are in a position to be independent. Blooms are nominally £4 3s. 6d. to £4 6s. 6d. ($20.33 to $21.07) per ton, f.o.b. Antwerp. Billets are in good demand, but makers are not seeking business. As a result, prices

---

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0	18s.	to	£0	18¼s.	$4.39	to	$4.45
Bilbao Rubio ore*	1	1½				5.24		
Cleveland No. 1 fdy.	3	7½				16.44		
Cleveland No. 3 fdy.	3	5				15.83		
Cleveland No. 4 fdy.	3	4				15.59

3/16-in. ship plates:								
Belgium	6	5				1.39		
Luxemburg	6	5				1.39		
Sheets, heavy:								
Belgium	6	1				1.34		
Germany	6	1				1.34		

(a) Nominal.

are nominally £4 8s. to £4 11s. ($21.43 to $22.16) per ton. Makers of sheet bars are well booked with business, and, with demand large, prices are firm at about £4 12s. 6d. ($22.53) per ton, f.o.b. Antwerp.

Finished Material.—Prices show no further advance, but are decidedly strong. Buyers are unwilling to pay the present level of quotations, and mills seem to have developed an exaggerated idea of values. Steel bars are quoted at £5 5s. to £5 7s. 6d. per ton (1.16c. to 1.18c. per lb.), but some business has been closed at £5 2s. to £5 3s. 6d. per ton (1.13c. to 1.15c. per lb.), f.o.b. Antwerp. Hoops are quoted at about £6 2s. 6d. per ton (1.35c. per lb.), f.o.b. Antwerp.

JAPAN BUYS TIN PLATE

Nippon Oil Co. Places Order Here—British Export Sheet Prices Reduced

New York, Feb. 28.—Export trade continues light, and prices quoted by American mills are not particularly strong. While tin plate for export to Japan and China is quoted at about $5.20 per base box, c.i.f. Japanese or Chinese port, exporters seem to believe that with a sizable tonnage to place some concession could be obtained. The quarterly requirements of the Nippon Oil Co. in Japan, about 63,500 base boxes of oil can tin plate, have been placed with exporters in the United States. The Kioto Oil Co. in Japan is expected to enter the market shortly for 20,000 to 25,000 boxes of tin plate. Both Chinese and Japanese consumers are interested in the purchase of tin plate waste and tin plate waste waste, but are unwilling to pay the prices quoted by sellers. In some instances exporters to the Far East have been seeking to locate scrap tin plate cut from old tin cans and similar material of large size, believing that it might be used by some Far Eastern consumers and could be sold at a price within their means.

The light-gage sheet market is quiet, with American mill prices for export at $77 to $78 per ton, c.i.f. Japan or China. Recently British sellers have reduced their export prices on these specifications to £14 18s. ($72.57) per ton, c.i.f. Japan. This is only 6d. (12c.) per ton more than the recent German price of £14 17s. 6d. ($72.45). It is expected that the German quotation may be lowered to about 5s. per ton less than the British market.

Some rail business has been placed by Japanese companies. The South Manchuria Railway Co. has awarded 250 tons of splice bars to an exporter in New York for execution by an American mill and 975 tons of tie plates to a Japanese exporter for execution by a Belgian mill.

Mannesmann Works Makes Stainless Steel Tubes
